IDENTIFICATION

PRODUCT CODE: ZZ-ENSAA-7.0

PRODUCT TITLE: VAX DIAGNOSTIC SUPERVISOR

PRODUCT DATE: 18-JUN-1984

DEPARTMENT: BASE SYSTEM DIAGNOSTIC ENGINEERING

Diagnostic Supervisor release notes V5.3

A buffer in show device was increased to 256 characters.

Channel services was fixed to disable interrupts before releasing the vectors and the INVALIDATE function made to work.

SET MM ON, SET MM OFF, and SHOW MM commands were added to enable and disable memory management. At the same time DS$MMON and DS$MMOFF were modified to prevent the program from disabling memory management if the operator enabled it.

SYS$SETIMR and SYS$CANTIM were enhanced to change mode to kernel before doing MTPR's or disabling interrupts. This resolved some problems caused by interrupting programs that had set the processor mode to user.

Cleanup was enhanced to reset memory management and re-initialize the SCB after the program cleanup is complete.

Dummy entry points were added to $DS_DSSDEF and the entry vectors to accomodate SYS$LKWSET, SYS$SETAST, SYS$SETPRI, SYS$SETRWM, SYS$ULKPAG, SYS$ULWSET.

SYS$FAO used in stand-alone was modified to fix problems with !*? directives.

The known device data base was updated to include DL11, LP25, RX02, RX211, TM78, TS04, TS11, TU58, and TU78 support. The descriptor for KA780 has changed, the optional arguments are now G-floating, H-floating, WCS last address, and accelerator type.

An error is now gererated if the processor type specified in the system identification register is not 1, indicating an 11/780.

Error text and status codes are returned if the supervisor is run from a command file. The next release will support running in batch.

DS$LOAD has been enhanced to allow programs to read parts of files indicated by the starting block number argument. The name of the console storage device is now always CSan.

The count of loops on subtests has been fixed to correctly reflect the number of passes thru the specified subtest.

The logout for SBI WRITE timeouts now includes the timeout address register.

The ABORT command and DS$ABORT now reset the stacks and reset the processor mode before doing program cleanup.

Diagnostic Supervisor release notes V5.4

Release 5.4 of the diagnostic supervisor has been made. ESSAA.EXE 5.4;214 and ECSAA.EXE 5.4;121 represent 11/780 and 11/750 supervisors. Relevert files can be found on PROTO 3 in Tewksbury as follows:

```
SYS$LIBRARY:DIAG.MLB;611
[DS]ESSAA.EXE;214     11/780 STAR supervisor
[DS]ECSAA.EXE;121     11/750 COMET supervisor
[DS]EVQDB.EXE         QIO driver for RP04,5,6
[DS]EVQDL.EXE         QIO driver for RL02
[DS]EVQDR.EXE         QIO driver for RM80,RP07,RM03,RM05
[DS]EVQDM.EXE         QIO driver for RK06,RK07
[DS]EVQXF.EXE         QIO driver for DR780
[DS]EVQTM.EXE         QIO driver for TM03/TE16,TU77,TU45
[DS]EVQTS.EXE         QIO driver for TS11
[DS]DIAGBOOT.EXE      Secondary Bootstrap
```

Please use these components in testing programs. Needless to say if any problems are encountered please report them to me immediately so their solutions can be included in the next release.

Release notes

- Support for drivers was upgraded to reflect VMS 2.0 interface changes. Loadable drivers have been re-released to reflect Release 2.0 of VMS.

- The supervisor can be run from a VMS command proceedure. When the supervisor is running under VMS it uses RMS to access SYS$INPUT and SYS$OUTPUT.

- Bug fixed to remove supervisor error when supervisor is started again after interrupting a script.

- The APT interface will now generate an error if no PTEXT is found when a process PTEXT command is given.

- A buffer in show device was increased to 256 characters.

- Internal processor registers can be examined with EXAMINE Pxx, where xx is a register number in the current radix. If only the decimal values are available Try EX P%D127 to get register ^X7F. Internal registers can be changed with the DEPOSIT command.

- Channel services was fixed to disable interrupts before releasing the vectors and the INVALIDATE function made to work. Also SETMAP now sets and clears all map registers and allows all to be used for transfers.

- Support was added for the RL02 as a boot device.

- Time conversion routines were changed to fix loss of precision in hundredths.

- SET MM ON, SET MM OFF, and SHOW MM commands were added to enable and disable memory management. At the same

time DS$MMON and DS$MMOFF were modified to prevent the program from disabling memory management if the operator enabled it. Also the return code in R0 now indicates the previous state of memory management and an error return if DS$MMOFF was trying to disable memory management and the operator had enabled it. If memory management is enabled the stack for each mode is write protected against lower access modes.

- DS$ASKSTR now returns 0 in R1 if the default answer was given to a query.

- SYS$SETIMR and SYS$CANTIM were enhanced to change mode to kernel before doing MTPR's or disabling interrupts. This resolved some problems caused by interrupting programs that had set the processor mode to user.

- Cleanup was enhanced tc reset memory management and re-initialize the SCB after the program cleanup is complete.

- Corrected errors induced when more the 2 megabyte of memory was present.

- Dummy entry points were added to $DS_DSSDEF and the entry vectors to accomodate SYS$LKWSET, SYS$SETAST, SYS$SETPRI, SYS$SETRWM, SYS$ULKPAG, SYS$ULWSET.

- SYS$FAO used in stand-alone was modified to fix problems with !*? directives.

- The known device data base was updated to include DL11, LP25, RX02, RX211, TM78, TS04, TS11, TU58, and TU78 support. The descriptor for KA780 has changed, the optional arguments are now G-floating, H-floating, WCS last address, and accelerator type.

- An warning is now generated if the processor type specified in the system identification register is not correct.

- DS$LOAD has been enhanced to allow programs to read parts of files indicated by the starting block number argument. The name of the console storage device is now always CSan.

- The count of loops on subtests has been fixed to correctly reflect the number of passes thru the specified subtest.

- The logout for SBI WRITE timeouts now includes the timeout address register.

- The processor mode and and all stacks and registers are now reset before the users cleanup code is executed.

1.0 BUFFERED I/O SUPPORT

The supervisor now includes support for QIO drivers using buffered I/O (such as line printers).

2.0 HELP FACILITY

The new Supervisor includes a HELP facility. It is invoked via the "HELP" command. In general it is identical functionally with the VMS HELP command. Additionally, it supports gathering HELP on diagnostics via typing the diagnostic code (ES, EV, EC pre-fix followed by diagnostic name, as "EVRAA", etc.) as the first keyword after HELP (e.g., "HELP EVRAA"). In standalone mode the HELP command will function off of any load media (including magtape and console media). In user mode however, it will not function from magtape or the console media, as these are not fully supported by VMS RMS (see below, description of Supervisor RMS).

3.0 LOAD AND SCRIPT

The Supervisor LOAD (which loads files for the commands RUN and LOAD as well as for diagnostics via the $DS_LOAD service call) and SCRIPT file handling services have been modified to use RMS file services.

4.0 MAGTAPE

The supervisor now supports magtape (TM03 only) as load media. TS-11 and TU-78 will be supported in a future release.

5.0 RMS IMPLEMENTATION

The diagnostic supervisor implementation of RMS is similar to the VMS implementation, but is specifically adapted to the standalone DS environment.

DISCLAIMER

Since there are currently no diagnostics which use RMS services, we can not guarantee 100% functionality of RMS code, though we have attempted thorough QA testing. However, services within the Supervisor which use RMS will function correctly.

Console Device Naming

Previous to release 6.0, due to a file name-handling loophole in the file load routine,

it was possible to specify the console device as "CS:". This is not consistent with Supervisor convention, which requires complete device names (i.e., "DMA0:" not "DM:" even if only one RK06/07 is attached). In Version 6.0, "CS:" will not function on COMET (11/730); it will fail when the TU58 driver attempts to access a non-existent drive. The solution is that full device names MUST be typed. In future versions of the Supervisor, this naming "loophole" will be closed, and omitting the controller letter or drive number in the console device specification will return an illegal device error (RMS$_DEV).

5.1 User Mode

To consistently support RMS in user mode (where RMS calls are passed through to VMS), the Supervisor SET LOAD command will function correctly in user mode (as will SHOW LOAD). This is done by translating or reassigning SYS$DISK for device names, and via an RMS housekeeping routine to alter default directory. The Supervisor exit handling routine will restore the original values: however for this to occur, the Supervisor must be terminated either by ^Z or by a ^Y, EXIT sequence. If the (VMS) STOP command is used, the original default directory is not (and CAN not be) restored.

5.2 Differences Between DS RMS And VMS RMS

Supervisor RMS functionality not duplicated by VMS:

- Supervisor RMS supports files on the console media (floppy or TU-58). These files are in RT-11 format, but the Supervisor RMS $GET facility will provide file records as if the file were an ODS CR-attribute, variable length record file. The FAB's RFM field (FAB$B_RFM) will have the value 4.

- Random by RFA (record's file address) access is supported for magtape as well as for conventionally random-access devices. VMS does NOT support magtape random access. In general, random file access should not be used by any level 2 diagnostic, since if the load device is magtape, the function is unsupported in user mode.

VMS RMS functionality not duplicated by Supervisor:

- The Supervisor does not support NAM blocks in any form.

- The Supervisor supports only one form of XAB (the FHC XAB, returning file header characteristics). Any other XAB in the FAB's XAB chain will be ignored, though no error will result. This is because the information is not meaningfull in the diagnostic environment.

- In the FHC XAB, the LRL (longest actual record length) field is not supported. It is meaningful only for ODS files in any case. It will be set to maximum record length always.

- Only sequential files are supported. An attempt to open a file with INDEX or RELATIVE organization results in error RMS$_ORG (illegal file organization).

- Only READ-type functions are supported, since the supervisor does not support write access to any media. To be specific, the functions which the Supervisor RMS package implements is:

  1. $OPEN (access a file on media and initialize FAB)

  2. $CONNECT (Define a record stream for access to a file, initialize RAB)

  3. $GET (Copy a record within the file to a user buffer)

  4. $READ (Unformatted read from file, beginning on block boundary)

  5. $DISCONNECT (Close out a record stream)

  6. $CLOSE (Close out any record streams associated with FAB, and de-access file attached to FAB)

- The bits in the FOP and ROP fields are not significant, except for the BIO bit in the ROP field (specifying block I/O via the $READ call).

- Asynchronous file operations are not supported.

- RMS operations to the terminal are not supported.

- A user may have up to three files open simultaneously.

- Multibuffering and multiblocking are not supported.

- Random access by key or record number is not supported.

- The RAB TMO (time out) field is ignored.

6.0 BUG FIXES

The following Supervisor "bugs" have been fixed for the

6.0 release:

- Channel services incorrectly calculated the number of map registers required for a transfer.
- The operator request routine incorrectly defaulted parameters when prompting was disabled.
- The COMET machine check log-out was incorrect.

1.0 BUG FIXES

- BUG: "EXAMINE PSL" with "/WORD" or "/BYTE" would use only low-order bits of PSL, but the high-order fields would still be decoded and typed as 0.

  FIX: PSL is now unaffected by "/WORD" and "/BYTE"; it is always longword.

- BUG: Previous to Version 6.0, the console storage device could be specified by "CS:". This is at odds with Supervisor convention which requires full device name given in attach command. It results from an accidental "loophole" in that only the first two characters were checked, and an unspecified unit number was converted to 0. In Version 6.0, the unit number conversion was (also accidentally) removed, and using the "CS:" form to Version 6.0 causes a device error on COMET (the STAR console load routine does not use unit number) when the TU58 attempts to access a non-existant (negative) unit.

  FIX: The "CS:" short form is no longer allowed. It will result in an "invalid or illegal device" RMS error (RMS$_DEV) during name parsing. You must type the full device name (e.g., "CSA0:").

2.0 ENHANCEMENTS

- The Supervisor now supports a DIRECTORY command. The format is:

  ```
  DIRECTORY [device:][[directory]]
  ```

  Examples:

  ```
  DS> DIRECTORY DBB3:[SYSMAINT]
  DS> DIR MTA0:
  DS> DIR CSA0:
  DS> DIR [DS]
  DS> DIR DBB3:
  DS> DIR
  ```

  Device and directory default to the current load path (original default is "<load device>:[SYSMAINT]" or last SET LOAD specification). All load media are supported. The format is identical to the standard default VMS directory format. There are no qualifiers. Only file name and version (if applicable, i.e., not on RT-11 media) are typed, and there is no provision for typing dates, sizes, etc.

- To support the AUTOSIZER program, the supervisor's ATTACH command processor has been made externally callable. The entry point is DS$ATTACH

(cmdline,[prompt]) where cmdline is the address of a string descriptor for the ATTACH command to be parsed, and prompt is the address of a descriptor for a buffer (MUST be at least 1 byte long if prompt is given!) to receive the ASCIC text with which to prompt the operator if the command line is incomplete or incorrect (on error, the prompt string is set, and the cmdline descriptor length is decreased to include only the correct part of the input line). The prompt argument is optional and in general is useless except within the Supervisor.

Format:

```
$DS_ATTACH (cmd, [pmt])          ! Bliss
$DS_ATTACH_x    cmd, [pmt]       ; Macro
```

- The Supervisor HELP routine has been made callable, to allow programs implementing a conversation mode to include a HELP command. You pass the address of a descriptor of a command string; this string is just what you'd type on a Supervisor HELP command line, except leave out the "HELP" keyword. You can access the program's usual HELP file (preferable) by prefixing whatever keys the operator types with the program name. Keep in mind that HELP will fiddle with the adapter and controller, etc. in the path to the load device.

  Format:

```
$DS_HELP (keylst)                ! Bliss
$DS_HELP_x      keylst           ; Macro
```

- User control of ^C

  - In some diagnostics, it may be necessary to call DS services which do implicit "$DS_BREAK" calls during sections of code which must not be interrupted by "^C". To solve this problem, new functionality has been added to the $DS_CNTRLC service. A second argument, DISABL, has been implemented. The value of this argument defaults to "0", and the DS$CNTRLC routine accepts argment lists of only one argument to maintain compatibility with currently released diagnostics. If the low bit (bit 0) of DISABL is SET, ^C will be ignored by the Supervisor. If a user ^C handler is set, it will not be called, nor will the Supervisor itself take any special action beyond setting it's ^C flag bit. Note that if ^C recognition is disabled, and a ^C character is typed, the ^C will be honored as soon as ^C recognition is re-enabled. Therefore, the ^C is effectively postponed beyond the non-interruptable segment of code, but is not lost.

    Format:

```
$DS_CNTRLC ([astadr], [disabl]) ! Bliss
$DS_CNTRLC      [astadr], [disabl]      ; Macro
```

. Previously, the user ^C handler routine had no value. Now, the user handler has the option of telling the Supervisor to handle the ^C normally even though there was a user handler defined. To do this, the user's handler should return a failure status code (R0 bit 0 clear). If the user handler returns a success code, the Supervisor will do nothing further.

- It is possible for messages to be typed out asynchronously, by AST routines for example. This type-out may occur while the operator is keying in commands and/or data. In such a circumstance, VMS will retype the input line automatically (as if a ^R had been typed), but the Supervisor would just let the line "dangle". Now, the Supervisor will perform the "^R"

3.0 NEW LOAD DEVICE SUPPORT

- Supervisor RMS (and therefore all Supervisor file utilities including HELP, DIRECTORY, DS$LOAD, RUN, and LOAD) now will function with the TS-11/TS-04 tape drive sub-system. This addition is transparent to users of the utilities, syntax and programming-wise.

- A user control-C handler returning failure status under APT would cause the Control-C to be ignored, since status information was cleared before the user routine was CALLed. This has been fixed by deferring the status clear.

- DIRECTORY - due to an inconsistency in string descriptor handling, access violations could occur during DIRECTORY depending on previous stack contents. Specifically, if a HELP command with keywords was entered previously, DIRECTORY would fail, but would succeed if HELP without any keywords was typed. The problem has been fixed.

NOTE

Addition to directions for DIRECTORY command:

1) In order to get a directory in user mode, the target device must be mounted (do NOT use the /FOREIGN qualifier!). You can not get a directory from the console device in user mode, since VMS RMS does not support it.

2) The target device must be attached before you can get a directory of it. This applies in both standalone AND user modes. This is due to the fact that the Supervisor does not enforce device naming conventions, and therefore requires access to a Ptable to figure out what type of directory structure it is accessing.

3) The directory command will not work on ODS structure level 1 disks in standalone. (This is a bug, and will be corrected in a future version of the Supervisor!)

1.0 BUG FIXES

- o If the COMET supervisor is loaded from a Massbus device, it currently attaches the load MBA as RH0, irregardless of the actual unit number. In version 6.3, this has been fixed, and it will attach the correct unit number.

- o In the $DS_DEVTYP macro, under certain circumstances the supervisor could be fooled into thinking that a device name string was part of a Ptable descriptor when it actually was only a name. This is because it looks 5 bytes beond the end of the string for a byte 80(x), and if the byte IS 80, the supervisor thinks it is a Ptable descriptor. This has been fixed by adding a null byte to the end of the DEVTYP string list. This does not affect any diagnostic already assembled as it is transparent to both diagnostic and supervisor, occuring only within the library DIAG.

- o For the $DS_ABORT macro, there was a difference in syntax between the MACRO and BLISS forms, as BLISS required 'PROGRAM' while MACRO would accept PROGRAM or program. BLISS will now accept PROGRAM and program, as well as 'PROGRAM' for compatibility with older versions.

- o The $DS_WAITMS macro has been fixed so it will work correctly.

- o The DV11 is now ATTACH-able. Previously the Supervisor knew of the device but would not allow ATTACH-ing it.

- o RMS fixes (to match VMS RMS functionality more closely):

  - When $GET returns RMS$_RTB, the RAB$L_STV field will contain the full record size.

  - $READ will return the block number read in the first longword of the RFA (RAB$L_RFA0). The byte offset of the RFA (RFA$W_RFA4) is 0.

- o SBI silo register dump (11/780 only). Due to an incorrect assumption as to instruction context in indexed addressing mode, the wrong field was decoded for function ID. This problem has been corrected.

- o A fix to DS$WAITUS to promote more correct and consistent behaviour. This involves ensuring that the interrupt and error bits in the timer CSR are cleared.

- o It is now legal for a section name to include the characters "$" and "_". Previously, they could be used in a diagnostic section name definition, but the Supervisor /SECTION qualifier (RUN and START commands) would not recognize them as legal. The Supervisor will now accept these characters. In conjunction with this, the function code CLI$K_SYMBOL has been added to the $DS_CLIDEF macro, and may be used by any diagnostic. This code causes PARSE to recognize a string composed of the characters "A" to "Z", "a" to "z", "0" to "9", "$", and "_".

