ispLSI® and pLSI® 2064V

High Density Programmable Logic

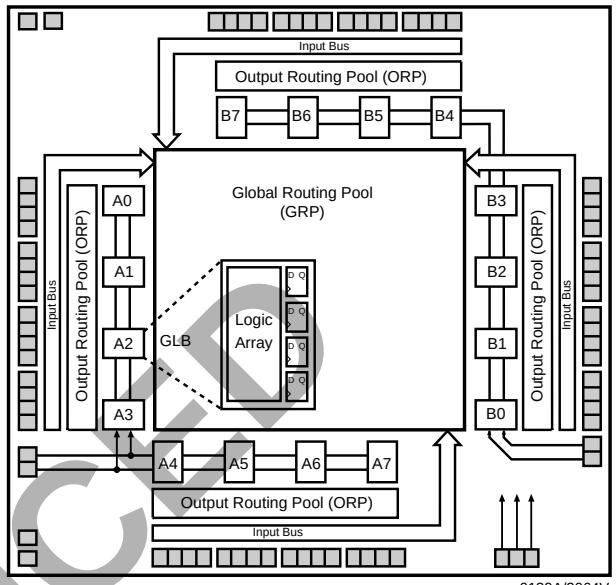
Features

- **HIGH DENSITY PROGRAMMABLE LOGIC**
  - **— 2000 PLD Gates**
  - **— 64 and 32 I/O Pin Versions, Four Dedicated Inputs**
  - **— 64 Registers**
  - **— High Speed Global Interconnect**
  - **— Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.**
  - **— Small Logic Block Size for Random Logic**
- **3.3V LOW VOLTAGE 2064 ARCHITECTURE**
  - **— Interfaces with Standard 5V TTL Devices**
  - **— Fuse Map Compatible with 5V ispLSI/pLSI 2064**
- **HIGH-PERFORMANCE E²CMOS® TECHNOLOGY**
  - **— f_{max} = 100MHz Maximum Operating Frequency**
  - **— t_{pd} = 7.5ns Propagation Delay**
  - **— Electrically Erasable and Reprogrammable**
  - **— Non-Volatile**
  - **— 100% Tested at Time of Manufacture**
  - **— Unused Product Term Shutdown Saves Power**
- **ispLSI OFFERS THE FOLLOWING ADDED FEATURES**
  - **— 3.3V In-System Programmability™ (ISP™) Using Boundary Scan Test Access Port (TAP)**
  - **— Open-Drain Output Option for Flexible Bus Interface Capability, Allowing Easy Implementation of Wired-OR or Bus Arbitration Logic**
  - **— Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality**
  - **— Reprogram Soldered Devices for Faster Prototyping**
- **THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FPGAs**
  - **— Enhanced Pin Locking Capability**
  - **— Three Dedicated Clock Input Pins**
  - **— Synchronous and Asynchronous Clocks**
  - **— Programmable Output Slew Rate Control**
  - **— Flexible Pin Placement**
  - **— Optimized Global Routing Pool Provides Global Interconnectivity**
- **ispLSI/pLSI DEVELOPMENT TOOLS**

  pDS® Software
  - **— Easy-to-Use PC Windows™ Interface**
  - **— Boolean Logic Compiler**
  - **— Manual Partitioning, Automatic Place and Route**

  pDS+™ Software
  - **— Industry Standard, Third-Party Design Environments**
  - **— Schematic Capture, State Machine, HDL**
  - **— Automatic Partitioning and Place and Route**
  - **— Comprehensive Logic and Timing Simulation**
  - **— PC and Workstation Platforms**

Functional Block Diagram



0139A/2064V

Description

The ispLSI and pLSI 2064V are High-Density Programmable Logic Devices available in 64 and 32 I/O-pin versions. The devices contain 64 Registers, four Dedicated Input pins, three Dedicated Clock Input pins, two dedicated Global OE input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2064V features in-system programmability through the Boundary Scan Test Access Port (TAP). The ispLSI 2064V offers non-volatile "on-the-fly" reprogrammability of the logic, as well as the interconnect, to provide truly reconfigurable systems. It is architecturally and parametrically compatible to the pLSI 2064V device, but multiplexes four input pins to control in-system programming.

The basic unit of logic on the ispLSI and pLSI 2064V devices is the Generic Logic Block (GLB). The GLBs are labeled A0, A1…B7 (see figure 1). There are a total of 16 GLBs in the ispLSI and pLSI 2064V devices. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

