Lattice™ Semiconductor Corporation

ispLSI® and pLSI® 1032E
## High-Density Programmable Logic

Features

- **HIGH DENSITY PROGRAMMABLE LOGIC**
  - **6000 PLD Gates**
  - **64 I/O Pins, Eight Dedicated Inputs**
  - **192 Registers**
  - **High Speed Global Interconnect**
  - **Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.**
  - **Small Logic Block Size for Random Logic**
- **HIGH PERFORMANCE E²CMOS® TECHNOLOGY**
  - **f_{max} = 125 MHz Maximum Operating Frequency**
  - **t_{pd} = 7.5 ns Propagation Delay**
  - **TTL Compatible Inputs and Outputs**
  - **Electrically Erasable and Reprogrammable**
  - **Non-Volatile**
  - **100% Tested at Time of Manufacture**
  - **Unused Product Term Shutdown Saves Power**
- **ispLSI OFFERS THE FOLLOWING ADDED FEATURES**
  - **In-System Programmable™ (ISP™) 5-Volt Only**
  - **Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality**
  - **Reprogram Soldered Devices for Faster Prototyping**
- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
  - **Complete Programmable Device Can Combine Glue Logic and Structured Designs**
  - **Enhanced Pin Locking Capability**
  - **Four Dedicated Clock Input Pins**
  - **Synchronous and Asynchronous Clocks**
  - **Programmable Output Slew Rate Control to Minimize Switching Noise**
  - **Flexible Pin Placement**
  - **Optimized Global Routing Pool Provides Global Interconnectivity**
- **ispLSI/pLSI DEVELOPMENT TOOLS**
  - **pDS® Software**
    - **Easy to Use PC Windows™ Interface**
    - **Boolean Logic Compiler**
    - **Manual Partitioning**
    - **Automatic Place and Route**
    - **Static Timing Table**
  - **pDS+™ Software**
    - **Industry Standard, Third Party Design Environments**
    - **Schematic Capture, State Machine, HDL**
    - **Automatic Partitioning and Place and Route**
    - **Comprehensive Logic and Timing Simulation**
    - **PC and Workstation Platforms**

Functional Block Diagram

0139A(A1)-isp

Description

The ispLSI and pLSI 1032E are High Density Program-mable Logic Devices containing 192 Registers, 64 Universal I/O pins, eight Dedicated Input pins, four Dedi-cated Clock Input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 1032E features 5-Volt in-system programmability and in-system diagnostic ca-pabilities. The ispLSI 1032E device offers non-volatile "on-the-fly" reprogrammability of the logic, as well as the interconnects to provide truly reconfigurable systems. It is architecturally and parametrically compatible to the pLSI 1032E device, but multiplexes four input pins to control in-system programming. A functional superset of the ispLSI and pLSI 1032 architecture, the ispLSI and pLSI 1032E devices add two new global output enable pins.

The basic unit of logic on the ispLSI and pLSI 1032E devices is the Generic Logic Block (GLB). The GLBs are labeled A0, A1…D7 (see figure 1). There are a total of 32 GLBs in the ispLSI and pLSI 1032E devices. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

