Production Note

This book was produced with the VAX DOCUMENT electronic publishing system, a software tool developed and sold by Digital. In this system, writers use an ASCII text editor to create source files containing text and English-like code; this code labels the structural elements of the document, such as chapters, paragraphs, and tables. The VAX DOCUMENT software, which runs on the VMS operating system, interprets the code to format the text, generate a table of contents and index, and paginate the entire document. Writers can print the document on the terminal or line printer, or they can use Digital-supported devices, such as the LN03 laser printer and PostScript printers (PrintServer 40 or LN03R ScriptPrinter), to produce a typeset-quality copy containing integrated graphics.

Introduction

The *VMS General User Master Index* is an edited compilation of the individual indexes for books in the VMS Version 5.4 General User Subkit.

Each main entry in the *VMS General User Master Index* is followed by an abbreviated book title and a reference to the page where the topic appears in that book. For example, an entry in the master index might appear in the following way:

Login command procedure • Files and Devices, 2-8;
Command Procedures, 1-9

This entry indicates that you can find information about login command procedures in the following places:

- Page 2–8 in the *Guide to VMS Files and Devices*
- Page 1–9 in the *Guide to Using VMS Command Procedures*

The subentries, if any, contain more specific information about the topic. For example, some subentries listed under *Login command procedure* are as follows:

alternate
execution of for batch jobs
system-defined

The following table lists the abbreviated names used in the *VMS General User Master Index* to reference each manual, the volume number of the binder that contains the manual, and the full manual title that corresponds to the abbreviated name:
