ispLSI® *and pLSI*® *3192*
High Density Programmable Logic

Features

- **HIGH-DENSITY PROGRAMMABLE LOGIC**
  - **— 192 I/O Pins**
  - **— 9000 PLD Gates**
  - **— 384 Registers**
  - **— High Speed Global Interconnect**
  - **— Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.**
  - **— Small Logic Block Size for Random Logic**

- **HIGH PERFORMANCE E²CMOS® TECHNOLOGY**
  - **— $f$max = 100 MHz Maximum Operating Frequency**
  - **— $t$pd = 10 ns Propagation Delay**
  - **— TTL Compatible Inputs and Outputs**
  - **— Electrically Erasable and Reprogrammable**
  - **— Non-Volatile**
  - **— 100% Tested at Time of Manufacture**
  - **— Unused Product Term Shutdown Saves Power**

- **ispLSI OFFERS THE FOLLOWING ADDED FEATURES**
  - **— In-System Programmable™ (ISP™) 5-Volt Only**
  - **— Increased Manufacturing Yields, Reduced Time-to-Market, and Improved Product Quality**
  - **— Reprogram Soldered Devices for Faster Debugging**

- **100% IEEE 1149.1 BOUNDARY SCAN COMPATIBLE**

- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
  - **— Complete Programmable Device Can Combine Glue Logic and Structured Designs**
  - **— Five Dedicated Clock Input Pins**
  - **— Synchronous and Asynchronous Clocks**
  - **— Programmable Output Slew Rate Control to Minimize Switching Noise**
  - **— Flexible Pin Placement**
  - **— Optimized Global Routing Pool Provides Global Interconnectivity**

- **ispLSI AND pLSI DEVELOPMENT TOOLS**

  pDS® Software
  - **— Easy to Use PC Windows™ Interface**
  - **— Boolean Logic Compiler**
  - **— Manual Partitioning**
  - **— Automatic Place and Route**
  - **— Static Timing Table**

  pDS+™ Software
  - **— Industry Standard, Third Party Design Environments**
  - **— Schematic Capture, State Machine, HDL**
  - **— Automatic Partitioning and Place and Route**
  - **— Comprehensive Logic and Timing Simulation**
  - **— PC and Workstation Platforms**

Functional Block Diagram

0139/3192

Description

The ispLSI and pLSI 3192 are High Density Programmable Logic Devices which contain 384 Registers, 192 Universal I/O pins, five Dedicated Clock Input Pins, twelve Output Routing Pools (ORP), and a Global Routing Pool (GRP) which allows complete inter-connectivity between all of these elements. The ispLSI 3192 features 5-Volt in-system programmability and in-system diagnostic capabilities. The ispLSI 3192 offers non-volatile "on-the-fly" reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems. It is architecturally and parametrically compatible to the pLSI 3192 devices.