Functional Block Diagram

Figure 1. ispLSI and pLSI 1032E Functional Block Diagram

*ISP Control Functions for ispLSI 1032E Only
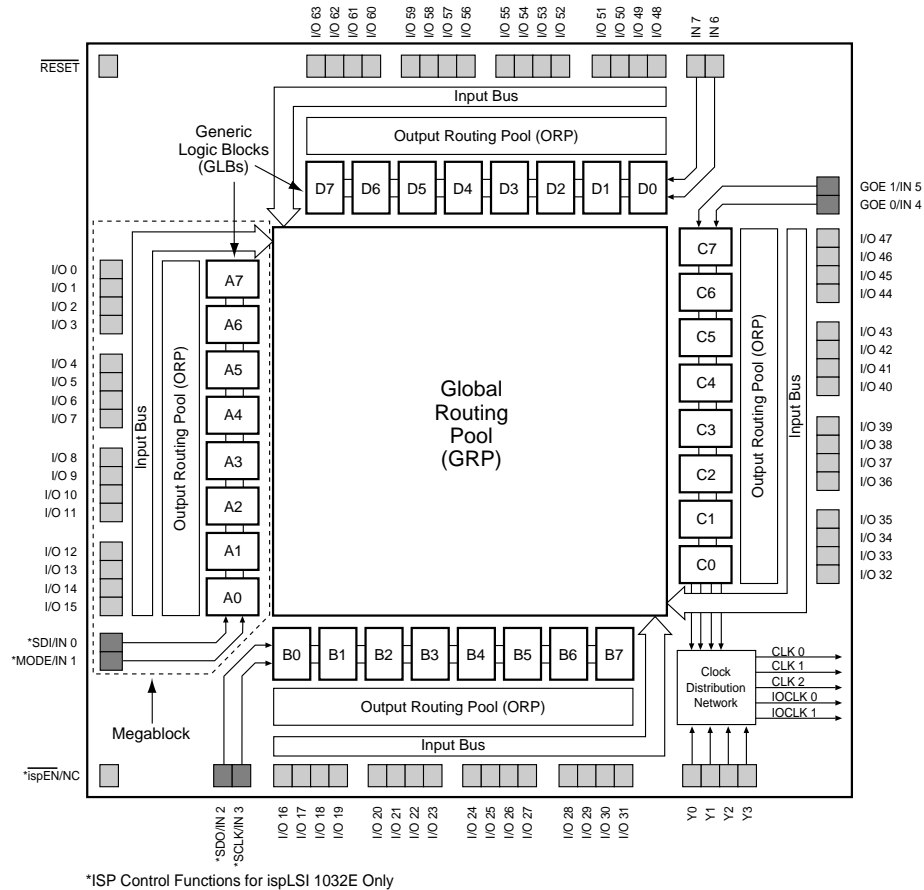

The devices also have 64 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, registered input, latched input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

Eight GLBs, 16 I/O cells, two dedicated inputs and one ORP are connected together to make a Megablock (see figure 1). The outputs of the eight GLBs are connected to a set of 16 universal I/O cells by the ORP. Each ispLSI and pLSI 1032E device contains four Megablocks.

The GRP has, as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI and pLSI 1032E devices are selected using the Clock Distribution Network. Four dedicated clock pins (Y0, Y1, Y2 and Y3) are brought into the distribution network, and five clock outputs (CLK 0, CLK 1, CLK 2, IOCLK 0 and IOCLK 1) are provided to route clocks to the GLBs and I/O cells. The Clock Distribution Network can also be driven from a special clock GLB (C0 on the ispLSI and pLSI 1032E devices). The logic of this GLB allows the user to create an internal clock from a combination of internal signals within the device.

Absolute Maximum Ratings [1]

Supply Voltage V_{CC} ....-0.5 to +7.0V

Input Voltage Applied .... -2.5 to V_{CC} +1.0V

Off-State Output Voltage Applied ..... -2.5 to V_{CC} +1.0V

Storage Temperature .... -65 to 150°C

Case Temp. with Power Applied .... -55 to 125°C

Max. Junction Temp. (T_J) with Power Applied ... 150°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Conditions

SYMBOL	PARAMETER	MIN.	MAX.	UNITS
T_A	Ambient Temperature	0	70	°C
V_{CC}	Supply Voltage	4.75	5.25	V
V_{IL}	Input Low Voltage	0	0.8	V
V_{IH}	Input High Voltage	2.0	V_{CC} +1	V

Table 2-0005/2000

Capacitance (T_A=25°C, f=1.0 MHz)

SYMBOL	PARAMETER	TYPICAL	UNITS	TEST CONDITIONS
C_1	Dedicated Input, I/O, Y1, Y2, Y3, Clock Capacitance	8	pf	V_{CC} = 5.0V, V_{PIN} = 2.0V
C_2	Y0 Clock Capacitance	15	pf	V_{CC} = 5.0V, V_{PIN} = 2.0V

Table 2 - 0006a

Data Retention Specifications

PARAMETER	MINIMUM	MAXIMUM	UNITS
Data Retention	20	–	Years
ispLSI Erase/Reprogram Cycles	10000	–	Cycles
pLSI Erase/Reprogram Cycles	100	–	Cycles

Table 2-0008A-isp

Switching Test Conditions

Input Pulse Levels	GND to 3.0V	
Input Rise and Fall Time 10% to 90%	-125	≤ 2 ns
	Others	≤ 3 ns
Input Timing Reference Levels	1.5V	
Ouput Timing Reference Levels	1.5V	
Output Load	See figure 2	

Table 2a-0003

3-state levels are measured 0.5V from steady-state active level.