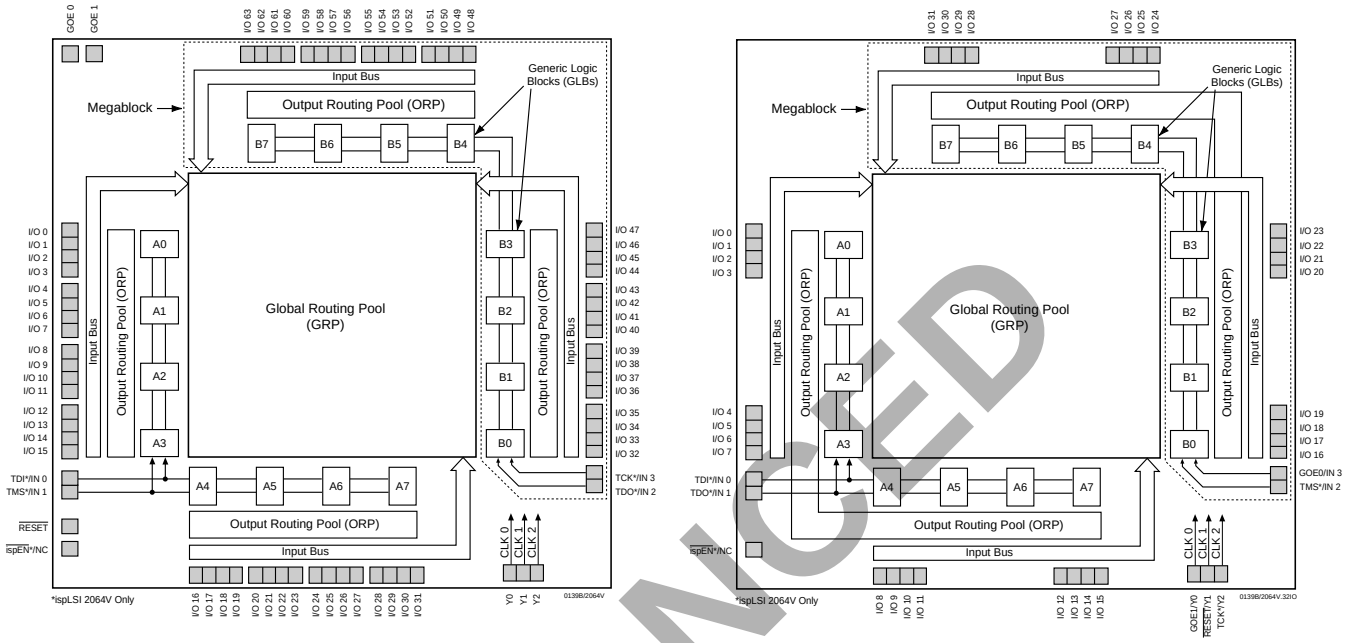
Functional Block Diagram

Figure 1. ispLSI and pLSI 2064V Functional Block Diagram (64-I/O and 32-I/O Versions)



The 64-I/O 2064V contains 64 I/O cells, while the 32-I/O version contains 32 I/O cells. Each I/O cell is directly connected to an I/O pin and can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise. Device pins can be safely driven to 5-Volt signal levels to support mixed-voltage systems.

Eight GLBs, 32 or 16 I/O cells, two dedicated inputs and two or one ORPs are connected together to make a Megablock (see Figure 1). The outputs of the eight GLBs are connected to a set of 32 or 16 universal I/O cells by two or one ORPs. Each ispLSI and pLSI 2064V device contains two Megablocks.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI and pLSI 2064V devices are selected using the dedicated clock pins. Three dedicated clock pins (Y0, Y1, Y2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

Programmable Open-Drain Outputs

In addition to the standard output configuration, the outputs of the ispLSI and pLSI 2064V are individually programmable, either as a standard totem-pole output or an open-drain output. The totem-pole output drives the specified Voh and Vol levels, whereas the open-drain output drives only the specified Vol. The Voh level on the open-drain output depends on the external loading and pull-up. This output configuration is controlled by a programmable fuse. When this fuse is erased (JEDEC “1”), the output is configured as a totem-pole output. When this fuse is programmed (JEDEC “0”), the output is configured as an open-drain. The default configuration when the device is in bulk erased state is totem-pole configuration. The open-drain/totem-pole option is selectable through the pDS and pDS+ software tools.

Software Support

The open-drain output option will be supported by pDS version 3.1 and above, or pDS+ version 3.5 and above.

Absolute Maximum Ratings [1]

Supply Voltage V_{CC} ..... -0.5 to +5.6V

Input Voltage Applied ..... -0.5 to +5.6V

Off-State Output Voltage Applied ..... -0.5 to +5.6V

Storage Temperature ..... -65 to 150°C

Case Temp. with Power Applied ..... -55 to 125°C

Max. Junction Temp. (T_J) with Power Applied ..... 150°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Condition

SYMBOL	PARAMETER	MIN.	MAX.	UNITS
T_A	Ambient Temperature	0	70	°C
V_{CC}	Supply Voltage	3.0	3.6	V
V_{IL}	Input Low Voltage	V_{CC} – 0.5	0.8	V
V_{IH}	Input High Voltage	2.0	5.25	V

Table 2-0005/2064V

Capacitance (TA=25°C, f=1.0 MHz)

SYMBOL	PARAMETER	TYPICAL	UNITS	TEST CONDITIONS
C_1	Dedicated Input Capacitance	8	pf	V_{CC} = 3.3V, V_{IN} = 2.0V
C_2	I/O Capacitance	8	pf	V_{CC} = 3.3V, $V_{I/O}$ = 2.0V
C_3	Clock and Global Output Enable Capacitance	13	pf	V_{CC} = 3.3V, V_Y = 2.0V

Data Retention Specifications

PARAMETER	MINIMUM	MAXIMUM	UNITS
Data Retention	20	–	Years
ispLSI Erase/Reprogram Cycles	10000	–	Cycles
pLSI Erase/Reprogram Cycles	100	–	Cycles

Table 2-0008A-isp

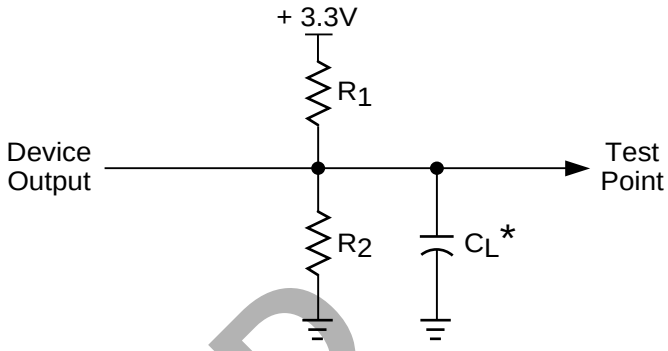
Switching Test Conditions

Input Pulse Levels	GND to 3.0V
Input Rise and Fall Time 10% to 90%	≤ 1.5 ns
Input Timing Reference Levels	1.5V
Ouput Timing Reference Levels	1.5V
Output Load	See Figure 2

Table 2-0003/2064V

3-state levels are measured 0.5V from steady-state active level.

