

Virtual Machine/System Product

SC24-5264-02

**System Messages
Cross-Reference**

Release 6

Third Edition (August 1988)

This edition, SC24-5264-02, is a major revision of SC24-5264-01, and applies to the Virtual Machine/System Product Release 6, program number 5664-167, and to all subsequent releases of this product until otherwise indicated in new editions or Technical Newsletters. Changes are made periodically to the information herein; before using this publication in connection with the operation of IBM systems, consult the latest *IBM System/370, 30xx, 4300, and 9370 Processors Bibliography*, GC20-0001, for the editions that are applicable and current.

Summary of Changes

For a list of changes, see "Summary of Changes" on page 485.

Technical changes and additions to text and illustrations are indicated by a vertical line to the left of the change.

References in this publication to IBM products, programs, or services do not imply that IBM intends to make these available in all countries in which IBM operates. Any reference to an IBM licensed program in this publication is not intended to state or imply that only IBM's licensed program may be used. Any functionally equivalent program may be used instead.

Ordering Publications

Requests for IBM publications should be made to your IBM representative or to the IBM branch office serving your locality. Publications are *not* stocked at the address given below.

A form for readers' comments is provided at the back of this publication. If the form has been removed, comments may be addressed to IBM Corporation, Information Development, Dept. G60, P.O. Box 6, Endicott, New York, U.S.A. 13760. IBM may use or distribute whatever information you supply in any way it believes appropriate without incurring any obligation to you.

Preface

This publication is a reference manual for all users. It contains cross-reference listings of all messages produced by the IBM Virtual Machine/System Product (VM/SP).

"Chapter 1: Introduction", discusses message format, syntax conventions, and how messages are displayed at the terminal and in other languages. The remaining four chapters in this book, each contain different types of message listings. The chapters are organized as follows:

- Chapter 2 - by command
- Chapter 3 - by module code
- Chapter 4 - by message number
- Chapter 5 - by message text.

Each of these message chapters has five parts, one for each component of VM:

- Control Program (CP) Messages
- Conversational Monitoring System (CMS) Messages
- Interactive Problem Control System (IPCS) Messages
- Group Control System (GCS) Messages
- Transparent Services Access Facility (TSAF) Messages.

You can refer to the *VM/SP System Messages and Codes* book for an explanation, system action, and response of all error messages.

Note: New or changed messages for this release are indicated by a vertical line to the left of the message.

Introduction

This chapter describes:

- The format of messages VM/SP generates
- Syntax conventions used in this publication
- How messages are displayed at the terminal and in other languages.

VM/SP Message Format

Messages consist of a message identifier (for example, DMKCQG020E) and message text. The identifier distinguishes each message. The text is a phrase or sentence describing a condition that has occurred or requesting a response from the user.

The message identifier consists of four fields: a prefix, a module code, a message number, and a type code. The format of the message identifier is:

xxxmmnnns

where:

xxx is the prefix. Messages are prefixed as follows:

- CP messages -- DMK
- CMS messages -- DMS
- IPCS messages -- DMM
- GCS messages -- CSI
- TSAF messages -- ATS

mmm is the module code. These three letters indicate which module generated the message. This field is usually an abbreviation of the module name in which the error occurred.

nnn is the message number. These three digits are associated with the condition that caused the message to be generated.

s is the severity code. This letter indicates what kind of condition caused the message. The definition of the severity codes depends on the nature of the component producing the message.

Figure 1 summarizes the message severity codes for each of the four VM/SP components.

Figure 1. Types and Meanings of Severity Codes		
Prefix	Code	Meaning
CP Commands (DMK)	R	Response ¹
	A	Immediate action required
	I	Information only
	W	Warning or System Wait
	E	Error
CMS Commands (DMS)	R	Response ¹
	I	Information only
	W	Warning
	E	Error
	S	Severe error
IPCS Commands (DMM)	R	Response ¹
	I	Information only
	E	Error
	S	Severe error
GCS Commands (CSI)	R	Response ¹
	I	Information only
	W	Warning
	E	Error
	S	Severe error
TSAF Commands (ATS)	T	Terminating error
	S	Severe error
	E	Error
	W	Warning
	I	Information only

APPC/VM VTAM Support Messages

Error message listings and explanations for APPC/VM VTAM Support (AVS) are located in the *VM/SP System Messages and Codes* manual. No message cross-reference listings for AVS commands are included in this book. Additional information on AVS commands and responses can be found in the *VM/SP Connectivity Programming Guide and Reference* manual.

VM/SP System Product Editor Messages

Error messages for the System Product Editor are located in the CMS section of this publication. These messages can range from DMSmmm497E to DMSmmm700E. However, all messages within the DMSmmm500E to DMSmmm599S range pertain only to the System Product Editor.

¹ For Response (R), the system waits for a response from the user.

Messages With 4nxx Identifiers

All messages issued from the CMSBAM physical saved segment, as well as many of the messages issued from the CMSVSAM and CMSAMS physical saved segments, are identified by a 4nxx prefix. The text of these messages is in VSE format rather than the standard CMS format. Explanations for these messages are not in this book. The appropriate message book for referencing 4nxx prefix messages is determined by the associated access method. Messages relating to Sequential Access Method (SAM) are described in *VSE/Advanced Functions Messages*. Messages relating to Virtual Storage Access Method (VSAM) are described in *VSE/VSAM Messages and Codes*.

Unnumbered Responses

All regular, unnumbered responses indicating the successful completion of a command (such as ready messages) are included in the following publications:

- *VM/SP CP General User Command Reference* (CP commands) and
- *VM/SP CMS Command Reference* (CMS commands).

Unnumbered responses can also come from executing system generation macro instruction or service programs. These responses, known as MNOTES, are documented in logic listings only.

VM/SP Message Syntax Conventions

VM/SP message syntax is documented in this book as follows:

1. For uppercase messages (some CP, some CMS, some TSAF, and all IPCS messages), variables are denoted by lowercase. For mixed-case messages (most CP, most CMS, most TSAF, and all GCS messages), variables are denoted by italics. These variable names are replaced at execution time with the information they describe.

Note: There may be situations where a message is displayed in both mixed and uppercase. This depends on the method used by the individual module. Some modules display the messages differently.

See Figure 2 on page 4 for a partial list of variables used in this publication. (This table does not contain every message variable; just those that might be a little more difficult to identify.)

2. Any quote (') in message text in the book will be displayed when the message appears on your screen.
3. Anything within braces {...|...} indicates alternate text that will be selected at execution time.
4. Anything within brackets [...] may be optionally left out, depending on the condition arising.

Figure 2 (Page 1 of 2). Selected Message Variables	
Variable	Meaning
a...	alphabetic or numeric information
addr	address
bbcchh	bin, cylinder, and head
cc	cylinder number
cchhr	cylinder, head, record
char	character
col	column
cm	command code, in hexadecimal
cpuid	central processing unit identification
csw	channel status word
date	system date
devclass	IBM device class
devname	mnemonic name for an IBM device type
devtype	IBM device type
execname	filename of an exec
exectype	filetype of an exec
fileid	fn ft [fm]
fm	file mode
fn	file name
ft	file type
hexloc	hexadecimal location
imagelib	3800 printer image library
libname	library name
lrecl	logical record length
membername	library member name
mode	mode letter, or mode letter and mode number
mmm	module name code
module	module name
n...	decimal information
nodeid	node of a user
page	page number
pathid	virtual machine path identification
prefix	prefix subcommand or macro
psw	program status word
range	range (of addresses or registers)

Figure 2 (Page 2 of 2). Selected Message Variables

Variable	Meaning
rdev	real device address (formerly 'raddr' or 'cuu')
recfm	record format
rid	resource identifier
routine	CMS or GCS routine
rr	record number
rstor	real storage address
segname	segment name
sense	sense bytes
spoolid	spool file identification
storarea	storage area
subl.book	a book of a sublibrary
svc	supervisor call number
sysname	system name
vdev	virtual device address (formerly 'vaddr' or 'cuu')
vname	virtual screen name
volid	volume serial number
vstor	virtual storage address
wname	window name
x...	hexadecimal information
yyyy	reason code (GCS abend)

Displaying Messages at the Terminal

When you log on to VM/SP at your terminal, the default setting for displaying messages is TEXT. This means that only the text portion of the message appears when the message is displayed. The message identifier is not displayed.

Because this book is organized by message numbers within component codes, it will be difficult for you to find the explanations of messages if you search through the book for the message text. Therefore, you should issue the CP command, SET EMSG ON, after you log on. This command causes the message identifier to be displayed along with the text.

Note: If you do not use the SET EMSG ON command, you can still determine the message identifier by referring to "Message Summary by Text" on page 349. This chapter has the messages listed in alphabetical order by message text, along with the identifier.

Displaying Messages in Other Languages

All messages are documented in this book in American English; however, most messages are displayed at your terminal in the language set for your virtual machine. If your virtual machine is set to another language (either by the **SET LANGUAGE** command or the **OPTION LANG** directory statement), you will receive most VM/SP messages in this language.

Message Summary by Command

This chapter contains an alphabetical listing of CP, CMS, IPCS, GCS, and TSAF commands together with their associated messages. Under each command, the messages are listed in message-number sequence within module code.

Use this section when you want to find all the messages that a particular command generates.

CP Message Summary by Command

ACNT

DMKACP425E I/O error on spool device during accounting
 DMKCPV003E Invalid option - *option*
 DMKCPV007E Invalid userid - *userid*
 DMKCPV020E Userid missing or invalid
 DMKCPY045E *userid* not logged on

ADSTOP

DMKCFD004E Invalid hexloc - *operand*
 DMKCFD021E Real device address missing or invalid
 DMKCFD022E Virtual device address missing or invalid
 DMKCFD026E Operand missing or invalid
 DMKCFD160E Hexloc *hexloc* exceeds storage
 DMKCFD164E Hexloc *hexloc* non-addressable storage

ATTACH

DMKACR149E DEVICE PATH *rdev* PRESENTED CC=3 ON I/O REQUEST

DMSLBM047E	No function specified
DMSLBM056E	File <i>fn ft [fm]</i> contains invalid record formats
DMSLBM069E	{[Output]{filemode disk} <i>mode</i> [(<i>vdev</i>)] Directory <i>dirname</i> } not accessed
DMSLBM070E	Invalid parameter <i>parameter</i>
DMSLBM104S	Error <i>nn</i> reading file <i>fn ft fm</i> from disk
DMSLBM105S	Error <i>nn</i> writing file <i>fn ft fm</i> on disk
DMSLBM109S	Virtual storage capacity exceeded
DMSLBM157S	MACLIB limit exceeded[, last member added was <i>membername</i>]
DMSLBM167S	Previous MACLIB function not finished
DMSLBM213W	Library <i>libname</i> not created [,or erased if empty]
DMSLBM688E	XEDIT option only valid from XEDIT environment
DMSLBM689E	File must be F-format 130 or V-format
DMSLBM907T	I/O error on file <i>fn ft fm</i>

MACLIST Command

DMSWML002E	File <i>fn</i> MACLIB * not found
DMSWML651E	APPEND must be issued from MACLIST
DMSWML668E	The APPEND option must be specified alone

MAXIMIZE WINDOW Command

DMSMAX386E	Missing operand(s)
DMSMAX388E	Invalid keyword: <i>keyword</i>
DMSMAX391E	Unexpected operand(s): <i>operand</i>
DMSMAX921E	Window <i>wname</i> is not defined

MINIMIZE WINDOW Command

DMSMIN386E	Missing operand(s)
DMSMIN388E	Invalid keyword: <i>keyword</i>
DMSMIN391E	Unexpected operand(s): <i>operand</i>
DMSMIN921E	Window <i>wname</i> is not defined

MODIFY USER Command

(Also calls DMSOUTCK, DMSOUTGO, DMSSDM, and DMSJNL messages)

DMSJMF389E	Invalid <i>operandtype</i> : <i>operand</i>
DMSJMF1167E	Userid <i>userid</i> is not enrolled
DMSJMF1171E	You are attempting to delete too much storage for <i>userid</i>
DMSTJP1294E	The requested block increment exceeds the maximum allowed for userid <i>userid</i>

MODMAP Command

DMSMDP001E	No filename specified
DMSMDP070E	Invalid parameter <i>parameter</i>

MOREHELP Command

DMSMOR353E	No previous HELP command has been entered. Please enter HELP MOREHELP for information on the MOREHELP command.
DMSMOR354E	Related information is not available for the last HELP command entered.
DMSMOR639E	Error in <i>routine</i> routine; return code was <i>nn</i>

MOVEFILE Command

DMSMVE002E File{(s)} [*fn* [*ft* [*fm*]]] not found
DMSMVE003E Invalid option: *option*
DMSMVE037E [Output]{filemode|disk} *mode*[(*vdev*)] is [accessed as] read/only [; *fm* must be R/W for {DISK LOAD|CSLGEN}]
DMSMVE041E Input and output files are the same
DMSMVE069E {[Output]{filemode|disk} *mode*[(*vdev*)]|Directory *dirname*} not accessed
DMSMVE070E Invalid parameter *parameter*
DMSMVE075E Device *devtype* invalid for {input|output}
DMSMVE086E Invalid DDNAME *ddname*
DMSMVE127S Unsupported device for DDNAME
DMSMVE128S I/O error on input after reading *nnn* records; input error code on DDNAME
DMSMVE129S I/O error on output writing record number *nnnn*; output error code on DDNAME
DMSMVE130S Blocksize on V format file *ddname* is less than 9
DMSMVE225I PDS member *membername* moved
DMSMVE226I End of PDS move
DMSMVE232E Invalid RECFM--spanned records not supported
DMSMVE706I Terminal input; type null line for end of data
DMSMVE708I Disk file *fn* *ddname* A1 assumed for DDNAME *ddname*
DMSMVG089E Open error code *nn* on {*fn*|SYSaaa|TAP*n*}