- o In standalone, the $SETPRT service would return an incorrect

address vector. The start address would be 1FF hex, due to a reversal of operands in a BICL3 instruction. The address will now be correct.

o In standalone, the $DS_RELBUF (or $CNTREG) would fail with an ERRSUP (Supervisor fatal error) if the page geing released was in P1 or SYS space and had been modified with memory management on (M bit set in PTE). V6.3 corrects this problem.

2.0 ENHANCEMENTS

o Several QIO driver service entry points have been added to support level 2R to level 2 conversion: IOC$ALLOSPT, EXE$MAXACMODE, and EXE$READLOCK. These entry points are defined in the DIAG.MLB $DS_QIOVEC macro.

o Previous to V6.3, it was possible to attach a device to any of the predefined "main buses" recognised by the supervisor. Now, an error message will result if the main bus name does not match the CPU type; for example, if a device is attached to an SBI on a COMET processor the error message is "there is no SBI on this type processor." Also, two new "main bus" names have been defined. These can be used on any VAX implementation. They are PHAD (for "Physical Address Decoder") and HUB.

o The $DS_SETVEC macro (DS$SETVEC routine) now allows setting the processor mode in which an interrupt will be handled, without changing the handler address. To do this, set the SRVADR argument to 0, and use the CODE argument as usual. Bits 2 to 31 of the SCB vector will be unchanged, but bits 0 and 1 will still be set to CODE.

o New commands. These support customer service and manufacturing in using terminals narrower than 132 columns, without losing data.

- SET WIDTH n
- SHOW WIDTH

These commands will be accepted and carried out in user mode, but will have no effect on terminal characteristics (use VMS SET TERMINAL/WIDTH=n before running Supervisor). In standalone, a newline is forced when the cursor (printhead) passes column n.

o In user mode (only), the Supervisor will accept subdirectories in file specifications.

o HELP FILE: Where possible, I have included standard (fixed) CSR and vector addresses in the DEVICE portion of EVSAA.HLP. Also, the lines which used to read "Device:" now read "Description:" to avoid possible confusion over actual names. Finally, the recommended generic names have been brought into agreement with the "MASTER LIST OF PDP-11/VAX-11 DEVICE NAME CONVENTIONS" maintained by Kerby Altmann of VMS Development.

o Beginning with V6.3, the Supervisor .DOC file will contain a concatination of all release note files (from V5.3 on). This will allow easier reference to warnings on use of Supervisor features, as well as tracking enhancements/bug fixes.

1.0 BUG FIXES

- QIO driver entry points IOC$ALLOSPT, EXE$MAXACMODE, and EXE$READLOCK, which were supposed to have appeared in version 6.3, somehow didn't. They are present in 6.4.

- ECSAA attached MASSbus load device incorrectly. This has been fixed.

- Most bits of the 11/750 UBI register are undefined, specified as MBZ (Must Be Zero) but are actually unpredictable. This is confusing in the output of a $DS_SHOWCHAN call. Therefore, the Supervisor will now mask out these undefined bits.

- The $SETPRT system service (standalone) would not work if the caller was not already in Kernel mode. Version 6.4 will do a CHMK to insure kernel mode privilege for the routine.

- The byte context PRVPRT output argument of $SETPRT was being written as a longword. Version 6.4 will write it as a byte.

- The diagnostic cleanup code was not called when a loop on subtest terminated. This has been fixed.

- If a range of tests were used with the /SUBTEST qualifier, the diagnostic would loop on the first subtest with the specified number, irregardless of which test it was in. Now, it will only loop on the correctly numbered subtest in the last test number given.

- The VMS console device non-interrupt I/O drivers have been incorporated into the Diagnostic Supervisor. This means console reads which fail due to media bad spots will be re-tried. (This is more of an enhancement, but is listed under bugs because Manufacturing has complained of trouble with console bad spots under APT control).

- The bliss diagnostic library (DIAG.L32) had several bugs in it, including incorrect macros for $DS_$INITIALIZE and $DS_$STRING, many errors in %ERROR statements to point out bad macro useage, and incorrect compilation of $DS_PRINTSIG macro. These have all been fixed.

- A bug in $DS_SETVEC prevented setting the mode in which a 'soft-vectored' exception was handled. Soft vectored exceptions include BPT and T-bit traps. This problem has been fixed.

2.0 ENHANCEMENTS

- FIELD definitions for all Ptable types known to the Supervisor have been added to the Bliss library (DIAG.L32). They can be used via the $DS_HPODEF macro; for example, "$DS_HPODEF ($DS_DZ11_DEF)" allows

access to the basic Ptable fields, plus the fields of the DZ11 Ptable. Also, literals representing the length of these Ptables have been added. There are no FIELD definitions for Ptables which have no device dependent fields.

- Correct spelling of many Supervisor messages, and change to mixed case for greater legibility.

3.0 MISCILLANEOUS

- Note: The $SETAST system service (as documented in the VMS System Service manual) is supported by the Supervisor in standalone. It was added in version 5.4 for Supervisor internal use and was not documented. It may be used by level 2 and 3 programs freely.

- Note: The Diagnostic Design Guide is in error over the PRINT ($DS_PRINTX, $DS_PRINTB, $DS_PRINTF) format argument. It should be counted ascii (ASCIC) not ASCID.

3.1 Previously Undocumented Gems Of Wisdom: Linking Diagnostics

- Bliss-32 => If a diagnostic is written entirely in Bliss-32, without any Macro-32 modules, the diagnostic must be linked with a DS.STB file defining Diagnostic Supervisor entry points (for system services, etc.).

  DS.STB can be created easily from the following Macro-32 source:

```
        .TITLE  DS.STB  Symbol table to link with BLISS modules
        .LIBRARY        'SYS$LIBRARY:DIAG'
        $DS_DSADEF      GLOBAL
        $DS_DSSDEF      GLOBAL
        .END
```

  And assembled/linked as follows:

```
        $ MACRO DS
        $ LINK/SYMBOL_TABLE=DS/NOEXECUTABLE DS
```

  Link <diag> as such:

```
        $ LINK <qualifiers> <diag>+DS.STB
```

- Macro-32 => The $DS_BGNMOD and $DS_ENDMOD macros use a label called $M0 for checking. The $DS_BGNMOD macro defines "$M0 == 0", and the $DS_ENDMOD defines "$M0 == $M0 + 1". Therefore, a missing $DS_BGNMOD macro will cause an "undefined symbol" error at assembly time in that

module, and a missing $DS_ENDMOD will cause a "multiply defined global" error at link time, due to the fact that correct module(s) define $MO as 1 and modules missing $DS_ENDMOD macros define $MO as 0.

RELEASE NOTES FOR
VAX-11 DIAGNOSTIC SUPERVISOR
VERSION 6.5
4-DEC-1981

A. GENERAL ENCHANCEMENTS

1. UNIBUS Mapping

The entire UNIBUS is now mapped, instead of just the I/O pages. This allows diagnostics to get UNIBUS NXM errors instead of access violation errors.

2. Channel Services status

By popular demand, channel services has been enhanced to return additional information:

- o UNIBUS NXM errors reported by bit CHS$M_BUSNXM
- o MASSbus writecheck errors reported by three bits:
  - a. CHS$M_CHNDPE is set if either of the other two are set:
  - b. CHS$M_MBAWCKLWR is set if the MASSbus write check lower bit is set.
  - c. CHS$M_MBAWCKUPR is set if the MASSbus write check upper bit is set.

3. APT troubleshooting

To enable troubleshooting of diagnostic problems under APT, the hardware context will not be initialized when an ABORT command code is received from APT, if errors have occurred.

4. Automatic diagnosis assistance

There are several programs (including APT, RD, and EVXBB) which act as operators to VDS. Currently, this process requires parsing of the VDS ASCII output. With Version 6.5, VDS is growing to make the task of automated diagnosis easier: A new flag has been implemented, called BINARY. When this flag is set, VDS will output a binary 'type byte' as the first byte of every message (including prompts and diagnostic PRINTS). This type byte will indicate the message class (e.g., command error, program start, harderror, etc.) The type codes are defined in macro $DS_TYPECODE in DIAG.MLB and DIAG.L32. Currently, the implementation is incomplete. Most messages for this release will have a type code of 0 (ds$k_type_general). Only prompts, program sequence messages (start, first_pass, end, etc.), and command messages will generate meaningfull type codes. The BINARY flag is off by default, and is not turned on by SET FLAGS ALL (or turned off by CLEAR FLAGS ALL).

5. DEVICE UNIQUENESS

The concept of a unique device has been altered. Previously two devices with the same name were considered the same, and could not be ATTACHed at the same time. To support network nodes

(which may be accessible through several different network adapters), TWO DEVICES WITH THE SAME NAME BUT DIFFERENT LINKS ARE NOW CONSIDERED DIFFERENT. This means that a device attached to the wrong adapter can not be 'edited' by re-attaching it. The new DEATTACH command gives the ability to correct any ATTACH errors.

6. Error messages

All error messages (ERRHARD, ERRSOFT, ERRDEV, ERRSYS, and "Software detected error") now include a trailing "End of error" line heralded by "********". This makes it easier to separate errors and assorted intervening text on printouts. It was particularly devised in conjunction with the BINARY flag (see item 4 in this section), and has its own unique type code.

B. COMMAND ENHANCEMENTS/ADDITIONS

1. New Qualifier /BRIEF

This qualifier can be used on the SHOW DEVICE and SHOW SELECT commands. It will cause only the device name and type fields to be printed.

2. New qualifier /ADAPTER=name

This qualifier can be used on the DEATTACH, SELECT, DESELECT, and SHOW DEVICE commands. It will limit the command to devices attached to the adapter with device name 'name'. E.g., for select, "SELECT/ADAPTER=DW0 ALL" will cause all devices attached to DW0 (but not devices attached in turn to those devices) to be selected for test. The special adapter name "HUB" is recognised, but not "SBI", "CMI", etc.

3. DEATTACH

This command reverses the ATTACH command for a device. It can be used to remove incorrectly attached devices. The /ADAPTER=name qualifier is REQUIRED on this command. Since Ptables are linked in a tree structure, it makes no sense to de-attach a device which has other devices attached to it, unless those devices are also de-attached. Therefore, the DEATTACH command will recursively "seek and destroy" all lower level devices for each device it de-attaches. E.g., if DW0 has devices DMA and TTA attached to it, TTA has device TTA0 attached to it and DMA has DMA0 attached to it, typing "DEATTACH/ADAPTER=HUB DW0" will cause DW0, DMA, TTA, DMA0, and TTA0 to be de-attached. a message will be typed for each as it is de-attached. (note that the message order may appear strange, since the de-attach routine does a post-order search).

4. EXIT

In on-line mode, this command will execute a VMS $EXIT system service to terminate the VDS image. In standalone, it will do a HALT after re-initializing the machine (a console CONTINUE will return to VDS command mode, however).

5. SHOW BASE

Displays the current base value. (as in "SET BASE").

6. SHOW DEFAULT

   Displays the current default radix and data size.

7. SHOW SECTIONS

   Lists the SECTION names supported by the current diagnostic. An error results if no diagnostic is loaded.

8. SHOW STATUS

   Prints the name, revision, current time, error count, section, pass count, test, subtest, and PC for a CNTRL/C'd diagnostic. If there is not a running diagnostic, an error is typed.

9. SHOW SUPPORT

   Prints the list of devices supported by the current diagnostic. An error results if no diagnostic is loaded.

C. GENERAL CLI/PARSE ENHANCEMENTS

1. New PARSE features

   Special function codes have been added to PARSE to improve command parsing for the VDS CLI (they can also be used by diagnostics):

   o CLI$K_EOL: Accepts a string consisting of blanks (any number of spaces and/or tabs; including none of either) followed by either end of line (no more characters in string) or a "!" character (comment delimiter). It will call the action routine and branch through the miss label, as appropriate.

   o CLI$K_SLASH: Accepts blanks, followed by the character "/" followed by blanks.

   o CLI$L_COMMA: Like CLI$K_SLASH, but expects a "," instead of a "/".

   o CLI$K_VALUE: like CLI$K_SLASH, but expects either an "=" or a ":" instead of a "/". "=" and ":" are exactly equivalent (as in VMS DCL).

2. CLI improvements:

   o CLI uses the features listed above to make command syntax more flexible. For example, the qualifier "/PASSES:1" is the same as " / PASSES = 1".

   o The old CLI had two error messages: "Illegal command" and "Ambiguous command"; both of which were usually rather ambiguous themselves. The latter has been replaced by "Incomplete command" and the rules for generating each have been tightened:

     a. A command is illegal if something unexpected is found. E.g., the command "XYZZY".

b. A command is incomplete if something expected is NOT found. E.g., "CLEAR" lacking any arguments.

Furthermore, both error messages include some information on what was in error. "Illegal command" displays the command line UP THROUGH THE FIRST ILLEGAL CHARACTER. "Incomplete command" displays up to where the expected data should have been. E.g., the command "XYZZY" results in:

```
?? Illegal command
   \X\
```

while the command "CLEAR" results in:

```
?? Incomplete command line
   \CLEAR\
```

D. PTABLE DESCRIPTOR ENHANCEMENTS

1. New directives

o Previously, to request logical (yes/no) data, it was necessary to use the $DS_$STRING directive, supplying prompt, "NO", and "YES" strings. I have implemented the new directive $DS_$LOGICAL. It's only argument is the prompt string. This saves program space, and also allows ABBREVIATION of the words "Yes" and "No". All Ptable descriptors within VDS which require "Yes/No" input have been modified to use this directive.

o Value translation can now be accomplished by the directive $DS_$CASE. The argument is a list of "case_pairs"s. The current VALUE register is compared to the first value of each pair until a match is found; the second value of that pair becomes the new VALUE, and the case directive is exited. VALUE is not altered if no match is found.

Bliss-32:

```
$ds_$case (<1,%x'FFF'>, <2,%x'1CE0'>)
```

MACRO-32

```
$ds_$case <<1,<^xFFF>><2,<^x1CE0>>>
```

E. MISCELLANEOUS ENHANCEMENTS

1. VERIFY

VDS now supports a mechanism similar to the VMS "SET [NO]VERIFY". The flag VERIFY can be set or cleared via "SET FLAG VERIFY" or "CLEAR FLAG VERIFY". When the flag is set, commands read from VDS scripts are echoed to the console. When the flag is clear, command lines are not echoed. This does not affect error or information messages, and has no effect unless commands are being processed from a VDS SCRIPT file : commands read from a VMS command file are considered by VDS to be coming from the console!

!!The flag is CLEAR by default!!

2. MIXED CASE MESSAGES

Many messages throughout VDS have been altered from all caps to mixed case. We feel that this is much easier to read, as well as appearing "warmer", in the line of "human engineering".

F. BUG FIXES

1. Ptable descriptor location

A bug has existed which could cause errors when a program's DEVTYP list existed but had 0 elements. This has been fixed.

2. ATTACH

It is now possible to CNTRL/C out of an ATTACH prompt. Furthermore, ATTACH will not attempt to prompt a SCRIPT or APT for a missing or invalid parameter: the command will be aborted. From a SCRIPT, the error "Prompt not found" is generated. From APT mode, a "Software detected error" is generated.

3. Fixes to DIAG.L32 macros

o $DS_ENDMOD malfunctioned when a module did not contain tests (incorrectly setting an overlayed PSECT which at runtime should contain highest test number). This has been fixed.

o $DS_HPO_DECL has been fixed to correctly accept multiple arguments.

o $DS_$STRING and $DS_$INITIALIZE did not function properly. Now they will.

4. Event flag services

All standalone event flag services have been re-written to correspond to the VMS services. The $SETEF and $CLREF services will return SS$_WASSET or SS$_WASCLR when they should, as will $READEF.

G AUTOMATED DIAGNOSTIC QUALITY ASSURANCE

G.1 Background

Enhancements have been made to the Diagnostic Supervisor to enable it to automatically perform Quality Assurance checks on diagnostic programs.

This version of the Supervisor performs the Normal Start check (Section 3.1 in the "VAX Diagnostic Quality Assurance Checklist"), the Multiple Pass check (Section 3.2), the Loop on Test check (Section 3.7), and the Run Backwards check (Section 3.5). Other sections in the checklist will be added to the Supervisor as time and resources permit.

The Normal Start check does the following: saves the current setting of the Supervisor flags; turns on the TRACE flag; turns

off the following flags: BELL, IE1, IE2, IE3, IES, LOOP, OPER, PROMPT, QUICK, and SEARCH; performs a normal start of the diagnostic program, running all the tests in the specified section; turns the TRACE flag off; and either stops when a QA error is detected or proceeds to the next check.

The types of errors that the Normal Start check will detect are asking for operator input when the no-default flag is set (in the $DS_ASK macro) and reporting a diagnostic error via one of the $DS_ERR macros. When a QA error is detected, the Supervisor will print out information that should help the diagnostic engineer determine why the program failed QA. Then, an overall error summary table is printed, the Supervisor flags are restored to their previous settings, and the diagnostic is aborted.

If the Normal Start check succeeds, the Multiple Pass check is performed. This check performs a number of passes of the diagnostic program. The current setting of the QAMULTIPLEPASS flag is the number of passes that will be executed (see Section G.4). The types of QA errors that can occur are the same as those in the Normal Start check.

If the Multiple Pass check succeeds, the Loop on Test check is executed. This check runs each test QATESTLOOPS times (see Section G.4). Assuming a diagnostic has tests 1, 2, and 3, and QATESTLOOPS has been set to 4, this check will run the initialization code, followed by tests 1, 1, 1, 1, 2, 2, 2, 2, 3, 3, 3, and 3. The types of QA errors that can occur are the same as those in the Normal Start check.

If the Loop on Test check succeeds, the Run Backwards test is executed. This check runs the tests in reverse order. If a diagnostic contained tests 1, 2, 3, and 4, this check would execute the initialization code followed by test 4, test 3, test 2, and then test 1. The types of QA errors that can occur are the same as those in the Normal Start check.

If the Run Backwards check succeeds, the overall error summary table is printed, a line is printed saying that the program passed Auto-QA, the Supervisor flags are restored to their previous settings, and the diagnostic is aborted.

G.2 START/QA

A new qualifier has been added to the START command. If the START command contains the /QA qualifier, QA will be performed on the currently loaded diagnostic program. If the /QA qualifier is present, the /PASSES, /SUBTEST, and the /TEST qualifiers are ignored. The /SECTION qualifier may be used to run QA on a particular section in the program.

G.3 RUN/QA

The /QA qualifier has also been added to the RUN command. It functions exactly the same as the /QA qualifier on the START command.

G.4 QA Flags

There are five new Supervisor flags that will affect QA. However, only two of these are used in the current implementation.

