HOW THIS BOOK IS ORGANIZED

This book lists the data areas and control blocks (referred to collectively as "blocks") used by the VM/XA System Product Release 1 control program (CP). The blocks are named by their COPY file names, but they are listed alphabetically by DSECT name. You can determine the DSECT name by removing the prefix 'HCP' from the COPY file name. If there is no 'HCP' prefix, the DSECT name is the same as the COPY file name.

HOW EACH BLOCK IS ORGANIZED

The information provided for each block includes descriptive information (the block's name and function, and how it is located, created, and deleted); a picture of the block; and a listing of the fields and bits (or codes) defined in that block. The information given about each field includes its name (label), displacement, length (in bytes), a short description of the field, and any bits or codes defined in the field.

A NOTE ABOUT THE LENGTHS OF THE FIELDS

The length column sometimes contains the implied length of the field, not its actual length. This happens because the lengths were obtained from the cross reference of an Assembler H assembler listing. When the operand of a DS or DC instruction in the data area or control block is not coded with a length modifier, Assembler H assigns an implied length to that field in the cross reference.

The implied length depends on the type of constant that was coded in the operand. For example, if a field is coded as

```
LABEL1 DS 2F
```

its length appears in this book as 004, the implicit length for a fullword, and not as 008, which is the actual length of this field.

You can easily determine a field's actual length by comparing the field's displacement to the displacement of the field after it.

Figure 1 shows the implied lengths for different types of constants.

For more information about implied length, see the Assembler H Version 2 Application Programming: Language Reference.

Type	Implied Length, Bytes	Alignment	Format
C	-	Byte	Characters
X	-	Byte	Hexadecimal digits
B	-	Byte	Binary digits
F	4	Word	Fixed-point binary
H	2	Halfword	Fixed-point binary
E	4	Word	Short floating-point
D	8	Doubleword	Long floating-point
L	16	Doubleword	Extended floating-point

Figure 1 (Part 1 of 2). Constants and Their Implied Lengths

Type	Implied Length, Bytes	Alignment	Format
P	-	Byte	Packed decimal
Z	-	Byte	Zoned decimal
A	4	Word	Value of address
Y	2	Halfword	Value of address
S	2	Halfword	Address in base-displacement form
V	4	Word	Externally defined address value

Figure 1 (Part 2 of 2). Constants and Their Implied Lengths

FIELDS WITHOUT LABELS

When a field has no label, its length column contains the actual assembler operand for the length, rather than the length in bytes. If a field is coded as

```
DS CL24
```

its length appears as CL24, not as 024.

BIT AND CODE DEFINITIONS

Some fields have bits or codes defined in them. These bits and codes are equates, defined by the assembler EQU statement. The bits or codes defined in any given field are found in one of two places.

BITS DEFINED IMMEDIATELY AFTER THE FIELD

Sometimes the bits or codes are defined immediately after the field. In this case, they have the heading:

```
BITS DEFINED IN fieldname (AT HEX DISPLACEMENT: xxx)
```

or

```
CODES DEFINED IN fieldname (AT HEX DISPLACEMENT: xxx)
```

For example, the block HCPCPCBK contains a field called CPCDTFLG. This field has bits defined immediately after it:

```
003 CPCDTFLG 001 DATA TRANSFER CONTROL BYTE
      BITS DEFINED IN CPCDTFLG (AT HEX DISPLACEMENT: 3)
      80 CPCPSNSP SENSE DATA PENDING AT CCWFETCH
      40 CPCDTBWD READ-BACKWARD OPERATION
      20 CPCDTRTY COMMAND RETRY IS IN EFFECT
      10 CPCDTBEG DATA TRANSFER HAS BEGUN
      04 CPCDTSTP 'STOP' WAS SIGNALLED
      02 CPCDTCER CHANNEL END RECEIVED
      01 CPCDTEND RECEIVED FINAL STS FOR CMD
```

BITS DEFINED ELSEWHERE

The other possibility is that the bits or codes for a field are defined elsewhere. They could be defined in another field in the same block, or in another field in a different block. The "different block" is often one of the equates-only blocks included in the appendix of this book. Bits and codes that are defined elsewhere have the following heading:

**Restricted Materials of IBM
Licensed Materials - Property of IBM**

BITS DEFINED FOR fieldname BY blockname other-fieldname
or

CODES DEFINED FOR fieldname BY blockname other-fieldname

For example, a field called CPCCWFL in the block HCPCPCBK looks like this:

001 CPCCWFL 001 CCW CHANNEL CONTROL FLAGS

BITS DEFINED FOR CPCCWFL BY HCPEQUAT CCWFLAG

This means that CPCCWFL uses the bit definitions found in the field CCWFLAG which is in the block HCPEQUAT (one of the equates-only blocks).

As a final example, let's look at a field called ALOAVAIL in the block HCPALOC:

001 ALOAVAIL 001 AVAILABILITY OF TYPES

BITS DEFINED FOR ALOAVAIL BY HCPALOC ALOCMAP

In this case, bits are defined for ALOAVAIL by another field within the same block. ALOAVAIL uses the same bit definitions as the field called ALOCMAP.

HOW TO GET AN UPDATED LISTING OF THE DATA AREAS AND CONTROL BLOCKS

You can get the most up-to-date listing of CP data areas and control blocks by assembling a file called HCPBLOKS ASSEMBLE. To assemble this file, follow these steps.

Note:

Screen input and output appear in the left-hand column. Commands that you must type in (input) appear in **lowercase bold type**. Within these commands, variables that you must replace with your own values are indicated by underlining. The square bullet ■ indicates that you must press the ENTER key. The system's responses to your commands (output) appear in UPPERCASE type.

The right-hand column contains explanations.

1. Log on to the MAINT userid (by convention, IBM calls the virtual machine that supervises service MAINT).
2. Define a temporary disk. Use the chart below to determine how much DASD space you need:

Device (devtype)	Cylinders (cyls)
3330	22
3340	55
3350	10
3375	16
3380	10

def tdevtype vdevno cyls ■

DASD vdevno DEFINED
R; T=n.nn/n.nn hh:mm:ss

Substitute a device type for devtype, a virtual device number for vdevno, and a cylinder count for cyls.

3. Format the temporary minidisk and access it as A.

format vdevno a ■

Substitute the virtual device number for vdevno.

FORMAT WILL ERASE ALL FILES
ON DISK 'A(vdevno)'. DO YOU WISH
TO CONTINUE? (YES|NO):

yes ■
ENTER DISK LABEL:

label ■

Enter your own disk label for this
temporary disk.

FORMATTING DISK 'A'.
'nn' CYLINDERS FORMATTED ON 'A(vdevno)'.
R; T=n.nn/n.nn hh:mm:ss

4. Access MAINT's 394 minidisk (the CP source file disk) and copy the HCPBLOKS ASSEMBLE file.

access 394 c ■

You must access 394 as c. The file
you copy is in packed format. Use
the UNPACK option to unpack the
file.

R; T=n.nn/n.nn hh:mm:ss

copy hcpbloks assemble c (olddate unpack) ■

R; T=n.nn/n.nn hh:mm:ss

5. Access MAINT's 194 minidisk (the control file and MACLIB disk) and 294 minidisk (the update file disk).

access 194 b/a ■

B (194) R/O
R; T=n.nn/n.nn hh:mm:ss

access 294 c/a ■

'294' REPLACES 'C (394) '
C (294) R/O
R; T=n.nn/n.nn hh:mm:ss

6. Reaccess MAINT's 394 minidisk as a read-only extension to MAINT's A minidisk.

access 394 d/a ■

D (394) R/O
R; T=n.nn/n.nn hh:mm:ss

7. Check MAINT's minidisk accesses. The minidisks, access modes, and link mode (R/W or R/O) should be the same as shown.

query search ■

label	vdevno	A	R/W
MNT194	194	B/A	R/O
MNT294	294	C/A	R/O
MNT394	394	D/A	R/O
MNT190	190	S	R/O
MNT19E	19E	Y/S	R/O

R; T=n.nn/n.nn hh:mm:ss

label and vdevno are the values you
specified when you defined and
formatted the temporary minidisk.

8. Use the UPDATE command to update HCPBLOKS ASSEMBLE.

update hcpbloks assemble * hcpxa cntrl * (ctl) *

UPDATING 'HCPBLOKS ASSEMBLE D1'
APPLYING 'HCPBLOKS ft C1'
R; T=n.nn/n.nn hh:mm:ss

This example assumes there is an update file for HCPBLOKS. If there is an update file, it will have a special filetype (ft). If there is no update file, you will receive the message 'NO UPDATE FILES WERE FOUND'.

9. Issue the GLOBAL command for the macro libraries called by HCPBLOKS.

global maclib hcpxa dmssp cmslib osmacro osmacrol *
R; T=n.nn/n.nn hh:mm:ss

10. Set the virtual punch to stay open after spool files reach 50,000 records.

spool punch noeof *

The option NOEOF means the punch stays open after punch spool files reach 50,000 records.

