Currency Cartridge -- The 3624 Currency Cartridge is a purchase-only accessory and not included with the basic 3624. One cartridge for mdls 1 and 2 and two cartridges for mdls 11 and 12 are necessary for installation check-out and operation of 3624. Mdls 11 and 12 may also be operated with a single cartridge only. Cartridges are not maintained by IBM under the normal lease agreement or MMMC for purchased machine. The customer is responsible for determining if the cartridge is the failing unit; for providing cartridge for CE 3624 maintenance and testing (a minimum of one spare cartridge for mdls 1 and 2 and two spare cartridges for mdls 11 and 12 must be made available by customer to the CE for normal 3624 maintenance) and for setting the keying system on the cartridges and drive stations so that there is the desired match of currency denomination to drive station. See Customer Responsibilities in "Accessories" for installation and maintenance requirements.

Currency Sorting -- To achieve satisfactory operation, the customer must ensure that only new currency and good-quality used currency are used in the 3624. The general condition of used currency may vary. Used currency must be inspected to remove excessively worn, damaged, or torn bills. The *IBM 3624 Operator's Guide,* GA66-0006, and *IBM 3624 Cartridge Owner's Manual,* GA66-0005, contain procedures for preparation of new currency and inspection of used currency for operation in the 3624. For the 3624 mdls 11 and 12, the customer must ensure that each feed mechanism is loaded with the proper denomination currency. The cartridges contain a keying mechanism which can be set by the customer to ensure a match between specific cartridges and cartridge drive stations.

Printer Ink Rolls -- The customer is responsible for procurement and replacement of ink rolls in transaction statement and depository printers.

Logo Lamp -- The customer is responsible for procurement and replacement of the lamp in the logo panel light assembly.

Damage -- IBM is not responsible for intentional damage to the 3624 or any 3624 accessories. Repair of such damage is not covered under the IBM Maintenance Contract, Lease Agreement or Pilot Test Plan. Repair of such damage at cost of time and materials will be made to leased and pilot test machines and can be provided for purchase machines.

System Integrity -- Subhost operation, under control of the 3600 or 4700 Finance Communication Controller, requires customer systems design and support. Maintenance of system integrity in the subhost is a customer responsibility.

IBM is not responsible for any loss of money to the financial institution or its customers through the use of the 3624.

Third Track System Security Statement -- Customers ordering Third Track feature (#7950) must be advised that:

"IBM believes that the system security is optimized in an online environment, where PIN validation and transaction authorization can be performed in conjunction with positive-file data bases. The scope of

3624 Consumer Transaction Facility (cont'd)

security exposure expands with the degree of offline implementation, for which the Third Track might be used. The U.S. Federal Information Processing Data Encryption Standard (DES) algorithm is utilized to provide cryptographic security in the 3624 and may be used in conjunction with the third track application. IBM recommends that the customer consider using DES for this purpose. An optional security feature of the proposed ANSI/ISO Third Track Data Content standard is a Crypto Check Digits (CCD) field in the card, which may be used to relate the data elements of track 3 to the magnetic stripe. This does not imply, however, that its use is not subject to fraud techniques. ANSI/ISO has not prescribed using the optional CCD field or any specific CCD implementation technique. IBM recommends that the customer consider its value in his application, weighing possible enhancements in security with economic and performance implications for his system. IBM will continue to pursue a course of action with customers and industry to maintain a high level of system security.

IBM reserves the right to modify the parameters of the Third Track functions if the parameters of the final ANSI/ISO standard differ from those now in the process of standardization. However, this reservation of rights is not intended nor should it be construed as a commitment by IBM to support parameters different from those published by ISO/DIS 4909-June 1976."

Publications: GC20-0370

SPECIFY

- Voltage (AC, 1-phase, 60 Hz): **#9911** for 120V (usable on 115V).
- Cabling: Refer to *Installation Manual-Physical Planning,* GA27-2766 and GA26-1658. Also see M3601 and 3602 pages.
- Numeric or Alphameric Keyboard Arrangement:

  Specify **#9301** for numeric-only keypad. Specify **#9302** for alphameric keypad. Alphameric arrangement is the basic touch-pad telephone format with the Q and Z added over the numeric "0" and no alpha over the numeric "1" or Specify **#9303** for alphameric keypad. Alphameric arrangement is the *American Banking Association Standard* format with the Q and Z over the numeric "1" and no alpha over the numeric "0". All are field installable.
- Currency Cartridge: See "Accessories" for ordering instructions.
- Currency Denomination: **#9091** U.S. 5, 10, 20 dollar.
- Keyboard: Specify one of the following for standard keyboard; an RPQ should be submitted for any keyboard not shown below. All are field installable. The Change key allows the user to request a change in the denomination mix to be issued on mdls 11 and 12. The change key is used also, on all mdls, to page displays with the Multiline Display feature (#4750).

Specify Number		Transaction Type									From Acct/ To Acct			
Without Change Key (all mdls)	With Change Key (mdls 11/12) or All Mdls with #4750	Withdrawal	Special (3)	Balance	Transfer	Deposit (2)	Pmt Enclosed (2)	Pmt from Acct (2)	Cash Check (2)		Checking	Savings	Cr Card	Other
#9351	#9451	(1)									(1)			
#9352	#9452	(1)									0	0	0	
#9353	#9453	0		0							0	0	0	
#9354	#9454	0	0								0	0	0	0
#9355	#9455	0	0	0							0	0	0	
#9356	#9456	0	0	0							0	0	0	0
#9357	#9457	0	0	0	0	0	0	0			0	0	0	0
#9358	#9458	0	0	0		0					0	0	0	0
#9359	#9459	0	0	0	0						0	0	0	0
#9360	#9460	0	0	0		0					(1)			
#9361	#9461	0	0	0							(1)			
#9362	#9462	0	0	0	0	0	0	0	0		0	0	0	0
#9363	#9463	0	0	0		0			0		0	0	0	0
#9364	#9464	0	0	0		0			0		(1)			

Notes:
(1) Key position does not appear on the keyboard panel; single function is selected automatically.
(2) Prerequisites: Depository #3233, #3234, #3243 or #3244.
(3) Prerequisites: Depository #3233, #3234, #3243 or #3244 if any Special transactions are customized to require a deposit step.

- Logo Panel Group: Specify **#9401** if logo panel is to be shipped with the 3624. Specify **#9402** if logo panel(s) is to be shipped prior to the 3624. (**Note**: More than one panel may be ordered on specify code **#9402** if customer desires to have several panels delivered before the 3624 (e.g., for customization at one time). Specify **#9403** if logo panel is not to be ordered with 3624 and will be ordered separately by P/N through MES or has been ordered through specify code **#9402** on another 3624. See "Accessories" for ordering information. Purchase only.
- Controller-Data Designation: 1st and 2nd position designation is required to control distribution and maintenance of controller-data media necessary for 3624 load images. Specify either **#9491** or **#9492** as follows:

  1st Position Designator (**#9491**). Used to determine controller-data set to be distributed to host-system location. One 3624 attached to a host-system processor is specified **#9491**.

  2nd Position Designator (**#9492**). Used to identify additional 3624s attached to host-system. Controller-data set media are not distributed to host-system location for any 2nd position designated 3624s.

  When 1st position **#9491** is specified, also specify one of the following:

  If magnetic tape is used at the host system location:

#9412	9-track	800 bpi
#9413	9-track	1600 bpi
#9414	9-track	6250 bpi

  If magnetic tape is not used at the host system location (DOS/VS users only):

#9431	80-Column cards
#9432	96-column cards

  When 1st position **#9491** is specified, additional information is required to determine the shipping address of the controller-data media. Supplemental Specifications are to be entered exactly as follows to indicate the shipping address of the host system location:

3624 Consumer Transaction Facility (cont'd)

Line 1--IBM Programming Support Representative (PSR)
Line 2--C/O (Name of Customer)
Line 3--Street Address (or PO Box Number)
Line 4 (etc.)--City, State, Zip Code

This is the address to which controller-data media will be automatically shipped after the first 3624 is ordered.

Changes to 1st Position Designators for On-order and Installed 3624s: If a 1st position **#9491** 3624 is deferred, cancelled, or discontinued and 2nd position **#9492** 3624s have been specified, then one 2nd position 3624 must be altered from 2nd to 1st position (from **#9492** to **#9491**) to ensure continued distribution of controller-data media to host system location. When altering a 3624 to 1st position, include all items as required to be specified when **#9491** is specified (items specified on previous 1st position 3624). If the host system location changes the input medium (e.g., from 1600 bpi to 6250 bpi tape), the media specify code must be changed on the 3624 with **#9491** specified. In this case, the former media specify code must be deleted and the new one added by MES.

SPECIAL FEATURES

Add'l Storage (#1301): Provides an additional 2,048 bytes of storage. The user can utilize this to increase the number of custom messages, entries in Financial Institution Table, and as might be necessary for RPQs. To determine the number of additional storage features required, see GC66-0009, *IBM 3624 Programmer's Reference Manual and Component Description.* **Maximum:** Two if without Multiline Display (#4750). Five if with Multiline Display (#4750). **Field Installation:** Yes. **Prerequisites:** Storage Expansion Feature (#6501) is required for either: [1] First Add'l Storage Feature (#1301) increment when ordered with Multiline Display (#4750) and SDLC Communications Feature (#6301 or #6302) [2] Or third Add'l Storage Feature (#1301) increment when ordered with Multiline Display (#4750) and Terminal Loop Feature (#7820) , [3] Or first Add'l Storage Feature (#1301) increment when ordered with Multiline Display (#4750) and BSC Communications feature (#1421 or #1422).

BSC Communications With Clocking (#1421): Provides capability to attach to a host system (e.g., S/370) via BSC. Required for attachment to communications facilities through the IBM 1200 bps Integrated Modem (#5500), or through the EIA Interface (#3701) to any 1200 bps external modem which does not have internal clocking. **Limitations:** Cannot be installed with Terminal Loop (#7820), SDLC Communications feature (#6301 or #6302), BSC Communications Without Clocking (#1422), or 1200 bps Loop Integrated Modem (#8001). **Maximum:** One. **Field Installation:** Not recommended for field installation if Terminal Loop (#7820) or SDLC Communications feature (#6301 or #6302) is installed. Can be changed from BSC Communications Without Clocking (#1422) to BSC Communications With Clocking (#1421). **Prerequisites:** IBM 1200 bps Integrated Modem (#5500) if no external modem, or EIA Interface (#3701) if external modem. **Transmission:** This feature operates over common carrier communication facilities. For information concerning these facilities, see M2700 pages.