Figure 2. Test Load

$^*C_L$ includes Test Fixture and Probe Capacitance.

0213a

Output Load Conditions (see figure 2)

	TEST CONDITION	R1	R2	CL
A		470Ω	390Ω	35pF
B	Active High	∞	390Ω	35pF
	Active Low	470Ω	390Ω	35pF
C	Active High to Z at V_{OH}-0.5V	∞	390Ω	5pF
	Active Low to Z at V_{OL}+0.5V	470Ω	390Ω	5pF

Table 2-0004a

DC Electrical Characteristics

Over Recommended Operating Conditions

SYMBOL	PARAMETER	CONDITION	MIN.	TYP.[3]	MAX.	UNITS
V_{OL}	Output Low Voltage	I_{OL}= 8 mA	–	–	0.4	V
V_{OH}	Output High Voltage	I_{OH}= -4 mA	2.4	–	–	V
I_{IL}	Input or I/O Low Leakage Current	$0V \leq V_{IN} \leq V_{IL}$ (Max.)	–	–	-10	µA
I_{IH}	Input or I/O High Leakage Current	$3.5V \leq V_{IN} \leq V_{CC}$	–	–	10	µA
$I_{IL\text{-}isp}$	$\overline{ispEN}$ Input Low Leakage Current	$0V \leq V_{IN} \leq V_{IL}$	–	–	-150	µA
$I_{IL\text{-}PU}$	I/O Active Pull-Up Current	$0V \leq V_{IN} \leq V_{IL}$	–	–	-150	µA
I_{OS}[1]	Output Short Circuit Current	V_{CC}= 5V, V_{OUT} = 0.5V	–	–	-200	mA
I_{CC}[2, 4]	Operating Power Supply Current	V_{IL}= 0.5V, V_{IH}= 3.0V, f_{CLOCK} = 1 MHz	–	190	–	mA

Table 2-0007b-32-isp

1. One output at a time for a maximum duration of one second. V_{OUT} = 0.5V was selected to avoid test problems by tester ground degradation. Guaranteed but not 100% tested.
2. Measured using eight 16-bit counters.
3. Typical values are at V_{CC}= 5V and T_A= 25°C.
4. Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and Thermal Management section of the 1996 Lattice Semiconductor Data Book to estimate maximum I_{CC}.

Table 2-0042b-32

1. Calculations are based upon timing specifications for the ispLSI and pLSI 1032E-125.

Maximum GRP Delay vs GLB Loads
## Power Consumption

Power consumption in the ispLSI and pLSI 1032E device depends on two primary factors: the speed at which the device is operating, and the number of product terms used. Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

Notes: Configuration of eight 16-bit counters
Typical current at 5V, 25°C

I_{CC} can be estimated for the ispLSI and pLSI 1032E using the following equation:

I_{CC}(mA) = 15 + (# of PTs * 0.59) + (# of nets * Max freq * 0.0078)

Where:
    # of PTs = Number of Product Terms used in design
    # of nets = Number of Signals used in device
    Max freq = Highest Clock Frequency to the device (in MHz)

The I_{CC} estimate is based on typical conditions (V_{CC} = 5.0V, room temperature) and an assumption of 4 GLB loads on average exists. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

0127B-16-80-isp2/1032E

In-System Programmability

The ispLSI devices are the in-system programmable versions of the Lattice Semiconductor high density programmable Large Scale Integration (pLSI) devices. By integrating all the high voltage programming circuitry on-chip, programming can be accomplished by simply shifting data into the device. Once the function is programmed, the non-volatile E^2CMOS cells will not lose the pattern even when the power is turned off.

All necessary programming is done via five TTL level logic interface signals. These five signals are fed into the on-chip programming circuitry where a state machine controls the programming. The interface signals are isp Enable ($\overline{ispEN}$), Serial Data In (SDI), Serial Data Out (SDO), Serial Clock (SCLK) and Mode (MODE) control. Figure 4 illustrates the block diagram of one possible scheme for programming the ispLSI devices. For details on the operation of the internal state machine and programming of the device please refer to the ISP Architecture and Programming section of the 1996 Lattice Semiconductor Data Book.

