Cross-reference output	154	00:00:01.27	00:00:01.84
Assembler run totals	1786	00:00:23.71	00:00:37.69

The working set limit was 1000 pages.
90011 bytes (176 pages) of virtual memory were used buffer the intermediate code.
There were 50 pages of symbol table space allocated hold 863 non-local and 84 local symbols.
1019 source lines were read in Pass 1, producing 0 object records in Pass 2.
112 pages of virtual memory were used to define 39 macros.

;    0181  1     !
;    0182  1     !       This condition handler routine can be used to field any exceptions
;    0183  1     !       that indicate memory is in accessable.
;    0184  1     !       It does an SYS$UNWIND to the level of the caller of the routine
;    0185  1     !       that generated the condition.  The conditions trapped are
;    0186  1     !       DS$_MCHK, SS$_ACCVIO, and SS$_TRANSL.  The value of the aborted
;    0187  1     !       routine will be one of these values.
;    0188  1     !
;    0189  1     ! FORMAL PARAMETERS:
;    0190  1     !
;    0191  1     !       SIGNAL          Address of standard signal array
;    0192  1     !       MECHANISM       Address of mechanism array

Symbol table output	9	00:00:00.11	00:00:00.13
Psect synopsis output	7	00:00:00.03	00:00:00.03
Cross-reference output	23	00:00:00.31	00:00:00.70
Assembler run totals	964	00:00:24.25	00:00:35.44

The working set limit was 1000 pages.
76858 bytes (151 pages) of virtual memory were used to buffer the intermediate code.
There were 90 pages of symbol table space allocated to hold 1563 non-local and 5 local symbols.
430 source lines were read in Pass 1, producing 0 object records in Pass 2.
56 pages of virtual memory were used to define 18 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYS0.SYSMAINT]DS.MLB;218	1
DMA1:[SYS0.SYSMAINT]DIAG.MLB;953	0
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	7
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	6
TOTALS (all libraries)	14

1577 GETS were required to define 14 macros.

There were no errors, warnings or information messages.

;    0152  1     !
;    0153  1     !       This routine is called from the CLI module. It sets the specified
;    0154  1     !       QA flag to the requested value (within limits).
;    0155  1     !
;    0156  1     ! CALLER(S):
;    0157  1     !
;    0158  1     !       CLI
;    0159  1     !
;    0160  1     ! FORMAL PARAMETERS:
;    0161  1     !
;    0162  1     !       R2 - Points to the CLI data table base.
;    0163  1     !
;    0164  1     ! IMPLICIT INPUTS:
;    0165  1     !
;    0166  1     !       Cli_Base [CLI$L_FLAGS] - Indicates which flag to change.
;    0167  1     !       Cli_Base [CLI$L_DATA]  - Indicates the new desired value of the flag.
;    0168  1     !
;    0169  1     ! IMPLICIT OUTPUTS:
;    0170  1     !
;    0171  1     !       New value(s) for the QAx variables declared above.
;    0172  1     !
;    0173  1     ! COMPLETION CODES:
;    0174  1     !
;    0175  1     !       0 - Failure, value out of range.
;    0176  1     !       1 - Success.
;    0177  1     !
;    0178  1     ! SIDE EFFECTS:
;    0179  1     !
;    0180  1     !       Changes the value of the specifed flag, iff the value requested is
;    0181  1     !       within range.

;    0035  0     !
;    0036  0     !       Jack Stansbury
;    0037  0     !
;    0038  0     ! CREATION DATE:
;    0039  0     !
;    0040  0     !               15-October-1981, Version 6.5-00
;    0041  0     !       00      Put in code for all the support routines plus the following check routines: QA$Normal_Start,
;    0042  0     !               QA$Multiple_Pass, QA$Loop_On_Test, QA$Run_Backwards.
```

```
;    0043  0      ! MODIFIED:
;    0044  0      !
;    0045  0      !       01      Jack Stansbury, 14-December-1981, Version 6.6
;    0046  0      !               Added remaining QA check routines. Split QA.B32 into two different modules: QAMAIN.B32
;    0047  0      !               (this one) and QACHECKS.B32. While this one contains the support routines, the latter contains
;    0048  0      !               the actual check routines.
;    0049  0      !
;    0050  0      !       02      Jack Stansbury, 5-Jan-1982, Version 6.6
;    0051  0      !               Changed the code in QA$Dump to not print R0 and R1 in the register dump. There is no need to
;    0052  0      !               print these since they are not saved by the CALLx instructions.
;    0053  0      !
;    0054  0      !       03      Jack Stansbury, 1-Feb-1982, Version 6.6
;    0055  0      !               Released the three Supervisors to BSDE to find bugs. This includes all the check routine up to
;    0056  0      !               and including the Error Phase One check.