NAMEFIND Command

(Also calls FSOPEN messages)

DMSNAM002E Files [*fn* [*ft* [*fm*]]] not found
DMSNAM003E Invalid option: *option*
DMSNAM029E Invalid parameter *parameter* in the option *option* field
DMSNAM104S Error *nn* reading file *fn* *ft* *fm* from {disk|XEDIT}
DMSNAM156E Record *nnn* not found-- the file *fn* *ft* *fm* has only *nnn* records
DMSNAM618E NUCEXT failed
DMSNAM621E Bad plist: *message*
DMSNAM622E Insufficient [free] storage [*message*]
DMSNAM622W Insufficient free storage for NAMEFIND buffer, processing continues
DMSNAM633E Too many tags were encountered--maximum is 64 per line
DMSNAM633W Returned values were truncated
DMSNAM634E No value to search for was specified
DMSNAM635I No entries were found that matched your search criteria
DMSNAM637E Missing value for the *option* option
DMSNAM688E XEDIT option only valid from XEDIT environment

NAMES Command

DMSWNM006E No read/write disk accessed
DMSWNM645W The user tag name *name* is too long to display in the panel
DMSWNM653E Error executing GLOBALV
DMSWNM656E Error searching your NAMES file; rc=*nn* from NAMEFIND command
DMSWNM657E Undefined PFkey/PAkey
DMSWNM658W The value for the *tag* tag is too long to display on the panel
DMSWNM660E The nickname field must be filled in
DMSWNM660W Warning: this entry duplicates an existing nickname
DMSWNM662E You are not on an entry; press PF 5, 7 or 8 to move to an entry
DMSWNM663W There is/are *nn* undisplayed tag(s)
DMSWNM664E Entry not found
DMSWNM664E Next entry not found
DMSWNM664E Previous entry not found

NCPDUMP Command

See "NCPDUMP (A CMS command)" on page 20 for a list of these messages.

NETDATA Command

DMSDDL109S	{Virtual storage capacity exceeded Storage exceeded Insufficient free storage available}
DMSDDL1138E	File sharing conflict [{involving file <i>fn</i> for file <i>fn ft fm</i> }]
DMSDDL1262S	Error <i>nnn</i> {opening closing} file <i>fn ft fm</i>
DMSDDL1285S	Default option <i>option</i> is invalid

NOTE Command

DMSWNT006E	No read/write disk accessed
DMSWNT637E	Missing {value nodeid} for the { <i>option option</i> <i>operand operand</i> }
DMSWNT647E	Userid not specified for <i>nickname</i> in <i>userid</i> NAMES file
DMSWNT648E	Userid <i>name</i> not found; check the <i>userid</i> NAMES file
DMSWNT651E	ADD must be issued from NOTE
DMSWNT651E	CANCEL must be issued from NOTE
DMSWNT665E	File <i>userid</i> NOTE * not found; to begin a new note, enter NOTE <i>name</i>
DMSWNT666E	NOTE already exists; enter NOTE to continue or specify REPLACE option
DMSWNT667E	Note header does not contain the {keyword FROM keyword TO OPTIONS line DATE line}
DMSWNT668E	ADD option must be specified alone
DMSWNT669E	List of addressees cannot begin with CC:
DMSWNT670E	No names to be added were specified
DMSWNT676E	Invalid character * for Network ID
DMSWNT677E	Invalid option: <i>option</i> in option line

NUCXDROP Command

DMSNXD050E	Parameter missing after NUCXDROP
DMSNXD070E	Invalid argument <i>argument</i>
DMSNXD616W	<i>name</i> does not exist
DMSNXD617E	Error code <i>nn</i> from DMSFRET while unloading <i>module</i> module
DMSNXD624W	No nucleus extensions are loaded

NUCXLOAD Command

DMSNXL001E	No filename specified
DMSNXL070E	Invalid parameter <i>parameter</i>
DMSNXL589E	Missing FILEDEF for DDNAME SYSIN
DMSNXL618E	NUCEXT failed
DMSNXL619E	Module <i>module</i> not found
DMSNXL622E	Insufficient [free] storage [<i>message</i>]
DMSNXL639E	Error in DMSRLD routine; return code was <i>nnn</i>

NUCXMAP Command

DMSNXM070E	Invalid parameter <i>parameter</i>
DMSNXM622E	Insufficient [free] storage [<i>message</i>]
DMSNXM624I	No nucleus extensions are loaded
DMSPGM941I	{User program Nucleus extension} <i>progid</i> is not loaded

Open Library Command for CMS/DOS

DMSOPL089E Open error code *nn* on {*fn*|SYSaaa|TAP*n*}
 DMSOPL099E I/O error reading *vdev*
 DMSOPL158E No CMS/DOS procedure library support

OPTION Command

DMSOPT070E Invalid parameter *parameter*
 DMSOPT099E CMS/DOS environment not active

OSRUN Command

DMSLOS002I File(s) *fn* LOADLIB not found
 DMSLOS013E Member *membername* not found in library *libname*
 DMSLOS073E Unable to open file *ddname*
 DMSOSR001E No filename specified
 DMSOSR052E More than 100 characters of options specified
 DMSOSR070E Invalid parameter *parameter*

Parsing Messages

 DMSRCT1809E A *function* tape error has occurred with return code *rc*.
 DMSRCT1824E {*vdev|dirname*}, accessed as *fm*, is not R/W.
 DMSRCT1840W The AUX file entries in *fn1 ft1 fm1* and *fn2 ft2 fm2* do not match.
 DMSRCT1862I The LTO option was specified, but not all targets are accessed R/W as required. The LTO option has been set off.

 DMSRCT1875E XEDIT cannot save a file. Correct the problem and re-start the procedure.
 DMSRCT1899E There is a problem loading a file.
 DMSREC003E Invalid option: *option*
 DMSREC1801E There is no tape mounted on 181. Mount the correct tape and restart the receive procedure.

 DMSREC1802R The tape mounted is at a lower service level than the existing service map. The service tape is at service level *level* The SERVICE DISKMAP file indicates service level *service-level*. Is that what you want? (YES/NO)

 DMSREC1803E The tape is in the wrong format. Mount the correct tape and restart the receive procedure.

 DMSREC1804I Receiving service for {product *prodid*|component *compname* of product *prodid*}
 DMSREC1805E No parameters were entered. Check the syntax and re-enter the command.
 DMSREC1806I The current SERVICE DISKMAP contains the map of the mounted tape.
 DMSREC1807E *routine* cannot continue; the *fn ft* file was not found.
 DMSREC1808E The *ppfname* \$PPF product parameter file was not found.
 DMSREC1809E A *function* tape error has occurred with return code *rc*.
 DMSREC1811W The access of {*vdev|dirname*} failed for product *prodid*:
 DMSREC1812E Service for *prodid* is not on the mounted tape but the *prodid* product ID is in the SERVICE DISKMAP file. It is on the service tape mapped with a relative tape number of *number*.

 DMSREC1813E *option1* and *option2* are conflicting options.
 Check the syntax and re-enter the command.
 DMSREC1814E Service for the product ID *prodid* is on the mounted tape, but the *prodid* product ID is not in the SERVICE DISKMAP file.

 DMSREC1815E *parameter* is an unknown parameter. Check the syntax and re-enter the command.
 DMSREC1816E *parameter* is an unknown parameter. This product ID is not on the tape or in the SERVICE DISKMAP file.

 DMSREC1818E The product service header file cannot be found. The tape positioning might be in error. Restart the receive procedure beginning with service for product ID *prodid*.

 DMSREC1821E All file modes are being used. The previous access order will be restored.
 DMSREC1822W Access to {*vdev|dirname*} cannot be restored.
 DMSREC1838E The service exec requires file mode C to be accessed as R/W. Access mode C as R/W and re-try.

 DMSREC1850I The processing for *part-name* by the *fn* EXEC was bypassed.
 DMSREC1851I processing *fn ft* with the part handler *fn* EXEC.
 DMSREC1852I This is *volume-number* of *total-volumes* level *level* {PUT|COR} tape.
 DMSREC1860I *compname* is an invalid component name for product *prodid*.
 DMSREC1861W The *fn* service exec completed with return code *rc message*
 DMSREC1863W Service has been received on the S minidisk.
 Module generation and/or reIPL of CMS might be required.

 DMSREC1869R *prodid compname* begins on PUT|COR *tapenum* volume *vol*. Mount volume *vol* and press ENTER or type QUIT.

 DMSREC1871R Do you want to continue: (YES/NO)

- DMSREC1872E COR is a nonsupported option for the *prodid* product ID. The tape has been positioned to the beginning of the product's first file. Use the product's corrective service procedure to process.
- DMSREC1873W *prodid compname* relative tape file *number, label* is listed in the product directory but is not in the \$PPF file. This tape file will not be received.
- DMSREC1874R The *execname* option *PUT|COR* does not match the type of the mounted tape *PUT|COR*. Do you want to continue? (YES/NO)
- DMSREC1875E XEDIT cannot save a file. Correct the problem and re-start the procedure.
- DMSREC1877R *prodid compname* begins on *PUT|COR tapenum* volume *vol*. Do you want to continue? (YES/NO)
- DMSREC1878I No files have been found for *prodid compname* on the *PUT|COR level level*.
- DMSREC1879R *product-name component-name* on *PUT|COR level- number* volume *vol-number* continues on volume *vol-number2*. Mount volume *vol-number2* and press ENTER or type QUIT.
- DMSREC1887W The *fn* EXEC file was not found. The {user exit| part handler} *fn* was not executed.
- DMSREC1889E The *ppfname* \$PPF product parameter file contains invalid data on the *record* record
- DMSREC1890E The *ppfname* \$PPF product parameter file is invalid. *record* is missing or out of order. Correct the file and retry.
- DMSREC1891E Part handler *name* failed for component *compname* of product ID *prodid*.
- DMSREC1894W Ensure that all parts of *prodid compname* have been received before proceeding to the APPLY step.
- DMSREC1897E A problem occurred reading file *fn ft* while function *function* was executing.
- DMSREC1898E A record cannot be written to file *fn ft fm*.
- DMSREC1899E There is a problem loading a file.
- DMSRUP1809E A *function* tape error has occurred with return code *rc*.
- DMSRUP1824E {*vdev|dirname*}, assessed as *fm*, is not R/W.
- DMSRUP1864E *service exec* previously failed for *prodid compname1* on PUT *level1*.
You must rerun *service-exec* for *prodid compname1* on PUT *level1* before running *service-exec* for *prodid compname2* on PUT *level2*
- DMSRUP1865W Update files for *prodid compname* have been found on the target. The target should be empty. The MERGE tag parameter in the \$PPF file might be improperly specified.
- DMSRUP1866W Duplicate update files have been found in the target and APPLY access orders. Merge might not have been done correctly.
- DMSRUP1871R Do you want to continue: (YES/NO)
- DMSRUP1875E XEDIT cannot save a file. Correct the problem and re-start the procedure.

CSIERW421S Disk '*mode (vdev)*' is full
 CSIPIO005S Virtual storage capacity exceeded
 CSIPIO028S Device *vdev* not attached
 CSIPIO029S Unit check on device *vdev*. CSW = *csw*, SENSE = *sense*
 CSIPIO030S Unrecoverable I/O error on device *vdev*. CSW = *csw*
 CSIPIO030T Unrecoverable I/O error on device *vdev*. CSW = *csw*
 CSIPIO346S Intervention required on device *vdev*

GCS Initialization Routine

CSIINI129T No virtual console attached. Re-IPL *sysname*.
 CSIINI130T Virtual console not ready. Re-IPL *sysname*.
 CSIINI131T ECMODE must be set ON to IPL *sysname*.
 CSIINI134I *sysname* has *nnnnnnnn* bytes of available common free storage
 CSIINI138T *nnnnnnnn* bytes needed for requested number of users exceeds available common free storage of *mmmmmmmmmm* bytes
 CSIINI139T *nnnnnnnn* bytes needed for requested trace size exceeds available common free storage of *mmmmmmmmmm* bytes
 CSIINI142T Storage needed for Storage Management exceeds available common free storage. Define more common storage.
 CSIINI143T Storage needed for Storage Management exceeds available private free storage. Define more private storage.
 CSIINS109T System *sysname* defined in DMKSNT with NAMESYS parameter VMGROUP=NO
 CSIINS129T No virtual console attached. Re-IPL *sysname*.
 CSIINS130T Virtual console not ready. Re-IPL *sysname*.
 CSIINS131T ECMODE must be set ON to IPL *sysname*.
 CSIINS132S Segment '*segname*' does not exist
 CSIINS133S Paging I/O error for segment '*segname*'
 CSIINS135T Group allocation exceeded for system '*sysname*'
 CSIINS136T Recovery machine '*userid*' is not IPLed. System '*sysname*' cannot be initialized
 CSIINS143T Storage needed for Storage Management exceeds available private free storage. Define more private storage.
 CSIIUI401I Directory error encountered during initialization of the IUCV environment
 CSIIUI402I A GETMAIN error occurred while trying to obtain storage for the *sysname* IUCV Path Table
 CSIIUI403I An IUCV CONNECT error occurred while trying to connect to CP Signal Services. IPRCODE = *xx*.

