

Features

- **HIGH DENSITY PROGRAMMABLE LOGIC**
 - 1000 PLD Gates
 - 32 I/O Pins, Two Dedicated Inputs
 - 32 Registers
 - High Speed Global Interconnect
 - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
 - Small Logic Block Size for Random Logic
- **HIGH PERFORMANCE E²CMOS[®] TECHNOLOGY**
 - $f_{max} = 180$ MHz Maximum Operating Frequency
 - $t_{pd} = 5.0$ ns Propagation Delay
 - TTL Compatible Inputs and Outputs
 - Electrically Erasable and Reprogrammable
 - Non-Volatile
 - 100% Tested at Time of Manufacture
 - Unused Product Term Shutdown Saves Power
- **ispLSI OFFERS THE FOLLOWING ADDED FEATURES**
 - In-System Programmable[™] (ISP[™]) 5-Volt Only
 - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
 - Reprogram Soldered Devices for Faster Prototyping
- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
 - Complete Programmable Device Can Combine Glue Logic and Structured Designs
 - Enhanced Pin Locking Capability
 - Three Dedicated Clock Input Pins
 - Synchronous and Asynchronous Clocks
 - Programmable Output Slew Rate Control to Minimize Switching Noise
 - Flexible Pin Placement
 - Optimized Global Routing Pool Provides Global Interconnectivity
- **ispLSI/pLSI DEVELOPMENT TOOLS**

pDS[®] Software

 - Easy to Use PC Windows[™] Interface
 - Boolean Logic Compiler
 - Manual Partitioning
 - Automatic Place and Route
 - Static Timing Table

pDS+[™] Software

 - Industry Standard, Third Party Design Environments
 - Schematic Capture, State Machine, HDL
 - Automatic Partitioning and Place and Route
 - Comprehensive Logic and Timing Simulation
 - PC and Workstation Platforms

Functional Block Diagram

Description

The ispLSI and pLSI 2032 are High Density Programmable Logic Devices. The devices contain 32 Registers, 32 Universal I/O pins, two Dedicated Input Pins, three Dedicated Clock Input Pins, one dedicated Global OE input pin and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2032 features 5-Volt in-system programmability and in-system diagnostic capabilities. The ispLSI 2032 offers non-volatile "on-the-fly" reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems. It is architecturally and parametrically compatible to the pLSI 2032 device, but multiplexes four input pins to control in-system programming.

The basic unit of logic on the ispLSI and pLSI 2032 devices is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. A7 (see figure 1). There are a total of eight GLBs in the ispLSI and pLSI 2032 devices. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

Functional Block Diagram

Figure 1. ispLSI and pLSI 2032 Functional Block Diagram

The devices also have 32 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

Eight GLBs, 32 I/O cells, two dedicated inputs and two ORPs are connected together to make a Megablock (see figure 1). The outputs of the eight GLBs are connected to a set of 32 universal I/O cells by the ORP. Each ispLSI and pLSI 2032 device contains one Megablock.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI and pLSI 2032 devices are selected using the dedicated clock pins. Three dedicated clock pins (Y0, Y1, Y2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

Absolute Maximum Ratings ¹

Supply Voltage V_{CC} -0.5 to +7.0V
 Input Voltage Applied -2.5 to $V_{CC} + 1.0V$
 Off-State Output Voltage Applied -2.5 to $V_{CC} + 1.0V$
 Storage Temperature -65 to 150°C
 Case Temp. with Power Applied -55 to 125°C
 Max. Junction Temp. (T_J) with Power Applied ... 150°C

1. Stresses above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Condition

SYMBOL	PARAMETER	MIN.	MAX.	UNITS	
V_{CC}	Supply Voltage	Commercial $T_A = 0^\circ\text{C to } + 70^\circ\text{C}$	4.75	5.25	V
		Industrial $T_A = -40^\circ\text{C to } + 85^\circ\text{C}$	4.5	5.5	V
V_{IL}	Input Low Voltage	0	0.8	V	
V_{IH}	Input High Voltage	2.0	$V_{CC}+1$	V	

Table 2 - 0005/2032

Capacitance ($T_A=25^\circ\text{C}$, $f=1.0\text{ MHz}$)

SYMBOL	PARAMETER	TYPICAL	UNITS	TEST CONDITIONS
C_1	Dedicated Input Capacitance	6	pf	$V_{CC} = 5.0V, V_{IN} = 2.0V$
C_2	I/O Capacitance	7	pf	$V_{CC} = 5.0V, V_{IO} = 2.0V$
C_3	Clock Capacitance	10	pf	$V_{CC} = 5.0V, V_Y = 2.0V$

I _{OS} ¹	Output Short Circuit Current	V _{CC} = 5V, V _{OUT} = 0.5V	-	-	-200	mA	
I _{CC} ^{2,4}	Operating Power Supply Current	V _{IL} = 0.0V, V _{IH} = 3.0V f _{TOGGLE} = 1 MHz	Comm.	-180, -150	-	60	mA
			Others	-	-	40	mA
			Industrial	-	-	40	mA

Table 2-0007Aisp/2032

- One output at a time for a maximum duration of one second. V_{OUT} = 0.5V was selected to avoid test problems by tester ground degradation. Guaranteed but not 100% tested.
- Measured using two 16-bit counters.
- Typical values are at V_{CC} = 5V and T_A = 25°C.
- Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and Thermal Management section of this Data Book to estimate maximum I_{CC}.