;    0057  0      !
;    0058  0      !       04      Jack Stansbury, 1-Feb-1982, Version 6.6
;    0059  0      !               Changed the headings on the two table printouts to make the table name more distinctive.
;    0060  0      !
;    0061  0      !       05      Jack Stansbury, 11-Feb-1982, Version 6.6X
;    0062  0      !               Changed the DSX$Branch routine so as to make it compatible with Sam Duncan! He wanted R0 saved
;    0063  0      !               across the branch macro code expansion, so I made significant changes to both the branch macros
;    0064  0      !               (in DIAG.*) and to this branch routine. All of that just for Sam!
;    0065  0      !
;    0066  0      !       06      Jack Stansbury, 27-July-1982, Version 6.9
;    0067  0      !               Changed the spelling of the VDS ^C handler variable.
;    0068  0      !
;    0069  0      !       07      Jack Stansbury, 19-Jan-1983, Version 6.10 (?)
;    0070  0      !               Took out all the references to any of the checks above the Run Backwards check. This
;    0071  0      !               includes taking out the previously entered Error Phase One check. It doesn't work
;    0072  0      !               properly with subroutines in diagnostic programs.
;    0073  0      !
;    0074  0      !       08      Bob Bergazzi    May 17, 1983    Version 6.11
;    0075  0      !               Changed the order of searching libraries.

```
:    0383  1     %SBTTL 'DSX$BRANCH'
:    0384  1
:    0385  1     GLOBAL ROUTINE DSX$Branch (Register_0, Branch_Code, Error_Number, Branch_Value) : Call_DSX$Branch =
:    0386  1
:    0387  1     !++
:    0388  1     ! FUNCTIONAL DESCRIPTION:
:    0389  1     !
:    0390  1     !       This global routine is called by the $DS_Branch macros. It decides if the branch should be taken.
:    0391  1     !       If the QA flag is set, it will call QA$Main, which calls the appropriate check routine. NOTE:
:    0392  1     !       This routine preserves R1 and attempts to preserve R0 when not forcing an error. At most, the low
:    0393  1     !       bit of R0 will be changed.
:    0394  1     !
:    0395  1     ! FORMAL PARAMETERS:
:    0396  1     !
:    0397  1     !       Register_0    : The general register R0.
:    0398  1     !
:    0399  1     !       Branch_Code   : A literal defining what type of branch is being executed by the diagnostic.
:    0400  1     !
:    0401  1     !       Error_Number  : A diagnostic error number.
:    0402  1     !
:    0403  1     !       Branch_Value  : The value that will determine whether or not the branch should actually be taken.
:    0404  1     !
:    0405  1     ! CALLER(S):
:    0406  1     !
:    0407  1     !       The diagnostic program.
:    0408  1     !

;    1415  1      !++
;    1416  1      ! FUNCTIONAL DESCRIPTION:
;    1417  1      !
;    1418  1      !       Find the user's last call frame by following the linked list
;    1419  1      !       of call frames. Find the first call frame whose saved PC is
;    1420  1      !       less than the starting location of the Supervisor. This should
;    1421  1      !       insure that that call frame was put on the stack when the user
;    1422  1      !       called a Supervisor service routine. This called frame will
;    1423  1      !       contain the saved PC, AP, FP, PSW, perhaps some of the general
;    1424  1      !       registers, and (indirectly) the SP.
;    1425  1      !
;    1426  1      ! CALLER:
;    1427  1      !
;    1428  1      !       QA$Dump - to find the call frame so it can print the debugging
;    1429  1      !                 information.
;    1430  1      !
;    1431  1      ! FORMAL PARAMETERS:
;    1432  1      !
;    1433  1      !       Frame_Start - will contain the starting location of the
;    1434  1      !                     found call frame.
;    1435  1      !

;    1577  1      ! FUNCTIONAL DESCRIPTION:
;    1578  1      !
;    1579  1      !       This global routine is called from different points in the Supervisor and from the DSX$Branch
;    1580  1      !       routine. It decides, based on the QA$AOB_Check_State bit vector, which check is currently being
;    1581  1      !       executed. If a check routine returns with an unsuccessful return, this will call the QA$Dump
;    1582  1      !       routine and then halt. If the diagnostic was not run with the /QA qualifier, do nothing.
;    1583  1      !

0000     60 ;                Roger Riggs, 10-Aug-1980
0000     61 ;        10      Use QIO driver prefix from controller instead of device
0000     62 ;                this allows for terminals to be connected to more than
0000     63 ;                one type of Async controller.  The first prefix
0000     64 ;                encountered while linking back through the P-tables is
0000     65 ;                used.