11. Issue the HASM command for HCPBLOKS.

hasm fn (sysparm (exp) xref (full) print) *

PRT FILE nnnn FROM MAINT
PRT RECS nnnn COPY 001 A
NOHOLD NOKEEP
R; T=n.nn/n.nn hh:mm:ss

If updates were applied to HCPBLOKS ASSEMBLE, substitute \$HCPBLOK for fn. If updates were not applied to HCPBLOKS ASSEMBLE, substitute HCPBLOKS for fn.

The PRT file contains the assembled listing of HCPBLOKS ASSEMBLE.

 THERE ARE 256 CONTIGUOUS AUXILIARY STORAGE ADDRESS
 ENTRIES (ASATE'S) CONTAINED IN THE PGMASATB.
 ANY SPECIFIC ASA TABLE ENTRY CAN BE OBTAINED BY
 EXTRACTING THE PAGE NUMBER (BITS 12-19) FROM A
 VIRTUAL ADDRESS MULTIPLYING THE PAGE NUMBER TIMES 4
 AND ADDING THE OFFSET OBTAINED TO PGMASATB.
 ALSO, USING THE ADDRESS OF A PAGTE AS THE ADDRESS
 OF A VPGBK THE CORRESPONDING ASATE CAN BE FOUND
 BY ADDRESSING FIELD VPGASATE IN THE VPGBK.

IFSNT

HCPIFSNT— INTERPRETATION FACILITY SUBCHANNEL NUMBER TABLE

DSECT NAME: IFSNT

DESCRIPTIVE NAME: INTERPRETATION FACILITY SUBCHANNEL NUMBER TABLE

FUNCTION: TO ALLOW THE MICROCODE TO DETERMINE IF A SIOF INSTRUCTION ISSUED, UNDER SIE, BY THE V=R GUEST SHOULD BE PASSED THROUGH OR CAUSE INTERCEPTION. THE IFSNT IS A 16K TABLE ON A PAGE FRAME BOUNDARY. IT IS CONTAINED IN FIXED, CONTIGUOUS REAL STORAGE. IT CONTAINS ONE ENTRY (4 BYTES LONG) FOR EACH DEVICE THAT COULD BE SUPPORTED UNDER I/O PASS THROUGH. IT IS ONLY APPLICABLE FOR A 370 V=R GUEST. DEVICES WITH ADDRESSES 000 THRU FFF ARE SUPPORTED UNDER I/O PASS THROUGH. THE MICROCODE USES THE DEVICE ADDRESS OPERAND OF THE SIOF INSTRUCTION TO INDEX INTO THE IFSNT. IF THE FIRST BYTE OF THE ENTRY IS NON-ZERO, THE SIOF INSTRUCTION IS ELIGIBLE TO BE PASSED THROUGH. THE FIRST BYTE THEN CONTAINS THE LOGICAL PATH MASK (LPM) TO BE PLACED IN THE OPERATION REQUEST BLOCK (ORB) CONSTRUCTED BY THE MICROCODE. IF THE FIRST BYTE OF THE ENTRY IS ZERO, SIOF MUST CAUSE INTERCEPTION. THE SECOND BYTE IS RESERVED AND THE THIRD AND FOURTH BYTES CONTAIN THE SUBCHANNEL NUMBER.

IPARML - IUCV PARAMETER LIST AND EXTERNAL INTERRUPT

DSECT NAME: IPARML

DESCRIPTIVE NAME: IUCV PARAMETER LIST AND EXTERNAL INTERRUPT MAPPING MACRO

FUNCTION: TO MAP THE PARAMETER LIST USED WHEN AN IUCV FUNCTION IS ISSUED, AND TO MAP THE EXTERNAL INTERRUPT BUFFER WHEN AN IUCV EXTERNAL INTERRUPT IS REFLECTED TO A VIRTUAL MACHINE.

LOCATED BY:

PARAMETER LIST ADDRESS IS SPECIFIED BY A USER VIRTUAL MACHINE.
 EXTERNAL INTERRUPT IS SPECIFIED BY THE USER VIRTUAL MACHINE AND MAINTAINED IN IUCBFAD1 AND IUCBFAD2 FIELDS IN HCPIUCVB.

CREATED BY:

-PARAMETER LIST PASSED ON MOST IUCV FUNCTIONS

LCKBK

HCPLCKBK— LOCK BLOCK

DSECT NAME: LCKBK

DESCRIPTIVE NAME: LOCK BLOCK

FUNCTION: HCPLCKBK IS USED TO SYNCHRONIZE EXECUTION FOR SECTIONS OF NONREENTERABLE CODE. EACH SUCH SECTION OF CODE HAS ITS OWN UNIQUE 8 BYTE IDENTIFIER (NAME) WHICH IS PASSED TO THE LOCKING ROUTINES AS AN ARGUMENT. THIS IDENTIFIER IS SAVED IN 'LCKNAME'. A TASK THAT ATTEMPTS TO GET A LOCK THAT IS ALREADY HELD BY ANOTHER TASK IS FORCED TO WAIT UNTIL THE EARLIER TASK RELEASES THE LOCK. WHILE THE TASK IS WAITING, IT IS REPRESENTED BY A CPEBK THAT IS TEMPORARILY CHAINED OFF OF 'LCKQUE'. WHEN THE TASK HOLDING THE LOCK RELEASES IT, THE CPEBK REPRESENTING THE WAITING TASK IS STACKED SO THAT THE WAITING TASK RESUMES EXECUTION.

LOCATED BY:

CREATED BY:

MCKBK

HCPMCKBK— MACHINE CHECK DESCRIPTOR BLOCK

DSECT NAME: MCKBK

DESCRIPTIVE NAME: MACHINE CHECK DESCRIPTOR BLOCK

FUNCTION: THE MCKBK IS THE MAIN WORK AREA OF THE MACHINE-CHECK AND CHECK-STOP HANDLERS. THE FIRST PART CONTAINS 'FOOTPRINT' FLAGS, AND A LOCAL TRACE TABLE FOR MACHINE CHECKS, AND OTHER STATUS FIELDS THAT MIGHT BE USEFUL IN DEBUGGING. THIS FIRST PART OF THE MCKBK IS APPENDED TO (AND RECORDED WITH) THE ERROR RECORD AND IS OCCASIONALLY REFERRED TO AS THE 'DAMAGE ASSESSMENT AREA'. THE SECOND PART OF THE MCKBK IS NOT REGARDED AS VALUABLE FOR DEBUGGING AND CONSEQUENTLY IS NOT INCLUDED IN THE RECORDED ERROR RECORD. THIS PART OF THE MCKBK IS SOMETIMES REFERRED TO AS THE 'MACHINE-CHECK WORK AREA'. DATA IS PLACED IN THE MCKBK AT THE START OF AN ERROR INCIDENT (MACHINE CHECK OR CHECK-STOP) AND, FOR THE MOST PART, IS NOT CLEARED UNTIL THE START OF THE NEXT INCIDENT.

LOCATED BY:

A CPU'S MCKBK IS ANCHORED IN THE CPU'S PREFIX PAGE, POINTED TO BY PFXMCHA.

CREATED BY:

HCPMPS WHEN A PROCESSOR IS INITIALIZED. EACH CPU HAS ONE OF THESE BLOCKS, ALLOCATED AT SYSTEM INITIALIZATION TIME OR WHEN THE CPU IS VARIED ONLINE.
 NOTE: TO ACCOMODATE APPENDING THE MCKBK TO THE ERROR RECORD (MCHREC), THE MCHREC AND THE MCKBK ARE ALLOCATED FROM A SINGLE BLOCK OF STORAGE.

DELETED BY:

HCPMPS TWO MINUTES AFTER A PROCESSOR IS VARIED OFFLINE.

000	MCKDAMAG	008	START OF DAMAGE ASSESSMENT AREA.
000	MCKCNT2H	002	COUNT OF SECONDARY MACHINE CHECKS SUBSEQUENT TO MOST RECENT PRIMARY.
002	MCKCNTEQ	002	COUNT OF CONSECUTIVE IDENTICAL MACHINE CHECKS (MCIC'S). WHEN THIS COUNT EXCEEDS A THRESHOLD (MCKTHLD1), ERROR RECORDING IS SUSPENDED (RECORDS ARE DISCARDED) UNTIL THE COUNT IS RESET. THE COUNT IS RESET WHEN A DIFFERENT MACHINE CHECK OCCURS. BUT EVEN WHEN THIS COUNT IS NOT SET, AN ERROR IS ALLOWED TO BE RECORDED ROUGHLY EVERY (MCKTIM1) SECONDS.