BSC Communications Without Clocking (#1422): Provides capability to attach to a host system (e.g., S/370) via BSC through 3704, 3705 or 3725. Required for attachment to communications facilities through the EIA Interface (#3701) to any external modem which provides internal clocking speeds up to 4800 bps. **Limitations:** Cannot be installed with Terminal Loop (#7820), SDLC Communications feature (#6301 or #6302), BSC Communications With Clocking (#1421), IBM 1200 bps Integrated Modem (#5500), or 1200 bps Loop Integrated Modem (#8001). **Maximum:** One. **Field Installation:** Not recommended for field installation if Terminal Loop (#7820) or SDLC Communications feature (#6301 or #6302) is installed. Can be changed from BSC Communications With Clocking (#1421) to BSC Communications Without Clocking (#1422). **Prerequisites:** #3701. **Transmission:** This feature operates over common carrier communication facilities. For information concerning these facilities, see M2700 pages. **External Modems:** IBM external modems that may be attached are:

3863 Mdls 1	2400/1200	bps	Nonswitched
3864 Mdls 1	4800/2400	bps	Nonswitched
3872 Mdls 1	2400/1200	bps	Nonswitched

Depository Cartridge Locking (#3150): [Mdls 2, 12] Provides locking mechanism in the depository that prevents removal of the depository cartridge unless it is closed and locked. Operates with Depository Cartridge (#3155). See "Accessories" for purchase of cartridges. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #3243. Minimum of one #3155 is required for operation.

Depository Cartridge (#3155): [Mdls 2, 12] Portable container for receiving and transporting deposits. Required for operation with Depository Cartridge Locking Feature (#3150).

Depository, Lobby (#3233): [Mdls 1, 11] Provides envelope transport mechanism leading from a controlled access slot to deposit receptacle inside the 3624. The depository transport is designed to discourage tampering with previously inserted deposits. Includes a pedestal stand, with lockable rear access door and standard key, and a built-in depository envelope holder. Deposit envelopes may vary in size from 88.9mm x 152.4mm (3.5 x 6.0 in.) to 114.3mm x 247.7mm (4.5 x 9.75 in.) and shall be constructed of paper having basis weight of sub 20 through sub 28. Maximum thickness of a deposit envelope and its contents is 12.7mm (0.5 in.). **Limitations:** Cannot be installed in Pedestal, Lobby (#5510). **Maximum:** One. **Field Installation:** Yes.

Depository, Through-The-Wall (#3243): [Mdls 2, 12] Provides envelope transport mechanism leading from a controlled access slot in the security enclosure to deposit receptacle inside the 3624. In addition to the controlled access slot in the security enclosure, the depository transport is designed to discourage tampering with previously inserted deposits. Deposit envelopes may vary in size from 88.9mm x 152.4mm (3.5 x 6.0 in.) to 114.3mm x 247.7mm (4.5 x 9.75 in.) and shall be constructed of paper having basis weight of sub 20 through sub 28. Maximum thickness of a deposit envelope and its contents is 12.7mm (0.5 in.). **Limitations:** Cannot be installed with Heavy-Duty Enclosure, Single Function. **Maximum:** One. **Field Installation:** Yes. **Note:** Field installation requires Heavy-Duty Enclosure, Dual Function to have been initially ordered. **Prerequisites:** Heavy-Duty Enclosure, Dual Function.

Depository Printer (#3245): Prints sequence number on envelope as it passes through the depository throat. Six numeric digits are printed horizontally at repeated intervals along the envelope. Three digits are set by customer engineer to identify unit, and three digits are automatically sequenced when envelope passes print station. The depository ink roll is P/N 457149. It is customer's responsibility to purchase and replace the ink roll when required. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #3233 or #3243.

Currency Area Lockoff (#3312): [Mdls 2, 12] Provides a security panel to enclose the currency area. Enables the document feed mechanism to be locked in the machine. When used with the Depository Cartridge Locking feature (#3150), it restricts access to the currency area during normal operational servicing of the depository and/or other areas of the 3624. Includes keylock and standard key. Available only when installed with the Heavy-Duty Enclosure, Dual Function (#3902).

EIA Interface (#3701): Provides the appropriate cables and interface logic necessary to attach an external modem for communications attachment to the processor via BSC through the 3704, 3705 or 3725 SDLC through the 3704, 3705, 3725 or Communications Adapter on 4331 Processor. Non-IBM modems may be attached subject to the Multiple Supplier Systems Policy. **Limitations:** Cannot be installed with 1200 bps Integrated Modem (#5500) or Terminal Loop Feature (#7820). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #6301 or #6302 or BSC Communications Feature (#1421 or #1422).

Multi-line Display (#4750): Displays up to 240 characters (six lines of 40 characters each). Characters are presented in predefined 7x9 and 7x7 dot matrices for upper-case alphameric, special characters, and language-unique characters, including the Hebrew alphabet. Additional interactive functions are provided for expanded communications between the user and the attached host. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** [1] The change key is required if display paging. See "Keyboard Specify". [2] Increased storage may be required to support larger size of display and additional interaction function. See Add'l Storage Feature (#1301) and Storage Expansion Feature (#6501).

IBM 1200 bps Integrated Modem (#5500): Provides an internal modem for communications attachment to the processor via SDLC /BSC at 1200 bps over nonswitched half-duplex or duplex voice-grade lines. **Limitations:** Cannot be installed with Interface (#3701), SDLC Communications Feature Without Clocking (#6302), BSC Communications Without Clock (#1422), Terminal Loop Feature (#7820), or 1200 bps Loop Integrated Modem (#8001). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #6301 , #1421. **Specify:** **#9651** for 4-wire strapping or **#9652** for 2-wire strapping.

SDLC Communications With Clocking (#6301): Provides capability to attach to a host system via SDLC, e.g., S/370 or 4300 processor through 3704, 3705, 3725 or Communications Adapter on 4331 Processor. Required for attachment to communications facilities through the IBM 1200 bps Integrated Modem (#5500), or through the Interface (#3701) to any 1200 bps external modem which does not have internal clocking. **Limitations:** Cannot be installed with Terminal Loop Feature (#7820), SDLC Communications Without Clocking (#6302) or 1200 bps Loop Integrated Modem (#8001) or BSC Communications Feature (#1421 or #1422). **Maximum:** One. **Field Installation:** Not recommended for field installation if Terminal Loop Feature (#7820) or BSC Communications Feature (#1421 or #1422) is installed. Can be changed from SDLC Communications without Clocking (#6302) to SDLC Communications With Clocking (#6301). **Prerequisites:** #5500 if no external modem, or #3701 if external modem. **Transmission:** This feature operates over common carrier communication facilities. For information concerning these facilities, see M2700 pages.

3624 Consumer Transaction Facility (cont'd)

SDLC Communications Without Clocking (#6302): Provides capability to attach to a host system via SDLC, e.g., S/370 or 4300 Processor through 3704, 3705, 3725 or Communications Adapter on 4331 Processor. Required for attachment to communications facilities through the Interface (#3701) to any external modem which provides internal clocking speeds up to 4800 bps. **Limitations:** Cannot be installed with Terminal Loop Feature (#7820), SDLC Communications with Clocking (#6301), IBM 1200 bps Integrated Modem (#5500) or 1200 bps Loop Integrated Modem (#8001) or BSC Communication Adapter (#1421 or #1422). **Maximum:** One. **Field Installation:** Not recommended for field installation if Terminal Loop Feature (#7820) or BSC Communications Feature (#1421 or #1422) is installed. Can be changed from SDLC Communications With Clocking (#6301) to SDLC Communications Without Clocking (#6302). **Prerequisites:** #3701. **Transmission:** This feature operates over common carrier communication facilities. For information concerning these facilities, see M2700 pages.

External Modems: IBM external modems that may be attached are:

3863 mdl 1	2400/1200 bps nonswitched
3864 mdl 1	4800/2400 bps nonswitched
3872 mdl 1	2400/1200 bps nonswitched

Note: 4-wire Switched Network Backup is available on 3863 and 3864. For communications capability, product utilization, and features, see M2700, 3863 and 3864 pages.

Storage Expansion (#6501): Provides capability to add increments of Add'l Storage Feature (#1301) if Multiline Display (#4750) is installed. Required for either: The first Add'l Storage Feature (#1301) increment when ordered with Multiline Display (#4750) and SDLC Communications Feature (#6301 or #6302), or Multiline Display (#4750) and BSC Communication Storage Feature (#1421 or #1422), or #1301 increment when ordered with Multiline Display (#4750) and Terminal Loop Feature (#7820). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #4750.