0000     66 ;
0000     67 ;        11      - Jack Stansbury, 22-Oct-1981, Version 6.-
0000     68 ;                Fixed truncation errors. Also added .LIBRARY statements
0000     69 ;                for $DS and $DIAG. Also changed .PSECT SEP to WORK, CODE,
0000     70 ;                and DATA where appropriate.
0000     71 ;
C000     72 ;        12      - Jack Stansbury, 12-Nov-1981, Version 6.-
0000     73 ;                Changed the HALTD to HALT.
0000     74 ;
0000     75 ;        13      Marion Baggett, 9-Apr-1982, Version 6.7
0000     76 ;                Added .NoShow Conditionals after .IDENT statement.
0000     77 ;
0000     78 ;        14      Jack Stansbury, July 1, 1982, Version 6.8
0000     79 ;                Added the 'real' Exe$PwrTimChk routine.
0000     80 ;
0000     81 ;        15      Marion Baggett, 24-Sept-1982, Version 6.9
0000     82 ;                Changed the CASE instruction since WRITEVBLK and READVBLK
0000     83 ;                are to far away and a JMP was need.
0000     84 ;
0000     85 ;        16      Richard E. Muse, 9 January, 1984, Version 6.14
0000     86 ;                Added $PRDEF macro definition - VMS Version 4 change.
0000     87 ;
0000     88 ;        17      Domenic Andella, 9-Apr-1984, Version 6.14
0000     89 ;                Added code in FILL_ACF to handle case where
0000     90 ;                an SBIA is attached, and it is necessary to
0000     91 ;                'backtrack' another level.
0000     92 ;
0000     93 ;        18      Bob Bergazzi    24-Apr-1984     Version 7.0
0000     94 ;                        - Changed FILL_ACF to set up R3 with the CSR
0000     95 ;                          address for the subsequent call to FIND_ADP.
0000     96 ;                        - Changed FIND_ADP routine to compare ADP$L_CSR
0000     97 ;                          instead of ADP$W_TR. This accomodates the xxx
0000     98 ;                          cpu with multiple SBIs.
0000     99 ;                        - Changed INI_DRADP to add 100 or 300 to SCB_BASE
0000    100 ;                          depending on which SBI the adapter is connected to.
0000    101 ;                        - Removed UBINT... code from INI_UBADP since it
0000    102 ;                          only needs the size of that code (UBINTSZ), which
0000    103 ;                          is defined in ONLYXXX.
0000    104 ;-

                        .SBTTL  QIO$ADDUNIT     Add a unit to the QIO database
                ;++
                ; FUNCTIONAL DESCRIPTION:
                ;
                ;       This routine takes all the necessary steps to
                ;       insert a unit into the QIO database, including adding
                ;       ADP's, CRB's, IDB's, DDB's and UCB's.
                ;       The generic name of the device is used to locate the
                ;       device driver for the device.  Starting with the specified
                ;       device fields are copied from the P-table to the ACF block
                ;       which contains all the information necessary to build the
                ;       QIO database.  For unknown devices the unit and vector information
                ;       is copied. For a TM03 the unit is copied to only one of two fields.
                ;       For channels, (DR780, RH780 & DW780) the configuration register is set
                ;       and the ACF is complete. For all non-channel devices this process
                ;       is repeated for the link device, and then for it's link device...etc.
                ;       Note that it is impossible to catch the case where the TM03 is
                ;       omitted from the link chain for a magtape drive... i.e. no
                ;       error is reported.  Errors are reported if the channel is omitted.

Pass 2	677	00:00:06.17	00:00:11.42
Symbol table output	51	00:00:00.48	00:00:01.71
Psect synopsis output	7	00:00:00.03	00:00:00.03
Cross-reference output	148	00:00:01.88	00:00:03.46
Assembler run totals	2886	00:00:42.33	00:01:04.44

The working set limit was 1000 pages.
168454 bytes (330 pages) of virtual memory were used to buffer the intermediate code.
There were 80 pages of symbol table space allocated to hold 1494 non-local and 104 local symbols.
1630 source lines were read in Pass 1, producing 0 object records in Pass 2.
260 pages of virtual memory were used to define 56 macros.

Macro library statistics

Macro library name	Macros defined
DRB1:[DS.WORK]DIAG.MLB;955	24
DRB1:[DS.WORK]DS.MLB;218	3
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	6
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0

Psect synopsis output	7	00:00:00.02	00:00:00.02
Cross-reference output	29	00:00:00.33	00:00:00.75
Assembler run totals	1125	00:00:23.80	00:00:46.21

The working set limit was 1000 pages.
79127 bytes (155 pages) of virtual memory were used to buffer the intermediate code.
There were 70 pages of symbol table space allocated to hold 1212 non-local and 26 local symbols.