EQUATES

	09	MCKTHLD1	THRESHOLD ASSOCIATED WITH MCKCNTEQ.
	58	MCKTIM1	UNIT IS SECONDS, APPROX. (SEE MCKCNTEQ).
004	MCKCNT	002	COUNT OF RECENT MACHINE CHECKS. WHEN THIS COUNT EXCEEDS A THRESHOLD (MCKTHLD2), ERROR RECORDING IS SUSPENDED (RECORDS ARE DISCARDED) UNTIL THE COUNT IS RESET. THE COUNT IS RESET WHEN A MACHINE CHECK OCCURS AND AT LEAST (MCKTIM2) SECONDS HAVE ELAPSED SINCE THE LAST RESET.

EQUATES

HCPMCVBK— VIRTUAL MACHINE CHECK BLOCK

DSECT NAME: MCVBK

DESCRIPTIVE NAME: VIRTUAL MACHINE CHECK BLOCK

FUNCTION: HCPMCVBK MAINTAINS THE DESCRIPTION OF A MACHINE CHECK INCIDENT BEFORE THE INTERRUPT IS REFLECTED TO THE GUEST. THERE ARE THREE TYPES OF MCVBKs MAINTAINED IN THE SYSTEM. (1). MCVBK (DYNAMICALLY ALLOCATED MCVBK): STORAGE IS OBTAINED FOR A DYNAMICALLY ALLOCATED MCVBK WHEN REQUIRED. IT HAS TWO USES. THE CONTROL PROGRAM BUILDS MCVBKs WHEN SOME SYSTEM INCIDENT, THAT IS NOT A REAL MACHINE CHECK, IS TO BE REFLECTED TO THE GUEST AS A MACHINE CHECK. IT IS ALSO USED TO MAKE COPIES OF MCVBKs TO ALLOW THE REFLECTION OF MACHINE CHECKS TO A GUEST TO OCCUR ASYNCHRONOUSLY WITH OTHER CP FUNCTIONS. (2). MCVBK (CPU MCVBK): WE REFER TO THIS MCVBK AS THE 'CPU MCVBK' BECAUSE EACH CPU OWNS ONE, AND TO DISTINGUISH IT FROM THE 'SYSTEM TERMINATION MCVBK' DESCRIBED BELOW. THE CPU MCVBK CONTAINS A DESCRIPTION OF A REAL ERROR INCIDENT (IF ANY) CURRENTLY IN PROGRESS ON THIS CPU. IT IS NEEDED MAINLY FOR THE BENEFIT OF THE VIRTUAL SIDE OF THE SYSTEM (HCPGMCMC) SO THAT MACHINE CHECKS CAN BE REFLECTED TO GUESTS. HCPMCH CALLS HCPGMCMC AND PASSES THE CPU MCVBK CONTAINING THE DESCRIPTION OF THE INCIDENT. THE CPU MCVBK IS ANCHORED IN THE PREFIX PAGE BY 'PFXMCVBK'. DATA IS PLACED IN THE MCVBK AT THE START OF AN INCIDENT AND IS CLEARED AT THE END OF THE INCIDENT SO THAT THE BLOCK REMAINS EMPTY UNTIL THE NEXT INCIDENT. (3). MCVBK (SYSTEM TERMINATION MCVBK): THERE ARE ALSO 'SYSTEM TERMINATION' MCVBKs THAT ARE PERMANENTLY ALLOCATED IN WORK AREA HCPWRK1IC.

LOCATED BY:

HCPWRKMC (ANCHOR) SYSTEM TERMINATION PERMANENT MCVBKs
 VMDHCV FIELD OF HCPVMDBK
 PFXMCVBK FIELD OF HCPPFXBK (PERMANENTLY ALLOCATED)
 MCVNEXT FORWARD CHAIN
 CHCMCV FIELD OF HCPCHCBK

CREATED BY:

HCPGMC TO SEPARATE MCVBKs RECEIVED INTO ELEMENTARY MACHINE CHECKS AND TO GENERATE MCVBKs FOR MACHINE CHECK REFLECTION TO A GUEST.
 HCPMCH TO COPY PERMANENTLY ALLOCATED MCVBK.
 HCPMCW WHEN GUEST WAS RUNNING ON A PROCESSOR THAT IS RESET. TO COPY MCVBK RECEIVED FROM HCPALL.
 HCPMPS ACQUIRES PERMANENTLY ALLOCATED MCVBK FOR EACH PROCESSOR.
 HCPRFC CREATES A CRW MCVBK.
 HCPVDB CREATES A CRW MCVBK.
 HCPVOF CREATES A CRW MCVBK.
 HCPVSC CREATES A CRW MCVBK.

DELETED BY:

HCPMCH DELETES MCVBKs CREATED BY HCPMCH
 HCPMCW DELETES MCVBKs CREATED BY HCPMCW
 HCPMCV DELETES MCVBK AFTER REFLECTING MACHINE CHECK TO THE GUEST
 HCPMPS RETURNS PERMANENTLY ALLOCATED MCVBK FOR EACH PROCESSOR.

HCPPGMBK— PAGE MANAGEMENT BLOCK

DSECT NAME: PGMBK

DESCRIPTIVE NAME: PAGE MANAGEMENT BLOCK

FUNCTION: THE PAGE MANAGEMENT BLOCK DESCRIBES 1 MEGABYTE OF VIRTUAL STORAGE. IT CONTAINS THE PAGE TABLE, THE PAGE STATUS TABLE, THE AUXILIARY STORAGE ADDRESS TABLE, AND THE RCP BACKUP INFORMATION, FOR THE MEGABYTE. THE PGMBK IS A 4K ALIGNED 4K BLOCK.

LOCATED BY:

SEENTRY FIELD OF HCPSEGTB (BITS 1 THROUGH 19)
 THE PAGE TABLE POINTER IN SEENTRY IS ARCHITECTED TO BE BITS 1 THROUGH 25 BUT VM/XA MIGRATION AID USES 4K ALIGNED 4K BLOCKS. SEE HCPSEGTE.
 FRMPTE THE FRAME TABLE ENTRY POINTS TO A PAGE TABLE ENTRY WITHIN THE PAGE TABLE. THE PGMBK ADDRESS CAN BE FOUND BY ZEROING THE DISPLACEMENT OF THE PAGE TABLE ENTRY'S ADDRESS SINCE THE PAGE TABLE IS LOCATED AT THE BEGINNING OF THE PGMBK.

HCPPGSTE— PAGE STATUS TABLE ENTRY

DSECT NAME: PGSTE

DESCRIPTIVE NAME: PAGE STATUS TABLE ENTRY

FUNCTION: THE PGSTE DESCRIBES VARIOUS TYPES OF STATUS OF ONE PAGE OF VIRTUAL STORAGE.

LOCATED BY:

PGMPGSTB FIELD OF HCPPGMBK + (PAGE OFFSET
 VPGPGSTE IN A VPGEK USING A PAGE ADDRESS
 A PAGE STATUS TABLE RESIDES IN A
 PAGE MANAGEMENT BLOCK ASSOCIATED WITH A MEGABYTE
 OF VIRTUAL STORAGE AND IS POINTED TO BY PGMPGSTB.
 THERE ARE 256 CONTIGUOUS PAGE STATUS TABLE
 ENTRIES (PGSTE'S) CONTAINED IN THE PGMPGSTB.
 ANY SPECIFIC PGS TABLE ENTRY CAN BE OBTAINED BY
 EXTRACTING THE PAGE NUMBER (BITS 12-19) FROM A

HCPSAVBK— CALL WITH SAVEAREA BLOCK

DSECT NAME: SAVBK

DESCRIPTIVE NAME: CALL WITH SAVEAREA BLOCK

FUNCTION: THE SAVBK IS USED IN THE CALL-WITH-DYNAMIC-SAVEAREA CALLING LINKAGE. THE CALLER DOES NOT SUPPLY THE SAVEAREA. INSTEAD, THE LINKAGE ASSISTANCE ROUTINE (HCPSVCCL) ALLOCATES THE SAVBK AND THE CALLED ROUTINE THEN SAVES THE CALLER'S REGISTERS IN THE SAVBK. THE SAVBK DSECT IS ALSO USED AS A MAP OF THE SEVERAL FIXED SAVEAREAS SUCH AS PFXBALSV AND PFXTMPV. NOTE: THE SAVBK AND THE CPEBK HAVE THE SAME FORMAT AND OCCASIONALLY A SAVBK IS CONVERTED INTO A CPEBK OR VICE VERSA. THE FORMATS ARE IDENTICAL INTENTIONALLY SO THAT THESE CONVERSIONS CAN BE MADE.