Terminal Loop (#7820): Provides capability to attach to a 3600 or 4700 loop. Attachment to local loop is directly. Attachment to remote loop can be either directly or via remote subloop through a 3603, a 3604 mdl 2, 3 or 4, a 3614 or another 3624. **Limitations:** [1] Cannot be installed with SDLC Communications (#6301 or #6302) or BSC Communications Feature (#1421 or #1422) or Interface (#3701) or IBM 1200 bps Integrated Modem (#5500). [2] Remote loop speed is 1200 bps maximum when attached directly or via subloop through 3603 mdl 1, 3604, 3614 or 3624; is 2400 bps maximum via subloop through 3603 mdl 2. [3] Loop Integrated Modem (#8001) is not required if 3624 is attached to local loop, or via subloop to remote loop through 3603, 3604, 3614 or another 3624. **Maximum:** One. **Field Installation:** Not recommended for field installation if SDLC Communications (#6301 or #6302) or BSC Communications Feature (#1421 or #1422) is installed. **Prerequisites:** [1] Available position on the loop. [2] Depending on the configuration, the Add'l Storage Feature (#1005 or #1006 or #1007) may be required on the 3600 Controller, or Add'l Storage (#1008) may be required on the 4700 Controller. See M3600 or 4700 pages. [3] Attachment to a 3600/4700 local loop directly does not require additional feature. [4] Attachment to a 3601/3602 remote loop directly requires 1200 bps Loop Integrated Modem (#8001). [5] Attachment to a 3601/3602 remote loop via remote subloop requires one of the following: (1) 3603 Terminal Attachment Unit 3603 mdl 1 or 2 for 1200 bps; 3603 mdl 2 for 2400 bps; (2) 3604 mdl 2, 3, or 4 with Line Feature Base (#4751 or #4752) and appropriate modem; (3) 3614 with Terminal Loop Feature (#7820) and 1200 bps Loop Integrated Modem (#8001); or (4) another 3624 with Terminal Loop Feature (#7820) and 1200 bps Loop Integrated Modem (#8001). **Specify:** [1] For attachment to a 3601/3602/4701 local loop specify one of the following loop speeds: **#9062** for 1200 bps, **#9063** for 2400 bps or **#9064** for 4800 bps. [2] For attachment to 3601/3602 remote loop via subloop through 3603 mdl 1 or 2 at 1200 bps, specify **#9062**. [3] For attachment to 3601/3602/4701 remote loop via subloop through 3603 mdl 2 at 2400 bps, specify **#9063**. [4] For attachment to 3601/3602 remote loop via subloop through 3604, 3614, or 3624, specify **#9062** for 1200 bps.

Third Track (#7950): Provides for reading data on track 2 and/or both reading and writing data on track 3 of magnetic stripe card. Presently conforms to ISO/3554/AD1 Third Track Standard, and proposed Data Content Standard ISC/DIS 4909. Can read tracks 2 and 3 independently or in conjunction with each other. **Maximum:** One. **Field Installation:** Not recommended.

1200 bps Loop Integrated Modem (#8001): Provides an internal modem for attachment to 3601/3602 remote loop. Operates at 1200 bps over nonswitched unconditioned voice-grade lines. **Limitations:** Not required if 3624 is attached to a 3600 or 4700 remote loop through a 3603, 3604 mdl 2, 3 or 4, 3614 or another 3624, or if attached to a 3600 or 4700 local loop. If there are both a 3604 and a 3624 located at the same remote loop location that does not have a 3603 or 3614, it is recommended that the loop modem (#8001) be located on the 3624 because the 3624 might often be operating while the 3604 is not, e.g., weekends. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #7820.

Transaction Statement Printer (#8201): Prints document showing record of transaction and issues to user through the transaction statement slot; prints documents for audit use that can be retained in a journal stacker in the 3624. Print feed hopper has capacity of 2,000 documents. Journal stacker has capacity of 400 documents. Data is printed on 96-column card stock 66.7mm x 82.6mm (2-5/8 x 3-1/4 in.). Provides a 57-character set consisting of 56 printable graphics and space (blank). Four lines can be printed with up to 34 characters per line (maximum of 136 characters on each document). The data to be printed is determined by the host application program. Printing is overlapped with currency issue and user deposit cycles. **Card Limitations:** The 96-column card stock used in the statement printer must not have corner cuts. Detailed disclosure specifications describing 96-column card stock are available from IBM Corporation, Commercial Development Office, Armonk, N.Y. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS (None)

ACCESSORIES

Installation Accessories: [Mdls 2, 12] (Purchase only) Provide heavy-duty steel enclosure. through-the-wall bezel, front trim border, front dress panel, and pedestal base for installation of mdls 2 and 12 in configurations suitable for walk-up or drive-up use.

A heavy-duty enclosure is required. Two heavy-duty enclosures are available. A single function enclosure houses the currency dispensing mechanism on mdls 2 and 12 that do not have a depository. A dual function enclosure houses both the currency dispensing and the depository mechanisms on mdls 2 and 12 that have a depository. The dual function enclosure can also be used to house the currency dispensing mechanism only, on mdls 2 and 12 that do not have a depository. Both enclosures have a single rear access door that includes a combination lock and provides for a dial lock. The combination of the combination lock is set by the customer. The dial lock must be procured by the customer. A second combination lock is available as an optional feature. Both enclosures have a penetration-detection alarm grid across the inside of the front face. Construction of the heavy-duty enclosures meets requirements of UL291 and complies with the intent of U.S. Federal Regulation P for unattended paying and receiving machines.

Pedestal bases are available in a number of sizes to mount the enclosure at a height most suitable for walk-up or drive-up use. The recommended nominal mounting heights are 1,308mm (51.5 in.) from keyboard centerline to walkway for walk-up use and 1,079mm (42.5 in.) from keyboard centerline to driveway for drive-up use. The difference in elevation between walkway or driveway and the mounting surface should be considered in selecting the pedestal height. Refer to *Installation Manual -- Physical Planning*, GA27-2766 and GA26-1658. A lockable storage cabinet with standard key is included in the pedestal base. A lockable storage cabinet only is also available that can be used with the dual function heavy-duty enclosure to mount the enclosure directly to a floor surface where a pedestal is not required.

A through-the-wall bezel, front trim border that fits around the bezel, and front dress panel that fits within the bezel are required. Two through-the-wall bezels are available: one with a recessed bezelproviding a convenient shelf surface for user and recommended for a walk-up installation, and another with a non-recessed bezel positioning the user guidance area near the outside wall surface for more convenient use by a vehicle occupant and recommended for a drive-up installation. Two front trim borders are available: one with an envelope holder for depository transactions, and another without an envelope holder.

Warranty: These accessories are warranted free from defects in materials and workmanship for 90 days, commencing on the day Monday through Friday, following the later of: 1) one month from the accessories estimated date of shipment, or 2) one month from the actual date of shipment, or 3) the date the 3624 is installed, as specified by IBM. IBM's obligation is limited to providing replacement parts on an exchange basis during the warranty period.

Delivery Instructions: Supplemental Specs for installation accessory items must be submitted at least 90 days prior to the 3624 Friday schedule date. Because of installation requirements, the heavy-duty enclosure and pedestal items will generally be shipped three weeks prior to the 3624. Other accessories will be shipped with the 3624. Supplemental Specs (via terminal entry) are to be entered exactly as follows to indicate destination of these items:

Line 1 - c/o (Name of Customer)
Line 2 - Customer Designated Delivery Point (Note special considerations described below)
Line 3 - Street Address
Line 4 (etc.) - City, State, Zip Code

The 3624 mdls 2 and 12 will be shipped as three separate packages. The first package includes the heavy-duty enclosure, pedestal/storage cabinet and I/O module. This unit will be shipped on a pallet and will be 45"x 55"x 83" in total size. The total weight

3624 Consumer Transaction Facility (cont'd)

of the unit with pallet is approximately 3,500 lbs (3,100 lbs for 3624 without pallet).

The second package will contain the bezel and trim border. This is a palletized container weighing approximately 190 lbs and has dimensions of 59 x 45 x 24 in., including pallet.

The third package will contain miscellaneous ship items. This is a palletized container which may weigh as much as 250 lbs (depending on features and quantities ordered) and has dimensions of 50 x 42 x 40 in. including pallet.

The item will be shipped via common carrier to the delivery point designated by the customer and may require special handling or rigging at destination. The customer should be advised that it is suggested this item be delivered directly to a local drayman that has facilities to move an item of these dimensions and weight. The customer then should make local provisions to have the enclosure delivered for physical installation at the selected site. The plant will notify the Branch, via ITPS message, of shipment to destination indicated in the Supplemental Specs.

Close coordination should be maintained with the customer, the appropriate physical planning group, and Field Engineering. Customer installation responsibilities should be noted as described in this section.

Heavy-Duty Enclosure, Single Function (#3901): [Mdls 2, 12] Used to enclose currency dispensing mechanism on 3624 mdls 2 or 12 that do not have a depository. **Prerequisites:** Bezel, Through-The-Wall (#1490 or #1491), Front Dress Panel (#3951), and Front Trim Border Without Envelope Holder (#3962). **Note:** Pedestal (#4901), that includes a lockable storage cabinet, is available in several heights to mount the single function enclosure. **Limitations:** Cannot be installed with Depository, Through-The-Wall (#3243 or #3244), Pedestal for Dual Function Heavy-Duty Enclosure (#4902), Storage Cabinet for Dual-Function Heavy-Duty Enclosure (#4903), or Front Trim Border with Envelope Holder (#3961). Single Function Heavy-Duty Enclosure (#3901) cannot be field upgraded to a Dual Function Heavy-Duty Enclosure (#3902).

Heavy-Duty Enclosure, Dual Function (#3902): [Mdls 2, 12] Used to enclose the currency dispensing and the depository mechanisms on mdls 2 and 12 that have a depository. May also be used to enclose the currency dispensing mechanism only and provide spare lockable storage space on mdls 2 or 12 that do not have a depository. **Note:** Pedestal (#4902), that includes a lockable storage cabinet, is available in several heights to mount the dual function enclosure. A lockable storage cabinet only (#4903) is also available to mount dual function enclosure directly to a floor surface where a pedestal is required. **Limitations:** Cannot be installed with Pedestal for Single Function Heavy-Duty Enclosure (#4901), Heavy-Duty Enclosure (#3902). **Prerequisites:** Bezel, Through-The-Wall (#1490 or #1491), Front Dress Panel (#3951), and Front Trim Border, with or without Envelope Holder (#3961 or #3962).

Dial Lock (#3310:) [Mdls 2, 12] (Optional) Provides keylock for the combination dial on a heavy-duty enclosure. Can be used where dual control and/or bank examiner type lock is desired. When locked, the combination dial cannot be turned. **Specify: #9251** for key removable when locked or unlocked, dial must be locked by key or **#9253** for key removable when locked only, dial must be locked by key. **Limitations:** Installed on only one combination dial when Dual Lock (#3374) is also ordered. **Maximum:** One. **Field Installation:** No.