740 source lines were read in Pass 1, producing 0 object records in Pass 2.
57 pages of virtual memory were used to define 20 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	6
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	3
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	7
TOTALS (all libraries)	16

1481 GETS were required to define 16 macros.

There were no errors, warnings or information messages.

Assembler run totals	1266	00:00:27.37	00:00:48.88

The working set limit was 1000 pages.
103970 bytes (204 pages) of virtual memory were used to buffer the intermediate code.

There were 60 pages of symbol table space allocated to hold 1046 non-local and 26 local symbols.
592 source lines were read in Pass 1, producing 0 object records in Pass 2.
141 pages of virtual memory were used to define 36 macros.

Cross-reference output	11	00:00:00.11	00:00:00.11
Assembler run totals	720	00:00:11.09	00:00:16.70

The working set limit was 1000 pages.
32358 bytes (64 pages) of virtual memory were used to buffer the intermediate code.
There were 20 pages of symbol table space allocated to hold 317 non-local and 23 local symbols.
269 source lines were read in Pass 1, producing 0 object records in Pass 2.
70 pages of virtual memory were used to define 17 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	7
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	1

                        0000     66 ;        15      Changes to have only 1 SCB instead of 1 per machine
                        0000     67 ;                Space for SCB is allocated in kernel, initialization
                        0000     68 ;                is done here.  SCB_IMAGE is reduced to only 1 page.
                        0000     69 ;                Roger Riggs     6-NOV-1979
                        0000     70 ;        16      Made SETIPL change mode to KERNEL before setting the IPL
                        0000     71 ;                Roger Riggs, 26-Jan-1980, Version 5.2
                        0000     72 ;        17      Set supervisor vector for software IPL interrupts on
                        0000     73 ;                levels 6,9,10,11, to dispatch to EXE$FORKDSPTH
                        0000     74 ;                John Ciukaj, 5-feb-80.    Version 5.2
                        0000     75 ;        18      Delete 'MOVAB   IS(R3),(R2)' causing exception while
                        0000     76 ;                running diagnostic ECKAX, Exception depended on value
                        0000     77 ;                of R2 on entry to DS$INITSCB
                        0000     78 ;                Roger Riggs, 21-Mar-1980
                        0000     79 ;        19      Added EXE$GL_SCB to hold address of current SCB.
                        0000     80 ;                Roger Riggs, 18-SEP-1980, Version 6.0
                        0000     81 ;        20      Added code to DS$INITSCB to restart the clock
                        0000     82 ;                Dave Butenhof, 18-feb-1981, version 6.3
                        0000     83 ;        21      Also allow SETVEC w/out changing address
                        0000     84 ;        22      Fix several truncation errors
                        0000     85 ;
                        0000     86 ;        23      - Jack Stansbury, 22-Oct-1981, Version 6.5
                        0000     87 ;                Fixed several truncation errors. Changed SEP Psects to
                        0000     88 ;                what they should be. Added .LIBRARY statements for
                        0000     89 ;                $DS and $DIAG.
                        0000     90 ;
                        0000     91 ;        24      Jack Stansbury, 15-September-1982, Version 6.9
                        0000     92 ;                Added code in the SetVec routine that will take care of a race
                        0000     93 ;                condition with the interval clock interrupts and an MTPR
                        0000     94 ;                instruction that turns off the clock. Also changed the ICCS$M_ERR
                        0000     95 ;                to be bit 15, instead of bit 31.
                        0000     96 ;
                        0000     97 ;        25      Jack Stansbury, 16-September-1982, Version 6.9
                        0000     98 ;                Changed the ICCS$M_Err bit back to 31. The VAX Hardware Handbook
                        0000     99 ;                has a picture of the ICCS longword in the back of the book. This
                        0000    100 ;                picture states that the ERR bit is bit 15. However, in other
                        0000    101 ;                sections of the book (and in the SRM), the ERR bit is 15. The
                        0000    102 ;                NEBULA hardware thinks it is 15 also.
                        0000    103 ;
                        0000    104 ;        26      Bob Bergazzi    21-Oct-1982     version 6.9
                        0000    105 ;                Changed comments in DSX$SETVEC routine. Also see CLOCK.MAR [25]
                        0000    106 ;
                        0000    107 ;        27      Bob Bergazzi    April 26, 1983  Version 6.11
                        0000    108 ;                Added call to ONLY_SCB in DSX$INITSCB which fixes the SCB for XXX.
                        0000    109 ;
                        0000    110 ;        28      Bob Bergazzi    June 7, 1983    Version 6.12
                        0000    111 ;                Changed the CLRVEC routine to reset the clock vector before
                        0000    112 ;                resetting the clock. This compensates for the TOK hardware bug
                        0000    113 ;                on 11/750s, which caused interrupts once in a blue moon when
                        0000    114 ;                resetting the clock.

