1.0 GENERAL PROGRAM INFORMATION.

1.1 Program Purpose (Abstract)

This program has the ability to test memory from address 000000 to address 757777. It does so using:

- A. Unique addressing techniques
- B. Worse case noise patterns, and
- C. Instruction execution thruout memory.

There is also a special routine to type out all unibus address ranges which do not timeout, as well as two(2) toggle in address tests provided in section 6.1 of this document.

The intent of this program is to test as comprehensively as possible all memory systems manufactured by DEC without concentrating on any one system. Although the tests relate to general designs they may be complete for certain systems. E.G. Any core memory from the 8K MM11-L on up need not have any other addressing or worst case patterns run but in order to completely test the MS11-K MOS memory another diagnostic is required. This test is also not intended to be a 100% test of the memory. Other tests that do I/O may find memory problems that this test is unable to.

1.2 System Requirements

A. Hardware Requirements

PDP11 family processor with a minimum of 16K of memory.
optional...
Any parity memory control module.
KT11 memory management.

B. Software Requirements

The smallest unit of memory this program will recognize is 4K. If any address in a 4K bank causes a time out trap, that entire bank of memory is ignored by the program.

The program is designed to exercise the vector portion of memory (locations 0-776) in exactly the same manner as the rest of memory. To make this possible, without requiring memory management, no software traps are used in the program. This means that if memory management is not available or is disabled (SW12=1), if the program is relocated out of bank 0, if location 0-776 are selected for test, and if an unexpected hardware trap occurs, the results will be unpredictable.

The program has the proper interface code to allow running under the automated manufacturing test line system - ACT11 and APT.

1.3 Related Documents and Standards

- A. Programming Practices - Document No. 175-003-009-01
- B. PDP-11 MAINDEC SYSMAC Package - MAINDEC-11-DZQAC-C2-D
- C. The applicable Memory System Maintenance Manual
- D. The applicable Circuit Schematics

1.4 Diagnostic Hierarchy Prerequisites

Before running this program, a CPU diagnostic should be run to verify the functionality of the processor and PDP-11 instruction set.

If memory management is to be used, then the KT11 diagnostic should also be run before this program.

PDP-11/20 - MAINDEC-11-DZQKC
PDP-11/34 - MAINDEC-11-DFKTH
PDP-11/40 - MAINDFC-11-DBQEAE
OR MAINDEC-11-DCQKC
PDP-11/45 - MAINDEC-11-DCQKC
PDP-11/60 - MAINDEC-11-DQKDA
KT11-C - MAINDEC-11-DCKTA THRU DCKTF
KT11-D - MAINDEC-11-DBKTA THRU DBKTF

1.5 Assumptions

This program assumes the correct operation of the CPU and, if used, the memory management option.

2.0 OPERATING INSTRUCTIONS

2.1 Loading and Starting Procedures

2.1.1 Load the program using any standard absolute loader.

2.1.2 Starting address 200:

Normal program execution.

2.1.3 Starting address 204:

Allows the operator to input, via teletype conversation, first and last addresses to be exercised, and a data pattern to be used in tests 6 and 7.

2.1.4 Starting Address 210:

Restart program using previously selected parameters.

2.1.5 Starting Address 214:

Restore loaders and halt. This routine is capable of relocating the program back to banks 0 and 1 if the program was halted while running the top two banks of memory. There are special procedures required for this situation.

- A. If memory addresses 0-1000 have not been exercised, either through parameter selection (SA=204) or by running with SW05=1, then:

Load Address 214.
Press START.

- B. If running without memory management, then:

Load Address <214+relocation factor>
(Relocation factor is typed when the program is
relocated),
Press START.

- C. If running with memory management and the unibus has not been initialized (via reset instruction, start switch, etc.), then:

Load Address 777707 (PC)
Deposit 214
Press Continue

- D. If running with memory management and the unibus has been initialized:

Load Address 772340 (KIPARO)
Deposit <(relocation factor)/100>
(Example: Relocation factor=540000, then
deposit 005400)
Load Address 777572 (SRO)
Deposit 000001
Load Address 777707 (PC)
Deposit 214
Press Continue

2.1.6 Starting address 220:

Byte address memory map timeout routine. This routine performs DATI, DATIP, DATO, and DATOB on all possible addresses, and types the ranges of addresses which do not cause a timeout trap.

2.2 Special Environments

If the program is run in quick verify mode under ACTII or APTII the program is done after the first pass. Also, the

program does not relocate to test the lower 8K of memory.