LOCATED BY:

- R13** WHEN RUNNING IN ANY ROUTINE WHICH IS CALLED USING A CALL-WITH-DYNAMIC-SAVEAREA LINKAGE. POINTS TO CURRENT (ALREADY FILLED UP) SAVEAREA.
- SAVER13** THIS FIELD IN CALLEE'S SAVEAREA POINTS BACK TO THE CALLER'S SAVEAREA. (THIS ASSUMES THAT THE CALLER HAD A SAVEAREA OF HIS OWN AND THAT HE HAD ITS ADDRESS IN R13 AT THE TIME OF THE CALL. SEE ALSO SAVECSAV FOR ANOTHER BACKWARD POINTER.)
- SAVEFPNT** FORWARD CHAINING POINTER. THE CHAIN OF AVAILABLE SAVBK'S USES THIS POINTER. WHEN THE SAVBK IS IN USE AS A SAVEAREA, SAVEFPNT IS NORMALLY NOT USED FOR ANYTHING (SAVER13 POINTS BACK TO PRECEDING SAVBK IF THE CALLER HAD ONE).
- SAVEBPNT** THIS POINTER IS AVAILABLE FOR BACKWARD CHAINING, BUT IS NOT NORMALLY USED.
- VMDVOSAV** SIMULATION SAVBK STACK ANCHOR.

SEGTE

HCPSEGTE— SEGMENT TABLE ENTRY

DSECT NAME: SEGTE

DESCRIPTIVE NAME: SEGMENT TABLE ENTRY

FUNCTION: THERE IS ONE SEGMENT TABLE ENTRY FOR EACH MEGABYTE OF ADDRESS SPACE. A SEGMENT TABLE IS MADE UP OF CONTIGUOUS SEGMENT TABLE ENTRIES. THE SEGMENT TABLE DESCRIBES THE ADDRESS SPACE WHICH CONTAINS GUEST STORAGE AND THE RCP AREA. THE SEGMENT TABLE IS IMBEDDED IN THE VMDBK WHEN GUEST STORAGE IS DEFINED AS 31 MEGABYTES OR LESS. FOR GUEST STORAGE OVER 31 MEGABYTES, A SEPARATE PAGE OF STORAGE IS ALLOCATED. THERE IS ALSO A SEGMENT TABLE IDENTIFIED BY THE SYSTEM VMDBK WHICH DESCRIBES SYSTEM VIRTUAL ADDRESS SPACE. IT IS ALWAYS ALLOCATED AS TWO CONTIGUOUS FRAMES OF STORAGE AT SYSGEN TIME. THE FORMAT OF THE SEGMENT TABLE ENTRY IS ARCHITECTED.

SFNDX

HCPSFNDX— CHECKPOINT SPOOL FILE POINTERS

DSECT NAME: SFNDX

DESCRIPTIVE NAME: CHECKPOINT SPOOL FILE POINTERS

FUNCTION: TO POINT TO THE FIRST MAP PAGE (SPMBK) FOR EACH SPOOL FILE IN THE SYSTEM. THE NUMBER OF ENTRIES IN THIS TABLE IS DETERMINED BY THE SIZE OF THE WARMSTART AREA. EACH 4K PAGE ON THE WARMSTART CYLINDER ALLOWS FOR 1022 ENTRIES, ONE FOR EACH POSSIBLE SPOOLID. IF AN ENTRY CONTAINS A ZERO, IT INDICATES THAT THE CORRESPONDING SPOOLID IS AVAILABLE FOR A NEW SPOOL FILE.

LOCATED BY:

THE SFNDX ENTRIES OCCUPY THE FIRST 10 PAGES IMMEDIATELY FOLLOWING THE PAGEABLE MODULES IN THE NUCLUES. SFNDX ENTRY.

CREATED BY:

THE TEN PAGES OF STORAGE RESERVED FOR THE SFNDX ENTRIES ARE CLEARED TO ZERO WHEN THE SYSTEM IS COLD STARTED, OR REINITIALIZED BY HCPWRMST WHEN THE SYSTEM IS WARM OR FORCE STARTED. DURING NORMAL SYSTEM PROCESSING, THE SFNDX ENTRIES ARE INITIALIZED BY HCPSFPON WHEN OPENING A NEW SPOOL FILE.

DELETED BY:

WHEN A SPOOL FILE IS DELETED, HCPSFRDR ZEROES OUT THE CORRESPONDING SFNDX ENTRY. THE STORAGE ALLOCATED FOR THE SFNDX ENTRIES IS NEVER DELETED.

HCPSTLBK— SEGMENT TABLE ENTRY LIST BLOCK

DSECT NAME: STLBK

DESCRIPTIVE NAME: SEGMENT TABLE ENTRY LIST BLOCK

FUNCTION: THERE IS A SEGMENT TABLE ENTRY LIST BLOCK FOR EACH ACTIVE NAMED SAVED SYSTEM (NSS) OR DISCONTIGUOUS SAVED SEGMENT (DCSS). WITHIN THE BLOCK THERE IS ONE SEGMENT TABLE ENTRY FOR EACH MEGABYTE OF ADDRESS SPACE IN THE NSS OR DCSS. THE SEGMENTS CAN BE SHARED OR EXCLUSIVE. THE NUMBER OF SEGMENTS DETERMINES THE SIZE OF THE BLOCK.

LOCATED BY:

SNTSTLPT FIELD OF HCPSNTBK

CREATED BY:

HCPBPBSL WHEN AT NSS OR DCSS IS FIRST REFERENCED AN STLBK IS ATTACHED TO THE USER VIA AN IMBED OPERATION. ENTRY POINT HCPBPBIM PERFORMS IMBED OPERATIONS.

DELETED BY:

HCPRPBSL WHEN A NSS OR DCSS IS NO LONGER ACTIVE. AN STLBK IS DETACHED FROM THE USER VIA A REMOVE OPERATION. MODULE HCPRPDRM PERFORMS REMOVE OPERATIONS.

STLBK - SEGMENT TABLE ENTRY LIST BLOCK

disp	name	length	description
000	STLSTECT	002	NUMBER OF SEGMENT TABLE ENTRIES WITHIN THE STLBK. THE SIZE OF THE CONTROL BLOCK CAN BE DETERMINED BY: ((STLSTECT*4)+STLHDRLN+7)/8. ROUND THE QUOTIENT DOWN.
002		H	RESERVED FOR FUTURE IBM USE

EQUATES

04	STLHDRLN		LENGTH OF CONTROL BLOCK HEADER
004	STLSTEPT	004	FIRST STLBK SEGMENT TABLE ENTRY (SEGTE) WHICH POINTS TO A PAGE MANAGEMENT BLOCK (PGMBK). THIS FIELD CAN BE MAPPED BY COPY FILE HCPSEGTE. THE SEGMENT INVALID BIT (SEGINVAL=1) IS USED WITHIN AN STLBK SEGTE TO INDICATE THAT THE SEGMENT IS EXCLUSIVE AND THAT THE USER MUST BE GIVEN ACCESS TO A COPY OF THE ASSOCIATED PGMBK.
008	STLNTRY	004	START OF VARIABLE LENGTH DATA THE STLBK CAN HAVE A VARIABLE NUMBER OF SEGMENT TABLE ENTRIES.

STLBK**Restricted Materials of IBM
Licensed Materials - Property of IBM**

THERE IS ONE STLBK SEGMENT
TABLE ENTRY FOR EACH MEGABYTE
OF ADDRESS SPACE REPRESENTED
BY THE STLBK.
IF THERE IS MORE THAN ONE
SEGMENT TABLE ENTRY, THE REST
OF THE SEGMENT TABLE ENTRIES
WITHIN THE STLBK START AT THIS
FIELD.
SINCE THE SEGMENT TABLE ENTRIES
IN THE STLBK ARE MAPPED
BY COPY FILE HCPSEGTE, THE
ADDRESS OF THE NEXT SEGMENT
TABLE ENTRY WITHIN THE STLBK
CAN BE FOUND USING SEGNEXT.
STLNTRYIS CANNOT BE USED TO
ADDRESS THE NEXT SEGMENT TABLE
ENTRY WITHIN THE STLBK

SYNBK

HCPSYNBK— SYNCHRONIZING LOCK CONTROL BLOCK

DSECT NAME: SYNBK

DESCRIPTIVE NAME: SYNCHRONIZING LOCK CONTROL BLOCK

FUNCTION: THIS DSECT DESCRIBES THE CONTROL AREA WHICH IS USED TO REPRESENT A SPIN LOCK. IN GENERAL, THE SPIN LOCKS IN THE SYSTEM ARE PERMANENTLY IMBEDDED WITHIN OTHER CONTROL BLOCKS OR MODULES. THIS DSECT DESCRIBES COMMON FORMAT OF ALL SPIN LOCKS. THE LOCK IS ALWAYS 3 DOUBLE-WORDS. ALL SPIN LOCKS ARE OBTAINED THROUGH A STANDARD SYSTEM MACRO, WITH A CALL TO MODULE HCP SYN IF THE LOCK IS NOT OBTAINED IN-LINE TO THE REQUESTING CODE.