Figure 2. Test Load



*C_L includes Test Fixture and Probe Capacitance.

0213A/2064V

Output Load Conditions (see Figure 2)

TEST CONDITION		R1	R2	CL
A		316Ω	348Ω	35pF
B	Active High	∞	348Ω	35pF
	Active Low	316Ω	348Ω	35pF
C	Active High to Z at V_{OH}-0.5V	∞	348Ω	5pF
	Active Low to Z at V_{OL}+0.5V	316Ω	348Ω	5pF

Table 2-0004/2064V

DC Electrical Characteristics

Over Recommended Operating Conditions

SYMBOL	PARAMETER	CONDITION	MIN.	TYP.[3]	MAX.	UNITS
V_{OL}	Output Low Voltage	I_{OL} = 8 mA	–	–	0.4	V
V_{OH}	Output High Voltage	I_{OH} = -4 mA	2.4	–	–	V
I_{IL}	Input or I/O Low Leakage Current	0V ≤ V_{IN} ≤ V_{IL} (Max.)	–	–	-10	µA
I_{IH}	Input or I/O High Leakage Current	(V_{CC} – 0.2)V ≤ V_{IN} ≤ V_{CC}	–	–	10	µA
		V_{CC} ≤ V_{IN} ≤ 5.25V	–	–	50	mA
I_{IL-isp}	$\overline{ispEN}$ Input Low Leakage Current	0V ≤ V_{IN} ≤ V_{IL}	–	–	-150	µA
I_{IL-PU}	I/O Active Pull-Up Current	0V ≤ V_{IN} ≤ V_{IL}	–	–	-150	µA
I_{OS}[1]	Output Short Circuit Current	V_{CC} = 5V, V_{OUT} = 0.5V	–	–	-100	mA
I_{CC}[2, 4]	Operating Power Supply Current	V_{IL} = 0.0V, V_{IH} = 3.0V f_{CLOCK} = 1 MHz	–	–	–	mA

Table 2-0007/2064V

1. One output at a time for a maximum duration of one second. V_{OUT} = 0.5V was selected to avoid test problems by tester ground degradation. Guaranteed but not 100% tested.
2. Measured using four 16-bit counters.
3. Typical values are at V_{CC} = 3.3V and T_A = 25°C.
4. Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and Thermal Management section of the 1996 Lattice Semiconductor Data Book to estimate maximum I_{CC}.

External Timing Parameters

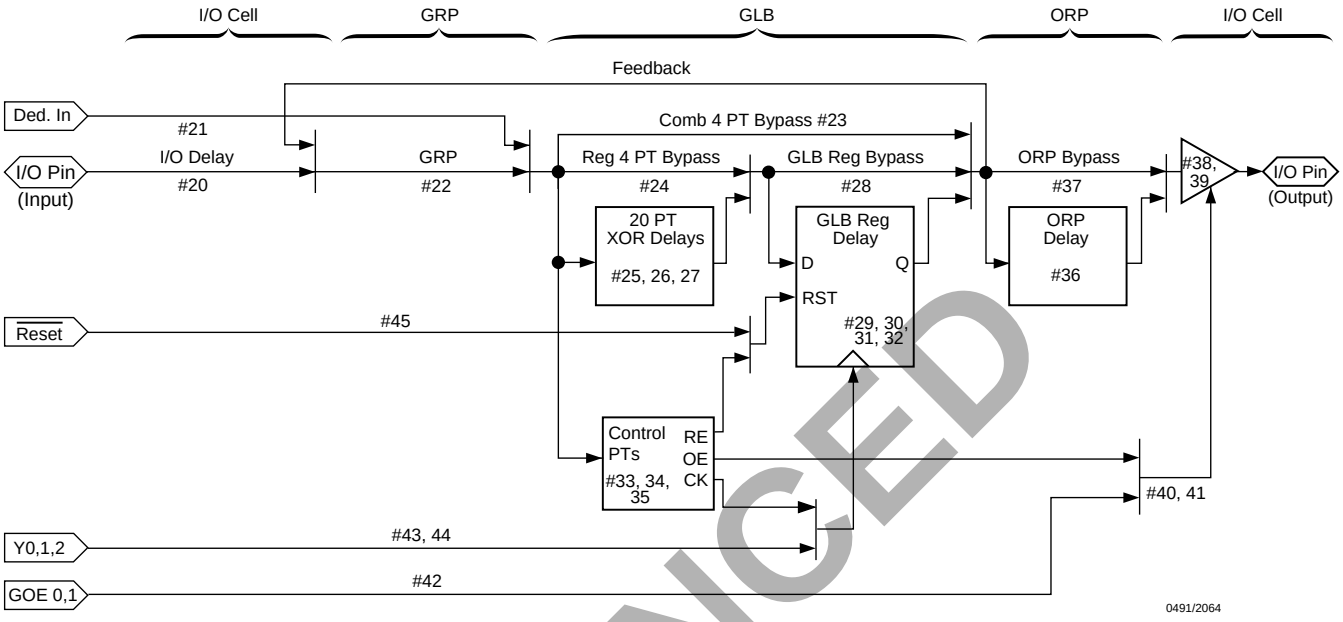
Table 2-0036/2064V

1. Internal Timing Parameters are not tested and are for reference only.
2. Refer to Timing Model in this data sheet for further details.
3. The XOR adjacent path can only be used by hard macros.

ispLSI and pLSI 2064V Timing Model



Derivations of tsu, th and tco from the Product Term Clock[1]

tsu = Logic + Reg su - Clock (min)
= (**t**io + **t**grp + **t**20ptxor) + (**t**gsu) - (**t**io + **t**grp + **t**ptck(min))

th = Clock (max) + Reg h - Logic
= (**t**io + **t**grp + **t**ptck(max)) + (**t**gh) - (**t**io + **t**grp + **t**20ptxor)

tco = Clock (max) + Reg co + Output
= (**t**io + **t**grp + **t**ptck(max)) + (**t**gco) + (**t**orp + **t**ob)