 7.7 \text{ ns} &= (0.6 + 0.7 + 3.8) + (0.7) + (0.7 + 1.2)
 \end{aligned}$$

Note: Calculations are based upon timing specifications for the ispLSI and pLSI 2032-180L

Table 2- 0042-16/2032

Power Consumption

Power Consumption in the ispLSI and pLSI 2032 device depends on two primary factors: the speed at which the device is operating and the number of Product Terms

used. Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

Notes: Configuration of Two 16-bit Counters
Typical Current at 5V, 25° C

ICC can be estimated for the ispLSI and pLSI 2032 using the following equation:

For 2032 -150, -180: $I_{CC}(mA) = 30 + (\# \text{ of PTs} * 0.46) + (\# \text{ of nets} * \text{Max freq} * 0.012)$
 For 2032 -135, -110, -80: $I_{CC}(mA) = 21 + (\# \text{ of PTs} * 0.30) + (\# \text{ of nets} * \text{Max freq} * 0.012)$

Where:

- # of PTs = Number of Product Terms used in design
- # of nets = Number of Signals used in device
- Max freq = Highest Clock Frequency to the device (in MHz)

The ICC estimate is based on typical conditions (VCC = 5.0V, room temperature) and an assumption of 2 GLB loads on average exists. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual ICC should be verified.

0127A/2032

In-System Programmability

The ispLSI devices are the in-system programmable versions of the Lattice Semiconductor high density programmable Large Scale Integration (pLSI) devices. By integrating all the high voltage programming circuitry on-chip, programming can be accomplished by simply shifting data into the device. Once the function is programmed, the non-volatile E²CMOS cells will not lose the pattern even when the power is turned off.

All necessary programming is done via five TTL level logic interface signals. These five signals are fed into the on-chip programming circuitry where a state machine controls the programming. The simple signals for the

interface include isp Enable ($\overline{\text{ispEN}}$), Serial Data In (SDI), Serial Data Out (SDO), Serial Clock (SCLK) and Mode (MODE) control. Figure 4 illustrates the block diagram of one possible scheme of the programming interface for the ispLSI devices. For details on the operation of the internal state machine and programming of the device please refer to the ISP Architecture and Programming section of this Data Book.

The device identifier for the ispLSI 2032 is 0001 0101 (15 hex). This code is the unique device identifier which is generated when a read ID command is performed.

Figure 4. ISP Programming Interface

ispLSI 2032 Shift Register Layout

Note: A logic "1" in the address shift register enables the row for programming or verification. A logic "0" disables it.

Pin Description

NAME	44-PIN PLCC PIN NUMBERS	44-PIN TQFP PIN NUMBERS	48-PIN TQFP PIN NUMBERS	DESCRIPTION
I/O 0 - I/O 3 I/O 4 - I/O 7 I/O 8 - I/O 11 I/O 12 - I/O 15 I/O 16 - I/O 19 I/O 20 - I/O 23 I/O 24 - I/O 27 I/O 28 - I/O 31	15, 16, 17, 18, 19, 20, 21, 22, 25, 26, 27, 28, 29, 30, 31, 32, 37, 38, 39, 40, 41, 42, 43, 44, 3, 4, 5, 6, 7, 8, 9, 10	9, 10, 11, 12, 13, 14, 15, 16, 19, 20, 21, 22, 23, 24, 25, 26, 31, 32, 33, 34, 35, 36, 37, 38, 41, 42, 43, 44, 1, 2, 3, 4	9, 10, 11, 13, 14, 15, 16, 17, 20, 21, 22, 23, 25, 26, 27, 28, 33, 34, 35, 37, 38, 39, 40, 41, 44, 45, 46, 47, 1, 2, 3, 4	Input/Output Pins — These are the general purpose I/O pins used by the logic array.
GOE 0	2	40	43	Global Output Enable input pin.
Y0 RESET/Y1	11 35	5 29	5 31	Dedicated Clock input. This clock input is connected to one of the clock inputs of all the GLBs on the device. This pin performs two functions: - Dedicated clock input. This clock input is brought into the Clock Distribution Network, and can optionally be routed to any GLB - Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device.
$\overline{\text{ispEN}}^{**}/\text{NC}$ SDI*/IN 0 MODE*/NC SDO*/IN 1 SCLK*/Y2	13 14 36 24 33	7 8 30 18 27	7 8 32 19 29	Input — Dedicated in-system programming enable input pin. This pin is brought low to enable the programming mode. The MODE, SDI, SDO and SCLK controls become active. Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as an input pin to load programming data into the device. SDI/IN0 also is used as one of the two control pins for the isp state machine. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin. Input — When in ISP Mode, controls operation of ISP state machine. Output/Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as an output pin to read serial shift register data. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin. Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as a clock pin for the Serial Shift Register. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated clock input. This clock input is brought into the Clock Distribution Network and can be routed to any GLB and/or I/O cell on the device.
GND VCC	1, 23 12, 34	17, 39 6, 28	18, 42 6, 30	Ground (GND) V_{CC}

Table 2-0002A-08isp/2032

* ispLSI 2032 only

** $\overline{\text{ispEN}}$ for ispLSI 2032 only; NC for pLSI 2032 must be left floating or tied to V_{CC} , must not be grounded or tied to any other signal.

Pin Configuration

ispLSI and pLSI 2032 44-pin PLCC

*Pins have dual function capability for ispLSI 2032 only
**NC for pLSI 2032 only.

ispLSI and pLSI 2032 44-pin TQFP

*Pins have dual function capability for ispLSI 2032 only
**NC for pLSI 2032 only.

Pin Configuration

ispLSI 2032 48-pin TQFP

48-Pin TQFP/2032

*Pins have dual function capability.