LOCATED BY:

THE SYNBK DESCRIBES ANY OF THE SEVERAL SPECIFIC SPIN LOCKS, THEREFORE LOCATING IT DEPENDS UPON LOCATING THE PARTICULAR SPIN LOCK OF INTEREST. FOR EXAMPLE, THE SCHEDULER SPIN LOCK IS CODED IN THE SRMBK AS:
 SRMSLOCK DS 3D SCHEDULER LOCK

CREATED BY:

GENERALLY THE SYNBK OF A SPIN LOCK IS:
 (1) HARD-CODED IN A MODULE AND THEREFORE GENERATED BY THE ASSEMBLER. E.G., THE SWITCH-MASTER LOCK IN HCPMPF.
 (2) IMBEDDED IN A PERMANENTLY ALLOCATED CONTROL BLOCK. E.G., THE SCHEDULER LOCK IN THE SRMBK.

DELETED BY:

GENERALLY SYNBK'S ARE NOT DELETED SINCE THEY ARE GENERALLY IMBEDDED IN MODULES OR IN PERMANENTLY ALLOCATED CONTROL BLOCKS.

HCPVDEV— VIRTUAL DEVICE CONTROL BLOCK

DSECT NAME: VDEV

DESCRIPTIVE NAME: VIRTUAL DEVICE CONTROL BLOCK

FUNCTION: DESCRIBE THE STATUS OF AN I/O DEVICE (REAL OR VIRTUAL) ACCESSABLE BY A VIRTUAL MACHINE.

LOCATED BY:

A POINTER IN THE LOWEST LEVEL INDEX VECTOR IN THE FOUR-LEVEL TREE ANCHORED IN:
 VMDCHRSN - FOR ACCESS VIA SUBCHANNEL NUMBER
 VMDCHRDN - FOR ACCESS VIA DEVICE NUMBER
 RDEVVDEV - DEDICATED DEVICE ONLY
 BLKVDEVA - DEVICES CONNECTED TO DASD BLOCK I/O SYSTEM SERVICE
 VDEVBASE - MULTIPLE EXPOSURE DEVICE ONLY
 VMDVSPRT - PRINTER TO USE IN DUMP, TRACE, ... CMDS
 VMDVCONS - CONSOLE
 MDIRVDEV - VDEV TO WHICH A MINI-DISK EXTENT IS VIRTUALLY RESERVED.

WHILE AN I/O EVENT IS OUTSTANDING FOR A VIRTUAL MACHINE, THE ADDRESS OF A VDEV MAY APPEAR IN:
 CHCQUEUE(I) - FIRST DEVICE WITH AN INTERRUPT PENDING ON CHANNEL I (OR IN CHANNEL CLASS I)
 VDEVFPNT - NEXT DEVICE WITH INTERRUPT PENDING ON THIS CHANNEL (OR THIS VDEV, IF LAST)
 VDEVBPNT - PREVIOUS INTERRUPT PENDING DEVICE ON THIS CHANNEL (OR THIS VDEV, IF FIRST)
 VMDWVDEV - DEVICE CAUSING I/O WAIT CONDITION
 - SYNCHRONOUS I/O VIA DIAGNOSE 18 OR 20
 - VIRTUAL MACHINE LOOPING ON TIO INSTR.
 IORVDEV - VDEV WITH WHICH VIRTUAL MACHINE'S I/O REQUEST IS ASSOCIATED.

I/O SUPERVISOR ROUTINES NORMALLY USE REGISTER 6 TO ADDRESS THE VDEV ASSOCIATED WITH THE EVENT BEING PROCESSED.

IT MUST START ON A 4K PAGE BOUNDARY. THIS AREA IS USED WHENEVER GUEST STORAGE IS DEFINED AS 31 MEGABYTES OR LESS. IF GUEST STORAGE IS DEFINED AS MORE THAN 31 MEGABYTES, A SEPARATE PAGE (OR PAGES) IS ALLOCATED TO CONTAIN THE SEGMENT TABLE.

FOR A GUEST SHARED-STORAGE MULTIPROCESSOR, ONLY THE BASE CPU STORAGE IS USED, AND DEFINED CPU'S REFER TO THE BASE CPU STORAGE.

USER LOGON IDENTIFICATION
 ACCOUNTING USER IDENTIFICATION.
 THIS FIELD CONTAINS THE USERID TO BE PUT IN THE ACCOUNTING RECORDS GENERATED. IT IS GENERALLY THE SAME AS THE USERID, WHICH IS HOW IT IS SET WHEN A USER LOGS ON. IT IS COPIED WHEN A LOCAL VMDBK IS BUILT. IT CAN BE CHANGED BY AN AUTHORIZED USER ISSUING A DIAGNOSE X'4C'. THIS IS INTENDED FOR USE BY THE CMS BATCH MACHINE.
 USERID CAUSING THIS USER'S LOGON
 FOR NORMAL USERS, THIS FIELD CONTAINS THE USER LOGON IDENTIFICATION. FOR USERS AUTOLOGGED BY THE SYSTEM AT IPL TIME, THIS FIELD CONTAINS 'SYSTEM'. FOR USERS AUTOLOGGED BY OTHER USERS, THIS FIELD CONTAINS THE USERID ISSUING THE AUTOLOG.
 FOR VMDBLOKS CREATED AS ADJUNCT VIRTUAL MACHINES, THIS FIELD CONTAINS THE USER IDENTIFICATION OF THE BASE VMDBLOK.
 USER ACCOUNTING NUMBER
 USER DISTRIBUTION CODE.
 THIS IS THE DEFAULT DISTRIBUTION CODE OBTAINED FROM THE DIRECTORY FOR THIS USER. IT IS USED IN SPOOL FILE COMMANDS TO ASSIGN THE DEFAULT DISTRIBUTION CODE TO THE SPOOL FILE.
 RACF ACI GROUP NAME
 SESSION LOGON TOD, BITS 0-31
 VALUE OF VMDTODON AT LAST 'ACNT' OR AT LOGON, WHICHEVER IS LATER.
 THE FOLLOWING FIELDS CONTAIN THE VALUES OF THE INDICATED ACCOUNTING FIELDS AT THE LAST 'ACNT' COMMAND OR AT LOGON, WHICHEVER IS LATER.
 SUBSEQUENT ACCOUNTING RECORDS ARE GENERATED USING THE DIFFERENCE BETWEEN THE CURRENT VALUE AND THE 'LAST' VALUE. THIS ALLOWS ACCOUNTING RECORDS TO BE GENERATED DURING A SESSION WHILE ALSO MAINTAINING SESSION TOTALS.
 NOTE: THE ASSEMBLER CONSTRUCT 'FL8S12' IS USED TO GENERATE A FIXED-POINT NUMBER WHICH REPRESENTS A TIME VALUE (IN MICROSECONDS) IN TOD CLOCK FORMAT OR CPU TIMER FORMAT. USE OF 'FL8S12E6' IS USED

VIMDBK

BITS DEFINED IN VMDGTLB (AT HEX DISPLACEMENT: 264)

20	VMDGPTLB	GUEST PTLB WAS SIMULATED. FOR SIMULATION OF THE PTLB INSTRUCTION AND FOR SIMULATION OF OTHER INSTRUCTIONS THAT REQUIRE CLEARING THE TLB, VMDGPTLB IS SET.
10	VMDINVPG	A GUEST PAGE TABLE ENTRY HAS BECOME INVALID, EITHER FROM THE STEAL TASK OR FROM A GUEST IPTE INSTRUCTION.

265 VMDGSTAT 001 GUEST VIRTUAL RUNNING STATUS

BITS DEFINED IN VMDGSTAT (AT HEX DISPLACEMENT: 265)

80	VMDVSIE	GUEST IS IN V/SIE MODE. THIS BIT IS SET WHEN SIMULATING A SIE INSTRUCTION, AFTER A V/SIE VMDBK HAS BEEN BUILT, AND ALL SIE ENTRY VALIDITY CHECKS ARE COMPLETE IN PREPARATION FOR ENTERING EMULATION. IT IS RESET AFTER AN INTERRUPT OR INTERCEPT TAKES US OUT OF EMULATION AND THE VUEST STATE DESCRIPTOR IS MADE TO APPEAR AS THOUGH SIE WERE JUST EXITED FOR THAT GUEST.
40	VMDRGPTR	PRESERVE A PENDING PER INTERRUPT DURING THE SIMULATION OF A GUEST SIE INSTRUCTION. THE PENDING PER INTERRUPT IS CLEARED DURING THE SIMULATION OF SIE TO PREVENT IT FROM BEING REFLECTED PREMATURELY IN THE EVENT OF A SUBSEQUENT INTERRUPT.
20	VMDRGTRD	PRESERVE A PENDING TRACE DISPLAY DURING THE SIMULATION OF A GUEST SIE INSTRUCTION. THE PENDING TRACE DISPLAY IS CLEARED DURING THE SIMULATION OF SIE TO PREVENT THE DISPLAY FROM OCCURRING PREMATURELY IN THE EVENT OF A SUBSEQUENT INTERRUPT.

THIS IS DONE TO SYNCHRONIZE THE CASE WHERE ONE VUEST IS IN SIE MODE, AND ANOTHER VUEST ISSUES AN IPTE. THE SYNCHRONIZATION IS NEEDED TO KEEP THE SHADOW TABLES OF THE FIRST VUEST UP TO DATE WITH THE PAGE TABLES AFFECTED BY THE IPTE.
08	VMDSCALK	PAGE CONTAINING THE SYSTEM CONTROL AREA (SCA) IS LOCKED FOR A PAGEABLE VUEST. THIS IS SET BY V/SIE SUPPORT IN PREPARATION FOR ISSUING SIE FOR THE V/SIE VMDBK. IT IS RESET WHEN THE VUEST IS REMOVED FROM V/SIE MODE.

80	VMDEXCF		INDICATES THAT CONSOLE FUNCTION EXECUTION IS IN PROGRESS. THAT IS, ONE OF THE FOLLOWING FUNCTIONS IS ACTIVE: THE STACK OF CONSOLE FUNCTION OUTPUT IS BEING DISPLAYED. THE CALL-FROM-CFM CPEBK STACK IS BEING UNSTACKED AND PROCESSED. THE COMMAND INPUT BUFFER IS BEING UNSTACKED AND COMMANDS ARE BEING PROCESSED. THIS BIT IS USED BY THE DISPATCHER TO PREVENT THE VMDBK FROM BEING DROPPED FROM THE DISPATCH LIST.
40	VMDDGCF		CONSOLE FUNCTION MODE ENTERED VIA DIAGNOSE INSTRUCTION
20	VMDCFRD		INDICATES WHEN A CONSOLE FUNCTION READ (CP READ APPEARS AT THE LOWER RIGHT HAND CORNER OF THE SCREEN) IS ACTIVE FOR A VIRTUAL CONFIGURATION. THIS IS USED TO AVOID ATTEMPTING A SUBSEQUENT CONSOLE FUNCTION READ BEFORE THE FIRST IS SATISFIED.
04	VMDSTOPD		INDICATES WHEN SET THAT A VIRTUAL CPU IS IN A HARD STOPPED STATE AS DEFINED BY 370 ARCHITECTURE. THAT IS, NO INSTRUCTIONS OR INTERRUPTIONS OTHER THAN THE RESTART INTERRUPTION MAY BE EXECUTED WHILE IN THIS STATE. THIS BIT IS USED BY CP TO DETERMINE WHICH VMDBKS MAY RUN. WHILE SET IN A VMDBK, THE VMDBK IS NOT ALLOWED TO RUN. IT IS SET WHEN HANDLING SOFT ABENDS AND

PROGRAM INTERRUPT LOOPS, SYSTEM AND CPU RESETS, AND WHEN INITIALIZING VMDBKS. IT IS RESET WHEN PROCESSING THE BEGIN, IPL AND SYSTEM RESTART COMMANDS.

02 VMDCFIDL INDICATES THAT THE GUEST CONFIGURATION IS IN CONSOLE FUNCTION WAIT AND IS IDLE. IT IS USED TO INDICATE THAT CONSOLE INPUT BE DIRECTED TO CP.

01 VMDCFACT INDICATES THAT THE VIRTUAL MACHINE WAS ACTIVE SINCE THE LAST CP READ. IT IS USED TO CONTROL THE DISPLAY OF THE 'CP' PROMPT BEFORE ISSUING A CP READ. IF SET, NO PROMPT IS DISPLAYED. IF NOT SET FURTHER TESTS ARE MADE TO DETERMINE IF A PROMPT IS NECESSARY.

389 VMDCFLAG 001 CONSOLE FUNCTION STATUS FLAGS

BITS DEFINED IN VMDCFLAG (AT HEX DISPLACEMENT: 389)

80 VMDLOGON USER NOT YET LOGGED ON
40 VMDLOGOF USER IS LOGGING OFF. THIS BIT IS SET ONCE LOG OFF PROCESSING BEGINS FOLLOWING A COMMAND REQUESTING LOGOFF OF A USER OR CPU, OR A CP DETECTED PROBLEM REQUIRING A LOGOFF.

20 VMDREST GUEST SYSTEM RESET IN PROGRESS. THIS BIT IS USED FOR TWO PURPOSES: TO FLAG SOFTWARE EXTERNAL INTERRUPT ROUTINES THAT THEY ARE BEING CALLED DUE TO A GUEST SYSTEM RESET; AND TO FLAG THE ROUTINE THAT RESTORES THE GUEST VIRTUAL PAGE USED BY THE IPL SIMULATOR THAT IT IS BEING CALLED DUE TO A SYSTEM RESET.

10 VMDUTERM CONSOLE FUNCTION OUTPUT IS NOT TO BE DISPLAYED TO THE DISPLAY STATION, BUT IS WRITTEN TO AND CONTROLLED BY THE VIRTUAL CONSOLE. THIS IS USED FOR TRACE OUTPUT AND CP COMMANDS ISSUED VIA THE DIAGNOSE X'08' INSTRUCTION.

04 VMDBUFWT VALID ONLY IN THE PRIMARY VMDBK: SET FOR CONSOLE FUNCTION OUTPUT TO A USER BUFFER ADDRESS FROM A DIAGHOSE CONSOLE FUNCTION COMMAND.

WHEN SET, THE FOLLOWING FIELDS IN THE PRIMARY VMDBK ARE ALSO VALID:

VMDBUFVM = ADDRESS OF VMDBK
VMDBUFAD = ADDRESS OF BUFFER
VMDBUFLN = REMAINING LENGTH

02 VMDBUFIF VMDBUFIF IS SET TO INDICATE THAT A GUEST PSW SWAP OCCURRED IN THE SIMULATION OF A DIAGNOSE X'08' INSTRUCTION THAT REQUESTED OUTPUT TO A BUFFER. THE PSW WAS SWAPPED TO REFLECT A PROGRAM INTERRUPTION FOR AN INSTRUCTION FETCH PER EVENT. IT IS NECESSARY TO RECORD THIS INFORMATION IN VMDBUFIF SINCE THE PROCESSING OF THE DIAGHOSE X'08' COMMANDS OCCURS AFTER THE DIAGHOSE INSTRUCTION SIMULATION HAS REACHED ENDOP AND THE PER EVENT PROGRAM INTERRUPTION IS REFLECTED. THE CONDITIN CODE FOR THE DIAGNOSE INSTRUCTION MUST BE SET BASED ON THE SUCCESS OF STORING THE COMMAND OUTPUT IN THE GUEST BUFFERS. IF THE PER INSTRUCTION FETCH IS ACTIVE, THE CONDITION CODE MUST BE SET IN THE GUEST'S PROGRAM CHECK OLD PSW, OTHERWISE IT IS SET IN THE GUEST'S CURRENT PSW.

01 VMDCFNUL INDICATES THAT NO DATA WAS INPUT FROM THE LAST CONSOLE FUNCTION READ THAT HCPCFM ISSUED. IT IS USED TOGETHER WITH OTHER FLAGS TO CONTROL THE DISPLAY OF THE 'CP' PROMPT BEFORE ISSUING A CP READ. IF SET, A PROMPT MAY BE REQUIRED. IF NOT SET, NO PROMPT IS DISPLAYED.

VMDBK

80	VMDSYSOP	USER IS PRIMARY SYSTEM OPERATOR
40	VMDUSRCT	USER INCLUDED IN SYSTEM USER CT
10	VMDFORCE	USER IS TO BE LOGGED OFF. THIS BIT IS SET WHENEVER CP DETERMINES THAT A VMDBK MUST BE LOGGED OFF. IT IS A CP REQUEST TO BEGIN LOGOFF PROCESSING FOR A VMDBK. THE REQUEST MAY BE A FORCED LOGOFF OR AT THE USER'S REQUEST VIA THE LOGOFF COMMAND.
08	VMDUFORC	USER IS FORCED TO LOGOFF THE SYSTEM.
04	VMDDISC	USER IS RUNNING DISCONNECTED
02	VMDAUTOL	AUTOLOGGED USER IN DISCONNECTED MODE. THIS BIT IS SET WHEN A USER IS AUTOLOGGED ON AND REMAINS SET UNTIL THE USER ENTERS A LOGON COMMAND FROM A DISPLAY STATION TO RECONNECT.

40	VMDSLEEP	VIRTUAL MACHINE IS SLEEPING
20	VMDCKST	VIRT CPU IN CHECK STOP STATE
10	VMDSCWT	USER IS IN 'DISCONNECTED WAIT' MODE. I/O WAS ATTEMPTED TO THE USER'S DISPLAY AND THE USER WAS DISCONNECTED, SO A TIMER IS SET TO LOG THE USER OFF IF NOT RECONNECTED WITHIN 15 MINUTES.