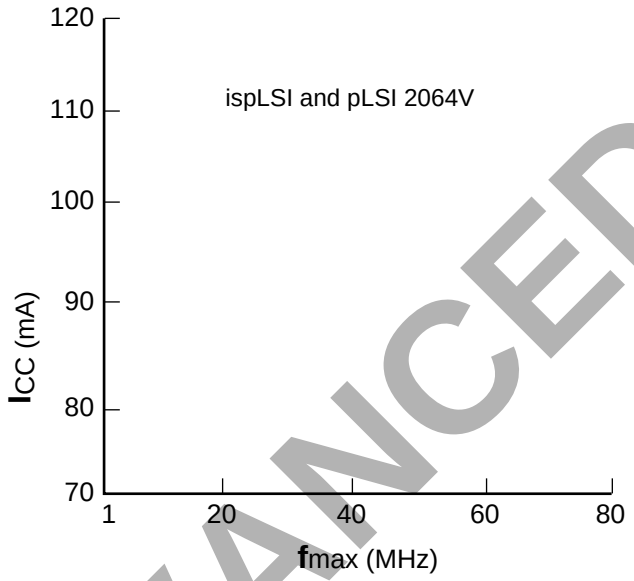
Note: Calculations are based on timing specifications for the ispLSI and pLSI 2064V-100L.

Table 2-0042/2064V

Power Consumption

Power Consumption in the ispLSI and pLSI 2064V device depends on two primary factors: the speed at which the device is operating and the number of Product Terms used. Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax



Notes: Configuration of Four 16-bit Counters
Typical Current at 5V, 25° C

I_{CC} can be estimated for the ispLSI and pLSI 2064V using the following equation:

I_{CC}(mA) =

Where:
# of PTs = Number of Product Terms used in design
# of nets = Number of Signals used in device
Max freq = Highest Clock Frequency to the device (in MHz)

The I_{CC} estimate is based on typical conditions (V_{CC} = 5.0V, room temperature) and an assumption of 2 GLB loads on average exists. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

0127/2064V

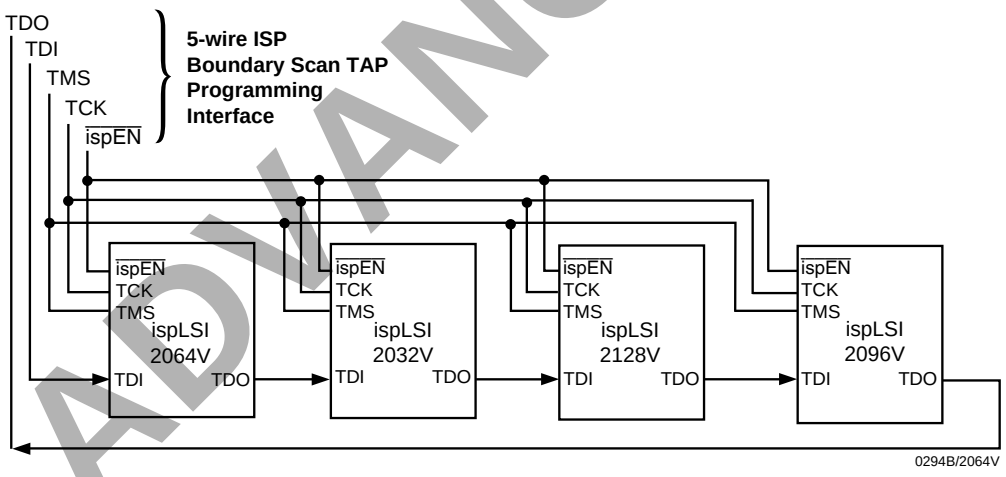
ispLSI 2064V Shift Register Layout

ispLSI devices are the in-system programmable versions of Lattice Semiconductor's high density programmable Large Scale Integration (pLSI) devices. By integrating all the high voltage programming circuitry on-chip, programming can be accomplished by simply shifting data into the device. Once the function is programmed, the non-volatile E^2CMOS cells will not lose the pattern even when the power is turned off.