I/O Routines

CSIFNS005T Virtual storage capacity exceeded
 CSIFNS030T Unrecoverable I/O error on device *vdev*. CSW = *csw*
 CSIFNS420T File system error detected. Virtual address '*vdev*'. Reason code *nn*.
 CSISCT306S Input error '*nnn*' on '*ddname*'
 CSISCT307S Output error '*nnn*' on '*ddname*'
 CSISER306S Input error '*nnn*' on '*ddname*'
 CSISER307S Output error '*nnn*' on '*ddname*'

INTERRUPT Handling Routines

CSIITP400T Program Exception *code* occurred at *vstor* in system routine *name*. Re-IPL *sysname*.
 CSIITP432T Program exception *code* occurred at *vstor* while no task active, re-IPL *sysname*
 CSIITS032T Supervisor error {1|2}. Re-IPL *sysname*
 CSIIXT431T SEVER external interrupt has occurred on the Signal Services Path. Re-IPL *sysname*.

IUCV Interface

CSIIUE032T Supervisor error 2. Re-IPL *sysname*
 CSIIUM032T Supervisor error 2. Re-IPL *sysname*
 CSIIUS032T Supervisor error 2. Re-IPL *sysname*
 CSIIUX032T Supervisor error 2. Re-IPL *sysname*

Message Summary by Module Code

This chapter lists all the CP, CMS, IPCS, GCS, and TSAF messages alphanumerically, in order by module code. For each module, the messages are listed in message number sequence.

Use this section when you want to find all the messages that are issued by a particular module.

CP Message Summary by Module Code
ACO

DMKACP425E I/O error on spool device during accounting

ACR

DMKACR149E DEVICE PATH rdev PRESENTED CC=3 ON I/O REQUEST

IUC

DMSIUC754W Label MSGEXIT, the IUCV Pending Connect exit, was given control. This is an error.

DMS

- DMSIUC911E An IUCV sever error occurred on path *pathid*, iprcode = *xx*; severing of other paths continues
- DMSIUC1070T An error occurred while establishing the CMS IUCV support environment. Re-IPL CMS.

IUH

- DMSIUH910T An error occurred while {the IUCV interrupt handler|private server processing} was trying to sever IUCV path *pathid*; re-IPL CMS

JAL

- DMSJAL002E [Input|Overlay] {File(s)|Dataset|Note } *fn ft [fm]*] not found
- DMSJAL1160E Directory *dirname* already open
- DMSJAL1163E The *command* command failed for {*fn ft fm|dirname*}
- DMSJAL1184E [File|Directory] [*fn ft fm|dirname | dirname*] not found or you are not authorized for it
- DMSJAL1210E Directory *dirname* [or directory *dirname*] not found [or you are not authorized to use RELOCATE on one of these directories.]
- DMSJAL1241E Directories specified are in different file pools
- DMSJAL1312E A filemode number may not be specified with the filemode of an alias

JAU

- DMSJAU002E [Input|Overlay] {File(s)|Dataset|Note } *fn ft [fm]*] not found
- DMSJAU065E *option* option specified twice
- DMSJAU066E *option1* and *option2* are conflicting options
- DMSJAU386E Missing operand(s)
- DMSJAU391E Unexpected operands(s): *operands*
- DMSJAU1163E The *command* command failed for {*fn ft fm|dirname* }
- DMSJAU1184E [File|Directory] [*fn ft fm|dirname | dirname*] not found or you are not authorized for it
- DMSJAU1198E {File|directory} *fn ft| fm|dirname* is currently open; it must be closed before {it can be erased|you can change the authority to any file in it}
- DMSJAU1210E Directory *dirname* [or directory *dirname*] not found [or you are not authorized to use RELOCATE on one of these directories.]
- DMSJAU1242E External security in effect for {*fn ft fm|dirname| fm|dirname*}. GRANT AUTHORITY command cannot be used.
- DMSJAU1243W {At least one user in the list (*userid*)| User *userid*} already has WRITE authority to {*fn ft fm|dirname | fm|dirname*}.
- DMSJAU1244W {User *userid*|At least one in the list *userid*} was not granted READ|WRITE authority to *fn ft fm|dirname*
- DMSJAU1245W Because *userid* owns *fn ft fm|dirname*, the authority cannot be revoked
- DMSJAU1246W Public WRITE authority already granted on {*fn ft fm| dirname | fm|dirname*}.
- DMSJAU1247W Public {READ|WRITE} authority did not previously exist on {*fn ft fm|dirname | dirname*}
- DMSJAU1248W Specified authorization revoked, but external security is still in effect for {*fn ft fm|dirname | fm|dirname* }.
- DMSJAU1287W You do not own file *fn ft {fm|directory }*
- DMSJAU1293I You have granted authority to all users of the file pool

JCA

- DMSJCA1152S APPC/VM sever occurred; accessed directories for file pool *filepoolid* released.

JCD

DMSJCD1184E File *fn ft dirname|fm* [or directory *dirname*] not found [or you are unauthorized to use *command-name* on {this directory|one of these directories}]
 DMSJCD1218E You cannot create top directories using the CREATE DIRECTORY command

JCR

DMSJCR065E *option* option specified twice
 DMSJCR1132E Invalid number of operands
 DMSJCR1132E Invalid number of operands
 DMSJCR1132E Invalid number of operands

JDE

DMSJDE109S {Virtual storage capacity exceeded|Storage exceeded |Insufficient free storage available}
 DMSJDE789E Invalid Response
 DMSJDE925E I/O error on screen
 DMSJDE1169W Public connect authority has not been established
 DMSJDE1172E You are not allowed to delete your own userid
 DMSJDE1172E You are not allowed to delete your own userid
 DMSJDE1173E User *userid* can not be deleted because the user's file space is currently in use.
 DMSJDE1215E {File *fn ft fm|dirname|Directory dirname* } is locked by another user
 DMSJDE1219R Do you want the {following|specified} USERS to be deleted? Enter 0 (No) or 1 (Yes):
 DMSJDE1224W One or more userids were not enrolled as {ADMINISTRATORs| USERs}
 DMSJDE1224W One or more userids were not enrolled as {ADMINISTRATORs| USERs}

JED

DMSJED069E {[Output]{filemode|disk}*mode* [(*vdev*)]|Directory *dirname*} not accessed
 DMSJED109S {Virtual storage capacity exceeded|Storage exceeded| Insufficient free storage available}
 DMSJED1187E Too many subdirectory levels in *dirid*
 DMSJED1188E Filemode *mode* is not associated with a directory
 DMSJED1189E Filemode *mode* is associated with a top directory
 DMSJED1223E There is no default file pool currently defined

JEN

DMSJEN029E Invalid parameter *parameter* [in the [option] *option* field]
 DMSJEN065E *option* option specified twice
 DMSJEN109S {Virtual storage capacity exceeded|Storage exceeded| Insufficient free storage available}
 DMSJEN1165W One or more userids were already enrolled as ADMINISTRATORs
 DMSJEN1166E Userid *userid* is already enrolled
 DMSJEN1175E Storage group does not exist

JLD

DMSJLD065E *option* option specified twice
 DMSJLD066E *option1* and *option2* are conflicting options
 DMSJLD109S {Virtual storage capacity exceeded|Storage exceeded| Insufficient free storage available}
 DMSJLD689E File must be F-format or V-format
 DMSJLD1160E Directory *dirname* already open

DMS

- DMSJLD1184E [File|Directory] [*fn ft fm|dirname* | *dirname*] not found or you are not authorized for it
- DMSJLD1210E Directory *dirname* [or directory *dirname*] not found [or you are not authorized to use RELOCATE on one of these directories.]

JLK

- DMSJLK002E [Input|Overlay] {File[(s)]|Dataset|Note } [*fn [ft[fm]]*] not found
- DMSJLK1139E You are not authorized to issue this command
- DMSJLK1160E Directory *dirname* already open
- DMSJLK1160E Directory *dirname* already open
- DMSJLK1163E The *command* command failed for {*fn ft fm|dirname*}
- DMSJLK1184E [File|Directory] [*fn ft fm|dirname|dirname*] not found or you are not authorized for it
- DMSJLK1184E File *fn ft* or directory *dirname* not found or you are not authorized for it
- DMSJLK1184E {File *fn ft dirname|fm|directory dirname*} not found or you do not have write authority to it
- DMSJLK1206W No locks are held by *userid* for (*fn ft fm|dirname*)
- DMSJLK1209E Nickname *nickname* resolved to more than one *userid* ; lock(s) can be deleted from only one *userid* at a time
- DMSJLK1210E Directory *dirname* [or directory *dirname*] not found [or you are not authorized to use RELOCATE on one of these directories.]
- DMSJLK1214E You have already created a lock type {EXCLUSIVE|SHARE|UPDATE } on {file *fn ft fm|dirname|directory dirname*}
- DMSJLK1215E A lock of type {EXCLUSIVE|SHARE|UPDATE} on {file|directory *fn ft dirname|dirname*} was already created by another user
- DMSJLK1291E There are no unused work units available

JMF

- DMSJMF389E Invalid *operandtype: operand*
- DMSJMF1167E Userid *userid* is not enrolled
- DMSJMF1171E You are attempting to delete too much storage for *userid*

JNA

- DMSJNA109S {Virtual storage capacity exceeded|Storage exceeded| Insufficient free storage available}
- DMSJNA1147E Storage management error trying to [get|free] storage
- DMSJNA1191E Namedef *namedef* already exists
- DMSJNA1192E Namedef *namedef* not found
- DMSJNA1193E There are no namedefs to be deleted.

JNL

- DMSJNL109S {Virtual storage capacity exceeded|Storage exceeded| Insufficient free storage available}
- DMSJNL637E Missing {value|nodeid} for the {*option option* | *operand operand*}
- DMSJNL647E {Userid|Localid} not specified for { *nickname in userid* | *userid at node in user's* } NAMES file
- DMSJNL653E Error executing *command*, rc = *rc*

JOI

- DMSJOI526E Option CURSOR valid in display mode only
- DMSJOI561E Cursor is not on a valid data field
- DMSJOI564W EOF reached
- DMSJOI575E Invalid argument or JOIN column(s) defined
- DMSJOI585E No line(s) changed

DMSJOI685E Joined line(s) exceed zone settings

JRL

DMSJRL002E [Input|Overlay] {File[(s)]|Dataset|Note } [*fn* [*ft* [*fm*]]] not found
 DMSJRL019E Identical fileids
 DMSJRL109S {Virtual storage capacity exceeded|Storage exceeded| Insufficient free storage available}
 DMSJRL1131E Directory *dirname* already exists
 DMSJRL1132E Invalid number of operands
 DMSJRL1160E Directory *dirname* already open
 DMSJRL1163E The *command* command failed for {*fn ft fm|dirname* }
 DMSJRL1184E [File|Directory] [*fn ft fm|dirname|dirname*] not found or you are not authorized for it
 DMSJRL1184E File *fn ft dirname|fm* [or directory *dirname*] not found [or you are unauthorized to use *command-name* on {this directory|one of these directories}]
 DMSJRL1187E Too many subdirectory levels in *dirid*
 DMSJRL1207E You cannot relocate a top directory
 DMSJRL1208E Directory cannot be relocated within itself
 DMSJRL1210E Directory *dirname* [or directory *dirname*] not found [or you are not authorized to use RELOCATE on one of these directories.]
 DMSJRL1241E Directories specified are in different file pools
 DMSJRL1251E Directories are from different directory structures
 DMSJRL1290E File *fn ft dirid* not relocated; source and target directories are the same
 DMSJRL1291E There are no unused work units available

REA

DMSREA830E I/O ERROR READING A BLOCK OF RECORDS FROM THE ERROR
RECORDING CYLINDERS

REC

DMSREC003E Invalid option: *option*
DMSREC1801E There is no tape mounted on 181. Mount the correct tape and restart the receive procedure.
DMSREC1802R The tape mounted is at a lower service level than the existing service map. The service tape is at service level *level*. The SERVICE DISKMAP file indicates service level *service-level*. Is that what you want? (YES/NO)
DMSREC1803E The tape is in the wrong format. Mount the correct tape and restart the receive procedure.
DMSREC1804I Receiving service for {product *prodid*|component *compname* of product *prodid*}
DMSREC1805E No parameters were entered. Check the syntax and re-enter the command.
DMSREC1806I The current SERVICE DISKMAP contains the map of the mounted tape.
DMSREC1807E *routine* cannot continue; the *fn ft* file was not found.
DMSREC1808E The *ppfname* \$PPF product parameter file was not found.
DMSREC1809E A *function* tape error has occurred with return code *rc*.
DMSREC1811W The access of {*vdev*|*dirname*} failed for product *prodid*:
DMSREC1812E Service for *prodid* is not on the mounted tape but the *prodid* product ID is in the SERVICE DISKMAP file. It is on the service tape mapped with a relative tape number of *number*.
DMSREC1813E *option1* and *option2* are conflicting options.
Check the syntax and re-enter the command.
DMSREC1814E Service for the product ID *prodid* is on the mounted tape, but the *prodid* product ID is not in the SERVICE DISKMAP file.
DMSREC1815E *parameter* is an unknown parameter. Check the syntax and re-enter the command.
DMSREC1816E *parameter* is an unknown parameter. This product ID is not on the tape or in the SERVICE DISKMAP file.
DMSREC1818E The product service header file cannot be found. The tape positioning might be in error. Restart the receive procedure beginning with service for product ID *prodid*.
DMSREC1821E All file modes are being used. The previous access order will be restored.
DMSREC1822W Access to {*vdev*|*dirname*} cannot be restored.
DMSREC1838E The service exec requires file mode C to be accessed as R/W. Access mode C as R/W and re-try.
DMSREC1850I The processing for *part-name* by the *fn* EXEC was bypassed.
DMSREC1851I processing *fn ft* with the part handler *fn* EXEC.
DMSREC1852I This is *volume-number* of *total-volumes* level *level* {*PUT*|*COR*} tape.
DMSREC1860I *compname* is an invalid component name for product *prodid*.
DMSREC1861W The *fn* service exec completed with return code *rc message*
DMSREC1863W Service has been received on the S minidisk.
Module generation and/or reIPL of CMS might be required.
DMSREC1869R *prodid compname* begins on *PUT*|*COR* *tape* volume *vol*. Mount volume *vol* and press ENTER or type QUIT.
DMSREC1871R Do you want to continue: (YES/NO)
DMSREC1872E *COR* is a nonsupported option for the *prodid* product ID. The tape has been positioned to the beginning of the product's first file. Use the products's corrective service procedure to process.