The QAMULTIPLEPASS flag controls how many passes are performed in the Multiple Pass check. This flag may be set as follows:

```
DS> SET QAMULTIPLEPASS 10
DS> SET QAM 3
```

In addition, the current setting of the flag may be printed as follows:

```
DS> SHOW QAMULTIPLEPASS
DS> SHOW QAM
```

Note that the QAMULTIPLEPASS flag may be abbreviated to QAM. The initial (and default) setting for this flag is 10. That is, 10 passes of the diagnostic will be executed in the Multiple Pass check.

The QATESTLOOPS flag controls now many times each test is executed in the Loop on Test check. For example, if a diagnostic program contains three tests and QATESTLOOPS equals 2, this check will first execute the initialization code, then tests 1, 1, 2, 2, 3, and 3.

This flag may be SET and SHOWn in the same manner as the QAMULTIPLEPASS flag. This flag may be abbreviated to QAT. The initial (and default) setting for this flag is 100.

Also, the following command will set all the QA flags to their default settings:

```
DS> SET QADEFAULTS
```

QADEFAULTS may be abbreviated to QAD. To show the default settings (not the current settings) of the five QA flags, the following may be used:

```
DS> SHOW QADEFAULTS
```

G.5 Modifications Necessary For QA

Diagnostic programs wishing to undergo QA must call the $DS_ENDPASS macro in the initialization code. This is necessary for the internal Supervisor sequencing of QA checks. The branch macros discussed in the "Design Specification for Automatic Quality Assurance for Diagnostic Programs" need not be used in the diagnostics for this version of QA.

Because of the way the Supervisor works, the code executed in the diagnostic's initialization code when pass0 is true (in conjunction with the $DS_BPASS0 or $DS_BNPASS0 macros) will be done only once. It is done at the start of the Normal Start

check. Also, the cleanup section will be done only once. It is done at the conclusion of the Normal Start check (before the Multiple Pass check is started).

Thus, the whole QA sequence of checks may be thought of as executing the diagnostic a number-of-passes times, with different things happening in different passes. That is, one pass is executed for the Normal Start check, then QAMULTIPLEPASS passes are executed in the Multiple Pass check, then one pass is executed in the Loop on Test check (with the tests executing more than once), and then one pass is executed for the Run Backwards check (with the tests being run in reverse order).

RELEASE NOTES FOR
VAX-11 DIAGNOSTIC SUPERVISOR
VERSION 6.7
03-May-1982

A. GENERAL ENCHANCEMENTS/NOTES

1. This release is almost identical to the Version 6.6 VDS which was released in the previous cycle. However, due to technical difficulties, particularly due to the support of VMS V2-style QIO interface in standalone, while linking VDS under V3 of VMS, it was not possible to release version 6.6 VDS for 11/780 and 11/750 processors.

   This release (6.7) includes all three processors; ENSAA (11/730), ECSAA (11/750), and ESSAA (11/780).

2. VMS V3a support

   Support of VMS V3a includes support for the new system directory structure, where [SYS0.SYSMAINT] replaces the old [SYSMAINT] directory. Earlier versions of VDS will not operate correctly with a 'rooted' SYSMAINT directory. This support requires DIAGBOOT.EXE V4, which was released with the previous release cycle.

   A side-effect of the support of rooted systems is that VDS now fully supports subdirectories in standalone mode.

   NOTE that while VDS 6.7 supports the directory structure of VMS V3a, it is linked under VMS V2.5, and so will run under VMS V2.5 or V3a.

3. New Device support

   VDS V6.7 includes support for the UDA-50 UNIBUS to SI disk adapter/controller, and for the RA- series disk drives which can attach to it.

B. COMMAND ENHANCEMENTS/ADDITIONS/FIXES

1. SELECT/DESELECT

   In version 6.5, the SELECT and DESELECT commands did not handle the new definitions of 'device uniqueness' correctly. If the device name specified was attached to more than one adapter, the commands would simply act upon the first such device found (unless the /Adapter qualifier was used). Since the SELECT command affects the order in which device names are searched, this often meant that it was impossible to DESELECT the device which had been SELECTed; yet no error message was given. Now, such a situation will result in an error message saying that the /Adapter qualifier must be used.

2. HELP

   In the process of major restructuring of the VDS command parser for version 6.5, a bug was inserted in the parsing of the HELP

command. Specifically, any command line which began with 'H' was taken as a HELP command; for example, a 'SHOW' command mis-typed as 'HSOW' was interpreted as if 'HELP SOW' had been typed. This has been fixed for VDS 6.6.

3. SHOW MEMORY

This new command displays the layout of VDS memory. In default mode, the start and end addresses of the diagnostic, VDS, and dynamic memory (used by VDS) are typed, as well as the physical memory size of the system, in both HEX and DECIMAL radix. There are several qualifiers to this command. Note that you can not use these qualifiers prior to the MEMORY keyword. E.g., 'SHOW MEMORY/ALL' but not 'SHOW/ALL MEMORY'.

a. /MAP : same as default mode

b. /DATA_STRUCTURE : shows internal VDS data structure addresses, including all stacks, page tables, SCB, and various simulated VMS data structures (PCB, PHB, etc.). knowing the addresses of these data structures can be usefull in debugging. Note that the memory layout in on-line mode is quite different than in standalone; in on-line mode, none of the aforementioned data structures are present within VDS memory space, and will not be displayed.

c. /BUFFER : Show available space for diagnostic buffers, both above and below VDS (this command is not meaningfull when no diagnostic is loaded). Note that since on-line mode allocates buffer space above VDS via $EXPREG as it is requested, /BUFFER on-line will not show space above VDS.

c. /ALL : Combine /Map, /Data_Structure, and /Buffer

4. DIRECTORY

The DIRECTORY command has been enhanced. Previously, it would accept as arguments only the device and directory parts of a filespec, and would take only one level of directory in standalone mode. Now, you can specify the filename, type, and version fields of the filespec; additionally, both the filename and type fields may include both "*" and "%" wildcards (with the same meaning as under VMS). Furthermore, subdirectory specification is now legal in standalone as well as on-line.

5. SUMMARY

The SUMMARY command has been enhanced. Whether or not the diagnostic program contains summary code, VDS will generate a header containing the name of the diagnostic and a summary of all HARD, SOFT, DEVICE, SYSTEM, and SUPERVISOR DETECTED errors which occurred during the run.

C. AUTOMATED DIAGNOSTIC QUALITY ASSURANCE

1. Introduction

These sections will explain what functionality I have added

to the Automatic Quality Assurance enhancement to the Diagnostic Supervisor, and what problems I have fixed since the 6.5 version of the Supervisor. Note that when I speak of versions of QA or versions of the Diagnostic Supervisor, I am actually speaking of the same thing.

2. Additional Functionality

The following gives the two new QA checks that have been added to the 6.6 version:

a. Loop On Subtest check:
This check performs a loop on every subtest in the diagnostic. The number of loops is user-controlled via the QASUBTESTLOOPS Supervisor flag. The following is an example of how this check works:

Assumptions:
Diagnostic EXXXX contains two tests.
Test one has three subtests.
Test two has two subtests.
QASUBTESTLOOPS has been SET to 3.

Order of Execution (Test#.Subtest#):
1.1
1.1
1.1

1.1
1.2
1.2
1.2

1.1
1.2
1.3
1.3
1.3

1.1
1.2
1.3
2.1
2.1
2.1

2.1
2.2
2.2
2.2

2.1
2.2
End of Pass

In the above, the blank lines represent places where QA internally aborts the diagnostic and restarts it so as to start looping on the next subtest. The ENDPASS routine is only executed at the very end of the check. However, the initialization code and the cleanup code are both

executed once for each of the above groupings.

b. Error Phase One check:
This QA check forces as many error reports as possible to be printed. This is a way of insuring that the parameters passed to the error routines are correctly coded, as well as allowing the user to check the format of the error messages. The following lists some points that must be considered when writing a diagnostic that will be QA'ed using Auto-QA:

i. Any error call that was not forced (i.e., was not preceeded by a branch macro in which QA forced the branch to change sense) will be treated as a QA error, resulting in termination of Auto-QA.

ii. No two branch macros should occur in sequence without an intervening error macro call. That is, the sequence should always be one branch macro followed by one error macro call.

iii. No branch macros should occur in a subroutine. Branch macros in subroutines may cause QA to go into an infinite loop and print error reports ad infinitum! This may be fixed in a later version of QA.

iv. The branch macros for use in MACRO diagnostic modules are listed below. For an explanation of the parameters, see Revision 1.1 of the "Functional Specification for Automatic Quality Assurance for Diagnostic Programs" memo. Contact Jack Stansbury (TW/F18) for a copy of this memo.

```
$DS_BLSS        ADR, NUM
$DS_BLSSU       ADR, NUM
$DS_BLEQ        ADR, NUM
$DS_BLEQU       ADR, NUM
$DS_BEQL        ADR, NUM
$DS_BEQLU       ADR, NUM
$DS_BGEQ        ADR, NUM
$DS_BGEQU       ADR, NUM
$DS_BGTR        ADR, NUM
$DS_BGTRU       ADR, NUM
$DS_BGTRU       ADR, NUM
$DS_BNEQ        ADR, NUM
$DS_BNEQU       ADR, NUM
$DS_BVS         ADR, NUM
$DS_BVC         ADR, NUM
$DS_BCS         ADR, NUM
$DS_BCC         ADR, NUM
$DS_BBS         POS, BASE, ADR, NUM
$DS_BBC         POS, BASE, ADR, NUM
$DS_BBSS        POS, BASE, ADR, NUM
$DS_BBSC        POS, BASE, ADR, NUM
$DS_BBCS        POS, BASE, ADR, NUM
$DS_BBCC        POS, BASE, ADR, NUM
$DS_BBCCI       POS, BASE, ADR, NUM
$DS_BBSSI       POS, BASE, ADR, NUM
$DS_BLBS        SRC, ADR, NUM
```

```
$DS_BLBC        SRC, ADR, NUM
$DS_BERROR      ADR, NUM
$DS_BNERROR     ADR, NUM
```

v. The branch macros for use in BLISS diagnostic modules are as follows (note that the BCS, BCC, BVS, and BVC branch macros are not implementable in BLISS):

```
$DS_BLSS    (VAL, NUM)
$DS_BLSSU   (VAL, NUM)
$DS_BLEQ    (VAL, NUM)
$DS_BLEQU   (VAL, NUM)
$DS_BEQL    (VAL, NUM)
$DS_BEQLU   (VAL, NUM)
$DS_BGEQ    (VAL, NUM)
$DS_BGEQU   (VAL, NUM)
$DS_BGTR    (VAL, NUM)
$DS_BGTRU   (VAL, NUM)
$DS_BGTRU   (VAL, NUM)
$DS_BNEQ    (VAL, NUM)
$DS_BNEQU   (VAL, NUM)
$DS_BBS     (POS, BASE, NUM)
$DS_BBC     (POS, BASE, NUM)
$DS_BBSS    (POS, BASE, NUM)
$DS_BBSC    (POS, BASE, NUM)
$DS_BBCS    (POS, BASE, NUM)
$DS_BBCC    (POS, BASE, NUM)
$DS_BBCCI   (POS, BASE, NUM)
$DS_BBSSI   (POS, BASE, NUM)
$DS_BLBS    (SRC, NUM)
$DS_BLBC    (SRC, NUM)
$DS_BERROR  (VAL, NUM)
$DS_BNERROR (VAL, NUM)
```

After all the errors are forced, a table is printed that summarizes the error numbers. This is the Forced-Error Summary table. This table looks like the following:

Summary of Forced-Errors

```
Test  X1   Subtest  Y1
--------   ----------
aaaaa-bbbb ccccc-dddd ...
mmmmm-nnnn ...

Test  X2   Subtest  Y2
--------   ----------
AAAAA-BBBB CCCCC-DDDD EEEEE-FFFF GGGGG-HHHH ...
MMMMM-NNNN OOOOO-PPPP QQQQQ-RRRR ...
...
```

The error numbers are printed in a test/subtest order, with the error numbers sorted within each test/subtest.

The Xi and Yi are the test and subtest numbers,

respectively. The 'aaaa', 'cccc', ..., 'AAAA', 'CCCC', etc. are the error numbers that are passed to the $DS_ERRxxxx macro.

The 'bbbb', 'dddd', ..., 'BBBB', 'DDDD', etc. are the number of times that error was forced. This number should be one except in those cases where the same error number is used more than once in one subtest.

If the diagnostic runs on a subset of the total number of tests in the DEFAULT section (by using the /TEST qualifier), the Overall Error Summary table will not be printed.

However, if the /TEST qualifier is not used, the Overall Error Summary table will be printed. This table gives the number of errors that occurred in each QA check. For the 6.6 version of the Supervisor, these numbers should be either all zeroes (in which case a line is printed saying the program passed Auto-QA), or else there will be at most one error (since Auto-QA is aborted upon detection of a single QA error).

3. Auto-QA Problems in the 6.5 Version

The following is a list of problems with QA that were discovered in the 6.5 version of the Supervisor:

a. The Halt-On-Error flag was not cleared before starting QA. I had meant to clear all the Supervisor flags when QA started, and then restore them when QA ended. However, I forgot this one flag. Although it probably will not cause any problems in the 6.5 version, it would have caused problems in this new version.

b. If a previously-started diagnostic is running, a Control-C is typed, and then a CONTINUE Supervisor command is executed, Auto-QA will start behaving strangely (it will set the number of passes to 0, and start executing forever).

c. The cleanup code in the diagnostic was executed at the end of the first QA check, the Normal Start check. After executing the cleanup code, QA caused the diagnostic to continue running by starting the Multiple Pass check. That is, the /QA qualifier on the START or RUN commands cause the following to happen:

   i. The diagnostic is started and executes one pass. This means it executes the initialization code (doing the pass-zero things, such as allocating buffers and assigning channels), then executes all the tests in the appropriate section (the DEFAULT section by default).

   ii. Then, after executing the last test in that section, the Supervisor calls the initialization code again. This time, the pass-zero things will not be done and the ENDPASS routine will be called.

iii. The ENDPASS routine calls the diagnostic's cleanup code (where the buffers are usually deallocated and channels deassigned).

iv. Normally at this point (i.e., when NOT under control of QA), the Supervisor would return to command mode. However, QA will cause the ENDPASS routine to set the number of passes to QAMULTIPLEPASS (settable via a "SET QAMULTIPLEPASS" DS command) and start the Multiple Pass QA check.

v. This causes test one to execute again. Note that the initialization code is NOT executed in between the Normal Start check and Multiple Pass check. Thus, the buffers that were deallocated at the end of the Normal Start check (in the cleanup code) are no longer available to the diagnostic in the Multiple Pass check. This was causing several diagnostics (including the Cluster Exerciser) to fail.

d. The branch macros (i.e., $DS_BERROR, $DS_BLBS, $DS_BBS, $DS_BNFQ, etc.) will destroy the contents of R0. This happens because the branch macros expand into a Supervisor service routine, which is executed with a CALLS instruction. Since R0 is never saved across CALL instructions, the contents can not be guaranteed upon return from this routine.

e. The register values that are printed out when a QA error is detected are incomplete. That is, at most three of the registers are correct, with the others having a default value of zero. This led to some confusion.

f. The /TEST qualifier was ignored on the START or RUN commands when used in conjunction with the /QA qualifier.

g. The /SECTION qualifier did not work properly when used in conjunction with the /QA qualifier. The DEFAULT section is the only section that can be run when using the /QA qualifier.

4. Fixes to the Above Problems

The following describes the status of the above problems:

a. The HALT flag is now cleared when QA is running. As with the other Supervisor flags (e.g., IE1, IE2, IE3, TRACE, BELL, etc.), it is restored to its previous state (i.e., to the same setting it had before the START or RUN command was executed) after QA finishes.

b. A Control-C will now cause the diagnostic currently being QA'ed to be aborted only if Control-C has NOT been disabled by the diagnostic. That is, if the diagnostic has disabled C's, C's will be ignored when running under QA. If the diagnostic has not disabled C's, (they are enabled by default), the Supervisor will gain control

(before the diagnostic's Control-C handler) and will abort the diagnostic. Note that a CONTINUE Supervisor command in this context will not work.

c. The way the QA check routines execute the diagnostic has been fundamentally changed. Whereas before the sequence of checks could be thought of as executing a variable number of passes of the diagnostic, the sequence is now like STARTing the diagnostic a fixed number of times (the number of times depends on the number of QA checks).

For example, ASSUMING (note that even though there is none, this has been suggested as an enhancement) there was a new qualifier on the START (and RUN) command that would allow one to select which particular QA check routine to execute (such as /QA=NORMAL_START to execute ONLY the Normal Start QA check on the diagnostic), then the sequence of checks can now be thought of as being:

```
DS> START/QA=NORMAL_START
DS> START/QA=MULTIPLE_PASS
DS> START/QA=LOOP_ON_TEST
DS> START/QA=LOOP_ON_SUBTEST
DS> START/QA=RUN_BACKWARDS
DS> START/QA=ERROR_PHASE_ONE
```

That is, the diagnostic program is reSTARTed at the beginning of each QA check and executes as though a normal START Supervisor command had been executed. This implies that the initialization code is always done at the beginning of each check routine, then all the tests execute (a varying number of times depending on which QA check is executing), then the ENDPASS routine is executed causing the cleanup code to execute, and then the next QA check routine performs the same way. This new implementation should alleviate the deallocation problems encountered by several people.

d. The implementation of the branch macros has changed somewhat. Some diagnostic engineers felt that the $DS_BERROR and $DS_BNERROR macros should NOT alter the contents of R0 both when QA is not running, and when QA is running but not forcing errors (as happens in the Error Phase One QA check). In this version of the Supervisor and of the DIAG library, the $DS_BERROR and $DS_BNERROR macros will alter the contents of R0 only when QA is running and forcing errors.

For branch macros other than $DS_BERROR and $DS_BNERROR, the contents of R0 may change across the branch macro call. The main reason an exception was made in the case of the above two macros is that they existed prior to the QA enhancement and did not alter the contents of R0. Therefore, to be compatible with old diagnostics, it was felt that this should not change. However, with the new branch macros, R0 will change only in the low bit position (i.e., it may change from a one to a zero, or vice-versa). Note that this bit may change even when the /QA qualifier is not being used (i.e., in normal running of the diagnostic).

e. The register values printed out when a QA error is detected are now correct. The values printed are the values at the time of the call to the Supervisor Service routine that produced the QA error (e.g., a $DS_ERRHARD call).

f. The /TEST qualifier is no longer ignored when used in conjunction with the /QA qualifier. This allows one to run QA on a particular test in a diagnostic, or on a range of tests. However, if the /TEST qualifier is used, the Overall Error Summary table is not printed (see later section).

g. The /SECTION qualifier is still essentially ignored. This will be fixed in the next version of the Supervisor.