3624 Currency Area Lockoff (#3312): [Mdls 2, 12] (Purchase only) Provides a security panel to enclose the currency area. Enables the document feed mechanism to be locked in the machine. When used with the Depository Cartidge Locking Feature (#3150), it restricts access to the currency area during normal operational servicing of the depository and/or other areas of the 3624. Includes keylock and standard key. **Note:** This accessory does not change the customer's responsibility to remove any currency in the 3624 when the unit has to be serviced by a CE if customer desires to change lock and/or key provided, customer is responsible for their procurement and installation. **Limitations:** Cannot be installed with Heavy-Duty Enclosure, Single Function (#3901). **Maximum:** One. **Field Installation:** Yes.

Dual Lock (#3375): [Mdls 2, 12] (Optional) A second combination-lock for the rear access door of a Heavy-Duty Enclosure (#3901 or #3901). **Field Installation:** No.

Bezel, Through-The-Wall, Recessed (#1490), Non-Recessed (#1491): [Mdls 2, 12] Bezel for thorugh-the-wall installation of 3624, #1490 is recessed, providing a shelf surface, and is recommended for walk-up installation. #1491 is non-recessed, placing the user guidance area nearer the outside wall surface for convenience of a vehicle occupant, and is recommended for drive-up installation. **Prerequisites:** Heavy-Duty Enclosure, Single or Dual Function (#3901 or #3902). Front Dress Panel (#3951), and Front Trim Border with or without Envelope Holder (#3961 or #3962).

Pedestal, for Heavy-Duty Enclosures (#4901 or #4902): [Mdls 2,12] A mounting stand to locate the 3624 at a height most convenient for user operation. Includes a lockable storage cabinet. Available for single and dual function heavy-duty enclosures in heights appropriate for walk-up or drive-up use. Recommended nominal keyboard heights are 1,321mm (52.0 in.) for walk-up; 1,067mm (42.0 in.) for drive-up. #4901 is for 3624s that use the single function enclosure (#3901) and #4902 is for 3624s that use the dual function enclosure (#3902). **Specify:** For keyboard centerline height from mounting surface: **#9701** for 1,079mm (42.5 in.), **#9702** for 1,206mm (47.5 in.), or **#9703** for 1,308mm (51.5 in.).

Notes: (1) If single function enclosure is installed without a pedestal, the keyboard centerline is 368mm (14.5 in.) from mounting surface. (2) See storage cabinet for dual function heavy-duty enclosure (#4903) for installing with keyboard centerline height lower than 1,067mm (42.0 in.) from mounting surface.

Storage Cabinet for Dual Function Heavy-Duty Enclosure (#4903): [Mdls 2, 12] (Optional) Lockable storage cabinet only, for mdls 2 or 12 dual function enclosure mounted directly to floor surface without pedestal. The keyboard centerline height is 965mm (38 in.) from mounting surface. A standard key is provided. **Limitations:** Cannot be installed with Heavy-Duty Enclosure, Single Function (#3901). **Prerequisites:** Heavy-Duty Enclosure. Dual Function (#3902). **Note:** Storage cabinet is included with the Pedestal for dual Function Heavy-Duty Enclosure (#4902).

Front Dress Panel (#3951): [Mdls 2,12] Provides panel to cover face of heavy-duty enclosure and I/O module. **Prerequisites:** Bezel, Through-The-Wall Recessed or Non-Recessed (#1490 or #1491), and Heavy-Duty Enclosure, Single or Dual Function (#3901 or #3902).

Front Trim Border, With Envelope Holder (3961), Without Envelope Holder (#3902): [Mdls 2,12] Provides trim paneling around the bezel to seal through-the-wall installation. #3961 includes built-in depository envelope holder and is available only when the depository feature is installed. #3962 does not include a depository envelope holder. **Prerequisites:** (1) Bezel, Through-the-Wall, Recessed or Non-recessed (#1490 or #1491). (2) Front Trim Border, With Envelope Holder (#3961) requires Depository, Through-the-Wall (#3243 or #3244).

Depository Cartridge (#3155): [Mdls 2,12] (Purchase only) Portable container for receiving and transporting deposits. Required for operation with Depository Cartridge Locking Feature (#3150). Capacity of approximately 300 deposited envelopes (certain conditions could cause capacity to vary). Cartridge case is made of a high impact resistant, fire retardant material. Built-in carrying handle provides ease of loading transportation. Locking mechanism provides for customer insertion of keylock. The cartridge is loaded into the 3624 depository in the closed and locked condition. During loading, the locking mechanism in the depository unlocks and slides the cartridge door open without allowing access to the contents of the cartridge. During unloading, the locking mechanism slides the cartridge door closed and locks it before the cartridge may be removed from the 3624. Cartridges can be opened only by a companion key corresponding to the key in the 3624. There is also provision for affixing a seal to the locked cartridge. A mechanical counter, enclosed within the cartridge, is incremented each time the door is partially opened, providing an audit against unauthorized access.

Customer Responsibilities: The customer must be advised that: (1) The customer is responsible for procurement and installation of cartridge lock and for installation of the companion cartridge lock key in the 3624 depository locking mechanism. (2) The customer is responsible for determining required spare (see "Spares" below). (3) The customer is responsible for determining if the cartridge is the failing unit. (4) The customer is responsible for providing cartridge when required for CE 3624 depository maintenance and testing. (5) The Customer is responsible for replacement if required of the cartridge audit counter. (6) Purchaser agrees that IBM is relieved of responsibility for claims, including but not limited to, loss of currency or documents contained in or associated with the depository cartridge. (7) The Customer will be responsible for removing, controlling, and reloading all money and deposits in the 3624 when the unit has to be serviced by a CE.

Maintenance: Cartridges are not maintained by IBM under the normal lease agreement or MMMC for purchased machines. Replacement, if required, of the security lock and the internal audit counter in the cartridge is the responsibility of the customer. IBM Maintenance Agreements are not available. If requested by the customer, CE can provide on-site service of the cartridge on a per call billable basis. CE can perform those maintenance operations (normally performed by the customer) that are described in the 3624 Cartridge Owners Manual (GA66-0005). IBM Repair Center service is not available.

Spares: To maintain continual depository operations at the ATM, at least two cartridges are required. Additional spares may be required, depending upon deposit, volume between scheduled unloadings such as over weekends, physical location of 2624s, where cartridge

3624 Consumer Transaction Facility (cont'd)

contents are removed, where temporarily stored, and the needs for problem determination in the event of depository malfunctioning. A recommended nominal quanity of cartridges per 3624, including spares is shown below. It assumes for every depository cartridge loaded in a machine, another cartridge has been unloaded, emptied and made available. In addition, approximately one spare is available for every five 3624s. This should provide sufficient quantities of spares for customer and CE 3624 testing and for replacement of inoperative cartridges. These quantities should be adjusted to the customer's particular system requirements.

Recommended Quantity:

3624s	Cartridges (including Spares):
1	3
2	5
3	7
4	9
5	11
6	14
7	16
8	18
9	20
10	22

Cartridges required for more than ten 3624s can be extrapolated from the above table by taking a multiple of these numbers.

Warranty: The cartridge is warranted free from defects in workmanship and material for a period of 90 days, commencing on the day, Monday through Friday, one month following the *later* of: 1) the estimated date of shipment, or 2) the actual date of shipment. Defective cartridges will be replaced under the warranty provisions.

Ordering: Order by feature number and specify quantity.

Accessory Repair Parts: Repair parts, including the belts mentioned below, are referenced in:

- *IBM 3624 Consumer Transaction Facility Cartridge Owner's Manual,* GA66-0005.
- *IBM 3624 Consumer Transaction Facility Accessories Owner's Manual,* GA66-0012.

IBM will not order customer requested parts, if these parts are not available at IBM.

Pedestal, Lobby (#5510): [Mdls 1, 11] (Purchase only) A mounting stand for free-standing configuration of lobby mdl without the depository feature. Note: **#5510** is not required if customer intends to install a mdl 1 or 11 without the depository feature on an alternative mounting surface or stand. **#5510** is not required if a mdl 1 or 11 is installed with a depository feature (#3233), since a pedestal base is included in #3233.

Logo Panel (#9401, #9402, or #9403): (Purchase only) Backlighted Logo Panel, suitable for customization by silkscreening or other acceptable process.

If **#9401** is specified, logo panel will be shipped with 3624.

If **#9402** is specified, logo panel will be shipped approximately three weeks prior to 3624. Note: More than one panel may be ordered when **#9402** is specified (e.g., customer may desire to order spares or to arrange to have several panels delivered for customization at one time). When more than one panel is ordered using **#9402**, then **#9403** should be specified on the other 3624s to avoid duplicating orders for logo panels.

If **#9403** is specified, logo panel will not be ordered with 3624 and must have been ordered separately by P/N through MES or as **#9402** on another 3624.

Note: Additional Logo Panels can be ordered by P/N from IBM.

	Machine	P/N
Logo Panel	3624 mdl 1 or 11	945618
Logo Panel	3624 mdl 2 or 12	945617

Currency Cartridge (#9110): (Purchase only) Portable currency container, interchangeable between 3624s. Cartridge case is made of a high-impact resistant, fire retardant material. Removable access cover and built-in carrying handle, for ease of loading and transportation. Locking mechanism provides for customer installation of keylock and affixing security seals to transport of the cartridge. The cartridge is connected to a cartridge drive station in the 3624 for power and communication of cash-low and cash-out currency levels. A keying system is provided so that a match between the cartridge and the cartridge drive station must be satisfied before the cartridge can be properly loaded in the drive station. The maximum new bill capacity is 2,300 bills. The used bill capacity is approximatley 2,000.

Customer Responsibilities: The customer must be advised that: (1) The customer is responsible for determining if the cartridge is the failing unit. (2) The customer should schedule the frequency of cleaning and belt replacement procedures for optimum cartridge performance according to the usage, to maintain maximum machine availability. (3) The customer may repair the cartridge or he may send it back to the Repair Center (see "Maintenance" below. (4) The customer is responsible for determining required spares (see "Spares" below). (5) The customer is responsible for providing cartridges for CE 3624 maintenance and testing; a minimum of one spare cartridge for mdl 1 and two spare cartridges for mdls 11 and 12 must be made available by the customer to the CE for normal 3624 maintenance. (6) The customer is responsible for setting the keying system on the cartridges and drive stations so that there is the desired match of currency denomination to drive station. (7) Purchaser agrees that IBM is relieved of responsibility for all claims, including, but not limited to, loss of curency or documents contained in, dispensed by, or associated with the cartridge.