2.3 Program Options

| | |
|--------------------|--|
| SW15 = 1 OR UP.... | HALT ON ERROR |
| SW14 = 1 OR UP.... | LOOP ON TEST |
| SW13 = 1 OR UP.... | INHIBIT ERROR TYPEOUT |
| SW12 = 1 OR UP.... | INHIBIT MEMORY MANAGEMENT (INITIAL START ONLY) |
| SW11 = 1 OR UP.... | INHIBIT SUBTEST ITERATION |
| SW10 = 1 OR UP.... | RING BELL ON ERROR |
| SW9 = 1 OR UP.... | LOOP ON ERROR |
| SW8 = 1 OR UP.... | LOOP ON TEST IN SWR<4:0> |
| SW7 = 1 OR UP.... | INHIBIT PROGRAM RELOCATION |
| SW6 = 1 OR UP.... | INHIBIT PARITY ERROR DETECTION |

NOTE: With parity error detection enabled, a memory failure while running the worse case noise tests (non-parity) can cause a parity error. The error printout on a parity error does not type the good data. Thus a bit drop or pickup will not be typed as such. It is best to run the program for 1 pass with parity disabled, then, restart the program with parity enabled.

| | |
|-------------------|--|
| SW5 = 1 OR UP.... | INHIBIT EXERCISING VECTOR AREA (LOCATIONS 0-1000). |
|-------------------|--|

2.4 EXECUTION TIMES

Execution time is dependent on type of memory, and amount of memory. Worse case run times with 900ns memorys are:

a. For Non-Parity Memory
First Pass: 65 seconds for first 16k + 15 seconds for each additional 16k.

Full Pass: 3 minutes 40 seconds for first 16k + 3 minutes for each additional 16k.

Iteration Inhibited: same as first pass

b. For Parity Memory
First Pass: 1 minute 40 seconds per 16k.

Full Pass: 8 minutes per 16K
Iteration Inhibited: same as first pass

3.0 ERROR INFORMATION

3.1 Error Reporting

There are a total of 31(8) types of error reports generated by the program. Some of the key column heading mnemonics are described below for clarity:

FC = Program Counter of error detection code.
(V/PC=P/PC)

V/PC = Virtual Program Counter. This is where the error detection code can be found in the program listing.

P/PC = Physical Program Counter. This is where the error detection code is actually located in memory.

TRP/PC = Physical Program Counter of the code which caused a trap.

MA = Memory Address

REG = Parity REGister address.

PS = Processor Status word.

IUT = Instruction Under Test.

S/B = What contents Should Be.

WAS = What contents WAS.

3.2 Error Halts

With the 'HALT ON ERROR' switch (SW15) not set there are several programmed 'HALTS' in the program:

- A. In the error trap service routine for unexpected traps to vector 4. This one will occur if a 2nd trap to 4 occurs before the error report for the first has had a chance to be printed out.
- B. In the relocation routine if the program is being relocated back to the first 8K of memory and the program code was not able to be transferred properly.
- C. In the case of error reporting and there is no terminal to allow the information transfer.

D. In the power fail routine if the power up sequence was started before the power down sequence had a chance to complete itself.

E. In the Memory mapping routine or any of the address control routines, failures to find a meaningful map.

4.0 PERFORMANCE AND PROGRESS REPORTS

Not applicable

5.0 DEVICE INFORMATION TABLES

The following is a picture view of a parity control status registers, which will show bit assignments and definitions, to provide a handy reference:

5.1 CORE PARITY REGISTER

| | | | | | | | | | | | | | | | |
|----|---|---|---|---|---|---|---|---|---|---|---|---|----|---|----|
| I | I | I | I | I | I | I | I | I | I | I | I | I | I | I | I |
| PE | | | | | | | | | | | | | WP | | AE |
| I | I | I | I | I | I | I | I | I | I | I | I | I | WP | I | AE |

15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00

Bit assignments are defined as follows:

BIT15 PARITY ERROR

BITS 11-5 ERROR ADDRESS

HIGH ORDER ADDRESS
BITS OF ADDRESS OF
PARITY ERROR (BITS
17-11 OF ADDRESS)

BIT02 WRITE WRONG PARITY

NORMAL PARITY (ODD)
WHEN CLEAR; OTHER
PARITY (EVEN) WHEN SET

BIT00 ACTION ENABLE

NO ACTION WHEN CLEAR
TRAP TO VECTOR 114
WHEN SET

5.2 MOS PARITY REGISTER

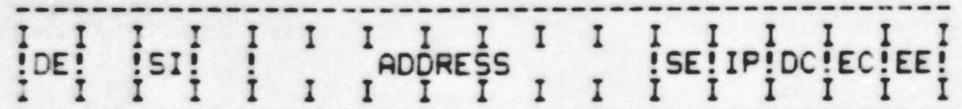

| | | | | | | | | | | | | | | | |
|----|---|---|---|---|---|---|---|---|---|---|---|---|----|---|----|
| I | I | I | I | I | I | I | I | I | I | I | I | I | I | I | I |
| PE | | | | | | | | | | | | | WP | | AE |
| I | I | I | I | I | I | I | I | I | I | I | I | I | WP | I | AE |