D. DIAGBOOT (DIAGNOSTIC SECONDARY BOOTSTRAP PROGRAM)

(DIAGBOOT has not changed from release 6.6 to 6.7 of VDS; this section is included for the convenience of those who have not seen the 6.6 release notes).

DIAGBOOT is loaded by VMB when a BOOT command is issued with register 5 bit 4 set. DIAGBOOT will sense the type of processor (11/780, 11/750, or 11/730) and load the appropriate VDS image (ESSAA, ECSAA, or ENSAA respectively). This new version of DIAGBOOT (version 4) supports the new VMS rooted systems (the old [SYSMAINT] becomes [SYS0.SYSMAINT], or [SYS1.SYSMAINT], etc.). The high nibble (bits 28 to 31) of R5 at boot time represent the hex digit which should be converted to ASCII and appended to the root directory name 'SYS'; this allows system root directories of 'SYS0' to 'SYSF' to co-exist on the same disk pack.

This new version of DIAGBOOT also allows the VDS image being booted to be non-contiguous. With previous versions of DIAGBOOT, VDS had to be contiguous.

RELEASE NOTES FOR
VAX-11 DIAGNOSTIC SUPERVISOR
VERSION 6.8
6-Jul-1982

A. GENERAL ENCHANCEMENTS

1. ATTACH enforces device naming conventions

An additional Ptable descriptor statement ($DS_$NAME; see VAX-11 Diagnostic Design Guide, chapter 17 for information) allows VDS to verify the names given to devices when they are attached. For example, when an RK07 is ATTACHed, it must have a name of the generic format 'ggan', where 'gg' is the device generic prefix, 'DM', 'a' is the controller

letter of the RK611, and 'n' is the unit number.
Previously, VDS imposed no constraints on device names other than on whether a unit number was allowed, and on the magnitude of the unit number if allowed.

Because this is new functionality, and some old SCRIPTS or even diagnostics may not function under these new constraints (e.g., scripts which ATTACH an RK07 as 'DMC'), new commands have been implemented which will enable and disable this functionality under operator control. The commands are:

- o SET ENFORCE : This command enables enforcement of device name enforcement. It is the default condition when VDS starts, EXCEPT when running under APT.

- o CLEAR ENFORCE : This command disables enforcement of device name enforcment. It will cause VDS to behave as it did prior to this enhancement. CLEAR ENFORCE is the default condition when VDS is run under control of APT.

****NOTE****
These commands are intended only for EMERGENCY use. You should fix your script files and/or diagnostic programs immediately to conform to the device naming conventions.

2. AUTOSIZER (EVSBA) changes

   The autosizer (EVSBA V1.4) has been modified to generate the correct names for V6.8 of the Diagnostic Supervisor. The entire attach command line generated for each device is described in a separated document.

3. $DS_ERRPREP_x [num], [unit], [msgadr], [prlink], [p1--6]

   A new error message facility has been added to the Supervisor

for detecting device preparation errors. You should use this macro after detecting a device preparation error (e.g. disk not spinning) instead of another error message facility. The parameter list is the same as for the other error macros and is fully described in section 8.7 of the Vax-11 Diagnostic Design Guide (EK-1VAXD-TM-002).

B. GENERAL BUG FIXES

1. KERNEL STACK NOT VALID ABORTS

Previously, VDS allocated only 3 pages for KERNEL mode stack. In certain commands, notably a directory of an ODS stuctured disk (standalone only, with MM ON), these 3 pages could be overflowed, resulting in a KERNEL STACK NOT VALID ABORT, due to the page below the kernel stack being marked 'no access' to catch stack overflows. To minimize the chances of this sort of behavior, the kernel stack has been expanded to 10 pages for V6.8. This problem can not occur in on-line mode (under VMS).

2. TM03/TE16/TU45/TU77

The problem with not being able to access magtapes on this controller through the Supervisor has been solved in this released.

3. MACHINE CHECK LOGOUT

The machine check logout for the 11/780 (ESSAA) has been changed to show the error summary register in addition to the other parameters.

C. NOTES

1. TM78 SUPPORT

VDS theoretically supports MAGTAPE devices as file load devices. Currently, the only Magtape devices supported are TM03 and TS11 controllers. This release includes the beginnings of TM78 (TU78 drive) support: however, due to a lack of standalone hardware, it is not debugged or supported. This note is just to warn those who may try a file command (DIRECTORY, HELP, LOAD, RUN) from a TM78 magtape, or who look at the VDS map listing and see 'IFBTDRIVR' (which is the VDS TM78 readonly driver) that the TM78 code is undebugged and probably will not work as-is. However, TM78 support will be completed as soon as possible, and documented in a future release.

2. INTERRUPT STACK

The INTERRUPT stack size has be increased 4 pages so the priviledge exerciser can print out errors without failing.

3. CUSTOMER RUNNABLE DIAGNOSTICS (CRD)

The Supervisor has been enhanced to support CRD AUTO TEST on the 11/730 machine. For more information on CRD, see the "Nebula Customer Runnable Diagnostics Functional Specification" DTM-82-001-01, document.

RELEASE NOTES FOR VAX-11 DIAGNOSTIC SUPERVISOR VERSION 6.9 8-Nov-1982

1.0 BUG FIXES

- The following sequence of commands caused a "?? Translation not valid Fault ..." :

```
DS> SET MM ON
DS> ATTACH ...
```

  This occurred only in standalone mode, and only if a program had not been previously loaded with a supervisor LOAD command.

- A "^Z", typed at the console terminal in stand-alone mode, echoed garbage as a non-printing character. It has been fixed so that it now imitates the supervisor EXIT command, and returns control to the console program.

- The following error message appears when any file services (such as LOAD, RUN, DIRECTORY, HELP, and script files) are attempted with an RL11/RL02:

  %RMS-F-DEV, bad device, or inappropriate device type (R0=00018404)

  This is a bug only in version 6.8 in standalone mode, and is fixed in version 6.9.

- Also, only in version 6.8 and only for the 11/750, there is a bug which prevents the supervisor from loading large files from the console TU58 tape cartridge. Some small files could be loaded. Typically, the tape cartridge indicator light would remain lit for an excessively long time, and eventually the supervisor would respond with an error message. This is fixed in version 6.9.

- New versions of VMS which modify the system service transfer vector table experienced a problem running the supervisor in on-line mode. This occurred because the supervisor copied three pages of system service vectors for its own use, but the transfer vectors had been modified to branch into a fourth page. In order to accomodate other possible modifications to the VMS system service transfer vectors, the supervisor's transfer table was modified to jump directly to the actual VMS system service transfer vector table.

2.0 ENHANCEMENTS

- Support for the TM78/TU78 magnetic tape device as a file load device is now functional. This means that commands such as DIRECTORY, HELP, LOAD, and RUN, will now work when the TU78 is ATTACHed and a SET LOAD command has been executed.

- The SHOW MEMORY/BUFFER command has been enhanced to show the amount of buffer space in use by the diagnostic. The command displays the amounts in use in P0, P1, and S0 space (the number of pages in use). Previously, only the available buffer space was displayed. The SHOW MEMORY/ALL also displays this information.

- CUSTOMER RUNNABLE DIAGNOSTICS (CRD): VAX-11/730 MENU TEST

  The VAX Diagnostic Supervisor now supports VAX-11/730 MENU TEST (CRD MENU) as part of the CRD Package. CRD MENU is an off-line Menu-driven test feature of CRD. The purpose of CRD MENU is to provide the customer, or inexperienced operator, stand-alone VAX Diagnostic test capability for the VAX-11/730 'base' system package and, in particular, for VAX-11/730 Add-on options. CRD MENU, therefore, represents a complementary test package to VAX-11/730 AUTO TEST (see DTM-82-001-01 Nebula CRD Auto Test Functional Specification).

  CRD MENU, when invoked, will automatically determine CRD MENU supported hardware on the system and satisfy the necessary software requirements required for executing VAX Diagnostics. Through the Menu interface, the operator may select and test one supported hardware unit for test, or with the 'Test All' mode feature, select and test all supported system hardware. CRD MENU, therefore, provides full functional verification and fault isolation to the subsystem level of the system.

  CRD MENU is invoked by VAX-11/730 Console Command (typing 'T/M' to console prompt), at the successful completion of VAX-11/730 AUTO TEST (invoked by typing 'T' to console prompt), or from VAX Diagnostic Supervisor Command Level (typing 'CRD' to VDS CLI command prompt). However, the 'CRD' Supervisor command is not supported for use in Supervisor command files.

  Four new Supervisor commands have been added for CRD MENU Test. The commands are as follows:

  ```
  SET CRD/TRACE
  CLEAR CRD/TRACE
  SHOW CRD
  CRD
  ```

  The functions of these commands are explained in the ENSAB.DOC file.

For additional information:

- see ENSAB.DOC
- see the Functional Specification for VAX-11/730 MENU TEST
- Type "HELP ENSAB MENU" to VDS CLI Command prompt (this requires that the ENSAB.HLP file be on the load device).

3.0 MISCELLANEOUS

- A bug in the $D1_ERR_L MACRO in DIAG, which caused an invalid conditional directive, has been fixed.

4.0 KNOWN BUGS AND DEFICIENCIES

- The following commands will cause an error message if a comment follows the command:

```
SET ENFORCE
CLEAR ENFORCE
SET CRD/TRACE
CLEAR CRD/TRACE
SHOW CRD
CRD
```

For example,

```
DS> SET ENFORCE             ! Comment
?? Illegal command
   \SET ENFORCE             ! C\
```

All of the above commands except the 'CRD' command will still perform their correct function even though the Supervisor responds with "?? Illegal command". NOTE: the 'CRD' command will FAIL if the command is followed by a comment on the same line.

RELEASE NOTES FOR VAX-11 DIAGNOSTIC SUPERVISOR VERSION 6.10 3-Jan-1982

1.0 BUG FIXES

- The 6.9 VDS bug concerning comments on the following Supervisor commands has been fixed. All of the following commands now accept comments after the command:
  - SET ENFORCE
  - CLEAR ENFORCE
  - SET CRD/TRACE
  - CLEAR CRD/TRACE
  - SHOW CRD
  - CRD

2.0 ENHANCEMENTS

- Support for the TM80 magnetic tape device as a file load device is now functional. This means that commands such as DIRECTORY, HELP, LOAD, and RUN, will now work when the TU80 is ATTACHed and a SET LOAD command has been executed.
- A new supervisor service call, which loads the COMET PCS microcode and patch bits, has been added. The service is called by a supervisor macro, $DS_LOADPCS_x ($DS_LOADPCS_DEF, $DS_LOADPCS_G, $DS_LOADPCS_L, and $DS_LOADPCS_S for MACRO and $DS_LOADPCS for BLISS), with no arguments. The service returns DS$_NORMAL if the service is completed successfully, and DS$_NOPCS if PCS is not available on this CPU. Currently, the only diagnostic program which uses this call is ECKAX. This release does not contain PCS microcode which affects any instructions. It merely restores the PCS to a known state. If the CPU attempts to execute any of the PCS microcode, an error message will be printed out.

3.0 MISCELLANEOUS

-

4.0 KNOWN BUGS AND DEFICIENCIES

o

RELEASE NOTES FOR
VAX-11 DIAGNOSTIC SUPERVISOR
VERSION 6.11
23-May-1983

1.0 BUG FIXES

o Implementation of Control-Z recognition in standalone mode was done incorrectly and has been removed, although no symptoms have been discovered.

2.0 ENHANCEMENTS

1. VDS 6.11 suoports booting and file loading from HSC50 on CI780.

3.0 MISCELLANEOUS

2. The device name for booting from the RP07 disk will now be DRan and not DBan

3. The driver for the TM78/TU78 was changed to have a longer delay between accesses of the ATTENTION register during the wait for command completion to prevent spurious operations caused by false signals. The driver was enhanced to work with tapes written at 6250 b.p.i and be usable on drives other that number 0.

o

4.0 KNOWN BUGS AND DEFICIENCIES

o

RELEASE NOTES FOR
VAX-11 DIAGNOSTIC SUPERVISOR
VERSION 6.12
21-Jul-1983

1.0 NEW FEATURES

- The SET WIDTH command has been changed to work in online mode. The default is the same as for standalone mode, 80 characters.

- The SET PAGE command has been added to freeze terminal output after a specified number of lines. The user is then prompted for more output. The default value is zero, which indicates that no paging will be done. In order to determine a maximum value for a video terminal such that no terminal output will be lost, subtract 2 from the number of lines capable of being displayed at one time by the terminal. Two is the number of lines taken by the prompt message. Thus, for a VT100 with a 24 line screen, SET PAGE 22, will print the maximum amount of lines without any being lost.

- A change has been made so that a person creating a script can force the answer to a prompting question to be fetched from the user terminal instead of from the script. If, in the script, a prompting message is followed by "" instead of the answer to the prompt, then the vds will print that prompt on the terminal and wait for a response to be typed. then the vds will continue executing the script. full documentation on this feature will be available in the next version of the vax-11 diagnostic design guide.

- the rc11 p-table descriptor has been added, so that aztec is now supported with p-table descriptors for the rc11, rc25, and rcf25.

- a new vds service has been added, called $dsGetterm. this service, "get terminal characteristics", can be used in both standalone and user mode to obtain characteristics about the user terminal. you can determine the terminal type, whether it is a video or hardcopy terminal, other information. full documentation on this feature will be available in the next version of the vax-11 diagnostic design guide.

2.0 BUG FIXES

- o A problem with ECKAX hanging has been fixed. The CLRVEC routine was changed to reset the clock vector before resetting the clock. This compensates for the TOK hardware bug on 11/750s, which caused interrupts once in a blue moon when resetting the clock.

- o $DSPRINT macros now return an error status. SS$NORMAL, SS$BUFFEROVF, or SS$BADPARAM will be returned.

- o $DSINLOOP will return DS$NORMAL or DS$ERROR, instead of just setting or clear the low bit of R0.

3.0 MISCELLANEOUS

- o LCN Low Cost Nebula will be supported with ENSAA diagnostic Supervisor.

RELEASE NOTES FOR
VAX-11 DIAGNOSTIC SUPERVISOR
VERSION 6.13
21-Nov-1983

1.0 NEW FEATURES

o

This is the first Diagnostic Supervisor to be linked under version 3 of VMS. Therefore it will not function correctly under those systems running version 2 or earlier versions of VMS.

o

The method of attaching the load path to the CI network has been modified to allow access to a user specified disk on the HSC50 controller. An example of the attach command lines for the 11/780 follows:

```
DS> ATTACH CI780 HUB PAA0 14 5 4
DS> ATTACH CI_NODE PAA0 CIA10 HSC50 10
DS> DISK CIA10 HSC50$DUA1
```

Please note the addition an extra attach command line for DISK

and the new form of the generic name. The name must be of the form 'name$DUannn' where 'name' is any alphanumeric string 1 to 6 characters long, and the '$DU' is required. The controller, 'a', is usually 'A' and 'nnn' is the disk unit number.

- A "SET MEMORY n" command has been added which allows the operator to change the amount of total physical memory available to the supervisor and diagnostic programs. This feature is useful when it is desired to verify that a diagnostic program and the supervisor will run in a smaller amount of memory than is actual y available on the system.

  The unit of measurement for "n" is pages. The value of "n" must be greater than or equal to zero, but less than the last value specified for total available physical memory. Total available physical memory may be reset to the actual available physical memory by using a value of zero for "n". A value greater than the actual available physical memory will be accepted but not used.

  The command will not be accepted in user mode. Also note that any devices attached or selected will be deselected and deattached after performing the command.

- A "INITPCS" command has been added. When this command is executed, the supervisor searches for the PCS750.BIN file on the console TU58. If it is found, the supervisor onboard image of the PCS750.BIN is

overwritten with the image found on the TU58. Otherwise, the supervisor onboard image remains the same. Then, the PCS is reloaded with the current PCS image.

This command will be useful when the supervisor being run does not contain the latest PCS750.BIN file, but the file is available on the console TU58. The command is not accepted when running the supervisor under VMS, and will only be accepted when running on an 11/750.

Also, this supervisor contains version CMT098 of PCS microcode patches.

2.0 BUG FIXES

- A bug in the $DS_EXIT_TEST macro, which caused an "[aborted]" message to be printed if TRACE was set and the low bit in R0 was clear, has been fixed. Now, the "[aborted]" message will only appear if the program does a $DS_ABORT_TEST

3.0 MISCELLANEOUS

RELEASE NOTES FOR
VAX-11 DIAGNOSTIC SUPERVISOR
VERSION 6.14
20-Feb-1984

1 NEW FEATURES

- New device support is provided for DMZ32.

2 BUG FIXES

- Several supervisor BOOTDRIVRs use the TODR to perform a timeout function. For the 11/750, the TODR remains at zero if the battery backup has failed, and the system has been powered off. Thus, the TODR in this case was not able to

perform the timeout function correctly. However, the BOOTDRIVRs were written so that the code would always appear to succeed. This has been fixed by writing a 1 into the TODR (which starts the clock ticking) if the battery backup has failed and the system was powered down. This may fix some of the 'unkown error' problems with supervisor file services for 11/750s.

- The problem of terminal output from a user's control-C handler being suppressed has been fixed. This bug occurred only in standalone mode.

- When a diagnostic is aborted, the supervisor attempts to print out a user PC. When run under VMS, sometimes a PC in VMS system space was printed. This has been fixed.

3 MISCELLANEOUS

- The SET MEMORY command has been enhanced so that ptables for the console load device and the boot path devices are saved. Previously, all ptables were lost.

- The format of supervisor messages which inform the user that an interrupt, trap, or exception has occurred, has been changed to state that the interrupt, exception or trap occurred through an SCB vector rather than just a vector. For example,

?? Reserved/privileged instruction Fault through SCB
vector: 10(X)

instead of,

?? Reserved/privileged instruction Fault through
vector: 10(X)

RELEASE NOTES FOR VAX-11 DIAGNOSTIC SUPERVISOR VERSION 7.0 18-Jul-1984

1 NEW FEATURES

o VMS V4 support

1. Long file name support.

Long filename support has been added to this version of VDS. A full file specification will have the capability for the filename and filetype each to have up to 39 characters maximum. The version number can have up to 5 characters. The directory names can have up to 39 characters and up to 7 nested sub-directories, each with up to 39 characters. The device names can have up to 15 characters and overall the full file specification is not to exceed 252 characters including punctuation.

EXAMPLE: DEVICE:[DIRECTORY]FILENAME.TYPE;VERSION
15 39.39.etc 39 39 5

2. Long device names.

Support code has been added to allow for device names up to 15 characters. VDS will scan 'device name' line for the long device name format. If found VDS will dynamically add device name buffer space to the Ptable,otherwise device names of the format 'ggan' will be handled as before. In both cases, ,the quadword descriptor ,HP$Q_DEVICE, will contain the length and string address of the device name and HP$T_DEVICE will contain the device name with the format of 'ggan'. The new device name format will be as follows: 'name$ggan',the total combination of which must not exceed 15 characters.

