74

75

The KDJ11-B is a PDP-11 CPU that incorporates the J11 chip set as the heart of the processor. It is a quad height Q22 bus module. The KDJ11-B has two on-board ROM's. One of them, the 16-bit addressable ROM, contains the self-test and the boot codes. The other ROM, the 8-bit addressable one, contains the base area with hardware selection parameters, optional bootstraps, optional UFD (User Friendly Diagnostic) system description area, and optional foreign language text.

On units to be shipped to non-English speaking countries, a dummy or "null" language is loaded into the EEPROM. The purpose of this is to disable English language error messages when the system is first installed. If and when the system passes its internal self tests, the user will be instructed to run a UFD (User Friendly Diagnostics) package which will be part of a "country kit" for each separate language. The UFD package will use the local language for the particular country and, in addition, will load diagnostic and error messages in the local language into the EEPROM, so each subsequent power-up or reboot will have diagnostic and error messages in the user's own language.

The purpose of this program is to load the local language into the EEPROM. If it detects an error, the program will attempt to restore the "old" language, if any and will print a message informing the user of that fact.

2. SYSTEM REQUIREMENTS

Hardware Requirements

To run successfully this utility needs:

1. KDJ11-B CPU module
2. console terminal
3. at least 28K of memory

3. LOADING AND STARTING PROCEDURES

To start-up this program:

1. Boot XXDP.
2. Type "R NAME", where NAME is the name of the BIN or BIC file for this program.

The starting address of the program is 1000.

Note: if trying to restart the program in an arbitrary place after HALT on Break the following registers should be set up:

- | | |
|---------------|---|
| 17777572=0 | to disable memory management |
| 17777520-1000 | to clear diagnostic mode (bit 8), but still save
HALT on Break |
| 17777746=400 | to flush the cache |

130 4. SPECIAL ENVIRONMENTS
131
132 The program is not APT compatible.
133
134 5. PROGRAM OPTIONS
135
136 None.
137
138 6. EXECUTION TIMES
139
140 The program runs in under 20 seconds.
141
142 7. ERROR INFORMATION
143
144 7.1 DEFECTIVE BYTE IN EEPROM
145
146 After each write, the Byte which should have been written is
147 compared to the Byte in the proper location, and if it is not correct,
148 the following error message is displayed:
149
150 EEPROM write error, PCR page n, address mmmmmmm.
151 Data written qqq, data read rrr.
152
153 where n is the EEPROM page selected by the Page Control Register (PCR),
154 mmmmmmm is the physical address of the bad byte in question, qqq is the
155 byte value that was written out to the address and rrr what was read
156 back in after the write. (should be identical to qqq)
157
158 7.2 PROCESSOR NOT KDJ11-B
159
160 The program checks the type of CPU it is running on, which must be a
161 KDJ11-B processor (MFPT returns 5 in r0). If not, the following message
162 is printed:
163
164 Language area not supported by this processor.
165
166 7.3 "OLD" BOOT ROM CODE, LANGUAGE AREA NOT SUPPORTED
167
168 The program checks to see if the ROM code version is 7.0 or later.
169 Earlier versions do not support the language area in the EEPROM
170 and would print garbage if one was loaded. The program prints the
171 following message in that case:
172
173 Current Boot ROM version does not support language area.
174
175 In addition, the language bit in the setup area of the EEPROM is
176 cleared, to prevent "garbage" from being printed.
177
178 7.4 CHECKSUM ERROR IN SETUP AREA
179
180 The checksum in the setup area is checked to see if it contains a valid
181 checksum. Also, bytes 6 and 103 (addresses 17765022 and 17765314,
182 respectively) are checked to see if they contain 0 and 252 octal,
183 respectively. If any of these conditions is not met, the following
184 message is printed:
185
186 EEPROM checksum error in setup area.

187
188 No attempt is made to correct a checksum error.
189
190 **7.5 DIFFERENCES BETWEEN UFD "QUIET" MODE AND "STANDALONE" MODE**
191
192 When this program is run in UFD "Quiet" mode (which will usually be
193 the case) none of the error messages will appear. If no error is
194 detected, no messages whatsoever are printed. If any error is
195 detected, the program will attempt to restore the UFD and language
196 areas to the state they were in when the program was started. If
197 the restoration was successful, the following message is printed in
198 the user's language:
199
200 Unable to load <language>
201
202 where <language> is the name of the language. If the restoration
203 was not successful, or there was no local language, the following
204 message is printed.
205
206 Unable to load <language> - reverting to U.S. English
207
208 where <language> is as above. The program then clears the bit
209 in the EEPROM setup area selecting a local language which means
210 that the ROM English will be used from now on.
211
212 **8. EXAMPLES**
213
214 After booting XXDP+ and running the program, no message should
215 appear, just the XXDP dot prompt (.)
216
217 If a problem occurred, one of the messages in section 7 should appear.
218
219 **9. PROGRAM DESCRIPTION**
220
221 The program consists of a body of code which loads the language into
222 the local language area of the EEPROM. The routine that performs the
223 write first checks the current value of the byte to be written and if
224 it is the same, no write is performed. This is done to extend the
225 life of the EEPROM. The write routine also checks the value in the
226 EEPROM after the write to insure it was written correctly. After a
227 successful run, no message appears, after an unsuccessful attempt to
228 write any of the bytes in the EEPROM, one of the message in section 7
229 appears. If run under UFD "Quiet" mode, no message is printed if the
230 program was successful, otherwise one of the messages in 7.5 appear.
231 In both cases, the XXDP prompt appears.