Performance indicators

Phase	Page faults	CPU Time	Elapsed Time
Initialization	32	00:00:00.14	00:00:00.42
Command processing	138	00:00:00.89	00:00:01.98
Pass 1	608	00:00:08.57	00:00:16.25
Symbol table sort	0	00:00:00.66	00:00:01.62
Pass 2	165	00:00:01.97	00:00:02.65
Symbol table output	37	00:00:00.24	00:00:00.32
Object synopsis output	8	00:00:00.03	00:00:00.04
Cross-reference output	60	00:00:01.11	00:00:01.67
Assembler run totals	1052	00:00:13.63	00:00:24.95

The working set limit was 1000 pages.
40010 bytes (79 pages) of virtual memory were used to buffer the intermediate code.
There were 30 pages of symbol table space allocated to hold 414 non-local and 31 local symbols.
683 source lines were read in Pass 1, producing 0 object records in Pass 2.
63 pages of virtual memory were used to define 19 macros.

Macro library statistics

Macro library name	Macros defined
DRB1:[DS.WORK]DIAG.MLB;955	4

0000    35 ;                Roger Riggs     20-Jun-78       Version 02.
0000    36 ;                True implementation of scripting in USER mode.
0000    37 ;       01       Added code to implement "skipping... " for mismatched scripts
0000    38 ;                Roger Riggs     12-Jun-1979
0000    39 ;       02       changed W^ to '^' on DSA$GL_FLAGS references
0000    40 ;                Roger Riggs, 17-Mar-1980, Version 5.3
0000    41 ;       03       DS$LOAD returns changed, reflected by getting SS$_NORMAL
0000    42 ;                Even if file was truncated.
0000    43 ;                Dave Butenhof   28-apr-80
0000    44 ;       04       Use $GET and $PUT for input/output if DS run from command file
0000    45 ;                Roger Riggs, 3-Sep-1980, Version 6.0
0000    46 ;       05       Modified SCRIPT$OPEN to use RMS instead of load
0000    47 ;
0000    48 ;                Dave Butenhof, 10-sep-1980, Version 6.0
0000    49 ;       06       Fix user mode RMS GETLINE code to perform case translation
```

```
0000     51 ;        07      - Jack Stansbury, 22-Oct-1981, Version 6.5
0000     52 ;                Fixed truncation errors. Also added .LIBRARY statements for
0000     53 ;                $DS and $DIAG.
0000     54 ;
0000     55 ;        08      - Dave Butenhof, 12-Nov-1981, version 6.5
0000     56 ;                Implement SET VERIFY/CLEAR VERIFY function.  When cleared,
0000     57 ;                this flag will cause command script input not to be echoed.
0000     58 ;                This is basically for the System Functional Text (EVXBB).
0000     59 ;
0000     60 ;        09      - Dave Butenhof, 17-Nov-1981, version 6.5
0000     61 ;                Implement type code bytes for all prompts.  The type code
0000     62 ;                will not be used in comparison of script file prompts,
0000     63 ;                but will be typed out to console or log file, if BINARY
0000     64 ;                flag is set.
0000     65 ;
0000     66 ;        10      -Jack Stansbury, 18-Dec-1981, Version 6.6
0000     67 ;                Added a little code in SCRIPT$FLUSH that will clear out the
0000     68 ;                QA bit in the DSA flags. This is to insure that QA gets turned
0000     69 ;                off when a Control-C interrupts a diagnostic in a script file,
0000     70 ;                and a non-continuable command (i.e., one that causes the script
0000     71 ;                file to be flushed) is issued. Before, if a START command was
0000     72 ;                issued, and a Control-C was typed, and a subsequent START
0000     73 ;                command was typed, the second one could be screwed up.
0000     74 ;
0000     75 ;        11      -Jack Stansbury, 26-Feb-1982, Version 6.6
0000     76 ;                Added comments to the DS_GETLINE routine to aid in
0000     77 ;                deciphering it.
0000     78 ;
0000     79 ;        12      - Jack Stansbury, 18-Mar-1982, Version 6.?
0000     80 ;                Took out any reference to the TypMsg routine. This is so
0000     81 ;                that type-coding can be added. Also added some new DS macros
0000     82 ;                that should make this more understandable.
0000     83 ;
0000     84 ;        13      Marion Baggett, 31-Mar-1982, Version 6.7
0000     85 ;                Added SYS$LIBRARY:LIB/
0000     86 ;
0000     87 ;        14      Marion Baggett, 8-Apr-1982, Version 6.7
0000     88 ;                Added type coding.