The Device ID for the ispLSI 1032E is 0000 1101 (0D hex). This code is the unique device identifier which is generated when a read ID instruction is performed.

Figure 4. ISP Programming Interface
ispLSI 1032E Shift Register Layout
Note: A logic "1" in the Address Shift Register bit position enables the row for programming or verification.
A logic "0" disables it.

Pin Description

NAME	PLCC PIN NUMBERS	TQFP PIN NUMBERS	DESCRIPTION
I/O 0 - I/O 3 I/O 4 - I/O 7 I/O 8 - I/O 11 I/O 12 - I/O 15 I/O 16 - I/O 19 I/O 20 - I/O 23 I/O 24 - I/O 27 I/O 28 - I/O 31 I/O 32 - I/O 35 I/O 36 - I/O 39 I/O 40 - I/O 43 I/O 44 - I/O 47 I/O 48 - I/O 51 I/O 52 - I/O 55 I/O 56 - I/O 59 I/O 60 - I/O 63	26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18	17, 18, 19, 20, 21, 22, 23, 28, 29, 30, 31, 32, 33, 34, 35, 36, 40, 41, 42, 43, 44, 45, 46, 47, 48, 53, 54, 55, 56, 57, 58, 59, 67, 68, 69, 70, 71, 72, 73, 78, 79, 80, 81, 82, 83, 84, 85, 86, 90, 91, 92, 93, 94, 95, 96, 97, 98, 3, 4, 5, 6, 7, 8, 9	Input/Output Pins - These are the general purpose I/O pins used by the logic array.
GOE 0/IN 4	67	66	This is a dual function pin. It can be used either as Global Output Enable for all I/O cells or it can be used as a dedicated input pin.
GOE 1/IN 5	84	87	This is a dual function pin. It can be used either as Global Output Enable for all I/O cells or it can be used as a dedicated input pin.
IN 6, IN 7	2, 19	89, 10	Dedicated input pins to the device.
ispEN**/NC	23	14	Input - Dedicated in-system programming enable input pin. This pin is brought low to enable the programming mode. The MODE, SDI, SDO and SCLK options become active.
SDI*/IN 0	25	16	Input - This pin performs two functions. When ispEN is logic low, it functions as an input pin to load programming data into the device. SDI/IN 0 is also used as one of the two control pins for the isp state machine. It is a dedicated input pin when ispEN is logic high.
MODE*/IN 1	42	37	Input - This pin performs two functions. When ispEN is logic low, it functions as pin to control the operation of the isp state machine. It is a dedicated input pin when ispEN is logic high.
SDO*/IN 2	44	39	Output/Input - This pin performs two functions. When ispEN is logic low, it functions as an output pin to read serial shift register data. It is a dedicated input pin when ispEN is logic high.
SCLK*/IN 3	61	60	Input - This pin performs two functions. When ispEN is logic low, it functions as a clock pin for the Serial Shift Register. It is a dedicated input pin when ispEN is logic high.
RESET	24	15	Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device.
Y0	20	11	Dedicated Clock input. This clock input is connected to one of the clock inputs of all of the GLBs on the device.
Y1	66	65	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB on the device.
Y2	63	62	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB and/or any I/O cell on the device.
Y3	62	61	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any I/O cell on the device.
GND VCC	1, 22, 43, 64 21, 65	13, 38, 63, 88 12, 64	Ground (GND) Vcc
NC		1, 2, 24, 25, 26, 27, 49, 50, 51, 52, 74, 75, 76, 77, 99, 100	No connect.

Table 2-0002A-32E
* ispLSI 1032E only

** ispEN for ispLSI 1032E; NC for pLSI 1032E, must be left floating or tied to V_{CC}, must not be grounded or tied to any other signal.

Pin Configurations

ispLSI and pLSI 1032E 84-Pin PLCC Pinout Diagram

* Pins have dual function capability for ispLSI 1032E only (except pin 23, which is $\overline{\text{ispEN}}$ only).
** Pins have dual function capability which is software selectable.