Spares: The customer may wish to replace (1) an empty or partially loaded cartridge with a fully loaded cartridge, (2) a failing cartridge with a spare for problem determination or while malfunctioning cartridge is being repaired, (3) A cartridge to enable the IBM CE to perform 3524 maintenance and testing. The customer should be advised to purchase sufficient cartridges to cover the above uses. The number of cartridges recommended is dependent upon the total number of cartridge drive stations the customer has installed, application requirements, physical location of 3624s, and location where cartridges are temporarily stored and loaded. The customer must be advised that it is recommended that spare cartridges should remain in use and not be stored for extended periods. A recommended quantity of spare cartridges and spare replacement belts per cartridge drive station is shown below. It assumes for every loaded cartridge installed in a cartridge drive station, another cartridge for the same currency denomination is available for currency replenishment. In addition, approximately one spare is available for every three cartridge drive stations of the same currency demonination. This should provide sufficient quantity of spares for customer and CE 3624 testing and for temporary replacement of cartridges in repair. These quantities should be adjusted to the customer's particular application requirements once he understands how his physical environment and usage affect cartridge and belt wear. The customer can replace separator and restraint belts in conjunction with performing the recommended operator cleaning and belt replacement procedure. Additional belts can be ordered from the normal DP Supply Order procedures.

		RECOMMENDED MINIMUM QUANTITY OF SPARE REPLACEMENT BELTS	
CARTRIDGE DRIVE STATIONS *	RECOMMENDED QUANTITY OF CARTRIDGES **	SEPARATION BELT P/N 945307	RESTRAINT BELT P/N 945242
1	3	1	1
2	5	1	1
3	7	1	1
4	10	2	2
5	12	2	2
6	14	2	2
7	17	3	3
8	19	3	3
9	21	3	3
10	23	3	3

* 3624 Mdls 1 and 2 have one cartridge drive station and Mdls 11 and 12 have two cartridge drive stations.

** Including Spares

Cartridges and belts required for more than ten drive stations can be extrapolated from the above table by taking a multiple of these numbers. Additional quantities over the recommended minimum quantity of spare replacement belts should be ordered as required as part of the customer's periodic belt inspection and replacement schedule for cartridges (in conjunction with IBM's general recommendation).

Maintenance: Cartridges are not maintained by IBM under the normal lease agreement or MMMC for purchased machine. A recommended operator cleaning and belt replacement procedure is provided in the *IBM 3624 Cartridge Owner's Manual,* GA66-0005. Under adverse operating conditions, it is the customer's responsibility to modify the procedure to meet his own particular requirements. The customer can replace separator and restraint belts in conjunction with performing the recommended procedure. If the cartridge is in need of repair, the cartridge can be sent to the designated IBM Repair Center. It is the customer's responsibility to package the unit in the designated shipping container and ship it prepaid to the designated IBM Repair Center.

If requested by the customer, CE can provide on-site service of the cartridge on a per call billable basis. CE can perform those maintenance operations (normally performed by the customer) that are described in the 3624 Cartridge Owners Manual (GA66-0005). CE can also provide maintenance services that are provided by the

3624 Consumer Transaction Facility (cont'd)

Repair Center. For the CE to provide this service the customer must provide the CE contents of B.M. 4801538 which includes the MIMS package, throat adjusting tool and cassette diagnostic tape. For IBM to provide cartridge servicing, the customer must provide a 3624 for testing of the repaired cartridge. It is recommended that the customer provide IBM with repair service facilities at a central site (rather than at a branch location). **Note:** Currency cartridge warranty service must be performed at the IBM Repair Center only.

IBM Repair Center Service: For cartridge repair, the customer will fill out an *IBM Repair Authorization Form*, GX27-2981, pack it and the defective cartridge inthe designated shipping container, and ship it to the designated IBM Repair Center, where repair will be made if the cartridge is repairable. The charge for the repair of the cartridge at IBM repair Center will cover handling, inspection, cleaning, repair, adjustment, testing, and return shipping. Billing will be at IBM's applicable hourly rates. In addition, all parts needed will be billed at IBM's prevailing parts prices. Alternately upon request, the IBM Repair Center will provide, for a minimum charge, an estimate of repair charges.

If, on the basis of an inspection, the repair center concludes that a cartridge is not repairable, no further work will be performed and the cartridge will be returned to the customer with a minimum charge to cover handling, inspection, testing, and return shipping charges.

Warranty: The cartridge is warranted to be free from defects in workmanship and material for a period of 90 days commencing on the day, Monday through Friday, one month following the *later* of: 1) the estimated date of shipment, or 2) the actual date of shipment. Warranty service for the cartridge will be performed at the IBM Repair Center.

If warranty service is performed at an IBM Repair Center, the customer will fill out an *IBM Repair Authorization Form,* GX27-2981, pack it and the defective cartridge in the designated shipping container, and ship it prepaid to the designated IBM Repair Center.

Ordering: Order by Feature Number below and specify quantity.

CURRENCY CARTRIDGE SUMMARY

		FEATURE
USA	5,10,20 dollar	**#9110**

Note: For cartridge parts, refer to the *IBM 3624 Cartridge Owners Manual*, GA66-0005.

SUPPLIES (None)

3631 PLANT COMMUNICATION CONTROLLER

PURPOSE

A programmable controller for attachment of 3640 terminals to S/370 or 4300 processors using appropriate virtual storage system control programs or an 8100 Information System using the Distributed Processing Program Executive (DPPX).

S/370 or 4300 Processor attachment is via a 3704, 3705 or 3725 Communications Controller using synchronous data link control (SDLC) transmission protocols over various common carrier or user-owned transmission facilities. The 8100 system attachment is via the 8130, 8140, and/or 8101 data link using various common carrier or user-owned transmission facilities. Communication is also possible via a Communications Adapter on the 4321 or 4331 Processor.

Terminal attachment is via directly attached or data link attached loops which utilize synchronous data link control (SDLC) transmission protocols. The loops are user-owned transmission facilities which are constructed from IBM accessories - see "Accessories" below.

MODELS

Model 1A A01 — Includes a diskette drive which accommodates a Diskette 1 diskette of 250K byte capacity.

Model 1B B01 — Includes a diskette drive which accommodates a Diskette 2 diskette of 500K byte capacity.

Prerequisites: Communications with a virtual storage host S/370 or 4300 processor via a 3704, 3705, 3725 or Communications Adapter on the 4321 or 4331 Processor equipped with appropriate features ... see M3704, 3705, 3725 or 4331 pages.

A 3604 mdl 6 Keyboard Display or its equivalent is required as a control station and is directly attached to the controller. Two 10-foot cables will be supplied with the 3631. The magnetic stripe features are not supported.

HIGHLIGHTS

Controls the functions of a 3630 Plant Communication System. Customers, utilizing SCP programs on virtual storage S/370 or 4300 Processor systems , will prepare user-written application programs which direct system operation. The controller can be programmed to operate independently when the Host System is unavailable. It is capable of controlling terminal functions, executing arithmetic and logic functions, and capturing data from the terminals for later transmission to the Host System. A keylock is provided for locking access to the diskette drive.

The mdl 1A accommodates Diskette 1 of 250K byte capacity. The mdl 1B accommodates Diskettes 1 or 2 having 250K and 500K byte capacities. The diskette provides permanent storage for system microcode and application programs, plus permanent and temporary storage for user data. Data required to be on the diskette, exclusive of customer data, will often exceed 200K bytes. During normal operation performance characteristics of the diskette drive dictate that that device be used primarily for infrequent data logging.

IBM and customer code is transmitted to the controller where it is written on a diskette. The diskette may also be used to hold application data in the space not required for the system microcode. At controller start-up, diagnostics, system microcode and application code are read from the diskette into control and application storage. During system operation the diskette may be used to access data and code.

Storage included in the controller is used for system microcode, and application control data and instructions. The amount of storage available for application programming depends on the attached terminal configuration and user environment. Included in the basic machine is 65,536 bytes of application storage. Both control and application storage may be extended in 16,384 byte increments -- see "Special Features".

All 3640 terminals are attached to customer-owned loops. A variety of accessories and wire are available for the construction of the loops (see "Accessories" below. Up to two Loop Adapters may be installed to directly connect one loop each. The Loop Adapters each provide two loop lobes. Each lobe may extend up to 3.2 cable-kilometers (2 cable-miles). Directly attached loops are operated at 9600 bps. A loop, consisting of one lobe, may be connected to the 3842 or 3843 Loop Control Unit. The 3842 can be connected multipoint or point-to-point on a common carrier or customer-owned transmission facility to a 3872 modem at the 3631 site for operation at 2400 bps. The 3843 supports point-to-point or multipoint telecommunication links via a synchronous modem transmitting at 2400, 4800, or 9600 bps. A loop can accommodate a number of loop-terminal connections - see the *IBM 3630 Plant Communication System Description* for additional information.

Communication with a virtual storage host S/370 or 4300 Processor is via a 3704, 3705, 3725 or a Communications Adapter on the 4331 Processor using SDLC and SNA protocols. The EIA/CCITT Interface - Host (#3701), and either an external modem or the #4716 Medium Speed, Local Attachment feature on the 3704, 3705 or 3725 are required (on 4331, the Local Attachment Interface feature #4801) for host communication. See M2700 and 4331 pages for Communications Adapter features on 4331. Each 3631 operates in half-duplex mode. Duplex communication line operations are possible with multiple 3631s and 3632s attached to the line ... one 3631/3632 transmitting while the other receives. See M2700 pages for available modems and communication services. Communication with an 8100 system is via the 8130, 8140, and/or the 8101 data link using the SDLC protocol. The 3631 feature #3701, EIA/CCITT Interface - Host, is used on an SDLC data link facility provided by the 8100. Each 3631 operates in half-duplex mode.