DMSREC1873W *prodid compname* relative tape file *number, label* is listed in the product directory but is not in the \$PPF file. This tape file will not be received.

DMSREC1874R The *execname* option *PUT|COR* does not match the type of the mounted tape *PUT|COR*. Do you want to continue? (YES/NO)

DMSREC1875E XEDIT cannot save a file. Correct the problem and re-start the procedure.

DMSREC1877R *prodid compname* begins on *PUT|COR tapenum* volume *vol*. Do you want to continue? (YES/NO)

DMSREC1878I No files have been found for *prodid compname* on the *PUT|COR level level*.

DMSREC1879R *product-name component-name* on *PUT|COR level- number* volume *vol-number* continues on volume *vol-number2*. Mount volume *vol-number2* and press ENTER or type QUIT.

DMSREC1887W The *fn EXEC* file was not found. The {user exit| part handler} *fn* was not executed.

DMSREC1889E The *ppfname \$PPF* product parameter file contains invalid data on the *record* record

DMSREC1890E The *ppfname \$PPF* product parameter file is invalid. *record* is missing or out of order. Correct the file and retry.

DMSREC1891E Part handler *name* failed for component *compname* of product ID *prodid*.

DMSREC1894W Ensure that all parts of *prodid compname* have been received before proceeding to the APPLY step.

DMSREC1897E A problem occurred reading file *fn ft* while function *function* was executing.

DMSREC1898E A record cannot be written to file *fn ft fm*.

DMSREC1899E There is a problem loading a file.

Message Summary by Number

This chapter contains all the CP, CMS, IPCS, GCS, and TSAF message identifiers, listed vertically in numerical order. All the message identifiers with the same number appear together.

Use this section when you want to find out which modules issue a given message.

CP Message Summary by Number

Message Summary by Text

This chapter contains all CP, CMS, IPCS, GCS, and TSAF messages, organized in alphabetical order by message text. Within each alphabetic letter, messages are listed in the following order:

1. Messages beginning with quotes or other special characters
2. Messages beginning with variable data (Note that information will be inserted in the variable when you see the message, however.)
3. Mixed-case messages (CP, CMS and GCS sections)
4. Upper case messages.

If you do not issue CP command SET EMSG ON, messages displayed on your screen will be text only, without a message identifier. By using this cross-reference, you can look up the text of the message and find its identifier. Once you know the identifier, you can find the message description in the *VM/SP System Messages and Codes* book.

CP Message Summary by Text

DMKCFX046E	{Device <i>rid</i> <i>devtype rdev</i> } offline
DMKGIV020E	{Groupid Userid} missing or invalid
DMKTRF816E	{Trapid Trapset} <i>ttttttt</i> does not exist
DMKTRF816W	{Trapid Trapset} <i>ttttttt</i> does not exist
DMKGTR289W	{User <i>userid</i> Group <i>groupid</i> } already enabled by <i>trapid trapid</i>
DMKGTR020E	{Userid Groupid} missing or invalid
DMKTCW020E	{Userid Groupid} missing or invalid
DMKCFX140E	<i>devtype rdev</i> attached to <i>userid</i>
DMKCFX143E	<i>devtype rdev</i> in use by system
DMKGIV120E	<i>devtype rdev</i> not attached; <i>userid vdev</i> already defined
DMKGIV134E	<i>devtype vdev</i> not attached; channel <i>X</i> dedicated
DMKGIV135E	<i>devtype vdev</i> not detached; channel <i>X</i> dedicated
DMKCFU140E	<i>devtype rdev</i> attached to <i>userid</i>
DMKCSB148E	<i>devtype rdev</i> buffer load <i>name</i> failed
DMKVER297I	<i>rdev</i> {CONTROLLER SCU CHANNEL} SOFTWARE WRITE INHIBIT REQUESTED
DMKSSP536I	<i>rdev</i> reports disabled interface; fault code = <i>code</i> ; notify CE
DMKVER564I	<i>rdev</i> PERMANENT PATH ERROR, RECOVERED ON ALTERNATE PATH
DMKDAD403I	<i>rdev</i> SCU {SERVICE MODERATE SERIOUS ACUTE} ALERT, MT = {3990-1 3990-2 3380-CJ} SER = <i>mmaa-ddddddd</i> , REFCODE = <i>symp-mod1-mod2</i>
DMKVER403I	<i>rdev</i> SCU {SERVICE MODERATE SERIOUS ACUTE} ALERT, MT = {3990-1 3990-2 3380-CJ} SER = <i>mmaa-ddddddd</i> REFCODE = <i>symp-mod1-mod2</i>
DMKVER402I	<i>rdev</i> SENSE DATA LOGGED FOR {DEVICE CONTROLLER}
DMKCPV045E	<i>userid</i> not logged on
DMKGIV045E	<i>userid</i> not logged on
DMKGTR045E	<i>userid</i> not logged on
DMKVDD045E	<i>userid</i> not logged on
DMKPEI047E	<i>userid</i> { <i>vdev</i> <i>segname</i> } does not exist
DMKLLNM298E	<i>userid vdev</i> not linked; request denied
DMKGIV331E	<i>vdev</i> not {defined attached linked created} - use a {shared non-shared} VCU instead
DMKRG4458I	A condition was detected that should not occur, line <i>xxx</i> will be disabled.
DMKPEI047E	A saved traceset does not exist
DMKWARM931W	All specified Auto Re-IPL start types failed
DMKDEF258I	All 3800 data checks will be reflected
DMKLOG054E	Already logged on {{ <i>line</i> <i>GRAF</i> <i>LUNAME</i> <i>LDEV</i> <i>device</i> } <i>rdev</i> line disconnected}
DMKCPI959W	Attached processor not online
DMKRPL930I	Auto Re-IPL start type <i>xxxxx</i> failed; A <i>xxxxx</i> start has been initiated
DMKCFY189E	AFFINITY not set; system in uniprocessor mode
DMKLOH189E	AFFINITY not set; system in uniprocessor mode
DMKFMT742E	ALLOCATION FUNCTION NOT ALLOWED--FORMAT OF VOLUME IS A PREREQUISITE
DMKMCT625I	ALTERNATE PROCESSOR RECOVERY SUCCESSFUL; PROCESSOR <i>nn</i> OFFLINE
DMKAPI958I	ATTACHED PROCESSOR NOW OPERATIONAL
DMKLOG059E	AUTOLOG failed for <i>userid</i> - accounting errors
DMKLOG059E	AUTOLOG failed for <i>userid</i> - incorrect password

DMKLOG059E AUTOLOG failed for *userid* - IPL failed
 DMKLOG059E AUTOLOG failed for *userid* - IPL failed. Error in CP director
 DMKLOG059E AUTOLOG failed for *userid* - IPL missing
 DMKLOG059E AUTOLOG failed for *userid* - I/O error on terminal
 DMKALG059E AUTOLOG FAILED FOR *userid* - {IPL MISSING|IPL FAILED|ACCOUNTING
 ERROR|INCORRECT PASSWORD}
 DMKLOJ059E AUTOLOG failed for *userid* - accounting error
 DMKALG115E AUTOLOG invalid; excessive incorrect passwords

DMKCSB043E Buffer *name* does not exist
 DMKCSB031E Buffer missing or invalid [*modifier*]

DMKCSPO24E BLKS missing or invalid
 DMKCSU024E BLKS missing or invalid
 DMKCSV024E BLKS missing or invalid
 DMKCSX024E BLKS missing or invalid

DMKDIA206E Cannot connect to host virtual machine
 DMKLOG206E Cannot connect to host virtual machine
 DMKVDE206E Cannot connect to host virtual machine
 DMKCDS166E Changed shared page not written to auxiliary storage

DMKVCH130E Channel *x* [processor *xx*] not attached to *userid*
 DMKVCH147E Channel *x* [processor *xx*] not attached; alternate paths defined
 DMKVCH132E Channel *x* already defined by *userid*
 DMKVCH129E Channel *x* [processor *nn*] devices in use
 DMKVCH048E Channel *x* [processor *nn*] does not exist
 DMKVCH138E Channel *x* [processor *xx*] not attached; insufficient free storage
 DMKCPT601E Channel control check device *xxx*
 DMKVDD034E Channel missing or invalid
 DMKVDE034E Channel missing or invalid

DMKCKS919E Checkpoint area invalid; checkpointing terminated
 DMKCKV917E Checkpoint area invalid; clear storage and cold start
 DMKWRN919E Checkpoint area invalid; checkpointing terminated

DMKCQH028E Class missing or invalid
 DMKCSB028E Class missing or invalid
 DMKCSO028E Class missing or invalid
 DMKCSPO28E Class missing or invalid
 DMKCSQ028E Class missing or invalid
 DMKCSU028E Class missing or invalid
 DMKCSV028E Class missing or invalid
 DMKSPT028E Class missing or invalid

DMKLOG067E Command format not valid
 DMKCF015E Command not valid before LOGON: *command*
 DMKCPV199E Command rejected; device *rdev* pending offline
 DMKDIA199E Command rejected; device *rdev* pending offline
 DMKLN199E Command rejected; device *rdev* pending offline
 DMKMCC199E Command rejected; device *rdev* pending offline
 DMKNES199E Command rejected; device *rdev* pending offline

DMK

DMKNET199E	Command rejected; device <i>rdev</i> pending offline
DMKNLD199E	Command rejected; device <i>rdev</i> pending offline
DMKNLE199E	Command rejected; device <i>rdev</i> pending offline
DMKSPT199E	Command rejected; device <i>rdev</i> pending offline
DMKVDE199E	Command rejected; device <i>rdev</i> pending offline
DMKCFX199E	Command rejected; device <i>rdev</i> pending offline
DMKCFX316E	Command rejected; LOGMSG/DUMP being updated
DMKQVM802E	Command rejected, devices not dedicated
DMKQVM800E	Command rejected, other virtual machines logged on
DMKQVM803E	Command rejected, spool devices not drained
DMKQVM806E	Command rejected, virtual address not equal to real address
DMKQVM809E	Command rejected, TRACE/ADSTOP/CCW translation in effect
DMKQVM807E	Command rejected, VM/SP attached processor mode

DMSDLB220R	Enter data set name:
DMSFLD220R	Enter data set name:
DMSLBD220R	Enter data set name:
DMSLDS220R	Enter data set name:
DMSWUT977I	Enter disk address where the service programs are to be written
DMSFOR605R	Enter disk label:
DMSDLB331R	Enter extent specifications:
DMSWSM847R	Enter name of SNT definition file or press ENTER key to quit
DMSRT604R	Enter sort fields:
DMSCPY601R	Enter specification list:
DMSAMS367R	Enter tape {input output} DDNAMEs:
DMSWSL737R	Enter the minidisk address for the <i>group element</i>
DMSWUT973R	Enter the minidisk address where the IPL decks were loaded
DMSWSM853R	Enter the name of your current CP directory file (the default is VMUSERS DIRECT):
DMSDSK1080R	Enter the new name for <i>fn ft fm</i>
DMSRDC1080R	Enter the new name for <i>fn ft fm</i>
DMSCPY602R	Enter translation list:
DMSLBD441R	Enter valid information
DMSDLB330R	Enter volume specifications:
DMSTLM435R	Enter IGNORE or CANCEL
DMSTLM443R	Enter REJECT or NEWTAPE
DMSTLM433R	Enter WRITE (<i>valid</i>) or REJECT
DMSTLM446R	Enter WRITE (<i>valid</i>), REJECT, or NEWTAPE
DMSWNM664E	Entry not found
DMSGND021E	Entry point <i>name</i> not found

Summary of Changes

To obtain editions of this publication that pertain to earlier releases of VM/SP, you must order using the pseudo-number assigned to the specific edition. For a listing of the pseudo-numbers, please see the *VM/SP Library Guide and Master Index*.