3. DIRECTORY/WIDE

In order to display long filenames, the DIRECTORY

command now has a /WIDE switch, which causes one filename per line to be printed. A DIRECTORY command without the /WIDE switch will display filenames in four 20-character columns, but for filenames longer than 20 characters, truncation will occur.

4. The value of the symbols IPL$_TIMER and $IPL_SYNCH is changed from 7 to 8 in VMS V4 library LIB. The supervisor, however, will continue to use the old value (7), because of possible conflicts between QIO services

and timer services. In order that diagnostics are encouraged to use the old value, the $IPLDEF macro has been included in the DIAG libraries.

5. This supervisor is not supported on versions of VMS prior to version 4.

2 BUG FIXES

- The $DS_CI_NODE ptable has been changed so that a response of KL10 to the Node_type question produces a value of 6 and a response of CINT a value of 7.

- Some internal supervisor errors of the form:

    ?? Software detected error in ...

  were causing the supervisor to hang in the middle of printing out the rest of this message. This has been fixed.

3 MISCELLANEOUS

- The supervisor now displays a legal statement at boot time regarding the right to use of the diagnostic supervisor and diagnostic programs.

    Two new VDS services, $DS_MOUNT and $DS_DISMOUNT, have been added.

- As of VMS Version 4, you cannot issue a VMS MOUNT command before running the VDS. If you do, and if the device's p-table indicates that the device should be allocated, then the VDS SELECT command will fail. This failure occurs because the SELECT command will try to allocate the device, but you cannot allocate a device that has already been mounted (in VMS V3 you could, if the device had been mounted by you and not someone else).

    Any diagnostic programs that require a device to be allocated AND mounted before it is tested will not work with this release. We know of only one such diagnostic, EVRMD. We are in the process of correcting the problem. The correction will be in a future release.

- When the supervisor is run in online mode (under VMS), the default load path has been changed to be equivalent to SYS$SYSROOT:[SYSMAINT]. Previously, a bug in the supervisor caused the default load device to be the translated value of SYS$DISK from the process name table rather than from the system name table. Normally, SYS$SYSROOT:[SYSMAINT] is the equivalent of SYS$MAINTENANCE, and the supervisor will be changed in some future release to fully translate SYS$MAINTENANCE.

Image Synopsis

```
Virtual memory allocated:                   00010000 0002C7FF 0001C800 (116736. bytes, 228. pages)
Stack size:                                       20. pages
Image header virtual block limits:                 1.        1. (    1. block)
Image binary virtual block limits:                 2.      229. (  228. blocks)
Image name and identification:              ENSAA  7.0
Number of files:                                   2.
Number of modules:                                91.
Number of program sections:                       18.
Number of global symbols:                       1025.
Including undefined count of:                      2.
Number of cross references:                     2563.
Number of image sections:                          6.
User transfer address:                      000293AD
Image type:                                 EXECUTABLE.
Map format:                                 FULL WITH CROSS REFERENCE in file DRB1:[MUSE.WORK.MODULES]ENSAA.MAP;574
Estimated map length:                       321. blocks
```

Link Run Statistics

Performance Indicators	Page Faults	CPU Time	Elapsed Time
Command processing:	88	00:00:00.49	00:00:00.99
Pass 1:	372	00:00:10.81	00:00:29.96
Allocation/Relocation:	77	00:00:00.64	00:00:01.07
Pass 2:	233	00:00:11.18	00:00:26.01
Map data after object module synopsis:	16	00:00:07.08	00:00:07.60
Symbol table output:	0	00:00:00.02	00:00:00.16
Total run values:	786	00:00:30.22	00:01:05.79

```
Using a working set limited to 1850 pages and 702 pages of data storage (excluding image)

Total number object records read (both passes):   10796
    of which 5398 were in libraries and 3294 were DEBUG data records containing 1234231 bytes

Number of modules extracted explicitly             = 86
    with 5 extracted to resolve undefined symbols

2 library searches were for symbols not in the library searched

A total of 0 global symbol table records was written

LINK/MAP=WORK$:ENSAA;574/CROSS/FULL/NODEBUG/NOTRACEBACK/NOSYSSHR/EXE=WORK$:ENSAA.EXE;574 DRB1:[DS.WORK]ENSAA.OPT;/OPTIONS

Psect synopsis output	6	00:00:00.02	00:00:00.02
Cross-reference output	21	00:00:00.24	00:00:00.25
Assembler run totals	1015	00:00:25.01	00:00:40.61

The working set limit was 1000 pages.
83787 bytes (164 pages) of virtual memory were used to buffer the intermediate code.
There were 60 pages of symbol table space allocated to hold 1185 non-local and 15 local symbols.
333 source lines were read in Pass 1, producing 0 object records in Pass 2.
104 pages of virtual memory were used to define 23 macros.

0000    28 ;
0000    29 ; ENVIRONMENT:
0000    30 ;
0000    31 ; AUTHOR:          N. HOWGATE      03-DEC-77       VERSION 01.
0000    32 ; MODIFIED BY:
0000    33 ;                  N. HOWGATE      22-JUN-78       VERSION 02(ESSAA-4.03).
0000    34 ;       01         CORRECT DUMP-MODE PROBLEM
0000    35 ;                  N. HOWGATE      07-DEC-78       VERSION 03 (ESSAA-5.01)
0000    36 ;       02         EMULATE CHARACTER STRING INSTRUCTION
0000    37 ;                  R. RIGGS        12-JUL-79
0000    38 ;       03         ADD CODE TO EXECUTE APT PTEXT DECODER
0000    39 ;                  Roger Riggs, 28-May-1980, Version 5.4
0000    40 ;       04         Added code to check that on APT PTEXT command
0000    41 ;                  that there is at least one command to process.
0000    42 ;
0000    43 ;       05         - Jack Stansbury, 23-Oct-1981, Version 6.-
0000    44 ;                  Changed SEP Psect to CODE.
0000    45 ;                  Fixed truncation errors. Change to lower case on message.
0000    46 ;                  Also added .LIBRARY statements for $DS and $DIAG.
0000    47 ;
0000    48 ;       06         - Jack Stansbury, 12-Oct-1981, Version 6.-
0000    49 ;                  Changed the call to DS$PARSE to DSX$SUPERPARSE. See the CLI
0000    50 ;                  module for an explanation of SUPERPARSE. It returns with the
0000    51 ;                  low bit clear in R0 if anything went wrong.
0000    52 ;
0000    53 ;       07         - Jack Stansbury, 12-Oct-1981, Version 6.-
0000    54 ;                  Took out references to HALTD and HALTI. Made them just HALT.
0000    55 ;
0000    56 ;       08         - Jack Stansbury, 3-Feb-1982, Version 6.6
0000    57 ;                  Added a .LIBRARY statement for LIB. Note: This .LIBRARY
```

```
0000     58 ;                  statement must be the first one since the libraries are
0000     59 ;                  searched in LIFC (Last-In, First-Checked) order.
0000     60 ;
0000     61 ;          09      Bob Bergazzi    2-Feb-1983      Version 6.11
0000     62 ;                  Added code to COM_PTEXT that clears out DS$GL_CLIBASE.
0000     63 ;                  We should clear these flags out on every command,
0000     64 ;                  otherwise subsequent commands may be affected by previous
0000     65 ;                  commands. This coincides with a change to APT which allows
0000     66 ;                  any commands as PTEXT. The bug prompting this was
0000     67 ;                  SET EVENT 1, CLEAR EVENT 1, which caused a hung load.
0000     68 ;
0000     69 ;          10      Bob Bergazzi    11-Apr-1983     Version 6.11
0000     70 ;                  Fixed the previous edit.

Pass 2	100	00:00:01.29	00:00:02.07
Symbol table output	27	00:00:00.17	00:00:00.17
Psect synopsis output	6	00:00:00.03	00:00:00.03
Cross-reference output	47	00:00:00.70	00:00:01.12
Assembler run totals	1053	00:00:10.29	00:00:16.76

The working set limit was 1000 pages.
68019 bytes (133 pages) of virtual memory were used to buffer the intermediate code.
There were 20 pages of symbol table space allocated to hold 267 non-local and 15 local symbols.
293 source lines were read in Pass 1, producing 0 object records in Pass 2.
49 pages of virtual memory were used to define 18 macros.

Cross-reference output	24	00:00:00.23	00:00:00.40
Assembler run totals	1063	00:00:20.76	00:00:32.67

The working set limit was 1000 pages.
72168 bytes (141 pages) of virtual memory were used to buffer the intermediate code.
There were 70 pages of symbol table space allocated to hold 1270 non-local and 15 local symbols.
330 source lines were read in Pass 1, producing 0 object records in Pass 2.
57 pages of virtual memory were used to define 20 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	3
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	4
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	9
TOTALS (all libraries)	16

1527 GETS were required to define 16 macros.

There were no errors, warnings or information messages.

Assembler run totals	841	00:00:10.95	00:00:23.20

The working set limit was 1000 pages.
35934 bytes (71 pages) of virtual memory were used to buffer the intermediate code.
There were 40 pages of symbol table space allocated to hold 641 non-local and 1 local symbols.
149 source lines were read in Pass 1, producing 0 object records in Pass 2.
40 pages of virtual memory were used to define 14 macros.

Macro library statistics

The working set limit was 1000 pages.
55740 bytes (109 pages) of virtual memory were used to buffer the intermediate code.
There were 40 pages of symbol table space allocated to hold 776 non-local and 20 local symbols.
450 source lines were read in Pass 1, producing 0 object records in Pass 2.
62 pages of virtual memory were used to define 25 macros.

0000    41  ;               Split DSV$ATTACH routine into DSV$ATTACH control routine
0000    42  ;               and DSX$ATTACH, which is callable by diagnostics and will
0000    43  ;               cause no typeout or console/script reads.  The primary
0000    44  ;               purpose is to support the AUTOSIZER.
0000    45  ;       [05] Dave Butenhof, 19-dec-1980, Version 6.2
0000    46  ;               Implement MCT as NEBULA 'central bus'.  Also generalize
0000    47  ;               'central bus' string compares, and generate error if
0000    48  ;               the wrong 'central bus' name is typed (e.g., 'CMI' for 780).
0000    49  ;       [06] Dave Butenhof, 30-mar-1981, version 6.3
0000    50  ;               Implement new 'hub' structures, cross-implementation-wise:
0000    51  ;               'HUB' and 'PHAD'.
0000    52  ;       [07] Marion Baggett, 2-Oct-1981 Version 6.-
0000    53  ;               Print only device and type fields for /BRIEF switch
0000    54  ;               on SHOW DEVICE, and SHOW SELECT commands.
0000    55  ;       [08] Dave Butenhof, 20-Oct-1981, version 6.-
0000    56  ;               Fix a bug in Ptable descriptor location routine.
0000    57  ;       [09] Dave Butenhof, 22-Oct-1981, version 6.-
```

```
                        0000     58 ;          Add ATTACH co  rol C handler.  Also new Ptable
                        0000     59 ;          descriptor comma ds $DS_$LOGICAL and $DS_$CASE.
                        0000     60 ;      [10] Jack Stansbury, 27-Oct-1981, Version 6.-
                        0000     61 ;          Fixed t uncation errors.
                        0000     62 ;      [11] Dave Butenhof, 06-Nov-1981, Version 6.-
                        0000     63 ;          Implemented SELECT/ADAPTER and DESELECT/ADAPTER.
                        0000     64 ;      [12] Dave Butenhof, 18-Nov-1981, version 6.5
                        0000     65 ;          Implement DEATTACH command.
                        0000     66 ;      [13] Dave Butenhof, 20-Nov-1981, version 6.5
                        0000     67 ;          Convert all PRINT's to use type codes, and delete unused
                        0000     68 ;          message 't_insfmem'.
                        0000     69 ;      [14] Dave Butenhof, 24-Feb-1982, version 6.6
                        0000     70 ;          Convert parsing of Device type field to allow use of
                        0000     71 ;          '_' in the name (e.g., 'CI_NODE').
                        0000     72 ;      [15] Dave Butenhof, 02-Mar-1982, version 6.6
                        0000     73 ;          Correct bug in SELECT/DESELECT: If /Adapter not specified,
                        0000     74 ;          and device is duplicated, only first found is acted on, and
                        0000     75 ;          no message is given.  Due to SELECT sorting, it may not even
                        0000     76 ;          be possible to DESELECT that device (without /Adapter).
                        0000     77 ;          Solution: Give error if no /Adapter on duplicate name.
                        0000     78 ;      [16] Dave Butenhof, 10-Mar-1982, version 6.6
                        0000     79 ;          Correct some truncation errors.
                        0000     80 ;      [17] Dave Butenhof, 07-Apr-1982, version 6.7
                        0000     81 ;          Add support for new Ptable descriptor directive, $DS_$NAME;
                        0000     82 ;          this will allow use of enforced generic naming conventions,
                        0000     83 ;          and inherited device names, while remaining compatible with
                        0000     84 ;          the current schema.  Note that this directive must IMMEDIATELY
                        0000     85 ;          follow the $DS_$INITIALIZE directive, and is treated as an
                        0000     86 ;          extension of same.
                        0000     87 ;      [18] Jack Stansbury, 13-Apr-1982, Version 6.7
                        0000     88 ;          Fixed two truncation errors.
                        0000     89 ;      [19] Dave Butenhof, 06-May-1982, Version 6.8
                        0000     90 ;          Make modifications (very minor) to support splitting
                        0000     91 ;          PTD$M_INHERITED into two separated bits, PTD$M_INHERIT_PRE
                        0000     92 ;          to inherit device prefix, and PTD$M_INHERIT_CON to inherit
                        0000     93 ;          controller designation.
                        0000     94 ;
                        0000     95 ;      [20] Marion Baggett, 6-Oct-1982 Version 6.9
                        0000     96 ;          When inserting PTABLE for RB730, do not re-adjust the RB730
                        0000     97 ;          PTABLE for CSR values.  The RB730 is not on the the unibus.
                        0000     98 ;
                        0000     99 ;      [21] Domenic Andella, 13-Apr-82 Version 6.11
                        0000    100 ;          Added central bus name "ABUS" to CENTRAL_BUS list, and
                        0000    101 ;          changed constant in DSX$ATTACH routine, GET_LINK label
                        0000    102 ;          from 3 to 4 to account for new central bus name.
                        0000    103 ;
                        0000    104 ;      22  John Ciukaj     14-Apr-1983     Version 6.11
                        0000    105 ;          - Inhibit device allocation in user mode during
                        0000    106 ;            Select operation if 'Inhibit Allocate' bit is
                        0000    107 ;            set in CRD flags
                        0000    108 ;
                        0000    109 ;      [23]    Domenic Andella 14-Apr-83       Version 6.11
                        0000    110 ;          Corrected bug in DSX$ATTACH routine, GET_LINK label
                        0000    111 ;          to check all CPU link names.
                        0000    112 ;
                        0000    113 ;      24  M. Baggett      11-MAY-1983     VERSION 6.11
                        0000    114 ;          Changed ptd$m_name to mean alphanumeric.
```

```
0000    115 ;
0000    116 ;       25      Bob Bergazzi    May 16,1983     Version 6.11
0000    117 ;               Changed the order of the .LIB statements.
0000    118 ;
0000    119 ;       26      M. Baggett      10-OCT-1983     VERSION 6.13
0000    120 ;               Change to support HSC50 disk/tape names of the form
0000    121 ;               name$GGannn, where 'name' is a maximum
0000    122 ;               of 6 characters and 'GG' is the generic name and is
0000    123 ;               present with a controller letter and unit number.
0000    124 ;
0000    125 ;       27      Domenic Andella 16-FEB-1984     VERSION 6.13
0000    126 ;               Add code in GET_LINK to add offset of X200 to
0000    127 ;               ptable vector field if attached to SBIA 1 for
0000    128 ;               a xxx CPU.
C000    129 ;
0000    130 ;       [28]    RE MUSE         11 MAY 1984     Version 7.0
0000    131 ;               added code to handle long device names (15 characters)
0000    132 ;               of the form 'node$device'.
0000    133 ;--