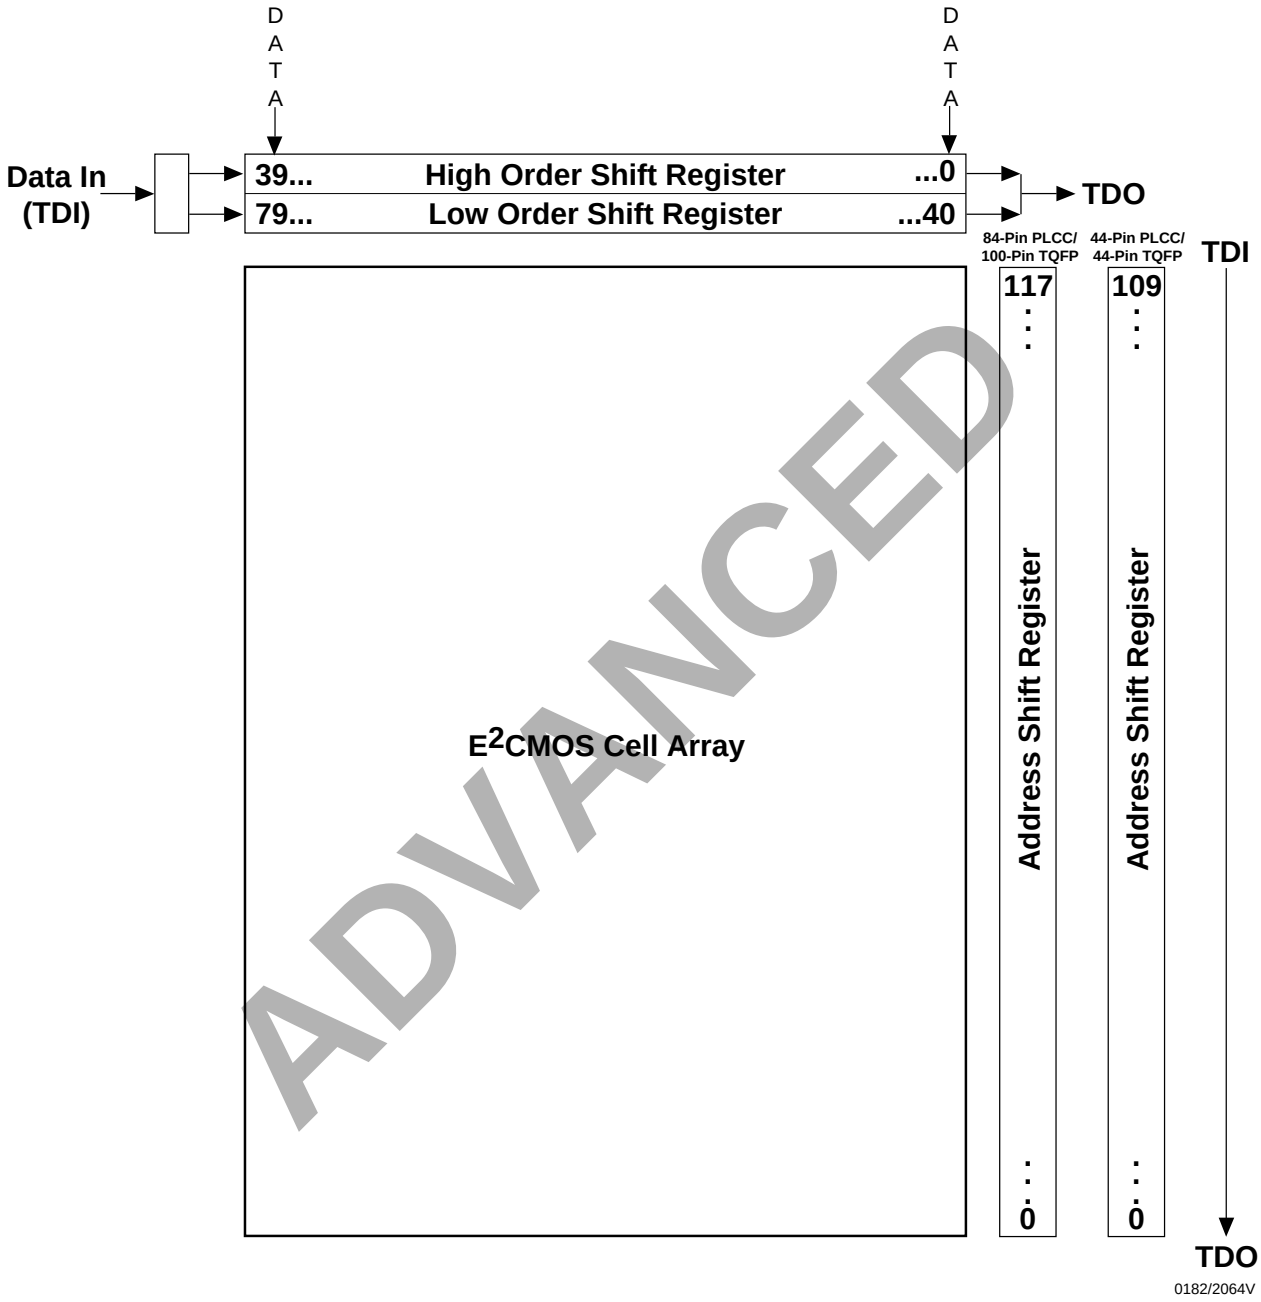
All necessary programming is done via five TTL level logic interface signals. These five signals are fed into the on-chip programming circuitry where a state machine controls the programming. The simple signals for the TAP interface include ISP Enable ($\overline{ispEN}$), Test Data In (TDI), Test Data Out (TDO), Test Clock (TCK) and Test Mode Select (TMS). Figure 4 illustrates the block diagram of one possible scheme of the programming interface for the ispLSI 2064LV devices. For details on the operation of the internal state machine and programming of the device please refer to the ISP Architecture and Programming section of the 1996 Lattice Semiconductor Data Book.

The device identifier for the ispLSI 2064V in the 44-pin PLCC and TQFP packages is 00306043. The device identifer for the ispLSI 2064V in the 100-pin TQFP and 84-pin PLCC packages is 00302043. This code is the unique device identifier generated when a read ID command is performed.

Figure 4. ISP Programming Interface



ispLSI 2064V Shift Register Layout



Note: A logic "1" in the address shift register enables the row for programming or verification. A logic "0" disables it.

GOE 0, GOE 1	64, 22	62, 13	Global Output Enable Input Pins
Y0, Y1, Y2	19, 67, 62	10, 65, 60	Dedicated Clock input. This clock input is connected to one of the clock inputs of all the GLBs in the device.
$\overline{\text{RESET}}$	20	11	Active Low (0) Reset pin which resets all registers in the device.
$\overline{\text{ispEN}}$**/NC	24	15	Input — Dedicated in-system programming Boundary Scan enable input pin. This pin is brought low to enable the programming mode. The TMS, TDI, TDO and TCK controls become active.
TDI*/IN 0	25	16	Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as an input pin to load programming data into the device. TDI/IN 0 also is used as one of the two control pins for the ISP state machine. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin.
TMS*/IN 1	43	37	Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as a pin to control the operation of the ISP state machine. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin.
TDO*/IN 2	1	87	Output/Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as an output pin to read serial shift register data. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin.
TCK*/IN 3	61	59	Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as a clock pin for the Serial Shift Register. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin.
NC	66	4, 9, 21, 25, 31, 38, 44, 50, 54, 64, 66, 71, 75, 81, 88, 94, 100	These pins are not used.
GND	23, 44, 63, 84	14, 39, 61, 86	Ground (GND)
VCC	2, 21, 42, 65	12, 36, 63, 89	Vcc

Table 2-0002A/2064V

* ispLSI 2064V only

** $\overline{\text{ispEN}}$ for ispLSI 2064V only; NC for pLSI 2064V must be left floating or tied to V_{CC} and must not be grounded or tied to any other signal.