The basic unit of logic on the ispLSI and pLSI 3192 devices is the Twin Generic Logic Block (Twin GLB) labelled A0, A1...F3. There are a total of 24 of these Twin GLBs in the ispLSI and pLSI 3192 devices. Each Twin GLB has 24 inputs, a programmable AND array and two OR/Exclusive-OR Arrays, and eight outputs which can be configured to be either combinatorial or registered. All Twin GLB inputs come from the GRP.
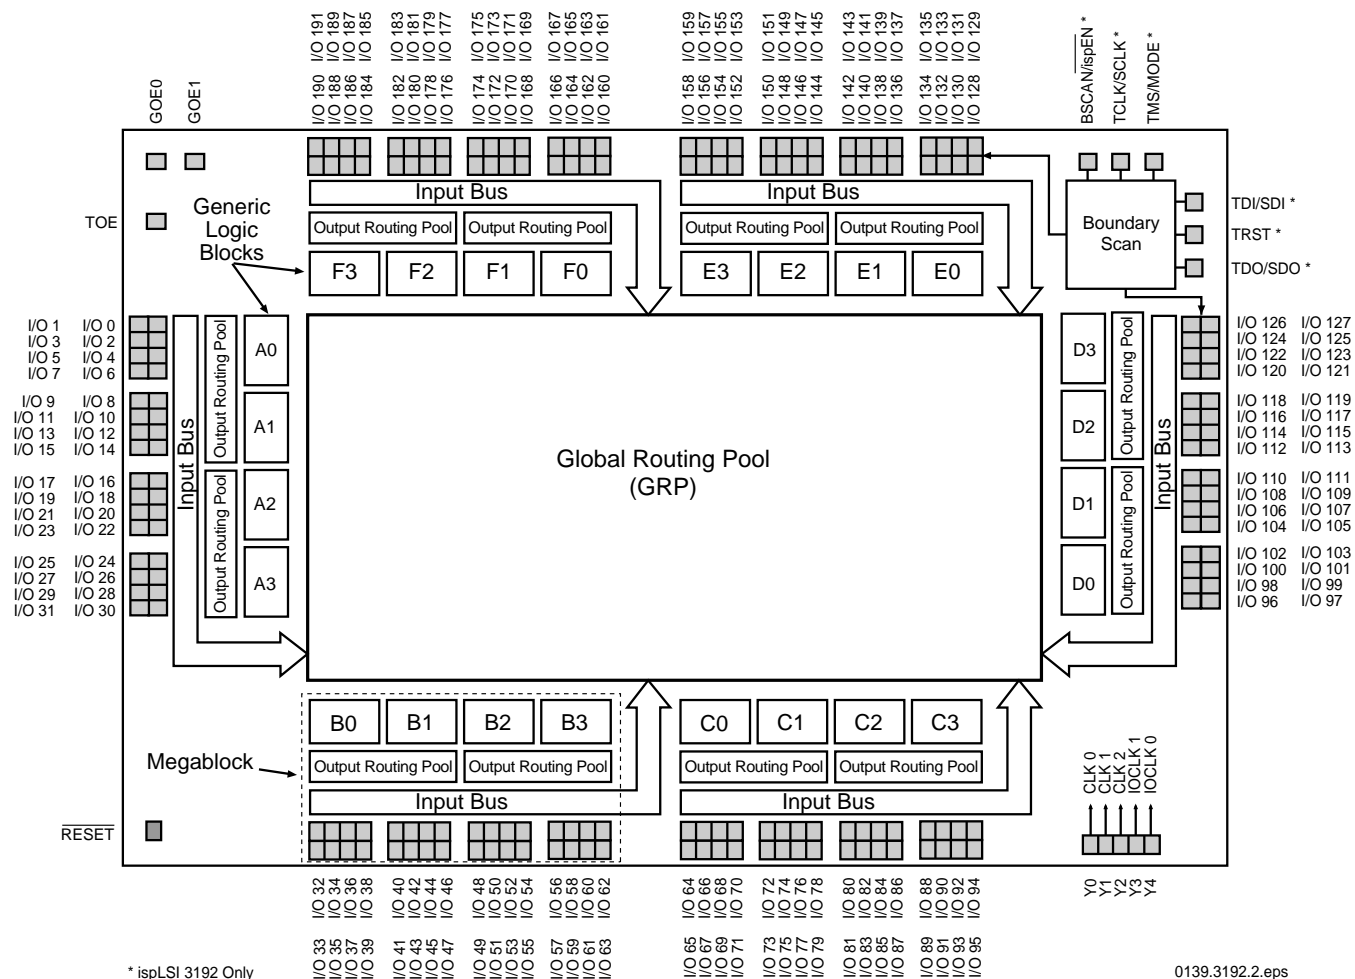

Functional Block Diagram

* ispLSI 3192 Only

Description (continued)

All local logic block outputs are brought back into the GRP so they can be connected to the inputs of any other logic block on the device. The device also has 192 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, a registered input, a latched input, an output or a bidirectional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

The 192 I/O Cells are grouped into six sets of 32 bits. Each of these I/O groups is associated with a logic Megablock through the use of the ORP. Each Megablock is able to provide one Product Term Output Enable (PTOE) signal which is globally distributed to all I/O cells. That PTOE signal can be generated within any GLB in the Megablock. Each I/O cell can select either a Global OE or a PTOE.