38C VMDCFPND 001 CONSOLE FUNCTION IS PENDING.
THIS FIELD CONTROLS THE PROCESSING OF THE CONSOLE FUNCTION TASK FOR A GUEST CONFIGURATION. ONCE THE C.F. TASK BEGINS, VMDCFPND IS SET TO ZERO TO KEEP THE C.F. TASK ACTIVE AS LONG AS THERE ARE (POSSIBLY) MORE CONSOLE FUNCTIONS TO HANDLE.

38D VMDCFPDR 001 CONSOLE FUNCTION READ PENDING.
USED IN HCPCFM TO INDICATE A CP READ REQUEST IS PENDING. A CP READ IS REQUESTED BY FIRST CALLING HCPCFMBK TO ASSIGN ZEROS TO VMDCFPDR, AND STACKING A GOTO TO HCPCFMRD TO HANDLE THE PENDING READ.

38E VMDCFHXF 001 CONSOLE FUNCTION HALT FLAG.
USED TO HALT LONG RUNNING CONSOLE FUNCTIONS (I.E. DISPLAY, DUMP) AND TO STOP ALL STACKED CONSOLE FUNCTION DISPLAY FROM BEING DISPLAYED. IT IS USED TO INTERRUPT CONSOLE FUNCTION OUTPUT WHEN THE USER ENTERS THE BRKKEY OR IS BEING FORCED TO LOGOFF.

38F VMDCFLG2 001 CONSOLE FUNCTION STATUS FLAGS.
THIS BYTE IS A LOGICAL EXTENSION OF VMDCFLAG.

BITS DEFINED IN VMDCFLG2 (AT HEX DISPLACEMENT: 38F)

80	VMDRSTLG	THE SYSTEM-RESET-CLEAR NEEDED FOR THE LOGOFF OF ONE OR MORE VMDBKS IN THIS CONFIGURATION HAS BEEN DONE. THIS BIT IS USED ONLY BY THE VMDBK LOGOFF PROCESSES AND MAY BE MISLEADING IF INSPECTED ELSEWHERE. THIS BIT IS ONLY VALID IN A BASE VMDBK.

390 VMDCFBUF 004 THIS IS THE ANCHOR TO A STACK OF INPUT BUFFERS (GSDBKS) CONTAINING CONSOLE COMMANDS TO BE PROCESSED. THE FIRST GSDBK ON THE STACK CONTAINS THE NEXT COMMAND TO BE PROCESSED.

394 VMDCFCAL 004 QUEUE OF CPEBKS TO BE SCHEDULED UPON ENTRY TO CONSOLE FUNCTION MODE. EXECUTE BLOCKS ARE STACKED ON THIS QUEUE WHEN A FUNCTION MUST EXECUTE WITH ALL VIRTUAL CPUS IN A VIRTUAL MP CONFIGURATION HELD AT ENDOP.

398 VMDCFREQ 001 CONSOLE FUNCTION ENTRY FLAG.
INDICATES WHEN A VMDBK IN THE LOCAL CYCLIC LIST HAS BEEN REQUESTED TO ENTER HCPCFM TO SUPPORT CONSOLE FUNCTION ENTRY REQUIREMENTS. A VALUE OF X'FF' INDICATES A REQUEST HAS BEEN MADE. ZEROS INDICATE NO REQUEST HAS BEEN MADE. THIS FIELD IS USED TO ENSURE THAT ALL VMDBKS IN THE LOCAL CYCLIC

LIST ENTER HCPCFM BEFORE ANY CONSOLE FUNCTIONS ARE PROCESSED. THIS IS PART OF THE TECHNIQUE TO REQUIRE ALL VMDBKS IN THE LOCAL CYCLIC LIST TO REACH ENDOP BEFORE PROCESSING CONSOLE FUNCTIONS.

399	VMDCFDSP	001	CONSOLE FUNCTION ENDOP FLAG. THIS FIELD INDICATES WHEN A VIRTUAL MACHINE IS BEING HELD AT ENDOP FOR CONSOLE FUNCTION MODE. A VALUE OF X'FF' INDICATES THE VMDBK WAS NOT RUNNING BUT WAS AT ENDOP. ZEROS INDICATE IT WAS RUNNING. HCPCFM SETS VMDCFDSP WHENEVER IT IS STOPPING A RUNNING VMDBK TO ENTER CONSOLE FUNCTION MODE. IT RESETS VMDCFDSP BEFORE EXITING TO HCPRUNU TO START A VMDBK RUNNING.

A ZERO VALUE INDICATES AN IDLE CONFIGURATION, ALL CPUS IN THE VIRTUAL CONFIGURATION ARE AT ENDOP. A VALUE OF MINUS ONE INDICATES THAT A CONSOLE FUNCTION IS RUNNING FOR THE CONFIGURATION. THIS FIELD IS THE CONSOLE FUNCTION LOCK, USED TO SERIALIZE THE PROCESSING OF CONSOLE FUNCTIONS. ONCE HELD EXCLUSIVELY (VMDCFCNT < 0), A CONSOLE FUNCTION TASK IS RUNNING AND NO SECOND CONSOLE FUNCTION TASK MAY BEGIN.

THE USER CHANGES THE VALUE IN THIS FIELD BY ISSUING THE 'CPU NNN' COMMAND. THE VMDBK ASSOCIATED WITH THE VIRTUAL CPU WITH CPU ADDRESS NNN WILL BE ASSIGNED TO VMDCFCPU.
3AC	VMDBUFVM	004	CONTAINS THE VMDBK ADDRESS OF THE VIRTUAL CPU THAT EXECUTED THE DIAGNOSE X'08' INSTRUCTION REQUIRING OUTPUT TO A BUFFER.
3B0	VMDBUFAD	004	THE GUEST REAL ADDRESS FOR A BUFFER TO RECEIVE THE NEXT CONSOLE FUNCTION OUTPUT FOR COMMANDS ISSUED VIA THE DIAGNOSE X'08' INSTRUCTION. THIS FIELD IS INITIALLY SET TO THE ADDRESS PROVIDED BY THE GUEST IN THE DIAGNOSE INSTRUCTION AND IS CONTINUALLY CHANGED AS OUTPUT IS MOVED TO THE BUFFER.
3B4	VMDBUFLN	004	CONTAINS THE LENGTH REMAINING IN THE DIAGNOSE X'08' CONSOLE FUNCTION BUFFER. IT IS INITIALLY SET TO THE LENGTH OF THE BUFFER AND IS CONTINUALLY CHANGED AS CONSOLE FUNCTION OUTPUT IS MOVED TO THE BUFFER.

HCPVSIBK— V/SIE SHADOW TRANSLATION TABLE CONTROL

DSECT NAME: VSIBK

DESCRIPTIVE NAME: V/SIE SHADOW TRANSLATION TABLE CONTROL

FUNCTION: THIS BLOCK CONTROLS THE SHADOW TRANSLATION TABLES USED WHEN A GUEST HAS ISSUED A SIE INSTRUCTION (V/SIE). THE SHADOW TRANSLATION TABLES ALLOW THE HARDWARE TO TRANSLATE FROM VIRTUAL GUEST REAL TO HOST REAL, IN THE SAME WAY AS IT NORMALLY TRANSLATES GUEST REAL TO HOST REAL FOR NORMAL GUESTS. WITHIN THIS CONTROL BLOCK, THERE ARE UP TO 12 COPIES OF THE VSHBK COPY FILE WHICH IS USED TO DESCRIBE THE PAGE TABLES USED BY V/SIE. THE VSIBK CONTAINS MOSTLY SEGMENT TABLE INFORMATION, WHILE THE VSHBK HAS PAGE TABLE INFORMATION.

GLOSSARY

A

automatic software re-IPL. The process by which the control program attempts to restart the system after abnormal termination. This process does not involve the hardware IPL process. See also virtual=real machine recovery.

C

CCW. Channel command word.

channel command word (CCW). A doubleword structure that directs an I/O operation on a device or channel and includes pointers to any storage areas associated with the operation. One or more CCWs make up a channel program.

CMS. Conversational monitor system.

control program (CP). The component of VM/XA SP that manages the resources of a single System/370-Extended Architecture system so that multiple computing systems appear to exist. Each virtual machine is the functional equivalent of either a System/370 computing system or a System/370-Extended Architecture computing system.

conversational monitor system (CMS). The component of VM/XA SP that, as a virtual machine operating system, provides interactive time-sharing. CMS allows users to communicate with the system and with each other, to create and edit files, and to develop and run application programs. It operates in either System/370 mode or 370-XA mode under the control of CP.

CP. Control program.