IBM External Modems are:

3863 Mdl 1	2400/1200 bps	Nonswitched
3868 Mdl 3/4	9600/4800 bps	Nonswitched
3864 Mdl 1	4800/2400 bps	Nonswitched
3868 Mdl 2	4800/2400 bps	Nonswitched
3865 Mdl 1/2	9600/4800 bps	Nonswitched
3868 Mdl 1	2400/1200 bps	Nonswitched
3872 Mdl 1	2400/1200 bps	Nonswitched

Note: 4-wire Switched Network Back-up is available on 3863, 3864, and 3865. For communications capabilities, product utilization, and features, see M2700, 3863, 3864 and 3872 pages.

Supplies: The customer-owned diskettes may be ordered from your SSD Sales Representative for initial and replacement quantities.

Model 1A: IBM Diskette 1, P/N 2305845
Model 1B: IBM Diskette 2, P/N 2736700 or IBM Diskette 1, P/N 2305845

For further information contact IBM .

The 3631 Controller and 3604 control terminal have been designed for operation in physical environments characteristic of office areas. See *3630 Plant Communication System Installation Manual - Physical Planning,* GA24-3675, for further information.

One host communication feature: #6301, #6302 or #4502.

A 3630 Test Loop (specify **#9445**) for installation with the first 3631 at each site.

Two wrap-type Loop Station Connectors for each local adapter (#4780).

3631/32 programming support material must be ordered from PID and installed on the host computer.

Loop Continuity and Relay Testers, P/N 1657420, should be purchased by the customer for testing his loop wiring. One tester should be available at each physical location of controller(s) loops or data link attached loop(s) that will require loop cable testing.

Telephone communication should be available at the controller site for communication with the host, data link attached, and key locations along loops.

A 3643 Keyboard Display terminal should be located in close physical proximity to 3842 and 3843 Loop Control Units for data link attached loop and connected terminal testing.

Publications: *IBM 3630 Plant Communication System, System Description,* GA24-3652 ... *Introduction to the IBM 8100 Information System,* GA27-2875 ... *IBM 3630 Plant Communication System, Installation Manual - Physical Planning,* GA24-3675 ... *IBM Multi-use Communication, Loop Planning Guide,* GA23-0038 ... *IBM Multi-use Communication, Loop Installation Guide,* GA23-0039 ... *IBM 3630 Plant Communication System, Controller Operating Guide,* GA24-3678

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (115V AC, 1-phase, 60 Hz, 1.8m (6.0 ft) cable): **#9880** for locking plug (usable on 120V AC systems), or **#9881** for non-locking plug (usable on 120V AC systems).
- **Distribution of Microcode:** One copy of the 3631 system microcode is required for each S/370 attaching a 3631. The address for the initial shipment must be supplied as a Supplementary Specification via AAS entry as shown below. Specify **#9491** for the initial 3630 system ordered for attachment to the S/370, or specify **#9492** for any additional 3630 system ordered for attachment to the S/370.

  For distribution of microcode to the S/370 location, specify the medium:

  #9412 - 9/800 Magnetic Tape
  #9413 - 9/1600 Magnetic Tape
  #9414 - 9/6250 Magnetic Tape
  #9431 - 80-Column Cards
  #9432 - 96-Column Cards

  If card or tape input is not available on the S/370, contact your Industry Support Center.

  Shipping address for the 3630 system microcode must be supplied exactly as follows:

3631 Plant Communication Controller (cont'd)

Line 1 -- IBM Programming Support Representative
Line 2 -- c/o (Name of Customer)
Line 3 -- Street Address (or P.O. Box)
Line 4 (etc.) -- City, State, Zip Code

Note: This is the address of the 3631 Controller location and the address to which the microcode automatically will be sent for the 3630 system (designated **#9141**). Whenever a 3630 is updated by an EC, the microcode will be sent to the current TPC (Teleprocessing Control Number) address. The TPC address is supplied and controlled by the Field Engineering Branch Office.

- **Loop Accessories and Loop Cable:** Ten Loop Accessory Keys are shipped with the 3631. See "Accessories" below.
- **3630 Test Loop:** Specify **#9445** on the first 3631 or 3632 to be installed at each site. **Field Installation:** Yes.

SPECIAL FEATURES

Additional Storage Feature (#1006): Provides an additional 16,384 byte increment of storage for device attachment or application storage. To determine the number and type of storage features required, see the table below or the configurator in the *3630 Plant Communication System Description*. **Maximum:** 5. **Field Installation:** Yes. **Specify: #9591** for Additional Device Attachment Control Storage. Maximum one. Field Installation: Yes. Specify **#9592** for Additional Application Storage. Maximum four. Field Installation: Yes.

Note: The quantity of feature #1006 must equal the combined quantities of Specify **#9591** and **#9592**.

Attachment Factor Table

Control storage for the 3631 controller is divided into two definable areas, Base and Extended. In the following table attachment factors labeled "Base" are applicable to the base attachment factor calculation only. Attachment factors in the column labeled "Base or Extended" are applicable to either the base or extended attachment factor calculation.

Device Type/Feature/Function	Attachment Factor	
	Base	Base or Extended
3604 (MDL 6)	0	–
SDLC (#4502)	0.7	–
BSC RPQ	2.0	–
Multiple Block I/O-Diskette	3.0	–
3641 and/or 3647	–	5.4
3642	–	4.1
3643	–	7.0
3644	–	1.9
3645	–	3.0
3646	–	2.2
Priority Dispatching	–	0.3
Translate Instruction	–	1.2
LSEEK Instruction	–	1.8
Data Decompression/Decompaction	–	1.2
Data Compression/Compaction	–	1.6
Scratch Pad Function	–	1.7
Set Diskette	–	0.9
Data Sequencing	–	1.6

The base area has an attachment factor value total of 8.0 The extended area has a minimum attachment factor value of 15.5. Support for the items listed above as "Base" items is loaded into the Base area. Support for those listed on "Base or Extended" items begins loading into the Extended area. If the attachment factor value of 15.5 for the extended area is exceeded, one additional 16,384 byte increment of storage (Feature #1006 and Specify **#9591**) may be required, resulting in a maximum attachment factor value total for the extended area of 31.8. Unused space in the base area can be used should the extended area become full.

Summary	Maximum Load Factor
Base Area	8.0
Extended Base	15.5
Extended Additional	16.3
Total Maximum Load Factor	39.8

For additional information, see the Configuration section of the *3630 Plant Communication System - System Description* (GA24-3652).

Attachment Factor Function

Data Sequencing: Allows user application to sequence, in storage, a block of data items or to collate, in storage, data items from two separate blocks into a third block, according to a parameter list.

Set Diskette: Allows user applications to reset the temporary files, to specify the type of start-up (i.e., warm or cold) to be performed on the next load, and/or to initiate a load of the controller.

Priority Dispatching: Provides the ability to specify the order in which workstations are dispatched. This function consists of the LCHAP instruction which activates or deactivates the dispatching priority specified in the table(s) generated by the PRIDSP macro.

Translate: The LTRT instruction processes an input data stream against user specifiable translate table(s) to generate a translated output data stream. The LTRTBEG, LTRTENT and LTRTGEN instructions assist the user application programmer in specifying the translate table(s).

Multiple Block I/O - Diskette: Permits multiple blocks to be accessed with a single execution of the LREAD and REPLACE instruction for permanent file and absolute addressing accesses. This may also result in enhanced performance when more than 3 blocks are read or 4 blocks are written.

LSEEKP: Locates a table entry which is "equal to", "greater than or equal to" or "less than or equal to" a search argument using a binary search algorithm. Tables may be included in the instruction section of the controller application program, thereby permitting the tables to reside in extended user programmable storage.

Scratch Pad Function: Provides access to optional global work areas distinct from segment storage which may reside in base or extended user programmable storage.

Data Compression/Compaction: This function allows a controller application program to condense a data stream by compressing repeated characters and compacting frequently occurring characters according to a user defined table. This can reduce the amount of data actually transmitted over a host link or stored in the controller.

Data Decompression/Decompaction: This function allows a controller application program to decompress and/or decompact a data stream which had previously been compressed and/or compacted by a host or a controller application program.

Host Communications Features

For communication with the host processor, each 3631 must be equipped with EIA/CCITT Interface - Host (#3701) and one of the following SDLC features: #4502, #6301 or #6302.

EIA/CCITT Interface - Host (#3701): Provides the appropriate cables and interface logic necessary to attach an external modem for communications to the host processor through the 3704, 3705 or Communications Adapter on the 4331 Processor or for local attachment to the 3704, 3705 or Communications Adapter on the 4331 without requiring modems. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #4502, #6301 or #6302.

SDLC Communications Without Business Machine Clocking (#4502): Required for attachment to communication lines through an external modem which provides clocking at speeds up to 9600 bps. **Limitations:** Cannot be installed with #6301 or #6302. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #3701.

Host Communications With Business Machine Clocking (#6301): Required for attachment to communication lines through any external modem which does not provide clocking for speeds of 600, 1200 and 2400 bps, or for local attachment to the 3704, 3705 -- see M3704, 3705 pages, feature #4716. **Limitations:** Cannot be installed with #6302 or #4502. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #3701.

Host Communications Without Business Machine Clocking (#6302): Required for attachment to communication lines through an external modem which provides clocking at speeds up to 4800 bps. **Limitations:** Cannot be installed with #6301 or #4502. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #3701.

Terminal Attachment

The Data Link Adapter (#3211), Loop Adapter (#4780), and EIA/CCITT Interface (#3703) features enable the 3631 Controller to attach 3640 terminals. Data link terminal attachment capability is provided by selection of the EIA/CCITT Interface - Data Link (#3703) with the Data Link Adapter (#3211). Direct terminal attachment capability is provided by selection of the Loop Adapter (#4780) and the Data Link Adapter (#3211). A maximum of two directly attached loops and two data links for attachment of 3842s or 3843s may be installed.

The data links are used to provide point-to-point or multipoint facilities for the connection of the 3842 Loop Control Units. The 3842 attaches at the remote ends of the data link where it establishes a remote loop. The 3872 modem connects the EIA/CCITT Interface - Data Link (#3703) and the data link at the controller. Other synchronous modems with clocking, transmitting at 2400, 4800, or 9600 bps, and the 3843 Loop Control Unit may replace the 3872 and 3842. The loop operates at the same speed as the data link.