15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00

BIT ASSIGNMENTS ARE DEFINED AS FOLLOWS:

| | | |
|-------|--------------------|--|
| BIT15 | PARITY ERROR | |
| BIT02 | WRITE WRONG PARITY | NORMAL PARITY (ODD) WHEN CLEAR; OTHER PARITY (EVEN) WHEN SET |
| BIT00 | ACTION ENABLE | NO ACTION WHEN CLEAR TRAP TO VECTOR 114 WHEN SET |

5.3 MS11-K CSR

BIT ASSIGNMENTS ARE DEFINED AS FOLLOWS:

| | | |
|-----------|----------------------|---|
| BIT15 | DOUBLE ERROR | |
| BIT 13 | SET INHIBIT MODE | WHEN THIS BIT IS SET TO A 1 IT ENABLES THE INH MODE POINTER TO INHIBIT EITHER THE FIRST OR SECOND 16K FROM EVER GOING INTO THQ DIAG. CHECK OR ECC DISABLE MODE. |
| BITS 11-5 | ERROR ADDRESS | WHEN BIT02 CLEARED CONTAINS HIGH ORDER BITS OF ADDRESS OF PARITY ERROR(BITS 17-11). WHEN BIT02 SET CONTAINS CHECK BITS FOR ECC. |
| BIT04 | SINGLE ERROR | SET WHENEVER SINGLE ERROR OCCURS |
| BIT03 | INHIBIT MODE POINTER | THE INHIBIT MODE POINTER WORKS IN CONJUNCTION WITH THE SET INHIBIT MODE BIT. WHEN BIT 13 IS SET TO A 1 A 16K PORTION OF MEMORY IS INHIBITED FROM OPERATING IN THE ECC DISABLE MODE OR |

DIAGNOSTIC CHECK MODE.
THE INHIBIT MODE
POINTER INDICATES
WHICH 16K IS BEING
INHIBITED,,,BIT 3 =1

THE SECOND 16K OF
MEMORY IS INHIBITED.
WHEN BIT 13 IS SET TO
A 0, BIT 3 BECOMES
INOPÉRATIVE.

| | | |
|-------|--------------------------|--|
| BIT02 | DIAGNOSTIC CHECK A | WHEN SET ENABLES READ-WRITE OF CHECK BITS(SEE BITS 11-5) |
| BIT01 | DISABLE ERROR CORRECTION | WHEN SET NO ERROR CORRECTION TAKES PLACE |
| BIT00 | DOUBLE ERROR ENABLE | WHEN SET ENABLES TRAP TO VECTOR 114 ON DOUBLE ERROR. |

5.0 SUB-TEST SUMMARIES

6.1 Section 1: Address Tests.

These tests verify the uniqueness of every memory address.

TEST 1 Writes and reads the value of each memory Word Address into that Memory location. After all memory has been written, all locations are checked again.

TEST 2 Writes the byte value of each address into that byte location and checks it.

TEST 3 Writes the complement of each word address into that location and checks it.

TEST 4 Writes the 4K bank number into each byte of that bank and checks it.

TEST 5 Writes the complement of the bank number into each byte of that bank and checks it.

6.2 Section 2: Worst Case Noise Tests.

These are intended to apply maximum stress to the various types of PDP-11 core memories.

TEST 6 and TEST 7 Are supplied to allow the operator to select a single word data pattern (SA=204) and SCOPE on

either the writing (DATO) in TEST 6 or the reading (DATI) in TEST 7 of that data.

TEST 10 Writes and then checks a series of single word patterns which are designed to stress parity memory.

TEST 11 Writes all memory with 1's in every bit and then "Ripples" a "0" through it.

TEST 12 Writes all memory with 0's in every bit and then "Ripples" a "1" through it.

TEST 13,14,15, AND 16 Write a pattern which complements when address BIT 3 XOR BIT 9 complements.

TEST 17 Writes wrong parity in each byte of memory and checks that the parity detection logic works. This test is skipped for non-parity memory.

TEST 20 Write "random" program code through memory and checks it.

5.3 Section 3: Instruction Execution Tests.

This group of tests place instructions in the memory under test, then executes the instructions, and finally, checks that they executed correctly.

TEST 21 Executes an instruction which does a DATI and a DATO on the memory under test.

TEST 22 Executes an instruction which does a DATI and a DATOB on the low byte of memory under test.

TEST 23 Executes an instruction which does a DATI and a DATOB on the high byte.