D

DCSS. Discontiguous saved segment.

directory. A CP disk file that includes an entry for each user in the system. The entry defines the characteristics of the user's initial virtual machine configuration. These characteristics include the userid, the password, normal and maximum allowable virtual storage, virtual device definitions, the privilege class, the dispatching priority, logical line editing characters, and the account number.

discontiguous saved segment (DCSS). A saved segment that occupies one or more architecturally-defined segments. It begins and ends on segment boundaries. It is accessed by its own name. Contrast with member saved segment. See also saved segment, segment, segment space.

dump viewing facility. A VM/XA SP component that allows users to display, format, and print data interactively from CP abend, stand-alone, and virtual machine dumps, and to process CP trace table data stored on tape.

dynamic paging area. The area of real storage allocated by CP for V=V machine paging. This area also contains CP nonresident modules, CP control blocks, CP trace tables, free storage pages, and the alternate processor's prefix storage areas.

E

Expanded Storage. Optional integrated high-speed storage used for paging. In VM/XA SP, Expanded Storage may be shared by CP and one or more virtual machines. It may also be dedicated to CP or to a particular virtual machine.

F

full-pack minidisk. A virtual disk that contains all of the addressable cylinders of a real DASD volume.

full-screen mode. In VM/XA SP, the environment in which an entire 3270 display screen is under the control of a program running in a virtual machine.

G

guest. An operating system running in a virtual machine managed by the VM/XA SP control program. Contrast with host.

guest real storage. The storage that appears real to the operating system running in a virtual machine. Contrast with guest virtual storage, host real storage, and host virtual storage.

guest virtual storage. The storage that appears virtual to the operating system

running in a virtual machine. Contrast with guest real storage, host real storage, and host virtual storage.

H

host. The VM/XA SP control program in its capacity as manager of a virtual machine in which another operating system is running. Contrast with guest.

host real storage. The storage that appears real to the control program. If VM/XA SP is running native, this is real storage; if VM/XA SP is running in a virtual machine, this is virtual storage. Contrast with guest real storage, guest virtual storage, and host virtual storage.

host virtual storage. The storage that appears virtual to the control program. Contrast with guest real storage, guest virtual storage, and host real storage.

I

image library. A set of modules, contained in a system data file, that define the spacing, characters, and copy modification data that a 3800 printer uses to print a spool file or that define the spacing and character set that an impact printer uses to print a spool file. See also system data file.

inter-user communication vehicle (IUCV). A generalized CP interface that facilitates the transfer of data among virtual machines.

IUCV. Inter-user communication vehicle.

M

member saved segment. A saved segment that begins and ends on a page boundary. It belongs to up to 64 segment spaces and is accessed either by the segment space name or by its own name. Contrast with discontinuous saved segment. See also saved segment, segment, segment space.

missing interrupt handler. A CP function for detecting and dealing with real I/O operations that do not complete within a specified time.

multiple preferred guests. A VM/XA SP enhancement that supports up to four preferred virtual machines when the 3090 Multiple High Performance Guests Support feature is installed in the real

machine. See also preferred virtual machine.

N

named saved system (NSS). A copy of an operating system that a user has named and retained in a system data file. The user can load the operating system by its name, which is more efficient than loading it by device number. See also discontinuous saved segment, member saved segment, saved segment, segment space, system data file.

NSS. Named saved system.

P

pageable virtual machine. Synonymous with virtual=virtual machine.

preferred virtual machine. A virtual machine that runs in the V=R area. CP gives this virtual machine preferred treatment in the areas of performance, processor assignment, and I/O interrupt handling. See also multiple preferred guests, virtual=fixed machine, virtual=real area, virtual=real machine.

R

real system operator. Any user who loads and runs VM/XA SP in the real machine. Contrast with virtual machine operator.

S

saved segment. One or more pages of storage that have been named and retained in a system data file. See also discontinuous saved segment, member saved segment, segment, segment space, system data file.

segment. In System/370 architecture, 64 kilobytes of storage. In 370-XA architecture, 1 megabyte of storage. See also saved segment.

segment space. A saved segment composed of up to 64 member saved segments accessed by a single name. A segment space occupies one or more architecturally-defined segments; it begins and ends on segment boundaries. A user with access to a segment space has access to all of its members. See also discontinuous saved segment, member saved segment, saved segment, segment.

**Restricted Materials of IBM
Licensed Materials - Property of IBM**

service virtual machine. A virtual machine that provides system services. These services include accounting, error recording, monitoring, and those provided by supported licensed programs.

SMSG function. A CP function that allows a virtual machine to send a special message to another virtual machine programmed to accept and process the message. See also special message.

special message. A data transmission, made up of instructions or commands, sent from one virtual machine to another via the SMSG function. A special message is processed by the receiving virtual machine and does not appear on the receiver's console. See also SMSG function.

spool file. A collection of data along with CCWs for processing on a unit record device. Contrast with system data file.

SVC 76. In VM/XA SP, a supervisor call instruction that records the error incidents encountered by certain operating systems running in virtual machines. When a virtual machine operating system issues an SVC 76, VM/XA SP translates the virtual storage and I/O device addresses to real addresses, records the information on the VM/XA SP error recording virtual machine, and returns control to the issuing virtual machine. This interface bypasses the virtual machine's own error recording routine, and avoids duplicate error recording.

System/370 mode. A virtual machine operating mode in which System/370 functions are simulated. Contrast with 370-XA mode.

system data file. A collection of data associated with a particular function. Types of system data files include saved segments, NSSs, UCR files, and image libraries. Because a system data file contains no CCWs, it cannot be processed on a unit record device. Contrast with spool file.

system hold status. A spool file status that prevents a file from being printed, punched, or read until the real system operator releases it. Contrast with user hold status.

U

UCR file. User class restructure file.

unit record device. A reader, a printer, or a punch.

user class restructure file (UCR file). A type of system data file that contains

information used to override the IBM-defined privilege class structure of CP commands, DIAGNOSE instruction codes, and certain CP system functions.

user directory. See directory.

user hold status. A spool file status that prevents a file from being printed, punched, or read until the file owner releases it. Contrast with system hold status.

V

Vector Facility (VF). A hardware feature that provides synchronous instruction processing for high-speed manipulation of fixed-point and floating-point data.

VF. Vector Facility.

V=F machine. Virtual=fixed machine.

virtual=fixed machine (V=F machine). A preferred virtual machine with a fixed, contiguous area of host real storage that does not start at page 0. CP provides performance enhancements for this virtual machine. See also multiple preferred guests, preferred virtual machine, virtual=real area, virtual=real machine, virtual=virtual machine.

virtual machines. In VM/XA SP, a functional equivalent of either a System/370 computing system or a System/370-Extended Architecture computing system. Each virtual machine is controlled by an operating system. VM/XA SP controls the concurrent execution of multiple virtual machines on an actual System/370-Extended Architecture system.

Virtual Machine/Extended Architecture System Product (VM/XA SP). An operating system that allows multiple IBM System/370 and 370-XA operating systems to run simultaneously on a single 370-XA processor. The multiple systems may be used for production, testing, developing application programs, maintenance, and migration. VM/XA SP also provides a high-capacity interactive environment. There are three components: the control program (CP), the conversational monitor system (CMS), and the dump viewing facility.

virtual machine operator. Any user who loads and runs an operating system in a virtual machine. Contrast with real system operator.

virtual=real area (V=R area). A fixed, contiguous section of real storage, starting at page 0, in which preferred virtual machines execute. CP does not page this storage. See also preferred

virtual machine, virtual=fixed machine, virtual=real machine.

virtual=real machine (V=R machine). A preferred virtual machine with a fixed, contiguous area of host real storage that starts at page 0. CP provides performance enhancements and an automatic recovery facility for this virtual machine. virtual=real machine recovery (V=R machine recovery). A CP function that allows the V=R machine to resume operation after most CP abnormal terminations. When possible, the facility reestablishes the V=R machine environment, allowing the operating system running in that virtual machine to perform its own recovery processes. See also automatic software re-IPL.

virtual=virtual machine (V=V machine). A virtual machine that runs in the dynamic paging area. CP pages this virtual machine's guest real storage in and out of host real storage. See also dynamic paging area, virtual=fixed machine, virtual=real machine.

virtual supervisor state. A condition, controlled by a virtual machine's current PSW, during which the control

program allows the virtual machine to issue input/output and other privileged instructions. When these instructions are not emulated, the control program intercepts these instructions and simulates their functions for the virtual machine.

virtual wait time. The period during which the control program suspends the processing of a program while a required resource is unavailable.

VII/XA SP. Virtual Machine/Extended Architecture System Product.

V=R area. Virtual=real area.

V=R machine. Virtual=real machine.

V=R machine recovery. Virtual=real machine recovery.

V=V machine. Virtual=virtual machine.

The numbers in parentheses are subject codes. A subject code is a two-digit number found on the System Library Subscription Service (SLSS) subscription form that represents a topic. (For example, general information, evaluation, and flyers are associated with code 20.) By choosing certain subject codes on the SLSS subscription form, you can order specific categories of information about IBM products rather than all of the literature about them. For a complete list of subject codes, see the SLSS subscription form.