Customer Responsibilities For Loops: The customer must purchase, install, and maintain loops for terminal attachment. See *IBM 3630 Plant Communication System Description* for further information. See *IBM Multi-use Communications Loop Planning Guide* (GA23-0038) and *IBM Multi-use Communications Loop Installation Guide* (GA23-0039) for further planning and installation information on: loop components, loop cable, loop wiring configurations, Continuity and Relay Tester, and maintenance and test procedures. See

3631 Plant Communication Controller (cont'd)

"Accessories" below. Contact IBM for information concerning contracts available to assist the customer with installation.

Data Link Adapter (#3211): Provides the control logic to establish SDLC communications for terminal attachment. **Maximum:** Four. **Field Installation:** Yes. **Prerequisites:** Required once for each Loop Adapter (#4780) and once for each EIA/CCITT Interface - Data Link (#3703).

EIA/CCITT Interface - Data Link (#3703): Provides an EIA/CCITT interface for attachment of an IBM 3872 Modem for the connection of the 3842. Other synchronous modems with clocking, transmitting at 2400, 4800, or 9600 bps, and the 3843 Loop Control Unit may replace the 3872 and 3842. **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** Data Link Adapter #3211.

Loop Adapter (#4780): Allows direct attachment of a loop with one or two lobes to the controller operating at a speed of 9600 bps. **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** Data Link Adapter #3211, and a wrap type Loop Station Connector in each connected lobe.

MODEL CONVERSIONS

Model 1A can be changed to Model 1B. Model 1A to 1B requires replacement of the diskette storage device. Adequate provision must be made for retaining data contained on the diskette by having the customer remove it prior to the start of any conversion. All replaced parts become the property of IBM.

ACCESSORIES

Cables: Loop Cables may be purchased from IBM or a customer selected source. See *IBM Multi-use Communication Loop Planning and Installation Guide,* GA27-3341, for part numbers, specifications and usage which is necessary for preplanning and ordering.

Bulk Loop Cable Description	P/N
Indoor Cable: UL approved (style 2919) for interconnection of low voltage electronic equipment. Maximum allowable cable temperature range is -34°C to +80°C.	**1657265**
Indoor Cable: UL approved for cable tray installation (NEC Art. 725-40b3). Maximum allowable cable temperature range is -34°C to +90°C.	**7838694**
Indoor Cable: UL approved for duct and plenum installation (NEC Art. 725-2b). Maximum allowable cable temperature range is -34°C to +105°C.	**7838695**
Outdoor Cable: For above ground installation. Maximum allowable cable temperature range is -34°C to +80°C.	**1657267**
Outdoor Cable: For below ground installation. Maximum allowable cable temperature range is -34°C to +80°C.	**1657268**

Ordering Instructions: Interior cable (P/N 1657265, 7838694 and 7838695) should be ordered in lengths of 304.8m to 609.6m (1,000 to 2,000 ft). Additional lengths up to 609.6m (2000 ft.) can be ordered by specifying the length wanted. Indoor cable splices can be accomplished via P/N 1657300. A minimum order quantity is 304.8m (1,000 ft).

Exterior cable (P/Ns 1657267 and 1657268) should be ordered in one continuous length, up to a maximum of 914.4m (3,000 ft), by specifying the length wanted.) Outdoor splices with aerial and burial cable should be avoided.

Warranty: Loop cable is warranted free from defects of workmanship and materials for 90 days.

Loop Accessories

A group of accessory products are offered to permit plant electricians or contract personnel to install the loops. Refer to *IBM Multi-use Communications Loop Planning and Installation Guide,* GA23-3341, for information necessary to plan the layout and for selection of the loop hardware, for Installation and Testing information.

Loop Splice Plate (LSP): The LSP splices together two segments of indoor cable or provides a connecting point for future expansion of the loop. The LSP consists of a single connector strip, to which the incoming loop cable and the outgoing loop cable can be attached; it is installed in a standard outlet box for business office environments, or weatherproof outlet box for industrial environments.

Loop Station Connector (LSC): The LSC is available as two unique types: Wrap and radial. The wrap LSC attaches an I/O unit or controller directly to the main loop cable; the radial LSC attaches an I/O unit only through an LWC to the loop. The wrap LSC attaches an incoming and outgoing loop cable; the radial LSC attaches at the end of one loop cable from the LWC.

The wrap LSC also offers the isolation feature of wrapping, which allows the customer to wrap the loop away from a loop wiring failure or to reconfigure the loop during alterations. Both wrap and radial LSCs contain bypass relays that bypass the I/O unit when the I/O unit is powered-off or disconnected. These accessories are installed in a standard or weatherproof outlet box.

2 X 4 Adapter Plate (2AP): The 2" X 4" Adapter Plate is used with the Loop Station Connector and accommodates the use of standard outlet boxes that have dimensions smaller than the outlet boxes defined in the Loop Installation and Planning Guide. It is not to be used with the environmental outlet boxes.

Loop Wiring Concentrator (LWC): The LWC provides the facility to attach a cluster of I/O units without a large number of drops on the loop cable. It attaches up to eight radial LSCs at the end of loop cables called *radials.* The point where a radial line terminates at the LWC is called an LWC *port.* Not all ports have to be used; unused ports can be reserved for future expansion.

The LWC has the same wrapping capability as the wrap LSC. In addition, the LWC allows the customer to bypass one or more of the radials by setting a corresponding switch located inside the LWC.

The LWC has its own enclosure or can be mounted in a NEMA-4X environmental equipment cabinet, with minimum measurement of 36x30x15cm (14x12x6 in.).

Loop Surge Suppressor (LSS): The LSS allows the loop to be run across an outdoor space to another building. It attaches two outdoor cables and two indoor cables, allowing the proper termination and grounding for each type of cable. In addition, the LSS contains four surge protectors, one for each twisted pair in the two outdoor cables, to protect from voltage surges caused by near strikes of lightning. There is no protection in the LSS from a direct lightning strike.

The LSS has its own enclosure or can be mounted in an electrical equipment cabinet, with minimum measurement of 36x30x15cm (14x12x6 in).

Continuity and Relay Tester: The Continuity and Relay Tester is used with a customer supplied volt-ohm meter, capable of reading 0.5 ohms and rated at least 5000 ohms/volt, to verify the loop installation, including loop cabling and accessories, after completion. By plugging the tester into any loop station connector and connecting the volt-ohm meter to the tester, the condition of the wire segment being tested can be determined as to conductor and shield continuity (opens or shorts), wrap switch operation, and total lobe resistance.

The loop station connector relays are also activated and their operation verified with this tester.

System Loop Accessories	P/N
Loop Splice Plate (LSP) (indoor)	1657300
Loop Station Connector (Radial LSC)	1657310
Loop Station Connector (Wrap LSC)	1657320
Loop Station Connector Gasket	1657260
Loop Wiring Concentrator (LWC)	1657330
LWC Circuit Board Assy (order instead of LWC-1657330) *	1657332
Loop Surge Suppressor (LSS)	1657350
LSS Circuit Board Assy (order instead of LSS-1657350) *	1657354
Continuity and Relay Tester	1657420
Wrap Switch Access Cover	1657325
Loop Accessory Keys (10 spares) **	1657379
2 X 4 Adapter Plate (2AP)	7838771
Conventional Box (indoor) 5 x 10cm - (2 x 4 inches)	2102151
Clamp (for cable to indoor box)	2100264
Electrical Box (outdoor) 7 x 11.5cm - (2.75 x 4.5 inches) (For industrial use)	1657280
Clamp - small (for indoor cable to environmental box)	2114285
Clamp - large (for outdoor cable to environmental box)	1657377

* For use with NEMA-4X enclosure and associated parts (used when installing in harsh environments) or as a replacement part for the LWC or LSS.

** 1 package (10 keys) shipped with each 3631. 1 key shipped with each LWC and wrap LSC.

Ordering Instructions:

Warranty: All loop accessories are warranted free from defects of workmanship and materials for 90 days.

Customer Responsibilities: The customer is responsible to provide (purchase, install, test, and maintain) the loop cables and accessories

3631 Plant Communication Controller (cont'd)

for terminal attachments. However, contact IBM for details of IBM services available to assist the customer with installation.

The customer is also responsible for procuring and stocking spare cable and spare parts for loop accessories. See *IBM Multi-use Communications Loop Planning and Installation Guide,* (GA27-3341) for a suggested schedule to allow the customer to plan, install, and test the loop cable and accessories prior to delivery of the system.

It is recommended that the customer order additional loop components for spares with the initial order, as spares will not be stocked in the Branch Office.

To enable a customer to test his installed loops, it is recommended that the customer order a Continuity and Relay Tester. Testing the loop wiring will require the tester or its equivalent.

Locks and Keys : The 3631 is shipped with two keys. Additional keys may be purchased from IBM. Indicate serial number of lock.

SUPPLIES (None)

3632 PLANT COMMUNICATION CONTROLLER

PURPOSE

A programmable controller for attachment of 3640 terminals to S/370 or 4300 processors using appropriate virtual storage system control programs or an 8100 Information System using the Distributed Processing Program Executive (DPPX).

S/370, 4331, 4341, 4361 or 4381 processor attachment is via a 3704, 3705, 3725 or Communications Adapter on the 4321, 4331 or 4361 processor using synchronous data link control (SDLC) transmission protocols over various common carrier or user-owned transmission facilities. The 8100 system attachment is via the 8130, 8140, and/or 8101 data link SDLC transmission protocols using various common carrier or user-owned transmission facilities.

Terminal attachment is directly attached or data link attached loops. The loops are user-owned transmission facilities which are constructed from IBM accessories - see "3630 Loop Accessories" in "Accessories". The loops are connected via common carrier or user-owned transmission facilities.

MODELS

Model 1A A01 — A programmable terminal controller with a 5 megabyte disk.

Model 1B B01 — A programmable terminal controller with a 9.2 megabyte disk.

Prerequisites: Communications with a virtual storage S/370, or 4331, 4341, 4361 or 4381 processor via a 3704, 3705, 3725 or Communications Adapter on 4321, 4331 or 4361 equipped with appropriate features ... see M3704, 3705, 3725, 4321, 4331 or 4361 pages. Communications with the 8100 system via the 8130, 8140, and/or 8101 data link using the appropriate features ... see M8130, 8140 and 8101 pages.