```

```
                        .SBTTL  DSX$ATTACH      Process ATTACH command

;++
;
; Functional description:
;       This routine is called from DSV$ATTACH to translate an attach
;       command line using a PTABLE descriptor, and create a PTABLE
;       from this data.  If any argument is missing or invalid, it will
;       return with the given prompt string buffer set to the correct
;       prompt to get more data from the operator, and the input line
;       descriptor re-set to exclude the remaining (if any) incorrect
;       text of the input line.
;
; Calling sequence:
;       DS$ATTACH (cmdline, [prompt])
;
; Input Parameters:
;       cmdline         pointer to command line descriptor
;       prompt          pointer to ASCIC-type buffer (with length of remainder
;                       of buffer in byte 1)
;
; Implicit inputs:
;       none
;
; Output Parameters
;       prompt          the buffer is filled with an ASCIC string suitable for
;                       prompting the operator for the next ATTACH parameter.
; Implicit outputs:
;       none
;
; Side Effects:
;       If successfull, creates a PTABLE in dynamic pool space
;
; Register usage:
;       R4,R5           Descriptor of remaining input string
;       R6              Pointer to prompt string descriptor
;       R8              Pointer to input descriptor
;       R10             PTABLE descriptor "PC" for decode
;       R11             Pointer to PTABLE
;
; Return codes:
;       DS$_BADTYPE     Device type argument is bad (no PTABLE descriptor)
;       DS$_BADLINK     Device given as link is not attached
;       DS$_ILLUNIT     Unit number not given or was illegal (too big)
;       DS$_DEVNAME     Invalid device name given
;       SS$_BADPARAM    Number was in bad radix or out of range
;       SS$_INSFARG     Too few arguments given to complete ATTACH
;--

0612   991          .SBTTL  PT_INTERPRET    Decode PT-descriptor
0612   992
0612   993 ;++
0612   994 ; FUNCTIONAL DESCRIPTION:
0612   995 ;
0612   996 ;       This routine is used to interpret the P-table descriptor
0612   997 ;       which builds the P-table for the current unit.
0612   998 ;       Each OP code is examined and executed.  If during the
0612   999 ;       execution input text is required, the input string is examined
0612  1000 ;       if the string is empty the input routine is called to get input.
0612  1001 ;
0612  1002 ; CALLING SEQUENCE:
0612  1003 ;
0612  1004 ;       PT$INTERPRET (INITPC, BASE, TEXT, PROMPT)
C612  1005 ;
0612  1006 ; INPUT PARAMETERS:
0612  1007 ;
0612  1008 ;       INITPC  Initial PC for interpretation
0612  1009 ;       BASE    Base for data storage
0612  1010 ;       TEXT    Address of Quad descriptor of text
0612  1011 ;       PROMPT  Address of buffer to receive ASCIC prompt text
0612  1012 ;               if failure
0612  1013 ;
0612  1014 ; IMPLICIT INPUTS:      NONE

Psect synopsis output	5	00:00:00.03	00:00:00.03
Cross-reference output	149	00:00:02.00	00:00:03.38
Assembler run totals	2605	00:00:33.88	00:00:45.25

The working set limit was 1000 pages.
130188 bytes (255 pages) of virtual memory were used to buffer the intermediate code.
There were 60 pages of symbol table space allocated to hold 989 non-local and 183 local symbols.
2533 source lines were read in Pass 1, producing 0 object records in Pass 2.
107 pages of virtual memory were used to define 37 macros.

                        0000     38 ;
                        0000     39 ;       This module contains a routine called BOO$QIO that handles I/O
                        0000     40 ;       transfers to and from the VMS system disks.
                        0000     41 ;
                        0000     42 ;  AUTHOR:
                        0000     43 ;
                        0000     44 ;       The VMS group
                        0000     .1 ;       DS02    Marion Baggett, 4-March-1983 Version 6.11
                        0000     .2 ;               Added support for HSCCI booting.
                        0000     .3 ;
                        0000     .4 ;       DS01    Roger Riggs, 24-oct-1980, version 6.1
                        0000     .5 ;               Added changes to version 4 VMB/BOOTDRIVR to make it usable
                        0000     .6 ;               as bootdrivers for the Diagnostic Supervisor.
                        0000     .7 ;               Note that some changes are here an others are in
                        0000     .8 ;               BOOTDRIVR.ENH, since there are conflicts between VMS
                        0000     .9 ;               changes and DS changes.
-2                      0000     47 ;
                        0000     .1 ;       0217    Bob Bergazzi    27-May-1983
                        0000     .2 ;               Added another dispatch for CPU XXX in the CPUDISP MACRO.
                        0000     .3 ;               This edit was put in by the supervisor group in the .ENH
```

```
0000     .4 ;                file because the edit applies to a change in the .ENH file.
0000     .5 ;                Eventually a new BOOTDRIVR module may be taken from VMS
0000     .6 ;                which has the correct code in it.
0000     .7 ;
0000     .8 ;        0216    CAS0001         C.A. Samuelson          30-Apr-1980
0000     .9 ;                Add Purge of Buffered Datapath for UBA boot drivers
0000    .10 ;
0000     48 ;        0215    TMH0001         Tim Halvorsen           10-Mar-1980
0000     49 ;                Mask off upper bits of PTE when constructing map register.
0000     50 ;
0000     51 ;        0214    KDM0092         Kathleen D. Morse       23-Jan-1980     16:40
0000     52 ;                Change VMB version number from 2 to 3.
0000     53 ;
0000     54 ;        00213   SRB0005         Steve Beckhardt         27-Nov-1979     16:10
0000     55 ;                Added code to support passing driver name from
0000     56 ;                boot driver to SYSBOOT.  Also added version # vector.
0000     57 ;        0212    SRB0004         Steve Beckhardt         31-Oct-1979     10:45
0000     58 ;                Moved all drivers into separate modules.  Added code
0000     59 ;                for connecting only the necessary driver.
0000     60 ;        0211    SRB0003         Steve Beckhardt         25-Oct-1979     16:40
0000     61 ;                Added console TU58 driver.
0000     62 ;        0210    CHF0001         Charlie Franks          23-Sep-1979     15:50
0000     63 ;                Added code and definitions to support RM80 bootable
0000     64 ;                system, includes: SSE and SSEI bit definitions, additions
0000     65 ;                to the MBAGEOM table and the MBA_DISK_DRUVER routine, and
0000     66 ;                the SSERROR skip sector routine.
0000     67 ;                Corrected byte count remaining update after encountering
0000     68 ;                a transfer error in MBA_DISK_DRIVER (convert MBA$L_BCR from
0000     69 ;                word to longword).
0000     70 ;        0209    SRB0002         Steve Beckhardt         13-Sep-1979     16:50
0000     71 ;                Added symbol EXE$GB_CPUTYPE (removed from module VMB)
0000     72 ;                so that it gets loaded into non-paged pool with the
0000     73 ;                boot driver.
0000     74 ;        0208    SRB0001         Steve Beckhardt         27-Aug-1979     10:30
0000     75 ;                Added boot device definitions ($BTDDEF).  Fixed CPUDISP
0000     76 ;                macro.  Added support for booting from console block
0000     77 ;                storage device.  Added 11/780 console floppy driver.
0000     78 ;                Changed boot value of R0 when booting from RL01/2 from
0000     79 ;                0 to 2.
0000     80 ;        0207    CHP0006         C. Peters               23-Jul-1979     16:16
0000     81 ;                Correct calculation of number of map registers needed.
0000     82 ;                Always invalidate one past the number required.
0000     83 ;        0206    CHP0005         C. Peters               20-Jul-1979     12:14
0000     84 ;                Add geometry of RM05 to MBAGEOM table.
0000     85 ;        0205    CHP0004         C. Peters               06-Jul-1979     14:06
0000     86 ;                Recode RK06/7 drive initialization code to correct bug
0000     87 ;                in RK07 handling.
0000     88 ;        0204    CHP0003         C. Peters               24-May-1979     14:24
0000     89 ;                Only invalidate the last UBA map register if the
0000     90 ;                transfer was page-aligned. Remove all code relating
0000     91 ;                to COMET-specific UBA map register format. All UBA
0000     92 ;                map registers are now alike. Delete definition of
0000     93 ;                storage for CPU_TYPE. Use instead a global symbol
0000     94 ;                EXE$GB_CPUTYPE initialized by VMB to hold the CPU
0000     95 ;                identification code.
0000     96 ;        0203    CHP0002         C. Peters               11-May-1979     13:20
0000     97 ;                Add code to invalidate the last UBA map register to stop
```

```
                                0000     98 ;                  a wild transfer. This code is CPU-specific.
                                0000     99 ;          0202    CHP0001         C. Peters                23-Mar-1979     8:48
                                0000    100 ;                  Fill out module header. Add CPUDISP macro. Add local
                                0000    101 ;                  symbol CPU_TYPE for CPUDISP's use. Add many comments.
                                0000    102 ;                  Extract processor type from PR$_SID and store in local
                                0000    103 ;                  CPU_TYPE. Find adapter type from CONFREG, and store in
                                0000    104 ;                  general register. Initialize map registers in a CPU-
                                0000    105 ;                  and adapter-dependent way. Determine which driver to
                                0000    106 ;                  use based on adapter and device type. Add routine
                                0000    107 ;                  header comments to MBA and RK06/7 driver code. Derive
                                0000    108 ;                  device CSR address in RK06/7 driver from PR$_MAPEN
                                0000    109 ;                  value used as index into RPB. Add routine header
                                0000    110 ;                  comments to ECC routine. Replace .PAGEs with form feeds.
                                0000    111 ;                  Add code and definitions to support RL02 bootable
                                0000    112 ;                  system: includes $RLDEF, a test for the RL02 device
                                0000    113 ;                  type, and the minimal RL02 driver code (written by C.
                                0000    114 ;                  Franks).
                                0000    115 ;
                                0000    116 ;--

Psect synopsis output	7	00:00:00.04	00:00:00.03
Cross-reference output	31	00:00:00.35	00:00:00.44
Assembler run totals	1157	00:00:23.48	00:00:36.82

The working set limit was 1000 pages.
71636 bytes (140 pages) of virtual memory were used to buffer the intermediate code.
There were 70 pages of symbol table space allocated to hold 1327 non-local and 24 local symbols.
689 source lines were read in Pass 1, producing 0 object records in Pass 2.
66 pages of virtual memory were used to define 21 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	0
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	9
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	7
TOTALS (all libraries)	16

1410 GETS were required to define 16 macros.

There were no errors, warnings or information messages.

                        0000    41 ;               Redo some entries in the file cache table.  Make the
                        0000    42 ;               page allocation part of BOO$CACHE_INIT a subroutine.
                        0000    43 ;               Divide it into two pieces.
                        0000    44 ;
                        0000    45 ;       V02-003 PHL0012         Peter H. Lipman         02-Aug-1981
                        0000    46 ;               Explicitly initialize the FILEREAD cache pointer.
                        0000    47 ;       Must not allow assembly time initialization since VMB can restart.
                        0000    48 ;               Fix PSECT so that VMB can overlay most of itself with
                        0000    49 ;       the secondary boot file.  Remove BOO$GL_RPBBASE.
                        0000    50 ;
                        0000    51 ;       V02-002 PHL0011         Peter H. Lipman         31-Jul-1981
                        0000    52 ;               The page at which the FILEREAD cache is located
                        0000    53 ;       should be relative to the RPB not absolute.
                        0000    54 ;
```

```
                        0000     55 ;       V02-001 PHL0007         Peter H. Lipman         14-Mar-1981
                        0000     56 ;               Extend parmeter list to FIL$RDWRTLBN to make it
                        0000     57 ;       possible to read more than one block at a time.  This
                        0000     58 ;       enhancement was made in conjunction with the cacheing
                        0000     59 ;       feature in FILEREAD.
                        0000     60 ;               Add new BOO$CACHE_INIT routine for VMB and SYSBOOT to
                        0000     61 ;       init the FILEREAD cache.
                        0000     62 ;               Move other common FILEREAD pieces into this module thus
                        0000     63 ;       avoiding them being in two places.
                        0000     64 ;               Add new BOO$IMAGE_ATT routine to fetch certain image
                        0000     65 ;       attributes from an image header.
                        0000     66 ;

Assembler run totals	553	00:00:06.76	00:00:12.28

The working set limit was 1000 pages.
13295 bytes (26 pages) of virtual memory were used to buffer the intermediate code.
There were 10 pages of symbol table space allocated to hold 183 non-local and 4 local symbols.
383 source lines were read in Pass 1, producing 0 object records in Pass 2.
25 pages of virtual memory were used to define 11 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	0
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	4
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	3
TOTALS (all libraries)	7

247 GETS were required to define 7 macros.

There were no errors, warnings or information messages.

Cross-reference output	7	00:00:00.09	00:00:00.09
Assembler run totals	562	00:00:08.67	00:00:13.52

The working set limit was 1000 pages.
23486 bytes (46 pages) of virtual memory were used to buffer the intermediate code.
There were 20 pages of symbol table space allocated to hold 327 non-local and 6 local symbols.
246 source lines were read in Pass 1, producing 0 object records in Pass 2.
25 pages of virtual memory were used to define 12 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	1
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	1
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	6
TOTALS (all libraries)	8

504 GETS were required to define 8 macros.

There were no errors, warnings or information messages.

Assembler run totals	620	00:00:06.77	00:00:12.94

The working set limit was 1000 pages.
45664 bytes (90 pages) of virtual memory were used to buffer the intermediate code.
There were 10 pages of symbol table space allocated to hold 140 non-local and 8 local symbols.
235 source lines were read in Pass 1, producing 0 object records in Pass 2.
38 pages of virtual memory were used to define 16 macros.

Cross-reference output	15	00:00:00.24	00:00:00.24
Assembler run totals	966	00:00:23.11	00:00:44.55

The working set limit was 1000 pages.
79415 bytes (156 pages) of virtual memory were used to buffer the intermediate code.
There were 60 pages of symbol table space allocated to hold 1076 non-local and 9 local symbols.
188 source lines were read in Pass 1, producing 0 object records in Pass 2.
112 pages of virtual memory were used to define 27 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYSO.SYSMAINT]DS.MLB;218	1
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	11
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	4
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	7
TOTALS (all libraries)	23

1520 GETS were required to define 23 macros.

There were no errors, warnings or information messages.

0000     29 ;
0000     30 ; ENVIRONMENT:
0000     31 ;
0000     32 ; AUTHOR:       Roger Riggs     10-Sept-1979    VERSION 01
0000     33 ;
0000     34 ; MODIFIED BY:
0000     35 ;                Roger Riggs, 14-Jan-1979, Version 5.2
0000     36 ;       01       Added lists for CVT$T_.... strings referenced in CVTREG
0000     37 ;       02       Added MTPR #1,#^X37 to do I/O subsystem clear on INITA
0000     38 ;                Roger Riggs, 21-MAY-1980,       Version 5.4
0000     39 ;       03       CLRMAP was clearing 512 map register, only 496 exist
0000     40 ;                Also fixed algorithm for determining how many maps to set
0000     41 ;                from starting address and byte count
0000     42 ;                Roger Riggs, 26-Jun-1980,       Version 5.5
0000     43 ;       04       Fixed bug which did not allocate enough map registers
0000     44 ;                for transfer of 1+n*pages.
0000     45 ;
0000     46 ;       05       - Jack Stansbury, 23-Oct-1981, Version 6.-
0000     47 ;                Removed all calls to $DS_BNERROR and $DS_BERROR since these
0000     48 ;                should be used only by the diagnostics. Replaced them with
0000     49 ;                their BLBx equivalents. Also added .LIBRARY statements for
0000     50 ;                $DS and $DIAG.
0000     51 ;
0000     52 ;       06       - Jack Stansbury, 26-Oct-1981, Version 6.-
0000     53 ;                Changed the .PSECT SEP to WORK, CODE, and DATA
0000     54 ;                where appropriate.
0000     55 ;
0000     56 ;       07       - Dave Butenhof, 23-Nov-1981, verison 6.5
0000     57 ;                Add .LIBRARY statement for DS.MLB, and fixed some
```

```
                        0000     58 ;                truncation errors.
                        0000     59 ;
                        0000     60 ;        08      - Dave Butenhof, 09-May-1981, version 6.5
                        0000     61 ;                Add CHM$_INVALIDATE function to DSX$SETMAP routine
                        0000     62 ;
                        0000     63 ;        09      - Dave Butenhof, 09-May-1981, version 6.5
                        0000     64 ;                Fix assorted register errors
                        0000     65 ;
                        0000     66 ;        10      - Dave Butenhof, 17-Dec-1981, Version 6.6
                        0000     67 ;                Fix problem with map invalidate: it assumed 496 map
                        0000     68 ;                vectors, while there are really 512.
                        0000     69 ;
                        0000     70 ;        11      Bob Bergazzi    May 16,1983     Version 6.11
                        0000     71 ;                Changed the order of the .LIB statements.
                        0000     72 ;--

The working set limit was 1000 pages.
70128 bytes (137 pages) of virtual memory were used to buffer the intermediate code.

There were 30 pages of symbol table space allocated to hold 525 non-local and 18 local symbols.
1530 source lines were read in Pass 1, producing 0 object records in Pass 2.
95 pages of virtual memory were used to define 25 macros.

Performance indicators

Phase	Page faults	CPU Time	Elapsed Time
Initialization	31	00:00:00.12	00:00:00.24
Command processing	148	00:00:00.74	00:00:01.68
Pass 1	449	00:00:04.77	00:00:06.55
Symbol table sort	0	00:00:00.27	00:00:00.35
Pass 2	87	00:00:00.85	00:00:01.04
Symbol table output	13	00:00:00.10	00:00:00.10
Psect synopsis output	7	00:00:00.03	00:00:00.03
Cross-reference output	33	00:00:00.37	00:00:00.41
Assembler run totals	772	00:00:07.26	00:00:10.40

The working set limit was 1000 pages.
35233 bytes (69 pages) of virtual memory were used to buffer the intermediate code.
There were 10 pages of symbol table space allocated to hold 202 non-local and 4 local symbols.