Pin Description

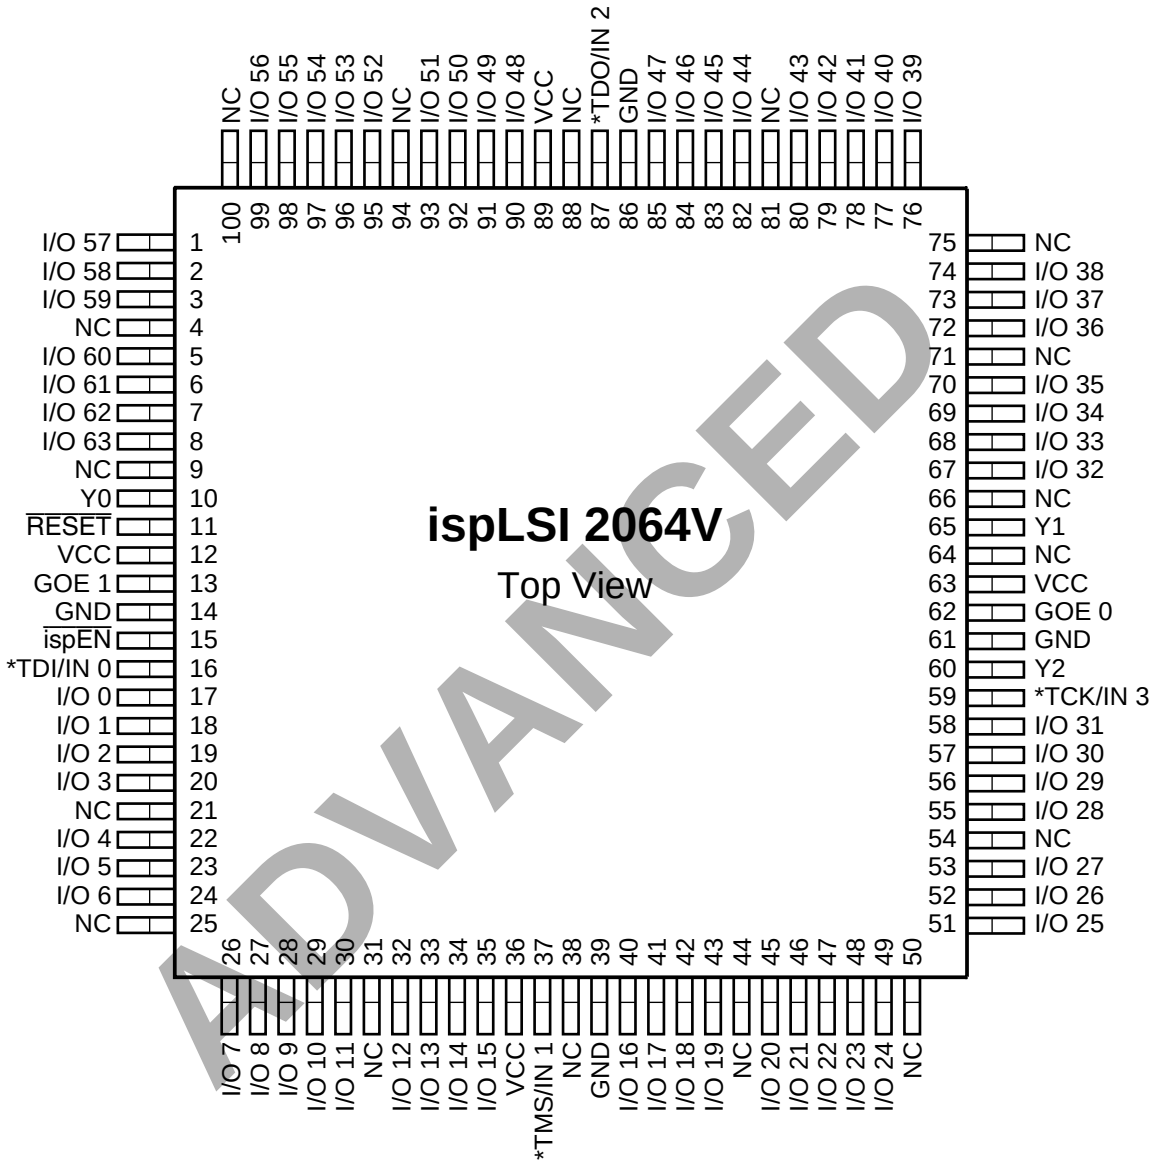
* ispLSI 2064V only

Table 2-0002B/2064V

** $\overline{\text{ispEN}}$ for ispLSI 2064V only; NC for pLSI 2064V, must be left floating or tied to V_{CC} and must not be grounded or tied to any other signal.