Four Twin GLBs, 32 I/O Cells and two ORPs are connected together to make a logic Megablock. The Megablock is defined by the resources that it shares. The outputs of the four Twin GLBs are connected to a set of 32 I/O cells by the two ORPs. The ispLSI and pLSI 3192 device contains six of these Megablocks.

The GRP has as its inputs the outputs from all of the Twin GLBs and all of the inputs from the bidirectional I/O cells. All of these signals are made available to the inputs of the Twin GLBs. Delays through the GRP have been equalized to minimize timing skew and logic glitching.

Clocks in the ispLSI and pLSI 3192 devices are provided through five dedicated clock pins. The five pins provide three clocks to the Twin GLBs and two clocks to the I/O cells.

The table below lists key attributes of the device along with the number of resources available.

An additional feature of the ispLSI and pLSI 3192 is the Boundary Scan capability, which is composed of cells connected between the on-chip system logic and the device's input and output pins. All I/O pins have associated boundary scan registers, with 3-state I/O using three boundary scan registers and inputs using one.

The ispLSI and pLSI 3192 supports all IEEE 1149.1 mandatory instructions, which include BYPASS, EXTEST and SAMPLE.

Key Attributes of the ispLSI and pLSI 3192

Attribute	Quantity
Twin GLBs	24
Registers	384
I/O Pins	192
Global Clocks	5
Global OE	2
Test OE	1

Table - 003/3192

Absolute Maximum Ratings [1]

Supply Voltage V_{CC} ....-0.5 to +7.0V

Input Voltage Applied........................ -2.5 to V_{CC} +1.0V

Off-State Output Voltage Applied ..... -2.5 to V_{CC} +1.0V

Storage Temperature................................. -65 to 150°C

Case Temp. with Power Applied .... -55 to 125°C

Max. Junction Temp. (T_J) with Power Applied ... 150°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Condition

SYMBOL	PARAMETER			MIN.	MAX.	UNITS

ispLSI and pLSI 3192 Timing Model

0902/3192

Derivations of t_{su}, t_h and t_{co} from the Product Term Clock[1]

t_{su} = Logic + Reg su - Clock (min)

= (t_{iobp} + t_{grp} + $t_{20ptxor}$) + (t_{gsu}) - (t_{iobp} + t_{grp} + t_{ptck}(min))

= (#24+ #30+ #34) + (#37) - (#24+ #30+ #43)

1.8 ns = (1.3 + 1.4 + 6.5) + (0.2) - (1.3 + 1.4 + 4.9)

t_h = Clock (max) + Reg h - Logic

= (t_{iobp} + t_{grp} + t_{ptck}(max)) + (t_{gh}) - (t_{iobp} + t_{grp} + $t_{20ptxor}$)

= (#24+ #30+ #43) + (#38) - (#24+ #30+ #34)

2.9 ns = (1.3 + 1.4 + 5.9) + (3.5) - (1.3 + 1.4 + 6.5)

t_{co} = Clock (max) + Reg co + Output

= (t_{iobp} + t_{grp} + t_{ptck}(max)) + (t_{gco}) + (t_{orp} + t_{ob})

= (#24 + #30 + #43) + (#39) + (#44 + #46)

12.2 ns = (1.3 + 1.4 + 5.9) + (0.1) + (1.1 + 2.4)

Table 2- 0042-3192

Note: Calculations are based upon timing specifications for the ispLSI and pLSI 3192-100L.