198 source lines were read in Pass 1, producing 0 object records in Pass 2.
33 pages of virtual memory were used to define 15 macros.

0000     38  ;       02        DSPR #7 - FIX FOR SHOW EVENT FLAGS.
0000     39  ;       03        MAKE 'ILLEGAL COMMAND' MESSAGE GLOBAL.
0000     40  ;
0000     41  ;                 KEN CHAPMAN     05-DEC-77       VERSION 04 (ESSAA-3.05)
0000     42  ;       04        DSPR #45 - REMOVE HALTI.
0000     43  ;
0000     44  ;                 KEN CHAPMAN     12-JAN-78       VERSION 05 (ESSAA-3.06)
0000     45  ;       05        DSPR #77 - FIXED VERSION NUMBER BRANCH OF TREE.
0000     46  ;       06        DSPR #100 - FIXED HALT BRANCH OF TREE.
0000     47  ;
0000     48  ;                 KEN CHAPMAN     16-FEB-78       VERSION 06 (ESSAA-3.07)
0000     49  ;       07        DSPR #104 - FIXED CLEAR BREAK BRANCH OF TREE.
0000     50  ;       08        ADDED 'COMPAT' FLAG.
0000     51  ;       09        CODE COMPRESSION USING CLI$_STRING MECHANISM.
```

```
0000     53 ;                KEN CHAPMAN     28-FEB-78       VERSION 07 (ESSAA-4.00)
0000     54 ;        10      SET COMMAND MODE FLAG ON ENTERING CLI.
0000     55 ;
0000     56 ;                NICK HOWGATE    29-MAR-78       VERSION 08 (ESSAA-4.01)
0000     57 ;        11      FIXED 'CONTINUE' IN APT MODE
0000     58 ;        12      ADDED PROPER SPELLING OF ''HEXADECIMAL''.
0000     59 ;        13      CHANGED 'VRRUN' & 'VRLOAD' TO 'DSV$RUN' & 'DSV$LOAD'
0000     60 ;                KEN CHAPMAN     06-APR-78
0000     61 ;        14      MADE 'COMPAT' COMMANDS CONDITIONAL ON 'VM11' DEFINED.
0000     62 ;                NICK HOWGATE    09-JUN-78       VERSION 09 (ESSAA-4.03).
0000     63 ;        15      FIX APT ^C PROBLEM
0000     64 ;                Roger Riggs     17-JUL-78       VERSION 10 (ESSAA-5.00).
0000     65 ;        16      Fix to let SUPERLINE do the prompt, clean up APT
0000     66 ;                stuff in area of prompt.
0000     67 ;                Roger Riggs     21-SEP-78
0000     68 ;        17      Insert support for new device selection commands.
0000     69 ;                Roger Riggs     04-FEB-79
0000     70 ;        18      Insert ''SET LOAD <filespec>'' command for default load device
0000     71 ;        22      Add SHOW LOAD command
0000     72 ;        23      Fix SET LOAD, SET LOOP, SET LOCK interaction
0000     73 ;                fix SELECT and DESELECT
0000     74 ;                Fix SE AMBIGIOUS error
0000     75 ;        24      Raise ASTLVL in command mode to prevent AST delivery
0000     76 ;                in command mode
0000     77 ;                Roger Riggs     4-Sept-1979
0000     78 ;        25      Made command tree and command action routine global for APT
0000     79 ;                Roger Riggs     6-Nov-1979
0000     80 ;        26      Changed version number on filespec to be decimal instead
0000     81 ;                of octal.
0000     82 ;                Changed MTPR x,PR$_IPL to call set so it's done in KERNEL mode
0000     83 ;        27      MARION BAGGETT  14-DEC-79
0000     84 ;                ALLOW SETTING OF MEMORY MANAGEMENT ON OR OFF
0000     85 ;                ALLOW EXAMINE AND DEPOSIT OF PROCESSOR REGISTERS
0000     86 ;
0000     87 ;        28      David Butenhof  09-Jan-80
0000     88 ;                Fix exam/deposit of processor registers
0000     89 ;
0000     90 ;        29      David Butenhof  06-feb-80
0000     91 ;                Be sure all possible AST levels are disabled to prevent
0000     92 ;                interrupt-driven diagnostic from continuing after ^C or
0000     93 ;                breakpoint.
0000     94 ;        30      David Butenhof  15-feb-80
0000     95 ;                Add SEARCH operator flag
0000     96 ;                Roger Riggs, 17-Jan-1980, Version 5.2
0000     97 ;        31      Corrected handling of command mode for APT, made sure
0000     98 ;                it typed ''DS> '' after ^C and processing of any command.
0000     99 ;        32      Fixed saved IPL to save all 5 bits of IPL instead of just 4.
0000    100 ;        33      Remove disable of ASTs in CLI so that WAITMS works and
0000    101 ;                ^C ASTs are delivered.
0000    102 ;                Dave Butenhof   30-jun-1980, version 5.5
0000    103 ;        34      Add HELP command in PARSE tree, and ACT_HELP action routine
```

```
0000   105 ;                Dave Butenhof, 02-oct-1980, Version 6.1
0000   106 ;        35      Add DIRECTORY command
0000   107 ;        36      Alter filespec parsing to recognise [000000] form as well as
0000   108 ;                [0,0] for UIC.
0000   109 ;                Dave Butenhof, 13-feb-1981, version 6.3
0000   110 ;        37      Change /SECTION:xxx so xxx can be symbol (inc. $ and _).
0000   111 ;        38      Add SET WIDTH command, and alter filespec parse to allow
0000   112 ;                subdirectories in user mode.
```

```
0000   114 ;
0000   115 ;       39      - dave butenhof, 06-Oct-1981, version 6.5
0000   116 ;               Implement SHOW STATUS command
0000   117 ;
0000   118 ;       40      - Jack Stansbury, 21-Oct-1981, Version 6.5
0000   119 ;               Added calls to QA$Main for the QA enhancement.
0000   120 ;               Also added .LIBRARY statements for $DIAG, $DS, and LIB.
0000   121 ;
0000   122 ;       41      - Jack Stansbury, 22-Oct-1981, Version 6.5
0000   123 ;               Fixed truncation errors.
0000   124 ;
0000   125 ;       42      - Jack Stansbury, 25-Oct-1981, Version 6.5
0000   126 ;               Many changes for the /QA qualifier on the
0000   127 ;               RUN and START commands, additional SET and SHOW
0000   128 ;               changes for the QA flags.
```

```
0000    130 ;       43      - Jack Stansbury, 3-Nov-1981, Version 6.5
0000    131 ;               Major revisions to the parse tree. Renumbered all the labels,
0000    132 ;               moved things around, ... Also incorporated checks so that a
0000    133 ;               SET FLAG WIDTH 130 is not allowed (as it was before). Also
0000    134 ;               changed the error messages to mixed case. Also took out T_CRLF,
0000    135 ;               because it was not used. Most of these changes are not marked
0000    136 ;               since so much was done. Also made use of the new CLI$K_SLASH,
0000    137 ;               CLI$K_VALUE, and CLI$K_COMMA character values in calls to
0000    138 ;               $DS_CLI. These allow "/", ":" or "=", and ",", respectively,
0000    139 ;               with optional spaces on either side of them. They were added
0000    140 ;               to PARSE.MAR by Dave Butenhof. Also added /ADAPTER qualifier
0000    141 ;               to the SHOW DEVICE, SELECT, and DESELECT commands. This qualifier
0000    142 ;               requires an adaptor name as its value. Also added SHOW DEFAULT
0000    143 ;               and SHOW BASE commands. Also added DCL-like printout of portion
0000    144 ;               of command line in error. That is,
0000    145 ;                       ?? error message
0000    146 ;                          \portion in error\
0000    147 ;
0000    148 ;       44      - Marion Baggett, Jack Stansbury, 05-Oct-1981, Version 6.5
0000    149 ;               Enhanced the SHOW DEVICE AND SHOW SELECTED command to allow
0000    150 ;               the qualifier and print only the device type and name.
0000    151 ;               Added a new command SHOW SUPPORT to show the devices a diagnostic
0000    152 ;               will support.
```

```
0000   154 ;        45      - Jack Stansbury, 11-Nov-1981, Version 6.5
0000   155 ;                Changed the DS$PARSE call to DSX$SUPERPARSE. SUPERPARSE does not
0000   156 ;                return when it encounters EOL. Rather, it continues following the
0000   157 ;                parse tree until it encounters CLI$K_EXIT. This takes care of the
0000   158 ;                problem with SET BASE 0, where DS$PARSE saw EOL, and returned to
0000   159 ;                here with the NOTNUF flag still set. Thus, it was not continuing
0000   160 ;                on in the parse tree, where it would have executed the ENUF action
0000   161 ;                routine, and then gone to EOL in the parse tree. DSX$SUPERPARSE
0000   162 ;                does continue, and thus will execute ENUF, and then go to EOL.
0000   163 ;                Also: changed the error handling and reporting. Established
0000   164 ;                different action routines for Illegal command versus Incomplete
0000   165 ;                commands. Checked return from DSX$PARSE and the various CLI flags
0000   166 ;                and printed appropriate error messages.
0000   167 ;                Also: changed the DCL-like printout of the command line in error
0000   168 ;                to print the portion of the line that was good. This was done becaus
0000   169 ;                of the strange results from doing it the previous way!!!???
0000   170 ;                Also: added action routines ACT_OPTIONAL, ACT_REQUIRED,
0000   171 ;                ACT_IF_REQUIRED, ACT_IF_FILE_SPEC, ACT_BINARY, and ACT_VERIFY.
0000   172 ;                Also: added recognition of SET BINARY, SET VERIFY, CLEAR BINARY,
0000   173 ;                and CLEAR VERIFY. These are new control flags.
0000   174 ;                Also added [illegible]ANCE action routine. It function exactly opposite of
0000   175 ;                BACKUP.
0000   176 ;
0000   177 ;        46      - Jack [illegible]ry, 13-Nov-1981, Version 6.5
0000   178 ;                Added [illegible]_CALL, CLI$K_RETURN, and CLI$K_BIFS to various places
0000   179 ;                in the parse tree. Dave Butenhof added these new character codes.
0000   180 ;                They are to be used for one-level-deep subroutine calls. Also added
0000   181 ;                SUCCESS and FAILURE action routines to be used in conjunction with
0000   182 ;                the above. Also added a new DS command: EXIT.  Also altered
0000   183 ;                ACT_DO_CMD to avoid dispatching if CLI$L_COMMAND(R2) is 0; this
0000   184 ;                allows ATTACH to 'kill' the command when the /Adapter value is bad.
0000   185 ;                Also added the SHOW SECTIONS command.
0000   186 ;
0000   187 ;        47      - Jack Stansbury, 17-Nov-1981, Version 6.5
0000   188 ;                Changed all BSBW's to JSB's.
0000   189 ;
0000   190 ;        48      - Dave Butenhof, 18-Nov-1981, version 6.5
0000   191 ;                Add DEATTACH command, and typecodes in messages
0000   192 ;
0000   193 ;        49      - Jack Stansbury, 21-Nov-1981, Version 6.5
0000   194 ;                Took out the DSQA constants and the calls to QA_MAIN.
0000   195 ;                It appears these will not be needed for the 6.5 DS version.
```

```
0000   197 ;
0000   198 ;       50      - Dave Butenhof, 04-Feb-1982, Version 6.6
0000   199 ;               Use the new CLI$K_FILE parse code for filename/type parse
0000   200 ;
0000   201 ;       51      - Dave Butenhof, 05-Feb-1982, Version 6.6
0000   202 ;               Add new command SHOW MEMORY.
0000   203 ;
0000   204 ;       52      - Jack Stansbury, 18-Feb-1982, Version 6.6
0000   205 ;               Changed the HELP command parsing so that HSOW will not result
0000   206 ;               in the HELP command looking for DS command SOW! That is, if
0000   207 ;               spaces are not found after the minimum characters for HELP
0000   208 ;               (H in this case), then there must be an EOL. If not EOL, it
0000   209 ;               is an error. Also, I added the VSDP Supervisor command. This
0000   210 ;               is for CRD use. Right now, it simply prints "Command not
0000   211 ;               implemented".
0000   212 ;
0000   213 ;       53      - Dave Butenhof, 09-Mar-1982, version 6.6
0000   214 ;               Change file parsing to accept subdirectories in standalone.
0000   215 ;
0000   216 ;       54      - Dave Butenhof, 10-Mar-1982, version 6.6
0000   217 ;               Correct HELP parsing to accept 'H<CR>' as well as 'H '.
```

```
0000   219 ;
0000   220 ;       55      - Jack Stansbury, 23-Mar-1982, Version 6.7
0000   221 ;               Added some macros (Br_If_Not_...) and took out some .LIST
0000   222 ;               statements.
0000   223 ;
0000   224 ;       56      Jack Stansbury, 10-Apr-1982, Version 6.7
0000   225 ;               Added support for running CRD-AutoTest on-line via   e VSDP
0000   226 ;               CLI command.
0000   227 ;
0000   228 ;       57      Dave Butenhof, 13-Apr-1982, version 6.7
0000   229 ;               Add command to enable/disable generic name enforcement,
0000   230 ;               as backup. 'Set/Clear Enforce'
```

```
0000    232 ;
0000    233 ;       58      Jack Stansbury, 6-May-1982, Version 6.8
0000    234 ;               Added code in DS$Cli to not clear the ^C bit in the DS flags
0000    235 ;               longword if CRD-AutoTest was running. This is to allow ^C's
0000    236 ;               to be caught faster and easier by CRD.
0000    237 ;
0000    238 ;       59      Richard Brown, 19-May-82, Version 6.8
0000    239 ;               Addition of DEBUG command.  This involves placing the command
0000    240 ;               in the command line interpreter decision tree and adding an
0000    241 ;               action routine for the command.
0000    242 ;
0000    243 ;       60      Jack Stansbury, 24-May-1982, Version 6.8
0000    244 ;               Changed the "VSDP" command to "CRD".
0000    245 ;
C000    246 ;       61      Dave Butenhof, 25-May-1982, version 6.8
0000    247 ;               Restore poor SHOW MM command, which got kicked out by
0000    248 ;               SHOW MEMORY (note, however, that SHOW MEMORY did not
0000    249 ;               intend to do this, and should not be accused of bullying).
0000    250 ;
0000    251 ;       62      Richard Brown, 7-July-82, Version 6.8
0000    252 ;               Addition of /DEBUG qualifier to RUN and START commands.
```

```
0000    254 ;
0000    255 ;       63      Jack Stansbury, 15-July-1982, Version 6.9
0000    256 ;               Added code to call CRD Menu Test when the CRD command is typed.
0000    257 ;
0000    258 ;       64      Jack Stansbury, 24-July-1982, Version 6.9
0000    259 ;               Added code (commented out for now) that will check to see if the
0000    260 ;               CRD Menu Test command (CRD) is being called in user mode. If so,
0000    261 ;               it will print an error message. NOTE: this will have to be taken
0000    262 ;               out before the Supervisor is frozen for 6.9!!!!
0000    263 ;
0000    264 ;       65      Jack Stansbury, 8-September-1982, Version 6.9
0000    265 ;               Added three new commands: SET CRDTRACE, CLEAR CRDTRACE, and
0000    266 ;               SHOW CRDTRACE. These three all have to do with a new DSA bit
0000    267 ;               called DSA$V_CRD_Trace. This bit, when set, will cause the CRD
0000    268 ;               routines to print trace and debugging information for the user.
0000    269 ;
0000    270 ;       66      Jack Stansbury, 15-September-1982, Version 6.9
0000    271 ;               Added code in the ACT_CRD routine that will clear the ^C handlers
0000    272 ;               and the ^C DS flag, and disable ^C's.
0000    273 ;
0000    274 ;       67      Jack Stansbury, 23-September-1982, Version 6.9
0000    275 ;               Changed the CRDTRACE qualifier to CRD/TRACE. The command are now:
0000    276 ;               SET CRD/TRACE, CLEAR CRD/TRACE, and SHOW CRD. Also changed the code
0000    277 ;               a bit at the activation of CRD - if CRD's initialization routine
0000    278 ;               returns failure, the DSR$Unload_CRD routine is now called.
0000    279 ;
0000    280 ;       68      Richard Brown, 27-Sep-82, Version 6.9
0000    281 ;               Changed default debugger name from DELTA to VDSDEBUG.
0000    282 ;
0000    283 ;       69      Jack Stansbury, March 3, 1983, Version 6.11
0000    284 ;               Added the SET CRD/DEBUG/TRACE command. This exact syntax
0000    285 ;               is required to minimize the number of people finding out
0000    286 ;               about and using this command. It turns on debugging mode in
0000    287 ;               CRD, and a LOT of output results!
0000    288 ;
0000    289 ;       70      Jack Stansbury, March 7, 1983, Version 6.11
0000    290 ;               Added the SHOW CALLS command. The routine is in the CRDImage module.
0000    291 ;
0000    292 ;       71      Bob Bergazzi    28-March-1983   Version 6.11
0000    293 ;               Added the SET/SHOW PAGE command for video console terminals
0000    294 ;               in standalone mode. Routines are in PRINT.
0000    295 ;
0000    296 ;       72      John Ciukaj     4-April-1983    version 6.11
0000    297 ;               - Changed CRD Command Action routine (ACT_CRD) to
0000    298 ;                 allow online debugging of CRD AUTO Offline
0000    299 ;                 test package and offline initiation of
0000    300 ;                 CRD AUTO Offline by CRD Command.
0000    301 ;               - Changed references to CRD bits in DSA Flags to
0000    302 ;                 distinguish between online and offline.
0000    303 ;
0000    304 ;       73      Bob Bergazzi    8-Apr-1983      Version 6.11
0000    305 ;               Cleared Line_count when we put out a DS>, so that if we are SET PAGE
0000    306 ;               our first screen isn't wasted with stuff we already saw.
0000    307 ;
0000    308 ;       74      Bob Bergazzi    May 16,1983     Version 6.11
0000    309 ;               Changed the order of the .LIB statements.
0000    310 ;
```

```
0000   311 ;        75      Bob Bergazzi    29-Aug-1983     Version 6.13
0000   312 ;                Added the SET MEMORY command.
0000   313 ;
0000   314 ;        76      Bob Bergazzi    20-Sep-1983     Version 6.13
0000   315 ;                Added the /TIME switch to the RUN and START commands.
0000   316 ;                Commented out for release 13 and 14.
0000   317 ;
0000   318 ;        77      Bob Bergazzi    21-Oct-1983     Version 6.13
0000   319 ;                Added the INI PCS command.
0000   320 ;
0000   321 ;        78      Domenic Andella 8-Nov-83        Version 6.14
0000   322 ;                Added branches to tree at GET_FILE_SPEC, and
0000   323 ;                START_AND_RUN routines. These modifications
0000   324 ;                are to allow '$' and '_' to be included in the
0000   325 ;                directory, filename, and file type when using
0000   326 ;                @ script filename, SET LOAD cmd, LOAD cmd, RUN,
0000   327 ;                and DIRECTORY cmd. These changes are necessary
0000   328 ;                for VDS to run under VMS V4.
0000   329 ;
0000   330 ;        79      RE MUSE         8 MAY 1984      Version 7.0
0000   331 ;                allow device names of the form 'node$ggan'
0000   332 ;
0000   333 ;        80      Bob Bergazzi    May 21, 1984    Version 7.0
0000   334 ;                Added /WIDE switch to the DIRECTORY command so
0000   335 ;                that filenames will be displayed one per line.
0000   336 ;                This fixes the problem of truncation of long filenames.
0000   337 ;--

                        715          ; Illegal command error:
                        716          ;
                        717          ; This is called with the parse character pointer pointing to the illegal
                        718          ; character. This will usually be a character within an unrecognized
                        719          ; qualifier or parameter such as the "X" in "SET WIDTX". It is possible
                        720          ; for this to be called when a command is actually INCOMPLETE. This
                        721          ; happens, for example, in recognizing "SET BREAKPOINTS" but failing
                        722          ; to see any (required) spaces after the "BREAKPOINTS". If no spaces
                        723          ; are seen, ILLEGAL is called even though the next symbol could
                        724          ; actually be EOL (implying INCOMPLETE). If it is not an EOL, then there
                        725          ; is an illegal character (e.g., the "X" above) and the command is
                        726          ; ILLEGAL. If it is an EOL, then the required address is missing and the
                        727          ; command is INCOMPLETE. Therefore, EOL is checked below to make a
                        728          ; determination about the kind of error that has occurred.
                        729          ;