Pin Configuration

ispLSI 2064V 100-Pin TQFP

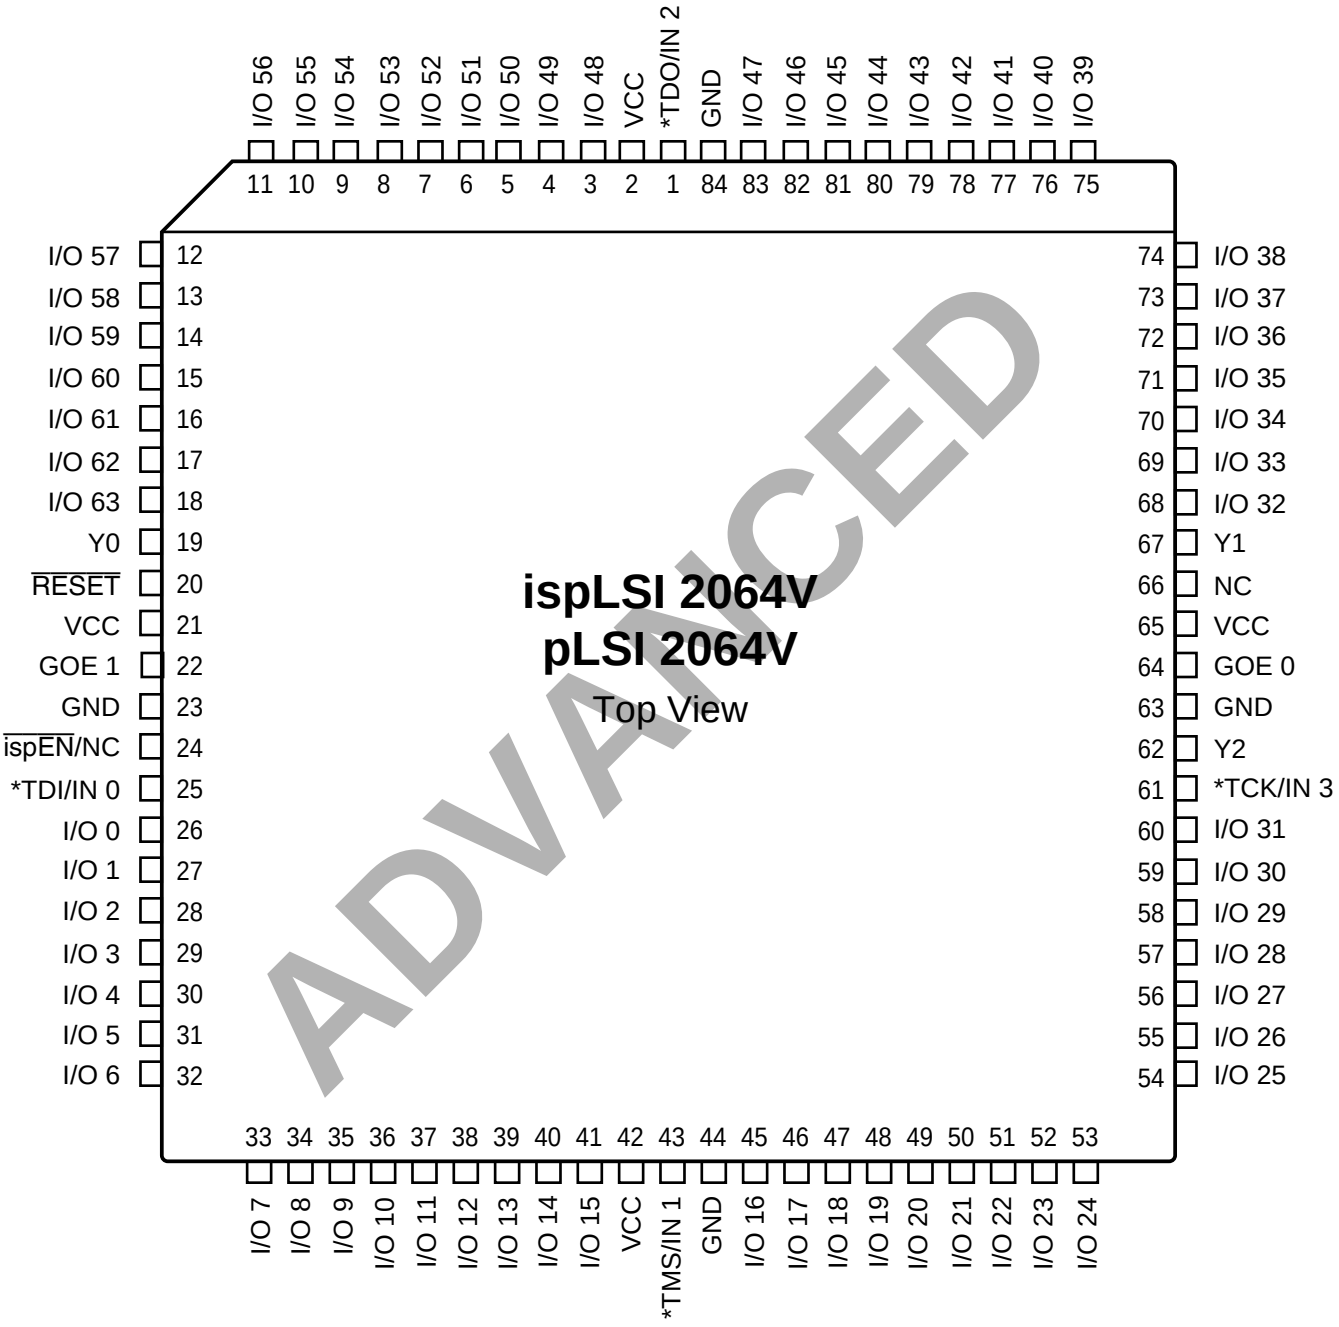


100 TQFP/2064V

*Pins have dual function capability.