0000     89 ;
0000     90 ;        15      Jack Stansbury, 12-Apr-1982, Version 6.7
0000     91 ;                Added support for the Customer Runnable Diagnostics package.
0000     92 ;
0000     93 ;        16      John Ciukaj,    4-Apr-1983,     version 6.11
0000     94 ;                - Redefined reference to CRD bits in DSA Flags to
0000     95 ;                  distinguish between online and offline
0000     96 ;
0000     97 ;        17      Peter Green,    20-Jul-1983,    version 6.12
0000     98 ;                Added code to support scripting where prompts are
0000     99 ;                printed to the terminal and an answer is given by
0000    100 ;                the user. This is only done when the script prompt
0000    101 ;                ends with "\\".
0000    102 ;
0000    103 ;        18      M. Baggett      25-Jan-1984     Version 6.14
0000    104 ;                Changed dynamic allocation of XAB, FAB, RAB to static form
0000    105 ;                so script files will work.

Pass 2	324	00:00:03.76	00:00:05.02
Symbol table output	46	00:00:00.28	00:00:00.31
Psect synopsis output	10	00:00:00.04	00:00:00.04
Cross-reference output	153	00:00:01.62	00:00:02.31
Assembler run totals	1778	00:00:25.13	00:00:42.97

The working set limit was 1000 pages.
92599 bytes (181 pages) of virtual memory were used to buffer the intermediate code.
There were 50 pages of symbol table space allocated to hold 927 non-local and 56 local symbols.
1095 source lines were read in Pass 1, producing 0 object records in Pass 2.
134 pages of virtual memory were used to define 54 macros.

Macro library statistics

                        0000     59 ;       12      Install test number range checking, also update DS$GL_NUMTEST.
                        0000     60 ;               fix so DS$M_DONFLG is set by DS_CLEANUP and not checked
                        0000     61 ;               before calling it.
                        0000     62 ;       13      Changes reflected by new structure of basic loop.
                        0000     63 ;               i.e. START and RESTART commands call test program directly
                        0000     64 ;               Roger Riggs             23-OCT-1978     VERSION 07 (ESSAA-5.01)
                        0000     65 ;       14      Changes to VRSTART to support new QIO initialization.
                        0000     66 ;       15      Added code to verify that this program is compatible with
                        0000     67 ;               this supervisor, via ENV$V_SUPER, Value must match
                        0000     68 ;               ENV$_SUPER, in DIAG. Updated when supervisor interface
                        0000     69 ;               changes REQUIRE diagnostic changes.
                        0000     70 ;               Roger Riggs     4-Sept-1979
                        0000     71 ;       17      Removed check of APT flag during start command
                        0000     72 ;               Roger Riggs, 14-Feb-1980, Vervsion 5.2
                        0000     73 ;       18      Changed so program will not be started if QIO initialization
                        0000     74 ;               fails, QIO has already printed the error message.
                        0000     75 ;               Roger Riggs, 12-Mar-1980, Version 5.3
                        0000     76 ;       19      In VRABORT or DSX$ABORT change mode back to kernel before
                        0000     77 ;               doing cleanup but after the abort message is printed
                        0000     78 ;               Roger Riggs, 5-Jun-1980, Version 5.4
                        0000     79 ;
                        0000     80 ;       20      Added code to change mode and stack back to kernel
                        0000     81 ;               before calling cleanup as a result of start.
```

```
                     0000     83 ;        21      - dave butenhof, 09-Sep-1981, version 6.-
                     0000     84 ;                It is desirable, under APT, and if program error had
                     0000     85 ;                occured, to have ABORT leave machine state intact, for
                     0000     86 ;                purposes of isolating error.  Add special code to skip
                     0000     87 ;                INIT_CONTEXT and CLEANUP calls if in APT mode and error
                     0000     88 ;                flag set.
                     0000     89 ;
                     0000     90 ;        22      - Marion Baggett 80-oct-1981 Version 6.-
                     0000     91 ;                Added new entry point to support command SHOW SUPPORT
                     0000     92 ;
                     0000     93 ;        23      - Jack Stansbury, 21-Oct-1981, Version 6.-
                     0000     94 ;                Added calls to QA$MAIN for the QA enhancement.
                     0000     95 ;                Also added .LIBRARY statements for $DS and $DIAG.
                     0000     96 ;
                     0000     97 ;        24      - Jack Stansbury, 22-Oct-1981, Version 6.-
                     0000     98 ;                Fixed truncation errors.
                     0000     99 ;
                     0000    100 ;        25      - Jack Stansbury, 26-Oct-1981, Version 6.-
                     0000    101 ;                Changed most of the error messages to mixed case
                     0000    102 ;                (as per government affirmative action regulations)!