```

```
                        ;
                        ; Start of the flags loop. That is, there can be any number of these flags
                        ; for a given SET FLAGS command. The flags must be separated by commas.
                        ; Spaces may be before and after the commas. Each flag that starts with
                        ; character(s) from other SET keywords (e.g., LOOP -> LOAD, BELL ->
                        ; BASE, BINARY -> BREAKPOINTS, ...) must recognize the minimum set of
                        ; characters. That is "BE" rather than just "B". This is so that a SET B
                        ; command will be recognized as INCOMPLETE, rather that accepting the B as
                        ; B in BELL. Note: this does not apply to QUICK vs. QA... so as to remain
                        ; compatible with pre-QA Supervisors.
                        ;

Pass 2	1335	00:00:12.90	00:00:18.28
Symbol table output	82	00:00:00.52	00:00:00.87
Psect synopsis output	8	00:00:00.04	00:00:00.04
Cross-reference output	549	00:00:10.21	00:00:12.19
Assembler run totals	4446	00:01:30.82	00:01:58.24

The working set limit was 1000 pages.
345368 bytes (675 pages) of virtual memory were used to buffer the intermediate code.
There were 60 pages of symbol table space allocated to hold 829 non-local and 433 local symbols.
4209 source lines were read in Pass 1, producing 0 object records in Pass 2.
113 pages of virtual memory were used to define 37 macros.

Macro library statistics

Macro library name	Macros defined
DRB1:[DS.WORK]DIAG.MLB;955	7
DRB1:[DS.WORK]DS.MLB;218	15
DRB1:[DS.WORK]CRD.MLB;12	1
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	1
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0

0000     43 ;                TOM SOUTTER     23-MAR-78
0000     44 ;       04       TURN ON SYSTEM REAL TIME USING INTERVAL TIMER & TODC
0000     45 ;                ROGER RIGGS     03-APR-78
0000     46 ;       05       MODIFIED SETIMR TO QUE LONG REQUESTS SO THAT
0000     47 ;                THE CLOCK CAN BE USED FOR QIO WATCH DOG TIMERS
0000     48 ;       06       Fixed DSR$SETIMR_INI to release buffers in timer queue.
0000     49 ;                NICK HOWGATE    06-DEC-78       VERSION 4 (ESSAA-5.01)
0000     50 ;       07       EMULATE 'QUEUE' INSTRUCTIONS
0000     51 ;                COPY REQIDT TO ASTPRM IN SETIMR
0000     52 ;                AND FIX CANTIM TO BE ABLE TO CANCEL SPECIFIC TIMERS
0000     53 ;       08       Fix residual time in WAITMS to return correct value
0000     54 ;                Roger Riggs     11-Jun-1979
0000     55 ;       09       Revamped timer interrupt service to fix bug caused
0000     56 ;                by lowering IPL from 18 to 7 in calling SCH$QAST
0000     57 ;                when delivering timer requests. Also EXE$SETIMR
```

```
                        ;
                        ;               was affected, since the queue is now sorted by completion
                        ;               time
                        ;               Roger Riggs     20-NOV-1979
                        ;       10      Remove W^ from several references
                        ;               Roger Riggs, 24-Jan-1980, Version 5.2
                        ;       12      Removed Errsup after clock overflow in WAITUS, since
                        ;               it is unnecessary and means that we loaded the clock
                        ;               with a value that will overflow before we can check it.
                        ;               Also added DS$GK_USOVR, used by WAITUS and defined
                        ;               in ONLY7xx for each processor, Expermentially determined
                        ;               to produce an accuracy of about 1%.
                        ;               Also added clear of overflow bit to clock interrupt service
                        ;               Roger Riggs, 27-Feb-1980
                        ;       13      Changed DSBINT to SETIPL(#18) before removing entries from
                        ;               timer queue. Also restore IPL before continuing.
                        ;       14      Assured that Both SETIMR and CANTIM are executed in KERNEL mode
                        ;               Roger Riggs, 22-July-1980, Version 5.5
                        ;       15      Moved EXE$GL_ABSTIM to ENTRY.
                        ;
                        ;               Dave Butenhof, 16-oct-1980, version 6.1
                        ;       16      Move EXE$GQ_SYSTIME to entry, to make it accessible to drivers.
                        ;               Dave Butenhof, 18-feb-1981, version 6.3
                        ;       17      Delete SEP psect.
                        ;               Dave Butenhof, 25-feb-1981, version 6.3
                        ;       18      Fix problem found in queue handling.  REMQUE/INSQUE instructs
                        ;               had been emulated.  Restore the queue instructions.
                        ;       19      Fix WAITUS bug (Tom Kraus generated fix).
                        ;
                        ;       20      - Dave Butenhof, 26-Feb-1982, version 6.6
                        ;               Add special code in WAITUS for Nebula...use interrupt
                        ;               instead of polling.
                        ;
                        ;       21      - Jack Stansbury, 26-Feb-1982, Version 6.6
                        ;               Added .LIBRARY statements for $DS, $DIAG, and $LIB.
                        ;
                        ;       22      Jack Stansbury, 15-September-1982, Version 6.9
                        ;               Changed ICCS$M_ERR from 31 to 15. Also added code in DSI$TimSrv
                        ;               routine that will not reset the interval timer if the SetVec routine
                        ;               is currently trying to stop the interval timer.
                        ;
                        ;       23      Jack Stansbury, 16-Septe mber-1982, Version 6 9
                        ;               Changed the ICCS$M_ERR bit back to #15. The VAX Hardware Handbook
                        ;               is wrong in its picture of the ICCS in the back of the book.
                        ;
                        ;       24      Marion Baggett, 24-Sept-1982,   Version 6.9
                        ;               Changed the entry mask in DSX$WAITUS to not save R2, R3. These regis
                        ;               are not changed, and the extra time for CAllx to save them should be
                        ;       25      Bob Bergazzi    21-Oct-1982     Version 6.9
                        ;               Changed DSJ$TIMSRV to clear the interrupt when the
                        ;               DS$GB_Stopping_The_Timer flag is set. Otherwise we get stuck
                        ;               in a loop of continuous interrupts.
                        ;
                        ;       26      Bob Bergazzi    25-April-1983   Version 6.11
                        ;               Added global symbol DSX$WAITUS_USOVR to the instruction in the
                        ;               DSX$WAITUS routine which computes the interval clock count,
                        ;               so that we can reference it from KERNEL and change the value
                        ;               of the clock routine overhead factor (DS$GK_USOVR).
```

```
0000    115 ;               if we are running on a SUPERSTAR processor. This is done from
0000    116 ;               KERNEL during the BOOT procedure so that we don't add any more
0000    117 ;               instructions to the DSX$WAITUS routine, which would change the
0000    118 ;               value of the overhead factor for the existing processors.
0000    119 ;               I.e. The code in KERNEL is modifying the instruction at
0000    120 ;               DSX$WAITUS_USOVR.
0000    121 ;
0000    122 ;       27      Bob Bergazzi    May 16,1983     Version 6.11
0000    123 ;               Changed the order of the .LIB statements.
0000    124 ;
0000    125 ;       28      Richard Brown   August 4, 1983  Version 6.13
0000    126 ;               Corrected bug in DSX$CANWAIT.  If this service was called
0000    127 ;               to cancel a $DS_WAITMS, it did not remove the entry from the
0000    128 ;               timer queue, so the AST was still being delivered.  Therefore,
C000    129 ;               the $SETIMR call in DSX$WAITMS was changed so that a request
0000    130 ;               ID is specified (-1).  DSX$CANWAIT was changed so that it
0000    131 ;               issues a $CANTIM to kill all timer requests with an ID of -1.
0000    132 ;
0000    133 ;       29      R.E.Muse        10 January 1984 version 6.14
0000    134 ;               added PRDEF macro definition - Version 4 changes.
0000    135 ;
0000    136 ;       30      Bob Bergazzi    Jan. 26, 1984   Version 6.14
0000    137 ;               Changed CLK$RE_INIT routine to call ONLY_CLOCK_INIT which
0000    138 ;               does cpu-specific stuff to the TODR.
0000    139 ;--

Pass 2	345	00:00:03.93	00:00:04.97
Symbol table output	51	00:00:00.35	00:00:00.42
Psect synopsis output	8	00:00:00.04	00:00:00.04
Cross-reference output	119	00:00:01.09	00:00:01.42
Assembler run totals	1784	00:00:27.53	00:00:38.15

The working set limit was 1000 pages.
106889 bytes (209 pages) of virtual memory were used to buffer the intermediate code.
There were 60 pages of symbol table space allocated to hold 1107 non-local and 42 local symbols.
1114 source lines were read in Pass 1, producing 0 object records in Pass 2.
141 pages of virtual memory were used to define 42 macros.

Macro library statistics

Macro library name	Macros defined
DRB1:[DS.WORK]DIAG.MLB;955	10

Psect synopsis output	5	00:00:00.02	00:00:00.02
Cross-reference output	25	00:00:00.25	00:00:00.93
Assembler run totals	1096	00:00:16.22	00:00:26.68

The working set limit was 1000 pages.
52423 bytes (103 pages) of virtual memory were used to buffer the intermediate code.
There were 40 pages of symbol table space allocated to hold 643 non-local and 9 local symbols.
314 source lines were read in Pass 1, producing 0 object records in Pass 2.
98 pages of virtual memory were used to define 25 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYS0.SYSMAINT]DS.MLB;218	0
DMA1:[SYS0.SYSMAINT]DIAG.MLB;953	7
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	6
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	8
TOTALS (all libraries)	21

987 GETS were required to define 21 macros.

There were no errors, warnings or information messages.

                                0000     66 ;               Fixed document typo, support RC25.
                                0000     67 ;
                                0000     68 ;       10      M. Baggett      3-March-1983    Version 6.11
                                0000     69 ;               Added suport for HSC50.
                                0000     70 ;
                                0000     71 ;       11      M. Baggett      9-may-1983      Version 6.11
                                C000     72 ;               Booting from RP07 will have device name of DR and not DB.
                                0000     73 ;
                                0000     74 ;       12      M. Baggett      22-May-1983     Version 6.11
                                0000     75 ;               Allow any length name to be boot device (eg, CIAx, CIAxx, CIAxxx).
                                0000     76 ;
                                0000     77 ;       13      M. Baggett      21-Sep-1983     Version 6.13
                                0000     78 ;               Change HSC50 boot to a disk on the HSC50 to allow selections
                                0000     79 ;               among the different disks. Changed the name of LESI to RC11, and
                                0000     80 ;               temporarily changed the RC25 generic to DU.
                                0000     81 ;
                                0000     82 ;       14      M. Baggett      7-Sep-1983      Version 6.13
                                0000     83 ;               Change HSC50 controller naming to match standards.
                                0000     84 ;               Generic name is  HSC50$DUAnnn for DISK p-table.
                                0000     85 ;
                                0000     86 ;       15      Bob Bergazzi    2-14-84         Version 6.14
                                0000     87 ;               Moved code from KERNEL to here which builds ptables for the
                                0000     88 ;               console and boot devices. Subroutine is called INI$LOAD_DEVICE.
                                0000     89 ;               Done so that SET MEM can call this routine.
                                0000     90 ;
                                0000     91 ;       16      M. Baggett      15-Feb-1984     Version 6.14
                                0000     92 ;               Changed the default name for RC25/RCF25 device to DUA temporary ****
                                0000     93 ;
                                0000     94 ;       17      M. Baggett      16-May-1984     Version 7.0
                                0000     95 ;               Fixed HSC50 disk name to show proper unit number.
                                0000     96 ;
                                0000     97 ;       18      M. Baggett      6-Jun-1984      Version 7.0
                                0000     98 ;               Change device name for RC11/RC25/RCF25 back to DA.
                                0000     99 ;
                                0000    100 ;       19      Richard Brown   10-July-1984    Version 7.0
                                0000    101 ;               Change all references of "RC11" to "LESI".

Cross-reference output	143	00:0C:01.22	00:00:01.60
Assembler run totals	1859	00:00:29.46	00:00:47.23

The working set limit was 1000 pages.
112476 bytes (220 pages) of virtual memory were used to buffer the intermediate code.
There were 70 pages of symbol table space allocated to hold 1289 non-local and 54 local symbols.
1094 source lines were read in Pass 1, producing 0 object records in Pass 2.
146 pages of virtual memory were used to define 51 macros.

                        26 ; FACILITY:     VAX DIAGNOSTIC SUPERVISOR.
                        27 ;
                        28 ; ABSTRACT:
                        29 ;
                        30 ;       This routine contains the interface with the LSI-11 console.
                        31 ;       It provides the routines necessary to read and write characters
                        32 ;       and strings on the operators console.  It contains the limited
                        33 ;       functionality to interface with QIO.
                        34 ;
                        35 ; ENVIRONMENT:
                        36 ;
                        37 ;       Operates as part of the Supervisor only in stand-alone.
                        38 ;       Portions hereof must operate in KERNEL mode.
                        39 ;
                        40 ; AUTHOR:
                        41 ;
                        42 ;       KEN CHAPMAN     10-NOV-77       VERSION 01.
                        43 ;
                        44 ; MODIFICATIONS:
                        45 ;
                        46 ;       01      NICK HOWGATE    30-DEC-77       VERSION 02.
                        47 ;               CMK$TCONSOLE - TURN OFF ALL OUTPUT IF APT REQUESTS
                        48 ;               NO REPORT (DSA$GL_FLAGS)=DSA$V_NORPT
                        49 ;
                        50 ;       02      Roger Riggs     25-JUL-78
                        51 ;               CMK$TCONSOLE looks also at DS$V_CTRLO in DS$GL_FLAGS
                        52 ;               MAKE ^O WORK.
                        53 ;       03      Made unsolicited input is echoed as bells instead of the
                        54 ;               characters typed.
                        55 ;
                        56 ;       04      NICK HOWGATE    5-FEB-79        (ESSAA-5.00)
                        57 ;               CONVERT TABS TO SPACES
                        58 ;
                        59 ;       05      Implement P4 buffer in WRITEBLK
                        60 ;
                        61 ;       06      Fix IO$_READPROMPT to always prompt on new line
                        62 ;
                        63 ;       07      Defer echo of ^C until KB_CHECK but suppress rest of output
                        64 ;               until ^C is serviced
                        65 ;
                        66 ;       08      MARION BAGGETT  NOV 12,1979
                        67 ;               ADD THE CONTROL S AND CONTROL Q FUNCTION FOR STARTING AND
                        68 ;               STOPPING THE PRINTOUT ON THE TERMINAL.
                        69 ;
                        70 ;       09      Roger Riggs, 14-Jan-1980, Version 5.2
                        71 ;               Added checking of IO$M_CANCTRLO  on write to terminal.
                        72 ;               Used by exception to make sure exceptions always print.
                        73 ;               Also fixed RINPUT to ignore character if bit 15 (ERR) is
                        74 ;               Set in the data register.
                        75 ;
                        76 ;       10      Dave Butenhof, 17-oct-1980, version 6.1
                        77 ;               Cause re-type of input line ('^R') after asynchronous output
                        78 ;               occurs, in the fashion of VMS.  Also, remove hyphen line
                        79 ;               continuation code, since it doesn't belong here.
                        80 ;
                        81 ;       11      To fully support ^C 'disable' in tight time-critical code,
```

```
                                0000     82 ;               cut down on instruction stream for control characters.
                                0000     83 ;               Specifically, test for ^C first in RINPUT instead of last.
                                0000     84 ;               Also, make new routine OUT_CNTRL to output ^C and ^O echo;
                                0000     85 ;               without all the overhead of doing extra KB_POLL each
                                0000     86 ;               character (small messages), or checking for tabs, etc.
                                0000     87 ;
                                0000     88 ;       12      Dave Butenhof, 17-mar-1981, version 6.3
                                0000     89 ;               Add VRSETWIDTH routine, and hooks for SET WIDTH command.
                                0000     90 ;               This allows users (FS in particular) to avoid destroying
                                0000     91 ;               80 column printer paper with output from DS. Also add
                                0000     92 ;               VRSHOWWIDTH routine.
                                0000     93 ;
                                0000     94 ;       13      - Jack Stansbury, 22-Oct-1981, Version 6.-
                                0000     95 ;               Changed SEP Psect to CODE, DATA, and WORK.
                                0000     96 ;               Also added .LIBRARY statements for $DS and $DIAG.
                                0000     97 ;
                                0000     98 ;       14      - Jack Stansbury, 26-Oct-1981, Version 6.-
                                0000     99 ;               Fixed more truncation errors....
                                0000    100 ;
                                0000    101 ;       15      - Jack Stansbury, 25-Jan-1982, Version 6.6
                                0000    102 ;               Changed the WIDTH variable to make it global, so that QA can
                                0000    103 ;               access it.
                                0000    104 ;
                                0000    105 ;       16      - Jack Stansbury, 23-Mar-1982, Version 6.?
                                0000    106 ;               Added typecoding to the output messages.
                                0000    107 ;
                                0000    108 ;       17      - Richard Brown, 8-June-82, Version 6.8
                                0000    109 ;               Addition of support for specification of
                                0000    110 ;               terminators other than carriage-return.  We will
                                0000    111 ;               now be functionally equivalent to VMS QIO calls
                                0000    112 ;               with respect to the optional terminator specification
                                0000    113 ;               (argument P4) for the terminal driver.
                                0000    114 ;
                                0000    115 ;       18      Bob Bergazzi    6-Aug-82        Version 6.8
                                0000    116 ;               Added code to change a ^Z into an EXIT command
                                0000    117 ;
                                0000    118 ;       19      Jack Stansbury, 26-Oct-1982, Version 6.9
                                0000    119 ;               Added code to echo the ^C character only if the
                                0000    120 ;               DS$V_Ctrl_C_No_Echo bit is clear. If it is set,
                                0000    121 ;               then ^C's will not be echoed.
                                0000    122 ;
                                0000    123 ;       20      Bob Bergazzi    5-March-1983    Version 6.11
                                0000    124 ;               Added code to make SET WIDTH work online.
                                0000    125 ;
                                0000    126 ;       21      Bob Bergazzi    8-Apr-1983      Version 6.11
                                0000    127 ;               Removed incorrectly implemented edit 18.
                                0000    128 ;
                                0000    129 ;       22      Domenic Andella 25-Apr-83       Version 6.11
                                0000    130 ;               Added code in CMK$TCONSOLE routine to activate
                                0000    131 ;               11/XXX console terminal line.
                                0000    132 ;
                                0000    133 ;       23      Richard Brown   22-June-83      Version 6.12
                                0000    134 ;               Added routine SIZE_TERM, which determines
                                0000    135 ;               console terminal type.
                                0000    136 ;
                                0000    137 ;               Also removed code in READVBLK that treated a
                                0000    138 ;               question mark as a terminator, since many
```

```
                                0000   139 ;                   terminal IDs contain question marks, and we
                                0000   140 ;                   couldn't figure why it was a terminator anyway.

Performance indicators

Phase	Page faults	CPU Time	Elapsed Time
Initialization	34	00:00:00.12	00:00:00.27
Command processing	147	00:00:00.72	00:00:01.69
Pass 1	887	00:00:12.46	00:00:28.73
Symbol table sort	0	00:00:00.96	00:00:02.42
Pass 2	307	00:00:03.37	00:00:05.34
Symbol table output	40	00:00:00.26	00:00:00.42
Psect synopsis output	8	00:00:00.04	00:00:00.27
Cross-reference output	146	00:00:01.38	00:00:02.04
Assembler run totals	1572	00:00:19.33	00:00:41.20

The working set limit was 1000 pages.
66786 bytes (131 pages) of virtual memory were used to buffer the intermediate code.
There were 40 pages of symbol table space allocated to hold 572 non-local and 79 local symbols.
1219 source lines were read in Pass 1, producing 0 object records in Pass 2.
83 pages of virtual memory were used to define 41 macros.

Macro library statistics

Macro library name	Macros defined
DRB1:[DS.WORK]DIAG.MLB;955	3
DRB1:[DS.WORK]DS.MLB;218	16
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	0
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	0
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	0
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	18
TOTALS (all libraries)	37

702 GETS were required to define 37 macros.

There were no errors, warnings or information messages.