TEST 24 Executes an instruction which does a DATIP and a DATO.

TEST 25 Executes an instruction which does a DATIP and a DATOB on the low byte.

TEST 26 EXECUTES AN INSTRUCTION WHICH DOES A DATIP and a DATOB on the high byte.

5.4 Section 4: Mos Tests

TEST 27 -Writes a pattern of 000377 through memory, then compliments it addressing downward, compliments the new pattern addressing upward, compliments the third pattern addressing upward and finally compliments this new AB patterns addressing downward.

TEST 30-31 Write a checkerboard through memory then stalls for 2 seconds and then verifies no data has changed.

6.5 Special Toggle In Tests

6.5.1 Toggle-in-program #1

The following is a toggle in memory address test. This test is useful when an address selection failure is suspected involving the first 8K of memory. This program writes the value of each address into itself starting with the lower limit and continuing to the upper limit. After all addresses have been written, each address is checked for the correct contents starting with the upper limit and continuing to the lower limit.

| LOCATION | CONTENTS | MNEMONIC | COMMENT |
|----------|----------|------------------|---|
| 10 | 012700 | MOV #50,R0 | :GET FIRST ADDRESS |
| * 12 | 000050 | | :TO TEST (EXAMPLE START ADDRESS) |
| 14 | 010001 | MOV R0,R1 | SAVE IN R1 |
| 16 | 020037 | 1S: CMP R0,0#SWR | CHECK UPPER LIMIT (IN SWITCH REGISTER) |
| 20 | 177570 | | BRANCH IF AT UPPER LIMIT |
| 22 | 001403 | BEQ 2S | LOAD VALUE INTO ADDRESS |
| 24 | 010010 | MOV R0,(R0) | STEP TO NEXT ADDRESS |
| 26 | 005720 | TST (R0)+ | LOOP UNTIL DONE |
| 30 | 000772 | BR 1S | SAVE UPPER LIMIT |
| 32 | 010004 | 2S: MOV R0,R4 | CHECK IF AT LOWER LIMIT |
| 34 | 020001 | 3S: CMP R0,R1 | BRANCH IF DONE |
| * 36 | 001767 | BEQ 1S | CHECK DATA WRITTEN |
| 40 | 024000 | CMP -(R0),R0 | BRANCH IF OK |
| 42 | 001774 | BEQ 3S | ERROR |
| 44 | 000000 | HALT | |
| 46 | 000772 | BR 3S | LOOP BACK |

After toggling the program LA=10**set upper limit**, start

NOTES: The upper limit address obtained from the switch register may be changed during program operation. However occasionally the program may halt because of 'SWITCH BOUNCE'. (The best procedure when changing limits is to stop the program make the change and continue.) The lower limit address (12) may be patched to any desired address.

6.5.2 Toggle-in-Program #2

The following is also a toggle in program to be used with toggle-in-program #1 for more complete address testing. This program writes the complement value of each address into itself starting with the upper limit and continuing to the lower limit. After all addresses have been written each address is checked for the correct contents starting with the

lower limit address and continuing to the upper limit.
Toggle in the following patches to the program above.

These are the patches to toggle-in-program #1:

| LOCATION | CONTENTS | MNEMONIC | COMMENT |
|----------|----------|----------|-----------------------|
| 12 | 100 | | :CHANGE LOWER LIMIT |
| 36 | 001404 | BEQ 4\$ | :BRANCH TO PROGRAM #2 |

These are the additions to toggle-in-program #1:

| LOCATION | CONTENTS | MNEMONIC | COMMENT |
|----------|----------|----------------|--------------------------|
| 50 | 010402 | 4\$: MOV R4,R2 | :GET UPPER LIMIT |
| 52 | 005142 | 5\$: COM -(R2) | :COMPLEMENT ADDRESS |
| 54 | 020201 | CMP R2,R1 | :CHECK IF AT LOWER LIMIT |
| 56 | 001375 | BNE 5\$ | :LOOP UNTIL DONE |
| 60 | 020204 | 6\$: CMP R2,R4 | :CHECK IF AT UPPER LIMIT |
| 62 | 001755 | BEQ 1\$ | :GO TO PROGRAM 1 IF DONE |
| 64 | 010203 | MOV R2,R3 | :GET VALUE OF ADDRESS |
| 66 | 005103 | COM R3 | :COMPLEMENT VALUE |
| 70 | 020322 | CMP R3,(R2)+ | :CHECK ADDRESS |
| 72 | 001772 | BEQ 6\$ | :BRANCH IF OK |
| 74 | 000000 | HALT | :ERROR |
| 76 | 000770 | BR 6\$ | :GO CHECK NEXT ADDRESS |