                     0000    103 ;
                     0000    104 ;        26      - Dave Butenhof, 19-Nov-1981, version 6.-
                     0000    105 ;                Add type codes to printouts
                     0000    106 ;
                     0000    107 ;        27      - Jack Stansbury, 16-Nov-1981, Version 6.5
                     0000    108 ;                Added the VRSHOWSECTIONS routine.
                     0000    109 ;
                     0000    110 ;        28      - Jack Stansbury, 21-Nov-1981, Version 6.5
                     0000    111 ;                Commented out three of the calls to QA_MAIN because it
                     0000    112 ;                appears they will not be needed for the 6.5 DS version.
                     0000    113 ;
                     0000    114 ;        29      - Jack Stansbury, 5-Jan-1982, Version 6.6
                     0000    115 ;                Added comments to the START routine in preparation for the
                     0000    116 ;                version 30 changes. Also took out the commented-out calls
                     0000    117 ;                to QA_MAIN since I will not be needing them.
                     0000    118 ;
                     0000    119 ;        30      - Jack Stansbury, 6-Jan-1982, Version 6.6
                     0000    120 ;                Added code and moved other code around in the START routine so
                     0000    121 ;                as to facilitate the "QA Start Loop".
                     0000    122 ;
                     0000    123 ;        31      - Jack Stansbury, 15-Jan-1982, Version 6.6
                     0000    124 ;                Changed the FMT_PROG header line so that it would print the
                     0000    125 ;                number of tests on the first line. Only the time appears on the
                     0000    126 ;                second line. This is in keeping with the EndPass message and
                     0000    127 ;                the End-Of-Looping message (in EndSub).
                     0000    128 ;
                     0000    129 ;        32      - Jack Stansbury, 20-Jan-1982, Version 6.6
                     0000    130 ;                Added code to not print the header line if the QA Loop on
                     0000    131 ;                Subtest check was executing and if a flag bit had been cleared.
                     0000    132 ;                This prevents the header line from being output once for every
                     0000    133 ;                subtest in the diagnostic when the Loop on Subtest check
                     0000    134 ;                routine is executing.
                     0000    135 ;
                     0000    136 ;        33      Marion Baggett, 9-Apr-1982, Version 6.7
                     0000    137 ;                Added .NoShow Conditionals after .IDENT , ordered .LIBRARY
                     0000    138 ;                statements. Change DS$PRINTF statement to use type codes
                     0000    139 ;
```

```
0000   140 ;        34      Richard Brown, 30-June-82, Version 6.8
0000   141 ;                Addition of call to MAP_DEBUGGER so repeated STARTs will
0000   142 ;                not wipe out the debugger once it has been loaded.
0000   143 ;                Also, addition of loading debugger before diagnostic is
0000   144 ;                started, if proper flag is set.
0000   145 ;
0000   146 ;        35      Marion Baggett, 24-Sept-82  Version 6.9
0000   147 ;                Fixed truncation error.
0000   148 ;
0000   149 ;        36      Bob Bergazzi    2-Nov-1982      Version 6.9
0000   150 ;                Changed VRSTART so that if we are loaded under APT do not
0000   151 ;                check the DSA$V_LOAD_DEBUGGER flag. APT sets this flag for
0000   152 ;                reasons long since lost. When running under APT, every
0000   153 ;                START would cause the supervisor to try and load the debugger
0000   154 ;                from the console device and cause APT to timeout.
0000   155 ;
0000   156 ;        37      Jack Stansbury, 8-Mar-1983, Version 6.11
0000   157 ;                Changed the abort routines to make sure they print the true
0000   158 ;                (if there is one) user PC.
0000   159 ;
0000   160 ;        38      John Ciukaj     3-May-1983      Version 6.11
0000   161 ;                - Alter Start routine so that an error does not occur
0000   162 ;                  when an ambiguous section name is found AND the section name
0000   163 ;                  is equivalent to the name entered.
0000   164 ;
0000   165 ;        39      Bob Bergazzi    May 16, 1983    Version 6.11
0000   166 ;                Changed the order of the .LIB statements.
0000   167 ;
0000   168 ;        40      Bob Bergazzi    Sep 21, 1983    Version 6.13
0000   169 ;                Added BIN_TIME quadword in PSECT WORK for START/TIME switch.
0000   170 ;                Just before call to DISPATCH, do a $SETIMR if /TIME was given.
0000   171 ;                Commented out for version 6.13 and 6.14, and 7.0
0000   172 ;
0000   173 ;        41      Bob Bergazzi    Jan. 26, 1984   Version 6.14
0000   174 ;                Fixed ABORT so it won't print out VMS system addresses as the
0000   175 ;                user PC.

                        963          .SBTTL  DSI$TIME_AST Routine
                        964 ;++
                        965 ; FUNCTIONAL DESCRIPTION:
                        966 ;
                        967 ;       This is the AST routine for the /TIME switch on the START command.      [40]
                        968 ;       Since we come here
                        969 ;       via an AST from a $SETIMR, the AP points to a parameter list which has
                        970 ;       the PC in the program or supervisor to return to. This routine modifies
                        971 ;       that PC to point to the DSI$ABORT routine. Note that the PC in the call
                        972 ;       frame cannot be changed, since it points to a VMS (or VDS) routine
                        973 ;       which cleans up after the AST. The value of R0 which is contained in the
                        974 ;       parameter list is replaced with the PC, so that DSI$ABORT can decide
                        975 ;       if the PC was in the program or not.
                        976 ;
                        977 ; CALLING SEQUENCE:
                        978 ;
                        979 ;       Called with a CALLG from system service which delivers ASTs.
                        980 ;
                        981 ; INPUT PARAMETERS:

Pass 2	267	00:00:03.59	00:00:04.67
Symbol table output	57	00:00:00.34	00:00:00.64
Psect synopsis output	7	00:00:00.04	00:00:00.07
Cross-reference output	124	00:00:01.77	00:00:02.15
Assembler run totals	1585	00:00:22.75	00:00:34.99

The working set limit was 1000 pages.
102702 bytes (201 pages) of virtual memory were used to buffer the intermediate code.
There were 40 pages of symbol table space allocated to hold 573 non-local and 47 local symbols.
1007 source lines were read in Pass 1, producing 0 object records in Pass 2.
114 pages of virtual memory were used to define 28 macros.

Assembler run totals	1015	00:00:22.22	00:01:09.34

The working set limit was 1000 pages.
71[illegible] bytes (141 pages) of virtual memory were used to buffer the intermediate code.
There were 70 pages of symbol table space allocated to hold 1284 non-local and 17 local symbols.
602 source lines were read in Pass 1, producing 0 object records in Pass 2.
51 pages of virtual memory were used to define 18 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYSO.SYSMAINT]DS.MLB;218	1
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	0
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	6
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	7
TOTALS (all libraries)	14

1185 GETS were required to define 14 macros.

There were no errors, warnings or information messages.

Assembler run totals	539	00:00:07.46	00:00:19.09

The working set limit was 1000 pages.
23413 bytes (46 pages) of virtual memory were used to buffer the intermediate code.
There were 30 pages of symbol table space allocated to hold 431 non-local and 17 local symbols.
236 source lines were read in Pass 1, producing 0 object records in Pass 2.
14 pages of virtual memory were used to define 8 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	0
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	0
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	5
TOTALS (all libraries)	5

481 GETS were required to define 5 macros.

There were no errors, warnings or information messages.

Symbol table output	1	00:00:00.01	00:00:00.01
Psect synopsis output	4	00:00:00.03	00:00:00.15
Cross-reference output	4	00:00:00.03	00:00:00.03
Assembler run totals	341	00:00:02.06	00:00:07.21

The working set limit was 950 pages.
1101 bytes (3 pages) of virtual memory were used to buffer the intermediate code.
There were 10 pages of symbol table space allocated to hold 6 non-local and 1 local symbols.
73 source lines were read in Pass 1, producing 0 object records in Pass 2.
0 pages of virtual memory were used to define 0 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYSO.SYSMAINT]DS.MLB;218	0
DMA1:[SYSO.SYSMAINT]DIAG.MLB;953	0
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	0
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	0
TOTALS (all libraries)	0

0 GETS were required to define 0 macros.

There were no errors, warnings or information messages.

Psect synopsis output	3	00:00:00.01	00:00:00.02
Cross-reference output	7	00:00:00.08	00:00:00.08
Assembler run totals	492	00:00:06.33	00:00:12.62

The working set limit was 1000 pages.
19914 bytes (39 pages) of virtual memory were used to buffer the intermediate code.
There were 30 pages of symbol table space allocated to hold 413 non-local and 1 local symbols.
162 source lines were read in Pass 1, producing 0 object records in Pass 2.
9 pages of virtual memory were used to define 7 macros.

Macro library statistics

Macro library name	Macros defined
DMA1:[SYS0.SYSMAINT]DS.MLB;218	0
DMA1:[SYS0.SYSMAINT]DIAG.MLB;953	0
SYS$SYSROOT:[SYSLIB]LIB.MLB;1	0
SYS$SYSROOT:[SYSLIB]STARLET.MLB;2	4
TOTALS (all libraries)	4

464 GETS were required to define 4 macros.

There were no errors, warnings or information messages.