Power Consumption

Power Consumption in the ispLSI and pLSI 3192 device depends on two primary factors: the speed at which the device is operating and the number of product terms used. Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

Notes: Configuration of 16 16-bit Counters
Typical Current at 5V, 25° C

I_{CC} can be estimated for the ispLSI and pLSI 3192 using the following equation:

I_{CC} = 50 + (# of PTs * 0.65) + (# of nets * Max. freq * 0.015) where:
# of PTs = Number of Product Terms used in design
# of nets = Number of Signals used in device
Max. freq = Highest Clock Frequency to the device

The I_{CC} estimate is based on typical conditions (V_{CC} = 5.0V, room temperature) and an assumption of 2 GLB loads on average exists. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

0127/3192

In-System Programmability

The ispLSI devices are the in-system programmable versions of the Lattice Semiconductor high density programmable Large Scale Integration (pLSI) devices. By integrating all the high voltage programming circuitry on-chip, programming can be accomplished by simply shifting data into the device. Once the function is programmed, the non-volatile E^{2}CMOS cells will not lose the pattern even when the power is turned off.

All necessary programming is done via five TTL level logic interface signals. These five signals are fed into the on-chip programming circuitry where a state machine controls the programming. The simple signals for interface include isp™ Enable ($\overline{\text{ispEN}}$), Serial Data In (SDI), Serial Data Out (SDO), Serial Clock (SCLK) and Mode (MODE) control. Figure 4 illustrates the block diagram of one possible scheme of the programming interface for the ispLSI devices. For details on the operation of the internal state machine and programming of the device please refer to the ISP Architecture and Programming section in this Data Book.

The device identifier for the ispLSI 3192 is 0010 0001 (21 hex). This code is the unique device identifier which is generated when a read ID command is performed.

A logic "0" disables it.

Boundary Scan

Lattice Semiconductor offers support for the IEEE 1149.1 Boundary Scan specification on the 3000 Family of devices.

The user interfaces to the boundary scan circuitry through the Test Access Port (TAP). The TAP consists of a control state machine, instruction decoder and instruction register.

The TAP is controlled using the test control lines: Test Data IN (TDI), Test Data Out (TDO), Test Mode Select (TMS), Test Reset ($\overline{TRST}$) and Test Clock (TCK).

All of the input cells and I/O cells are serially connected together in a long chain. The scan out of one cell is connected to the scan in of the next cell. The cells are connected in the following order: TDI to GOE0, GOE1, Y0, Y1, Y2, Y3, Y4, TOE, $\overline{RESET}$, I/O95 thru I/O0 to I/O96 thru I/O191 to TDO.
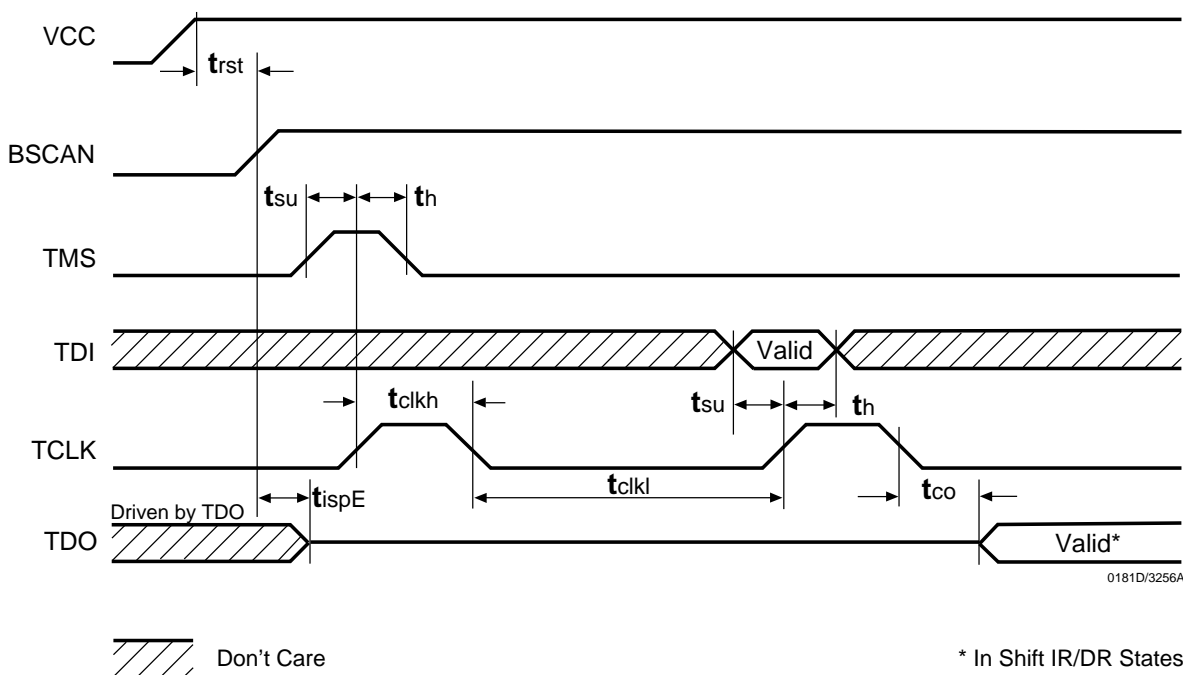