Summary of Changes to SC24-5264-2 for VM/SP Release 6

Integration of Between-Release Support Information to VM/SP Release 6

- VM/SP Enhancements to the IBM Enhanced Connectivity Facilities for VM/System Product, GC24-5295
- VM/SP 9370 Processors, 9332 and 9335 Direct Access Storage Devices, and 9347 Tape Drive, GC24-5315
- VM/SP DASD DUMP/Restore Streaming Support Improvements, GC24-5359
- VM/SP Transparent Services Access Facility 9370 Local Area Network Subsystems, GC24-5363
- VM IBM 3380 Direct Access Storage Models AJ4/BJ4 and AK4/BK4, GC24-5371
- VM IBM 3990 Storage Controls Models 1 and 2 and IBM 3380 Direct Access Storage Direct Channel Attach Model CJ2, GC24-5372
- VM/SP Automatic Re-IPL Enhancement, GC24-5391
- Tads

Additions and enhancements

Shared File System (SFS)

The Shared File System is a CMS file system for sharing CMS programs and data among users. Data kept by a file server virtual machine is on server-owned disk space, which is shared among all owners of files in that file pool. Requests for data from a CMS user machine are sent across an APPC/VM link to the server machine. Requests can originate either as commands or program function calls. Most current commands are supported for files in the SFS, along with a set of new commands for new function. The current program interface is supported, along with a new program interface, which supports all new function.

All messages that the Shared File System generates are now contained in this publication. These messages have a DMS prefix and are documented in mixed case with variables in italics.

VM Service Enhancements

This addition for Release 6 standardizes the installation and service processes in the VM environment for all VM system control programs and program products.

All messages generated by these enhancements are now contained in this publication. These messages have a DMS prefix, and are documented in mixed case with variables in italics.

Callable Services Library (CSL)

VM now supports callable services libraries (CSLs). CSLs are libraries containing assembler routines that can be called from application programs written in REXX or other high-level languages. The CSL provided with VM, named VMLIB, contains routines that provide access to various VM services like Shared File System functions. In addition, you can write your own routines and build your own CSLs.

Saved Segment Management

Saved Segment Management allows CMS and its applications to better utilize saved segments. It allows a physical saved segment to be viewed as a set of logical saved segments. In addition, each logical segment can contain multiple objects. These include MODULES, TEXT files, EXECs, callable services libraries, language repositories, and other user defined objects or a single shared minidisk directory as supported by the SAVEFD command. Programs that reside within a loaded logical segment can be invoked via standard CMS command and function call methods.

Miscellaneous

Minor usability, editorial, and technical changes have been made throughout this publication.

Summary of Changes to SC24-5264-1 for VM/SP Release 5

Transparent Services Access Facility (TSAF)

TSAF is a new component of VM/SP for Release 5. This facility lets users connect to and communicate with local or remote virtual machines within a group of systems. With TSAF, a user can connect to a program by specifying a name that the program has made known, instead of specifying a userid and node id.

All message cross references for TSAF are now contained in this publication. These messages have an ATS prefix, and they are documented in mixed case with variables in italics.

Other Additions and Enhancements

Parsing Facility

The CMS parsing facility is a new enhancement of VM/SP for Release 5. This facility parses and translates command name arguments. It is important to National Language Support (NLS) because it lets users enter commands in their own national language.

A user defines command syntax in a special language, the Command Syntax Definition Language (CSDL). The parsing facility parses a specified command by checking whether command arguments are specified according to the CSDL definition for that command.

Defining command syntax in a CSDL file and using the parsing facility has the following advantages:

- Syntax checking is unnecessary in programs
- Users can invoke programs in their own national language by modifying the CSDL file.

All messages that the parsing facility generates are now contained in this publication. These messages have a DMS prefix and are documented in mixed case with variables in italics.

CMS Session Services

The CMS Session Services is a new enhancement to VM/SP for Release 5. This enhancement provides window and virtual screens functions for the end user. When the command SET FULLSCREEN ON is issued, CMS is in full-screen mode and appears in a window. This lets a user enter commands from anywhere on the physical screen, scroll through data, and log data into files. Messages are routed to appropriate windows.

All messages that the window manager generates are now contained in this publication. These messages have a DMS prefix and are documented in mixed case with variables in italics.

Enhanced Connectivity Facilities on VM/SP

Enhanced Connectivity Facilities on VM/SP is a new component for VM/SP Release 5. It is also part of a set of programs that make up IBM System/370 to IBM Personal Computer Enhanced Connectivity Facilities.

This component provides a means for VM/SP to communicate with workstations (for example, IBM Personal Computers) and a programming interface called the Server-Requester Programming Interface.

All messages that IBM System/370 to IBM Personal Computer Enhanced Connectivity Facilities generates are now contained in this publication. These messages have a DMS prefix and are documented in mixed case with variables in italics.

Installation Messages

The messages that were in the back of the Release 4 *VM/SP Installation Guide*, SC24-5237 have been incorporated into this publication for this release.

National Language Support (NLS)

Most of the messages are now documented in mixed case. Variables in these messages are denoted by italics.

Miscellaneous

Minor usability, editorial, and technical changes have been made throughout this publication.

Glossary of Terms and Abbreviations

A

ABEND dump. The contents of main storage, or of part of main storage, written to an external medium for the purpose of debugging an error condition that resulted in the termination of a task before its regular completion.

ACF/VTAM. Advanced Communications Function for Virtual Telecommunications Access Method.

Advanced Communications Function for Virtual Telecommunications Access Method (ACF/VTAM). A licensed program that controls communications and flow of data in an SNA network. It provides single-domain, multiple-domain, and interconnected network capability.

Advanced Program-to-Program Communication (APPC). The inter-program communication service within Systems Network Architecture LU 6.2 (SNA LU 6.2) on which the APPC/VM interface is based.

Advanced Program-to-Program Communication/VM (APPC/VM). An application program interface (API) for communicating between two virtual machines that is mappable to the SNA LU 6.2 APPC interface and is based on IUCV functions. Along with the TSAF virtual machine, APPC/VM provides this communication within a single system and throughout a collection of systems.

AP. Attached processor.

APAR. Authorized program analysis report.

APPC. Advanced Program-to-Program Communication

APPC/VM. Advanced Program-to-Program Communication/VM.

API. Application program interface.

application program interface (API). The formally defined programming language interface between an IBM system control program or program product and its user.

For VM/SP, the term API means the boundary between an external program product and VM/SP itself. API specifically does not include any exclusive component-to-component interfaces that may exist within VM/SP; for example, between the Control Program (CP) component and the Transparent Services Access Facility (TSAF) component.

apply. In reference to installation and service, to load down program temporary fix (PTF) files from the tape, reassemble or rename as needed, and produce runnable (executable) code. The PTF may have been loaded down in a previous step. If that is the case, apply means to reassemble or rename if needed and place the files on the correct staging disk for the build step to use, then produce the runnable code.

area. This term is acceptable for storage space when there is no need to differentiate between DASD space on count-key-data devices and FB-512 devices. See *DASD space*.

attached processor (AP). A processor that has no I/O capability and is always linked to the processor initialized for I/O handling. Note that VM/SP High Performance Option also supports real multiprocessor (MP) configurations on the 158MP, 168MP, and 3033MP processors, and the 3081 dyadic processor.

authorized program analysis report (APAR). An official request to the responsible IBM Change Team to look into a suspected problem with IBM code. APARs describe a problem giving conditions of failure, error messages, ABEND codes, or other identifiers. They also contain a problem summary and resolution when applicable. See *program temporary fix (PTF)*.

auxiliary directory. In CMS, an extension of the CMS file directory, which contains the names and locations of certain CMS modules not included in the CMS file directory.

auxiliary file. In CMS, a file that contains a list of filetypes of update files to be applied to a particular source file. See *control file* and *preferred auxiliary file*.

auxiliary storage. Data storage other than main storage; in VM/SP, auxiliary storage is usually a direct access device.

AVS. APPC/VM VTAM support.

B

basic control (BC) mode. A mode in which a virtual machine resumes execution after an I/O interrupt, a page fault, or a DIAGNOSE code X'18'.

binary synchronous communication (BSC). Communication using binary synchronous line discipline in which transmission of binary-coded data between stations is synchronized by timing signals generated at the sending and receiving stations.

block. DASD space on FB-512 devices. Specifically, FB-512 devices are the IBM 3310 and 3370 Direct Access Devices employing fixed-block mode.

border. A boundary around a window. The user can enter one-letter BORDER commands from the corners of the border. For example, the letter "P" entered from a border corner pops the window. The border corners are indicated by a "+" (plus) sign.

bpi. Bits per inch.

BPI. Bytes per inch.

BSC. Binary synchronous communication.

buffer. An area of storage, temporarily reserved for performing input or output, into which data is read, or from which data is written.

build. In reference to installation and service of a product, to perform the steps necessary to produce executable code or systems. This is often referred to as the build process.

byte. A unit of storage, consisting of eight adjacent binary digits that are operated upon as a unit and that constitute the smallest addressable unit in the system.

C

CC. Condition code.

CCH. Channel-check handler.

CCW. Channel command word.

CE. (1) Channel end. (2) Correctable Error. (3) Customer Engineer.

changes. In reference to installation and service, IBM and original equipment manufacturer (OEM) supplied service for their programs. In the IBM service process, there are many ways users can receive information they need to fix (change) a portion(s) of a product they are running on a VM system. These include program temporary fixes (PTFs), Authorized Program Analysis Reports (APARs), user modifications, and information received over the phone. All these types of information are referred to as *changes*.

channel. A path in a system that connects a processor and main storage with I/O control units.

channel-check handler (CCH). In System/370, a feature that records information about channel errors and issues appropriate messages to the operator.

channel command word (CCW). A doubleword at the location in main storage specified by the channel

address word. One or more CCWs make up the channel program that directs data channel operations.

channel status word (CSW). An area in storage that provides information about the termination of I/O.

channel-to-channel (CTC) device. A hardware device that connects two channels on the same computing system or on different systems. CTC devices include both channel-to-channel adapters (CTCAs) and 3088 Multisystem Communications Units (MCU).

checkpoint (CKPT) start. A VM/SP system restart that attempts to recover information about closed spool files that was previously stored on the checkpoint cylinders. The spool file chains are reconstructed, but the original sequence of spool files is lost. Unlike warm start, CP accounting and system message information is also lost. Contrast with *warm start*, *cold start*, and *force start*.

class authority. Privilege assigned to a virtual machine user in the user's directory entry; each class specified allows access to a subset of all the CP commands. See *privilege class* and *user class restructure*.

class override file. A file containing control statements defining changes in the privilege classes of CP commands and diagnose codes. The file is used by the override program, DMKOV, to establish a new class structure of commands under user class restructure (UCR).

CMS. Conversational monitor system.

CMSDOS. The standard name of the CMS/DOS saved segment. See *saved segment*.

CMS/DOS. Refers to the functions of CMS that become available when the user enters the command: SET DOS ON. CMS/DOS is a part of the regular CMS system and is not a separate system. Users who do not use CMS/DOS are sometimes referred to as OS users, because they use the OS simulation functions of CMS.

CMS editor. A CMS facility that lets the user create, modify, insert, delete, or rearrange lines of data in a CMS file. See *input mode* and *edit mode*.

CMS file directory. A directory on each CMS disk that contains the name, format, size, and location of each of the CMS files on that disk. When a disk is accessed via the ACCESS command, its directory is read into virtual storage and identified with any letter from A through Z. Synonymous with *master file directory block*.

CMS files. Refers exclusively to files in the fixed-block format used by CMS file system commands. VSAM and OS data sets and DOS files are not compatible with the CMS file format and cannot be manipulated using CMS file system commands.

CMSSERV. The command that starts a CMS router in the Enhanced Connectivity Facilities environment of VM/SP.

cold start. A VM/SP system restart that ignores previous data areas and accounting information in main storage, and the contents of paging and spool files on CP-owned disks. Contrast with *warm start*, *checkpoint start*, and *force start*.

collection. A group of up to eight VM/SP systems that can share resources. Each system within the collection must have the Transparent Services Access Facility (TSAF) virtual machine installed and running.

command. A request from a user at a terminal for the execution of a particular CP, CMS, RSCS, or IPCS function. A CMS command can also be the name of a CMS file with a filetype of EXEC or MODULE. See *subcommand* and *user-written CMS command*.

command line. The line at the bottom of display panels that lets a user enter commands or panel selections. It is prefixed by an arrow (= = >).

common lock. A doubleword in storage, controlled by the GCS LOCKWD macro. When a program is using common storage, it can turn the common lock *on*. Other programs that examine the lock and find it on cannot gain access to common storage.

common storage. A shared segment of reentrant code that contains free storage space, the GCS supervisor, control blocks, and data that all members of a virtual machine group share.

communications scanner. A communications controller hardware unit that provides the connection between lines and the central control unit. The communications scanner monitors telecommunication lines and data links for service requests.

component. A collection of objects that together form a separate functional unit. A product may contain many components (for example, VM/SP has components of CP, CMS, GCS, TSAF, IPCS, AVS, and Procedures Language/VM). A component can be part of many products. (CP spans both VM/SP and VM/HPO products).

condition code (CC). A code that reflects the result of a previous input/output, arithmetic, or logical operation.

connect. Establishing a path to communicate with another virtual machine or with the user's own virtual machine.

console. A device used for communications between the operator or maintenance engineer and the computer.

console function. That subset of CP commands that lets the user simulate almost all of the functions available to

an operator at a real system console. Contrast with *CP command*.

console stack. Refers collectively to the program stack and the terminal input buffer.

control block. A storage area used by a computer program to hold control information.

control file (CNTRL file).

1. In CMS, the file that contains records that identify the updates to be applied and the macro libraries, if any, that are needed to assemble that source program. See *auxiliary file*.
2. A CMS file that is interpreted and directs the flow of a certain process through a series of specific steps. For example, the control file could contain installation steps, default addresses, and program temporary fix (PTF) prerequisite lists as well as many other items that are necessary.

control program. A computer program that schedules and supervises the execution of programs in a computer system. See *Control Program (CP)*.