Pin Configuration

ispLSI and pLSI 2064V 84-Pin PLCC

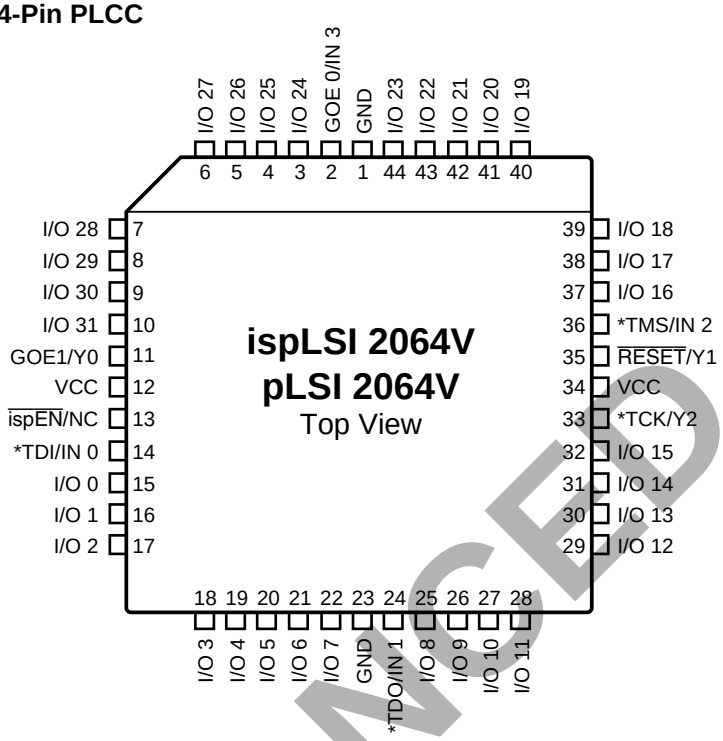


*Pins have dual function capability for ispLSI 2064V only (except pin 24, which is $\overline{\text{ispEN}}$ only).

84 PLCC/2064V

Pin Configuration

ispLSI and pLSI 2064V 44-Pin PLCC

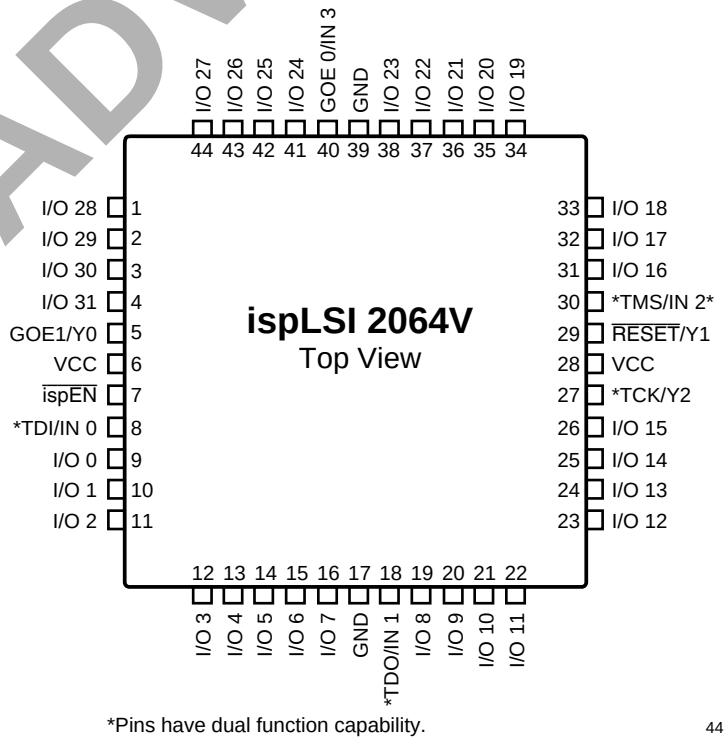


*Pins have dual function capability for ispLSI 2064V only.

44 PLCC/2064V

Pin Configuration

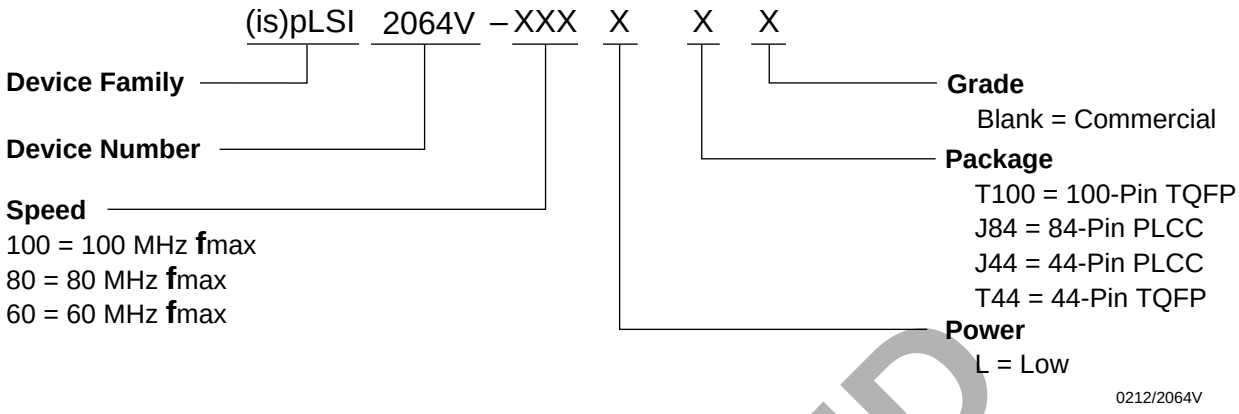
ispLSI 2064V 44-Pin TQFP



*Pins have dual function capability.

44 TQFP/2064V

Part Number Description



ispLSI and pLSI 2064V Ordering Information

COMMERCIAL

Device Family	fmax (MHz)	tpd (ns)	Ordering Number	Package
ispLSI	100	7.5	ispLSI 2064V-100LT100	100-Pin PLCC