The timing specifications for Boundary Scan are listed below. The waveforms are shown in figure 5.

Boundary Scan Timing Specifications

SYMBOL	PARAMETER	CONDITION	MIN.	TYP.	MAX.	UNITS

I/O 144 - I/O 149	212,	213,	214,	215,	216,	217,	
I/O 150 - I/O 155	219,	220,	221,	222,	223,	224,	
I/O 156 - I/O 161	226,	227,	228,	229,	230,	231,	
I/O 162 - I/O 167	233,	234,	235,	236,	237,	238,	
I/O 168 - I/O 173	240,	1,	2,	3,	4,	5,	
I/O 174 - I/O 179	7,	8,	9,	10,	11,	12,	
I/O 180 - I/O 185	14,	15,	16,	17,	18,	19,	
I/O 186 - I/O 191	21,	22,	23,	24,	25,	26	
GOE0 and GOE1	152 and 153						Global Output Enable input pins.
TOE	154						Test output enable pin.
$\overline{\text{RESET}}$	33						Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device.
Y0, Y1 and Y2	35, 34, 148						Dedicated Clock inputs. These clock inputs are connected to one of the clock inputs of all the GLBs on the device.
Y3 and Y4	149, 151						Dedicated Clock inputs. These clock inputs are connected to one of the clock inputs of all the I/O cells in the device.
BSCAN/$\overline{\text{ispEN}}$**	32						Boundary Scan Enable. Input - Dedicated in-system programming enable input pin. This pin is brought low to enable the programming mode. The MODE, SDI, SDO and SCLK options become active.
TDI/SDI*	30						Input - This pin performs two functions. It is the Test Data input pin when ispEN is logic high. When ispEN is logic low, it functions as an input pin to load programming data into the device. SDI is also used as one of the two control pins for the isp state machine.
TCLK/SCLK*	29						Input - This pin performs two functions. It is the Test Clock input pin when ispEN is logic high. When ispEN is logic low, it functions as a clock pin for the Serial Shift Register.
TMS/MODE*	28						Input - This pin performs two functions. It is the Test Mode Select input pin when ispEN is logic high. When ispEN is logic low, it functions as pin to control the operation of the isp state machine.
$\overline{\text{TRST}}$	155						Input - Test Reset, active low to reset the Boundary Scan State Machine.
TDO/SDO*	27						Output - This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as the pin to read the isp data. When $\overline{\text{ispEN}}$ is high it functions as Test Data Out.
GND	13,	31,	49,	63,	77,	91,	Ground (GND)
	105,	119,	133,	150,	169,	183,	
	197,	211,	225,	239			
VCC	6,	20,	42,	56,	70,	84,	V_{CC}
	98,	112,	126,	140,	162,	176,	
	190,	204,	218,	232			

Table 2 - 0002/3192

* ispLSI 3192 only

** $\overline{\text{ispEN}}$ for ispLSI 3192 only, NC for pLSI 3192 must be left floating or tied to V_{CC}, must not be grounded or tied to any other signal.
Lattice Semiconductor Corporation

Pin Configuration

ispLSI and pLSI 3192 240-pin MQFP