Control Program (CP). The component of Virtual Machine/System Product (VM/SP) that manages the resources of a single computer so that multiple computing systems appear to exist. Each virtual machine is the functional equivalent of an IBM System/370.

control statement. A statement that controls or affects the execution of a program in a data processing system.

control unit terminal (CUT). An operational mode that allows one logical terminal session. Contrast with *distributed functional terminal*.

conversational monitor system (CMS). A virtual machine operating system that provides general interactive time sharing, problem solving, program development capabilities, and operates only under the control of the VM Control Program (CP).

CP. Control Program.

CP assist. A hardware function available only on a processor that has Extended Control Program Support (ECPS), that reduces CP overhead by performing the most frequently used tasks of CP routines.

CP command. A request from the terminal user for the execution of programming that controls the user's virtual machine. The VM/SP control program commands are called CP commands. The subset of CP commands that perform console simulation are called console functions.

CP read. The situation in which the control program (CP) is waiting for a response or request for work from

the user. On a typewriter terminal, the keyboard is unlocked; on a display terminal, the screen status area indicates CP READ.

CP trace table. A table used for debugging VM/SP; its size is a multiple of 4096 bytes and is dependent on the size of real storage or a user specified value. This table contains the chronological occurrences of events that take place in the real machine, recorded in a wraparound fashion within the trace table.

CPTRAP. This facility is a CP debugging tool. It creates a reader spool file of selected trace table entries, CP data, and virtual machine data in the order that they happen. The IPCS commands can help the user access and print this collected data.

CPU. Central processing unit.

CSR. (IBM) Customer Service Representative.

CSW. Channel status word.

CTC. Channel-to-channel.

CUT. Control unit terminal.

cylinder. In a disk pack, the set of all tracks with the same nominal distance from the axis about which the disk pack rotates.

D

DASD. Direct access storage device.

DASD Dump Restore (DDR) program. In VM/SP, a service program that copies all or part of a minidisk onto tape, or loads the contents of a tape onto a minidisk.

DASD space. (1) Area allocated to DASD units on count-key-data devices. (2) Area allocated to DASD units on FB-512 devices. Note that *DASD space* is synonymous with *cylinder* when there is no need to differentiate between count-key-data devices and FB-512 devices. This term applies to VM/370, as well as to the VM/SP and VM/SP High Performance Option program products.

data control block (DCB). A control block used by access method routines in storing and retrieving data.

DBCS. Double-byte character set.

DCB. Data control block.

delimiter. (1) A flag that separates and organizes items of data. Synonymous with *separator*. (2) A character that groups or separates words or values in a line of input. In VM/SP, usually one or more blank characters separate the command name and each operand or

option in the command line. In certain cases, a tab, left parenthesis, or backspace character can also act as a delimiter.

device support facilities. A virtual disk initialization program operating under OS/VS1, OS/VS2 MVS, DOS/VSE and as a stand-alone program under a native or virtual machine environment. It can initialize a direct-access storage volume so that it can be used in an OS/VSE system, inspect a volume for defective tracks, reformat the volume label and IPL bootstrap and program records, and examine a device with a nonremovable storage mechanism to determine if there are problems with the drive or with reading and writing data stored on the volume.

DFT. Distributed function terminal.

direct access storage device (DASD). A storage device in which the access time is effectively independent of the location of the data.

directory. See *auxiliary directory*, *CMS file directory*, or *VM/SP directory*.

discontiguous saved segment. One or more 64K segments of storage that were previously loaded, saved, and assigned a unique name. The segment(s) can be shared among virtual machines if the segment(s) contains reentrant code. Discontiguous segments used with CMS must be loaded into storage at locations above the address space of a user's CMS virtual machine. They can be detached when no longer needed.

disk. Refers to a magnetic disk unit that is in the user's CMS virtual machine configuration. Also referred to as a virtual disk.

Disk Operating System/Virtual Storage Extended (DOS/VSE). An operating system that is an extension of Disk Operating System/Virtual Storage. A VSE system consists of: (a) licensed VSE/Advanced Functions support, and (b) any IBM-supplied and user-written programs required to meet the data processing needs of a user. VSE and the hardware it controls form a complete computing system.

display mode. A type of editing at a display terminal in which an entire screen of data is displayed at once and in which the user can access data through commands or by using a cursor. Contrast with *line mode*.

display terminal. A terminal with a component capable of displaying information on a viewing surface such as a cathode ray tube (CRT) or gas panel.

distributed data processing (DDP). Data processing in which processing, storage, and control functions, in addition to I/O operations, are distributed among remote locations and connected by transmission facilities.

distributed function terminal (DFT). An operational mode that allows multiple concurrent logical terminal sessions. Contrast with *control unit terminal (CUT)*.

distribution code. In the VM/SP directory, a one-to-eight character identification word printed or punched with the userid in the separator page (or punched card) to further identify the location or department of the user.

DOS. Disk Operating System (DOS), in certain cases, is used as a generic term. For example, disk packs initialized for use with VSE or any predecessor DOS or DOS/VS system may be referred to as DOS disks.

DOS/VSE. Disk Operating System/Virtual Storage Extended.

double-byte character set (DBCS). A character set that requires 2 bytes to uniquely define each character. This contrasts with EBCDIC, in which each character to be printed is represented by 1 byte.

dump. To write the contents of part or all of main storage, or part or all of a minidisk, to an external medium such as tape. See *ABEND dump*.

E

ECB. Event control block.

EC mode. Extended control mode. See *ECMODE*.

ECMODE. A mode in which all of the features of a System/370 computing system, including dynamic address translation, are operational. Contrast with *basic control (BC) mode*.

edit. A function that makes changes, additions, or deletions to a file on a disk. These changes are interactively made. The edit function also generates information in a file that did not previously exist.

edit mode. The environment in which use of CMS EDIT subcommands and System Product Editor (XEDIT) subcommands can be entered by the user to insert, change, delete, or rearrange the contents of a CMS file. Contrast with *input mode*.

element. In reference to installation and service of a product, a file provided on a program update tape (PUT) as input to the build process. See *build*. An element is the smallest serviceable unit of a component. Several files can be associated with a given element, but each file has the same filename.

enhanced connectivity. The strategy for sharing services and resources in a heterogeneous network.

entry point. An address or label of an instruction performed upon entering a computer program, a

routine, or a subroutine. A program can have several different entry points, each corresponding to a different function or purpose.

EOF. End of file.

error recording area. This term refers to the DASD space that the system programmer defines during system generation on the system residence volume that CP uses to record formatted outboard error recordings, machine check records, and channel check records. For count-key-data devices, this area is between two and nine contiguous cylinders in size; for FB-512 devices, the size of this area can be any number of contiguous pages.

event control block (ECB). A control block that represents the status of an event.

EXEC 2 language. A general-purpose, high-level programming language, particularly suitable for exec procedures and XEDIT macros. (The language is documented in the *VM/SP EXEC 2 Reference*, SC24-5219.) Procedures and XEDIT macros (programs) written in this language are executed by the EXEC 2 processor.

F

FCB. (1) Forms control buffer. (2) Function control block.

file access mode. A filemode number that designates whether the file can be used as a read-only or read/write file by a user. See *filemode*. The following are the filemode numbers available to the VM/SP user:

- 0 Limits access to a file to only those other users who have read/write access to the disk. Files having filemode 0 are not listed for another user who links to a disk in read-only mode and requests a list of files on the disk.
- 1 Allows general read/write use of the file; this is the default.
- 2 Allows general read/write use of the file. Filemode 2 usually groups together files on a common disk, such as the system disk.
- 3 Causes the file to be erased after it is read.
- 4 Causes the file to be written in OS simulated data set format.
- 5 Allows general read/write use of the file. Filemode 5 groups together files so they can be manipulated as a group.
- 6 Causes existing records of a file to be written back to their previous location on the disk rather than to a new location. Filemode 6 eliminates the need for the dual directory scheme of block location on a disk, and reduces the possibilities of

errors when one user links to another user's virtual disk.

filemode. A two-character CMS file identifier field comprising the filemode letter (A through Z) followed by the filemode number (0 through 6). The filemode letter indicates the CMS file directory on which the file resides and whether or not the disk is a user virtual disk or a CMS system disk. The filemode number indicates the access mode of the disk. See *file access mode*.

filename. A one-to-eight character alphanumeric field, comprising of A through Z, 0 through 9, and special characters \$ # @ + - (hyphen) : (colon) _ (underscore), that is part of the CMS file identifier and serves to identify the file for the user.

filetype. A one-to-eight character alphanumeric field, comprising of A through Z, 0 through 9, and special characters \$ # @ + - (hyphen) : (colon) _ (underscore), that is used as a descriptor or as a qualifier of the filename field in the CMS file identifier. See *reserved filetypes*.

force start. A VM/SP system restart that attempts to recover information about closed spool files that was previously stored on the checkpoint cylinders. All unreadable or invalid spool file information is ignored. Contrast with *checkpoint start*, *warm start*, and *cold start*.

forms control buffer (FCB). In the 3800 Printing Subsystem, a buffer for controlling the vertical format of printed output. The FCB is analogous to the punched-paper, carriage-control tape used on IBM 1403 Printers.

function control block (FCB). In Subsystem Support Services, a control block that contains information such as a function's status, event control block, task I/O queue, and I/O queue.

free storage. Storage that is not allocated. The blocks of memory that are available for temporary use by programs or by the system.

G

GAM/SP. Graphic Access Method/System Product.

GCS. Group Control System.

group. Synonym for *virtual machine group*.

Group Control System (GCS). A component of VM/SP, consisting of a shared segment that the user can IPL and run in a virtual machine. It provides simulated MVS services and unique supervisor services to help support a native SNA network.

H

high-water mark. The highest contiguous address, starting from location zero, where the virtual system's real addresses equal the virtual system's virtual addresses.

HELP. An online tool for supplying reference information on commands and messages for VM components.

I

I/O. Input/Output.

ID card. Under VM/SP, the identification card that indicates the destination userid of a deck of real cards to be read into the system card reader or into the card reader of an RSCS remote station.

IML. Initial microprogram load.

immediate command. A CMS command that, when entered after an attention interruption, causes program execution, tracing, or terminal display to stop. Another immediate command can be entered to resume tracing or terminal display. The immediate commands are HB (halt batch execution), HI (halt all System Product Interpreter or EXEC 2 programs or macros), HO (halt tracing), HT (halt typing), HX (halt execution), RO (resume tracing), RT (resume typing), SO (suspend tracing), TE (trace end), and TS (trace start). They are called immediate commands because they are executed as soon as they are entered; they are not stacked in the console stack. Within an exec, immediate commands can be established or cancelled by the CMS command IMMCMD.

initial microprogram load (IML). The action of loading a microprogram, which is a set of elementary instructions maintained in special storage that corresponds to a specific computer operation.

initial program load (IPL). The initialization procedure that causes an operating system to begin operation. A virtual machine user must IPL the specific operating system into the virtual machine that will control the user's work. Each virtual machine can be loaded with a different operating system.

input mode. In the CMS Editor or System Product Editor (XEDIT), the environment that lets the user key in new lines of data. Contrast with *edit mode*.

Inter-User Communications Vehicle (IUCV). A VM/SP generalized CP interface that facilitates the transfer of messages either among virtual machines or between CP and a virtual machine.

interactive. The classification given to a virtual machine depending on this virtual machine's processing characteristics. When a virtual machine uses less than its allocation time slice because of terminal I/O, the virtual machine is classified as being interactive. See *noninteractive*.

Interactive Problem Control System (IPCS). A component of VM/SP that permits online problem management, interactive problem diagnosis, online debugging for disk related CP or virtual machine abend dumps, problem tracking, and problem reporting.

interface. A shared boundary between two or more entities. An interface might be a hardware or software component that links two devices or programs together.

internal trace table. See *CP trace table*.

interrupt. In APPC/VM, a way in which the user can receive notification of pending functions.

invoke. To start a command, procedure, or program.

IPCS. Interactive Problem Control System.

IPL. Initial program load.

IUCV. Inter-user communications vehicle.

K

K. kilobyte.

kilobyte (K). 1024 bytes.

L

LAN. Local area network.

line mode. The mode of operation of a display terminal that is equivalent to using a typewriter-like terminal. When the CMS Editor is used, the terminal displays a chronological log of the CMS EDIT subcommands entered, the lines affected by the editing (unless that is suppressed), and the system responses. When the System Product Editor (XEDIT) is used, full-screen editing is the norm but line mode can be used instead. Contrast with *display mode*.

line number. A number located at either the beginning or the end of a record (line) that can be used during editing to refer to that line. See *prompting*.

link. (1) In RSCS, a connection, or ability to communicate, between two adjacent nodes in a network.

(2) In TSAF, the physical connection between two systems.

load. In reference to installation and service, to move files from tape to disk.

load map. A map containing the storage addresses of control sections and entry points of a program loaded into storage.

loader. A routine, commonly a computer program, that reads data into main storage.

local. (1) Two entities (for example, a user and a server) are said to be local to each other if they belong to the same system within a collection or to the same node within a SNA system. (2) In RSCS, channel-attached; that is, connected through only a channel, not through an RSCS-defined link. Local refers to a computer, I/O devices, and virtual machines that communicate with one another only over channels. Contrast with *remote*.

local area network (LAN). (1) A data network located on the user's premises in which serial transmission is used for direct data communication among data stations. (2) See *wide area network*.

logical record. A formatted record that consists of a 2-byte logical record length and a data field of variable length.

logical saved segment. A portion of a physical saved segment that CMS can manipulate. Each logical segment can contain different types of program objects, such as modules, text files, execs, callable services libraries, language repositories, user-defined objects, or a single minidisk directory. A system segment identification file (SYSTEM SEGID) associates a logical saved segment to the physical saved segment in which it resides. See *physical saved segment* and *saved segment*.

logical unit (LU). In SNA, a port through which an end user accesses the SNA network to communicate with another end user and through which the end user accesses the functions provided by system services control points (SSCPs). An LU can support at least two sessions, one with an SSCP and one with another LU, and may be capable of supporting many sessions with other logical units.

logoff. The procedure by which a user ends a terminal session.

logon. The procedure by which a user begins a terminal session.

M

machine. A synonym for a virtual machine running under the control of VM/370 or VM/SP.

macro. In assembler language programming, an assembler language statement that causes the assembler to process a predefined set of statements called a macro definition. The statements usually produced from the macro definition replace the macro instruction in the program.

macro instruction. In assembler language programming, an assembler language statement that causes the assembler to process a predefined set of statements called a macro definition. The statements usually produced from the macro definition replace the macro instruction in the program.

macro library. A library of macro definitions.

map. In CMS, the file that contains a CMS output listing, such as (1) a list of macros in the MACLIB library, including macro size and location within the library, (2) a listing of the directory entries for the DOS/VS system or private source, relocatable, or core image libraries, (3) a linkage editor map for CMS/DOS programs, and (4) a module map containing entry point locations.

master file directory block. Synonym for *CMS file directory*.

MDISK. Another name for minidisk. It is also the user directory that describes a user's storage space.

merge. In reference to service, including a change program temporary fix (PTF) into the code.

merge disk. In reference to service of a product, the disk containing changes that have been applied to a product. These changes have been copied from the delta disk and renamed to match the corresponding file on the base disk.

message. (1) In information theory, an ordered series of characters intended to convey information. (2) A group of characters and control bit sequences transferred as an entity. (3) A communication sent from a person or program to another person or program. (4) A unit of data sent over a telecommunication line. (5) For BSC devices, the data unit from the beginning of transmission to the first end of text (ETX) character, or between two ETX characters. (6) One or more message segments transmitted among terminals, application programs, and systems. (7) In SNA, deprecated term for message unit.

minidisk. A logical subdivision (or all) of a physical disk pack that has its own virtual device address, consecutive virtual cylinders (starting with virtual

cylinder 0), and a VTOC or disk label identifier. Each user virtual disk is preallocated and defined via a VM/SP directory entry as belonging to a user.

module. (1) A unit of a software product that is discretely and separately identifiable with respect to modifying, compiling, and merging with other units, or with respect to loading and execution. For example, the input to, or output from, a compiler, the assembler, the linkage editor, or an exec routine. (2) A nonrelocatable file whose external references have been resolved.

MSSF. Monitoring and service support facility.

multiprocessor. A computer employing two or more processing units under integrated control.

Multiple Virtual Storage (MVS). An alternative name for OS/VS2.

MVS. Multiple Virtual Storage.

N

NCCF. Network Communication Control Facility.

NCP. Network control program.

NCPDUMP. Network control program DUMP.

netdata. The name of the format used to send a file when the NEW option of the CMS SENDFILE command is specified.

network. Any set of two or more computers, work stations, or printers linked together in such a way as to permit data to be transmitted between them.

Network Communication Control Facility (NCCF). A product that controls a VM/SP system through the Programmable Operator Facility in a mixed environment.

Network Control Program (NCP). A licensed program that provides communication controller support for single-domain, multiple-domain, and interconnected network capability. 2. In System/38, a program transmitted to and stored in a communication controller to control the operation of the controller.

node. (1) A single processor or a group of processors in a teleprocessing network. (2) A computer, work station, or printer, when it is participating in a network.

node id. Node identifier. The name by which a node is known to all other nodes in a network.

noninteractive. The classification given to a virtual machine depending on this virtual machine's processing characteristics. When a virtual machine usually uses all

its allocated time slice, it is classified as being noninteractive or compute bound. See *interactive*.

nucleus. The part of CP, CMS and GCS resident in main storage.

NUCON. The nucleus constant area of CMS.

null line. A logical line with a length of zero; usually used to signal the CMS Editor to terminate input mode and enter edit mode. In VM/SP, a null line for typewriter terminals is a terminal input line consisting of a return character as the first and only information, or a logical line end symbol as the last character in the data line. For display devices, a null line is indicated by the cursor positioned at the beginning of the user input area or the data in the user input area ending with a logical line end symbol.

O

OLTSEP. Online test stand-alone executive program.

online test stand-alone executive program (OLTSEP). A program used by IBM for I/O maintenance.

operand. Information entered with a command name to define the data on which a command processor operates and to control the execution of the command processor.

Operating System/Virtual Storage (OS/VS). A family of operating systems that control IBM System/360 and System/370 computing systems. OS/VS includes VS1, VS2, MVS/370, and MVS/XA.

OS/VS. Operating System/Virtual Storage.

overlay. The technique of repeatedly using the same areas of internal storage during different stages of a program.

override file. See *class override file*.

P

pack. A set of flat, circular recording surfaces used in a disk storage device. A disk pack.

page. A fixed-length block that has a virtual address and can be transferred between real storage and auxiliary storage.

page number. The part of a virtual storage address needed to refer to a page.

paging. The process of transferring pages between real storage and external page storage.

parameter. A variable that is given a constant value for a specified application and that may denote the application.

parameter list (PLIST). In CMS, a string of 8-byte arguments that call a CMS command or function. The first argument must be the name of the command or function to be called. General register 1 points to the beginning of the parameter list.

password. In VM/SP, a one-to-eight character symbol that users are required to supply at the time they log on to identify themselves to VM/SP. The password is usually protected from inadvertent disclosure to unauthorized personnel by not displaying the password or by masking the password as it is keyed in. A password can also be assigned to a virtual disk to control or limit access to that disk.

path. In APPC/VM, any connection between two applications in virtual machines either on the same or different systems.

personal computer (PC). A properly configured IBM Personal Computer or 3270 Personal Computer that allows communication between enhanced connectivity programs. These communicating programs reside on both a personal computer and host system.

physical screen. See *screen*.

physical saved segment. One or more pages of storage that have been named and retained on a CP-owned volume (DASD). Once created, it can be loaded within a virtual machine's address space or outside a virtual machine's address space. Multiple users can load the same copy. A physical saved segment may contain one or more logical saved segments. A system segment identification file (SYSTEM SEGID) associates a physical saved segment to its logical saved segments.

physical unit block (PUB). In a VSE system, an entry in a table containing the channel and device address of a device. There is a physical unit block for each physical device available in the system.

PLIST. See *parameter list*.

preferred auxiliary file. In CMS, an auxiliary file that applies to a particular version of a source module to be updated, if multiple versions of the module exist.

prefix area. The five left-most positions on the System Product Editor's full-screen display, in which prefix subcommands or prefix macros can be entered. See *prefix subcommands* and *prefix macros*.

prefix macros. System Product Editor macros entered in the prefix area of any line on a full-screen display. See *prefix area*.

prefix subcommands. System Product Editor subcommands entered in the prefix area of any line on a full-screen display. See *prefix area*.

private storage. A combination of application code and GCS code available to only one particular virtual machine. No virtual machine can access or share another's private storage area.

privilege class. One or more classes assigned to a virtual machine user in a VM/SP directory entry; each privilege class specified lets a user access a logical subset of the CP commands. There are eight IBM-defined privilege classes that correspond to specific administrative functions. They are:

- Class A - operations
- Class B - resource
- Class C - programmer
- Class D - spooling
- Class E - analyst
- Class F - service
- Class G - general
- Class H - reserved for IBM use.

The privilege classes can be changed to meet the needs of an installation. See *class authority* and *user class restructure*.

process. A systematic sequence of operations to produce a specified result. A process is usually logical, not physical.

product. Any separately installable software program, whether supplied by IBM or otherwise, distinct from others and recognizable by a unique identification code. Common examples of software products include:

- 5664-167 - Virtual Machine/System Product
- 5748-F03 - VS/FORTRAN Program Product
- 5748-RC1 - VM/Pass-Through Product.

The product identification code is unique to a given product, but does not identify the release level of that product.

program stack. Temporary storage for lines (or files) being exchanged by programs that execute under CMS. See *console stack*.

program status word (PSW). An area in storage that indicates the order in which instructions are executed, and to hold and indicate the status of the computer system.

program temporary fix (PTF). Code changes needed to correct a problem reported in an APAR. The corrected code is included in later releases. It includes element replacements (for object code) or element updates (for source code) for elements changed by the fix. It also defines limitations on which the PTF can be included. Each PTF is unique to a given release of a product. If the same problem occurs in multiple releases of a

product, a separate PTF is defined for each release. A PTF defines only one replacement or update for each element, regardless of how many APARs are fixed.

program update tape (PUT). A tape containing a customized collection of service tapes (preventive service) to match the products listed in a customer's ISD (IBM Software Distribution) profile. Each PUT contains cumulative service for the customer's products back to earlier release levels of the product still supported. The tape is distributed to authorized customers of the products at scheduled intervals.

Programmable Operator Facility. This facility enables automatic filtering and routing of messages from a specified virtual machine (for example the operator) to a logical operator virtual machine in a local distributed or mixed environment. The Programmable Operator Facility also permits installation defined actions to be automatically performed.

prompting. An interactive technique that lets the program guide the user in supplying information to a program. The program types or displays a request, question, message, or number, and the user enters the desired response. The process is repeated until all the necessary information is supplied.

PSW. Program status word.

PTF. Program temporary fix.

PUB. Physical unit block.

PUT. Program update tape.

R

raddr. The real device address of an I/O device.

read. See *CP read* and *VM read*.

real address. (1) The address of a location in real storage. (2) The address of a real I/O device.

receive. Bringing into the specified buffer data sent to the user's virtual machine from another virtual machine or from the user's own virtual machine.

recovery machine. The first machine to join a virtual machine group. It has responsibility for executing routines that were set with the GCS MACHEXT macro and cleaning up system resources when machines leave the group.

remote. (1) Two entities (for example, a user and a server) are said to be remote to each other if they belong to different systems within a collection, or to different nodes within a SNA network. (2) In RSCS, a connection through one or more RSCS-defined links. *Remote* describes computers, I/O devices, and virtual

machines, to and from which information must pass over an RSCS-defined link. From the perspective of a particular node in an RSCS network, *remote* refers to any other node in the network. Contrast with *local*.

Remote Spooling Communications Subsystem (RSCS).

A licensed program for VM/SP, it is a special-purpose subsystem that supports the reception and transmission of messages, files, commands, and jobs over a computer network.

reply. The answer to a service request that came from the server.

requester. The program that relays a request to another computer through the server-requester programming interface (SRPI). Contrast with *server*.

reserved filetypes. (1) Filetypes recognized by the CMS editors (EDIT and XEDIT) as having specific default attributes that include: record size, tab settings, truncation column, and uppercase or lowercase characters associated with that particular filetype. The CMS Editor creates a file according to these attributes. (2) Filetypes recognized by CMS commands; that is, commands that only search for and use particular filetypes or create one or more files with a particular filetype.

resource. A program, a data file, a specific set of files, a device, or any other entity or a set of entities that the user might want to uniquely identify for application program processing in a VM system. A resource can be identified by up to eight characters.

resource manager. A program or set of programs executing in a virtual machine and managing access to one or more VM resources; also called a server.

Restructured Extended Executor (REXX) language. A general-purpose programming language, particularly suitable for exec procedures, XEDIT macros, or programs for personal computing. Procedures, XEDIT macros, and programs written in this language are interpreted and executed by the System Product Interpreter. Contrast with *CMS EXEC language* and *EXEC 2 language*.

route. A connection to another system via a logical link and many intermediate systems. In TSAF, a number of links and possible intermediate systems that allow the connection of one system to another.

RSCS. Remote Spooling Communications Subsystem.

S

saved segment. A segment of storage that has been saved and assigned a name. The saved segment(s) can be physical saved segments that CP recognizes or logical saved segments that CMS recognizes. The segments can be loaded and shared among virtual machines, which helps use real storage more efficiently, or a private, nonshared copy can be loaded into a virtual machine. See *logical saved segment* and *physical saved segment*.

saved system. A special nonrelocatable copy of a virtual machine's virtual storage and associated registers kept on a CP-owned disk and loaded by name instead of by I/O device address. Loading a saved system by name substantially reduces the time it takes to IPL the system in a virtual machine. In addition, a saved system such as CMS can also share one or more 64K segments of reenterable code in real storage between virtual machines. This reduces the cumulative real main storage requirements and paging demands of such virtual machines.

SCF. Service control file.

screen. An illuminated display surface; for example, the display surface of a cathode ray tube (CRT).

SDB. Structured data base.

secondary user. When a user is disconnected — that is, has no virtual console on line — a secondary user can be designated to receive the disconnected user's console messages and to enter commands to the disconnected user's console.

segment.

1. A contiguous 64K or 1024K area of virtual storage (not necessarily contiguous in real storage) that is allocated to a job or system task.
2. VM/SP does not use 1024K segments, but supports any virtual machine operating system that uses 1024K segments.

separator. Synonymous with *delimiter*.

server. (1) A program or set of programs executing in a virtual machine and managing access to one or more VM resources; also called a resource manager. (2) The program that responds to a request from another computer through the server-requester programming interface (SRPI). Contrast with *requester*.

server-requester programming interface (SRPI).

1. A protocol between requesters and servers in an enhanced connectivity network. Includes the protocol to define a cooperative processing subsystem.

2. The interface that enables enhanced connectivity between requesters and servers in a network.

service control file (SCF). A file that describes a program temporary fix (PTF) and contains all the information needed to install the PTF.

service routines. CP or CMS routines used for addressing and updating directories; formatting or initializing disks; or performing disk, tape, or terminal I/O functions.

session. A connection between two stations that lets them communicate.

sever. Ending communication with another virtual machine or with the user's own virtual machine.

shared read-only system residence disk. A system residence disk that is tailored so that most of the system residence information is read-only and accessible to all relevant virtual machines, leaving a relatively smaller private read/write system disk that must be dedicated to each virtual machine. This technique can substantially reduce the disk requirements of an installation by avoiding needless duplication of disk packs by virtual machines that use the same operating system. See *saved system*.

shared segment. A feature of a saved system or physical saved segment that lets one or more segments of reentrant code or data in real storage be shared among many virtual machines. For example, if a saved CMS system was generated, the CMS nucleus is shared in real storage among all CMS virtual machines loaded by name; that is, every CMS machine's segment of virtual storage maps to the same 64K of real storage. See *saved system* and *discontiguous saved segment*.

shared system. See *saved system* and *shared read-only system residence disk*.

single processor mode. In tightly coupled multiprocessing (MP) or attached processor (AP) systems, single processor mode lets an installation dedicate a processor to an MVS V=R virtual machine. In single processor mode, VM/SP runs in uniprocessor mode in the main processor, and the MVS V=R virtual machine runs under VM/SP in the main processor and has the exclusive use of the other processor for MP or AP operations. However, other virtual machines can operate under VM/SP concurrently with the MVS V=R virtual machine in single processor mode. Single processor mode should not be confused with VM/SP uniprocessor mode.

SIO. Start I/O.

SNA. Systems Network Architecture.

spool. (1) (Noun) An area of auxiliary storage defined to temporarily hold data during its transfer between

peripheral equipment and the processor. (2) (Verb) To use auxiliary storage as a buffer storage to reduce processing delays when transferring data between peripheral equipment and the processing storage of a computer.

spoolid. A spool file identification number that is automatically assigned by CP when the file is closed. The spoolid number can be from 0001 to 9900; it is unique for each spool file. To identify a given spool file, a user must specify the owner's userid, the virtual device type, and the spoolid.

spooling. The processing of files created by or intended for virtual readers, punches, and printers. The spool files can be sent from one virtual device to another, from one virtual machine to another, and to real devices. See *virtual console spooling*.

SRPI. Server-requester programming interface.

SSP. System service program.

stack. See *console stack* and *program stack*.

stand-alone. Pertaining to an operation independent of another device, program, or system.

subcommand. The commands of processors such as EDIT or System Product Editor (XEDIT) and DEBUG that run under CMS.

supervisor call instruction (SVC). An instruction that interrupts a program being executed and passes control to the supervisor so that it can perform a specific service indicated by the instruction.

SVC. Supervisor call instruction.

synonym. In CMS, an alternative command name defined by the user as equivalent to an existing CMS command name. Synonyms are entries in a CMS file with a filetype of SYNONYM. Entering the SYNONYM command allows use of those synonyms until that terminal session ends or until the use of synonyms is revoked by entering the SYNONYM command with no operands.

syntax. The rules for the construction of a command or program.

system administrator. The person responsible for maintaining a computer system.

system integrity. The property of a system that is designed, implemented, and maintained to protect itself from unauthorized access.

System Product Editor. The CMS facility, comprising the XEDIT command and XEDIT subcommands and macros, that lets a user create, modify, and manipulate CMS disk files.

System Product Interpreter. The component of the VM/SP operating system that processes procedures, XEDIT macros, and programs written in the Restructured Extended Executor (REXX) language.

Systems Network Architecture (SNA). The description of the logical structure, formats, protocols, and operational sequences for transmitting information units through and controlling the configuration and operation of networks.

system service program (SSP). In ACF/TCAM, an IBM-supplied or user-supplied program that performs system-oriented auxiliary functions in support of the message control program. System service programs run under control of the initiator as attached subtasks.

T

target. One of many ways to identify a line to be searched for by the System Product Editor. A target can be specified as an absolute line number, a relative displacement from the current line, a line name, or a string expression.

task ID. A 2-byte field that uniquely defines a task within a Group Control System virtual machine. Task ID is sometimes combined with machine ID to uniquely identify a task within a virtual machine group.

terminal. A device, usually equipped with a keyboard and a display, capable of sending and receiving information over a communications channel. With VM/SP, the terminal communicates with the system.

text library. A CMS file that contains relocatable object modules and a directory that indicates the location of each of these modules within the library.

time-of-day (TOD) clock. A hardware feature that is required by VM/SP. The TOD clock is incremented once every microsecond, and provides a consistent measure of elapsed time suitable for the indication of date and time; it runs regardless of the processor state (running, wait, or stopped).

TOD clock. Time-of-day clock.

tokenized PLIST (parameter list). A string of doubleword aligned parameters occupying successive double words.

trace table. See *CP trace table*.

transparent. An application-to-server interface is said to be transparent if it is identical for local and remote servers.

Transparent Services Access Facility (TSAF). (1) A facility that lets users connect to and communicate with local or remote virtual machines within a collection of systems. With TSAF, a user can connect to a program by specifying a name that the program has made known, instead of specifying a userid and node id. (2) A component in VM/SP that handles communication between systems by letting APPC/VM paths span more than one system.

TSAF. Transparent Services Access Facility.

U

uniprocessor mode. In VM/SP, this term indicates that there is only one processor in the physical configuration, or that VM/SP uses the facilities of one processor in an attached processor or multiprocessor system. The system operator can alter the VM/SP mode of operation, from attached processor or multiprocessor operation (using more than one processor), to a one-processor operation (and vice versa). The term uniprocessor mode identifies the one-processor operation. Contrast with *single processor mode*.

update file. The actual changed code used by the assembler or compiler to produce the object code. This file exists only in source-maintained products.

UPSI. User program switch indicator.

user. Anyone who requires the services of a computing system.

user class restructure. The extension of the class structure of CP instructions from 8 to 32 classes for each user, command, and diagnose code within the system. This extension allows the installation greater flexibility in authorizing CP instructions.

userid. User identification.

user program switch indicator (UPSI). An operand of the CMS SET command. The user can set the switches (1 byte) to a desired value, which can be tested by a program in CMS/DOS.

user-written CMS command. Any CMS file created by a user that has a filetype of MODULE or EXEC. Such a file can be executed as if it were a CMS command by issuing its filename, followed by any operands or options expected by the program or exec procedure.

userid. A one-to-eight character alphanumeric symbol identifying each virtual machine.

V

vaddr. Virtual address.

virtual address. An address that refers to virtual storage or a virtual I/O device address, and that must, therefore, be translated into a real storage or I/O device address when it is used.

virtual console. A 3210, 3215, 1052, or 3270 system console simulated on a communications terminal (such as a 2741 or 3278) by CP. The virtual device type and I/O address are defined in the VM/SP directory entry for that virtual machine.

virtual console spooling. The writing of console I/O on disk as a printer spool file instead of, or in addition to, having it typed or displayed at the virtual machine console. The console data includes messages, responses, commands, and data from or to CP and the virtual machine operating system. The user can invoke or terminate console spooling at anytime and as often as the user likes. When the console spool file is closed, it becomes a printer spool file.

virtual machine. A functional equivalent of a real machine.

virtual machine control block (VMBLOK). The CP control block that contains, for each virtual machine, the following types of information: the dispatch and priority level of the virtual machine, the virtual machine's processor registers, preferred virtual machine options currently in effect, and information concerning all other significant activities.

virtual machine group. The concept in the Group Control System of two or more virtual machines associated with each other through the same named system (for example, IPL GCS1). Virtual machines in a group share common read/write storage and can communicate with one another through facilities provided by the Group Control System. Synonymous with *group*.

Virtual Machine/System Product (VM/SP). A program product that manages the resources of a single computing system so that multiple computing systems (virtual machines) appear to exist. VM/SP consists of a Control Program (CP), which manages the real computer, and a Conversational Monitor System (CMS), which is a general-purpose conversational time-sharing system that executes in a virtual machine. Note that former VM/370 users continue to have a Remote Spooling Communications Subsystem (RSCS), which spools files to and from remote work stations, and the Interactive Problem Control System (IPCS), which provides an online problem management, diagnosis, debugging, and tracking facility.

Note: Because RSCS and IPCS were not modified to support some VM/SP functions, the RSCS Networking Program Product (5748-XP1) and the IPCS Extension Program Product (5748-SA1) are recommended for use with VM/SP.

virtual printer (or punch). A printer (or card punch) simulated on disk by CP for a virtual machine. The virtual device type and I/O address are usually defined in the VM/SP directory entry for that virtual machine.

virtual = real area. In VM/SP, that part of real storage, starting with real page 1, where a virtual = real machine can execute. CP maintains control of real page zero; only page 0 (zero) of the virtual = real machine is relocated. Only one virtual machine at a time can occupy the virtual = real area. The area must be defined during VM/SP system generation to contain the largest virtual = real machine that is likely to run. See *virtual = real option*.

virtual = real option. A VM/SP performance option that lets a virtual machine run in VM/SP's virtual = real area. This option eliminates CP paging and, optionally, CWC translation for this virtual machine.

virtual screen. A functional simulation of a physical screen. A virtual screen is a *presentation space* where data is maintained. The user can view pieces of the virtual screen through a window on the physical screen.

virtual storage. Storage space that can be regarded as addressable main storage by the user of a computer system in which virtual addresses are mapped into real addresses. The size of virtual storage is limited by the addressing scheme of the computing system and by the amount of auxiliary storage available, and not by the actual number of main storage locations.

virtual storage access method (VSAM). An access method for direct or sequential processing of fixed and variable-length records on direct access devices. The records in a VSAM data set or file can be organized in logical sequence by a key field (key sequence), in the physical sequence in which they are written on the data set or file (entry-sequence), or by relative-record number.

virtual storage extended (VSE). The generalized term that indicates the combination of the DOS/VSE system control program and the VSE/Advanced Functions program product. Note that in certain cases, the term DOS is still used as a generic term; for example, disk packs initialized for use with VSE or any predecessor DOS or DOS/VS system are sometimes called DOS disks. Also note that the DOS-like simulation environment provided under the VM/SP CMS component and CMS/DOS exists on VM/SP and VM/SP High Performance Option program product and continues to be referred to as CMS/DOS.

Virtual Telecommunications Access Method (VTAM). A licensed program that controls communication and the flow of data in a computer network. It provides single-domain, multiple-domain, and multiple-network capability. VTAM runs under OS/VS1, MVS, VSE, and VM/SP. Synonymous with *ACF/VTAM* unless otherwise distinguished.

VM read. The situation in which the user's virtual machine is not executing, but is waiting for a response or a request for work from the user. On a typewriter terminal, the keyboard is unlocked; on a display terminal, the screen status area indicates VM READ.

VMA. Virtual machine assist.

VMBLOK. Virtual machine control block.

VM/SP. Virtual Machine/System Product.

VM/SP directory. A CP disk file that defines each virtual machine's typical configuration; the userid, password, regular and maximum allowable virtual storage, CP command privilege class or classes allowed, dispatching priority, logical editing symbols to be used, account number, and CP options desired.

valid. The volume identification label for a disk.

volume table of contents (VTOC). (1) A table on a direct access volume that describes each data set on the volume. (2) An area on a disk or diskette that describes the location, size, and other characteristics of each file and library on the disk or diskette.

VSAM. Virtual storage access method.

vscreen. Virtual screen.

VSE. Virtual storage extended.

VTAM. Virtual Telecommunications Access Method.

VTOC. Volume table of contents.

W

warm start. (1) The result of an IPL that does not erase previous system data. (2) The automatic reinitialization of the VM/SP control program that occurs if the control program cannot continue processing. Closed spool files and the VM/SP accounting information are not lost. Contrast with *cold start*, *checkpoint start*, and *force start*.

window. In VM/SP, an area on the physical screen where virtual screen data can be displayed. Windowing lets the user do such functions as defining, positioning, and overlaying windows; scrolling backward and forward through data; and writing data into virtual screens.

work station. An I/O device from which jobs can be submitted to a host system for processing, or to which output can be returned, or both.

X

XEDIT. See *System Product Editor*.

Z

ZAP. A CMS command that changes or dumps MODULE, LOADLIB, or TXTLIB files. It can change either fixed or variable length MODULE files. It is used by system support personnel only.

NUMERICS

3340. Refers to the IBM 3340 Direct Access Storage Facility and the IBM 3344 Direct Access Storage.

3422. Refers to the IBM 3422 Magnetic Tape Subsystem.

370x. Refers to the IBM 3704/3705 Communication Controllers.

3800. Refers to the IBM 3800 Printing Subsystems, Models 1 and 3. A specific device type is used only when a distinction is required between device types.

9313. Refers to the IBM 9313 Direct Access Storage Device.

9332. Refers to the IBM 9332 Direct Access Storage Device.

9335. Refers to the IBM 9335 Direct Access Storage Device.

9347. Refers to the IBM 9347 Tape Drive.

9370. Refers to a series of processors, namely the IBM 9373 Model 20, the IBM 9375 Models 30, 40, 50, and 60, and the IBM 9377 Models 80 and 90.