A 3604 Model 6 Keyboard Display or its equivalent is required as a control station and is directly attached to the controller. Two 10-foot connecting cables will be supplied with the 3632. The magnetic stripe features are not supported. The 3632 Controller and 3604 control terminal have been designed for operation in physical environments characteristic of office areas. See *3630 Plant Communication System, Installation Manual - Physical Planning* , GA24-3675, for further information.

One host communication feature: #6301, #6302, or #4502.

A 3630 Test Loop (specify **#9445**) for installation with the first 3632 at each site.

Two wrap type Loop Station Connectors for each local adapter (#4780).

3631/32 programming support material must be ordered from IBM and installed on the host computer.

Loop Continuity and Relay Testers, P/N 1657420, should be purchased by the customer for testing his loop wiring. One tester should be available at each physical location of controller(s) loops or data link attached loop(s) that will require loop cable testing.

Telephone communication should be available at the controller site for communication with the host, data link attached, and key locations along loops.

A 3643 Keyboard Display terminal should be located in close physical proximity to 3842 and 3843 Loop Control Units for data link attached terminal testing.

HIGHLIGHTS

Controls the functions of a 3630 Plant Communication System. Customers, utilizing SCP programs on virtual storage S/370 or 4300 systems will prepare user-written application programs which direct system operation. The controller can be programmed to operate independently when the Host System is unavailable. It is capable of controlling terminal functions, executing arithmetic and logic functions, and capturing data from the terminals for later transmission to the Host System. Information may be stored on the disk for use in responding to terminal inquiries.

Houses a disk storage device (5 or 9.2 MB capacity) for storage of user data. This storage device is not removable except by service personnel. A fixed head feature is available which will provide 8 additional heads with access to data on 8 tracks ... see "Additional Disk Heads Feature (#1010, #1011)".

Houses a direct access diskette drive which accepts both IBM Diskette 1 and 2 having respectively 250K and 500K byte capacities. The diskette provides permanent storage for system microcode and application programs, plus permanent and temporary storage for user data. Data required to be on the diskette, exclusive of customer data, will often exceed 200K bytes. During normal operation performance characteristics of the diskette drive dictate that the device be used primarily for infrequent data logging.

IBM and customer code is transmitted to the controller where it is written on a diskette. The diskette may also be used to hold application data in the space not required for the system microcode. At controller start-up, diagnostics, system microcode and application code are read from the diskette into control and application storage. During system operation both the disk and the diskette may be used to access data and code.

Storage included in the controller is used for system microcode, and application control data and instructions. The amount of storage available for application programming depends on the attached terminal configuration and user environment. Included in the basic machine is 65,536 bytes of application storage. Both control and application storage may be extended in 16,384 byte increments -- see "Special Features".

All 3640 terminals are attached to customer-owned loops. A variety of accessories and wire are available for the construction of the loops (see "Loop Accessories - 3630, 4331, 4361 and 8100 Systems" in "Accessories"). Up to two Loop Adapters may be installed to directly connect one loop each. The Loop Adapters each provide two loop lobes. Each lobe may extend up to 3.2 cable-kilometers (2 cable-miles). Directly attached loops are operated at 9600 bps. A loop, consisting of one lobe, may be connected to the 3842 or 3843 Loop Control Unit. The 3842 can be connected multipoint or point-to-point on a common carrier or customer-owned transmission facility to a 3872 modem at the 3632 site for operation at 2400 bps. The 3843 supports point-to-point or multipoint telecommunication links via a synchronous modem transmitting at 2400, 4800, or 9600 bps. A loop can accommodate a number of loop-terminal connections - see *IBM 3630 Plant Communication System Description* for additional information.

Communication with a virtual storage host S/370 or 4331, 4341, 4361 or 4381 processor is via a 3704, 3705, or Communications Adapter on the 4321, 4331 or 4361 processor using SDLC and SNA protocols. The EIA/CCITT Interface - Host (#3701), and either an external modem or the #4716 Medium Speed, Local Attachment feature on the 3704/3705. On the 4331 or 4361, the Local Attachment feature (#4801) is required for host communication. See M2700, 4331 and 4361 pages for Communications Adapter features on 4331. Each 3632 operates in half-duplex mode. *Duplex communication line operations are possible with multiple 3631s and 3632s attached to the line ... one 3631/3632 transmitting while the other receives. See M2700 pages for available modems and communication services. Communication with an 8100 system is via the 8130, 8140, and/or 8101 data link using the SDLC protocol. The 3632 feature #3701, EIA/CCITT Interface - Host is used on an SDLC data link facility provided by the 8100. Each 3632 operates in half-duplex mode.

IBM External Modems are:

3863 Mdl 1	2400/1200 bps Nonswitched
3868 Mdl 3/4	9600/4800 bps Nonswitched
3864 Mdl 1	4800/2400 bps Nonswitched
3868 Mdl 2	4800/2400 bps Nonswitched
3865 Mdl 1/2	9600/4800 bps Nonswitched
3868 Mdl 1	2400/1200 bps Nonswitched
3872 Mdl 1	2400/1200 bps Nonswitched

Note: 4-wire Switched Network Back-up is available on 3863, 3864, and 3865. For communications capabilities, product utilization, and features, see M2700, 3863, 3864 and 3872 pages.

Publications: *IBM 3630 Plant Communication System, System Description,* GA24-3652 ... *Introduction to the IBM 8100 Information System,* GA27-2875 ... *IBM 3630 Plant Communication System, Installation Manual - Physical Planning,* GA24-3675 ... *IBM Multi-use Communication loop Planning Guide,* GA23-0038 ... *IBM Multi-use Communication Loop Installation Guide,* GA23-0039 ... *IBM 3630 Plant Communication System, Controller Operating Guide,* GA24-3678.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (AC, 1-phase, 60 Hz):
  115V (usable on 120V): **#9880** for locking plug or **9881** for non-locking plug.
  208V: **#9884** for locking plug or **#9885** for non-locking plug.
  230V: **#9886** for locking plug or **#9887** for non-locking plug.
- Distribution of Microcode: One copy of the 3631 system microcode is required for each S/370 attaching a 3631. The address for the initial shipment must be supplied as a Supplementary Specification via AAS entry as shown below. Specify **#9491** for the initial 3630 system ordered for attachment to the S/370, or specify **#9492** for any additional 3630 system ordered for attachment to the S/370. **Field Installation:** Yes.

  For distribution of microcode to the S/370 location, specify the medium:

  #9412 - 9/800 Magnetic Tape
  #9413 - 9/1600 Magnetic Tape
  #9414 - 9/6250 Magnetic Tape
  #9431 - 80-Column Cards
  #9432 - 96-Column Cards

3632 Plant Communication Controller (cont'd)

If card or tape input is not available on the S/370, contact your Industry Support Center.

Shipping address for the 3630 system microcode must be supplied exactly as follows:

Line 1 -- IBM Programming Support Representative
Line 2 -- c/o (Name of Customer)
Line 3 -- Street Address (or P.O. Box)
Line 4 (etc.) -- City, State, Zip Code

Note: This is the address of the 3632 Controller location and the address to which the microcode automatically will be sent for the 3630 system (designated **#9141**). Whenever a 3630 is updated by an EC, the microcode will be sent to the current TPC (Teleprocessing Control Number) address. The TPC address is supplied and controlled by the Field Engineering Branch Office.

- Loop Accessories and Loop Cable: Ten Loop Accessory Keys are shipped with the 3632. See "Accessories" for descriptions and ordering instructions for 3630 and loop Accessories.
- 3630 Test Loop: Specify **#9445** on the first 3631 or 3632 to be installed at each site. **Field Installation:** Yes.

SPECIAL FEATURES

Additional Storage (#1006): Provides an additional 16,384 byte increment of storage for device attachment or application storage. To determine the number and type of storage features required see the table below and/or the configurator in the *3630 Plant Communication System Description*. **Maximum:** 5. **Field Installation:** Yes. **Specify: #9591** for Additional Device Attachment Control Storage. Maximum 1. Field Installation Yes. Specify **#9592** for Additional Application Storage. Maximum 4. Field Installation Yes.

Note: The quantity of feature #1006 must equal the combined quantities of specify **#9591** and **#9592**.

Attachment Factor Table

Control storage for the 3632 controller is divided into two definable areas, Base and Extended. In the following table attachment factors labeled "Base" are applicable to the base attachment factor calculation only. Attachment factors in the column labeled "Base or Extended" are applicable to either the base or extended attachment factor calculation.

Device Type/Feature/Function	Attachment Factor	
	Base	Base or Extended
3604 (MDL 6)	0	–
SDLC (#4502)	0.7	–
BSC RPQ	2.0	–
Multiple Block I/O-Diskette	3.0	–
3641 and/or 3647	–	5.4
3642	–	4.1
3643	–	7.0
3644	–	1.9
3645	–	3.0
3646	–	2.2
Disk File	–	10.0
Dynamic Sector Relocate	–	0.6
Priority Dispatching	–	0.3
Translate Instruction	–	1.2
LSEEK Instruction	–	1.8
Data Decompression/Decompaction	–	1.2
Data Compression/Compaction	–	1.6
Scratch Pad Function	–	1.7
Set Diskette	–	0.9
Data Sequencing	–	1.6

The base area has an attachment factor value total of 20.0. The extended area has a minimum attachment factor value of 15.5. Support for the items listed above as "Base" items is loaded into the Base area. Support for those listed on "Base or Extended" items begins loading into the Extended area. If the attachment factor value of 15.5 for the extended area is exceeded, one additional 16,384 byte increment of storage (Feature #1006, specify **#9591**) may be required, resulting in a maximum attachment factor value total for the extended area of 31.8. Unused space in the base area can be used should the extended area become full.

Summary	Maximum Load Factor
Base Area	20.0
Extended Base	15.5
Extended Additional	16.3
Total Maximum Load Factory	51.8

For additional information, see the Configuration section of *3630 Plant Communication System - System Description*, GA24-3652.

Attachment Factor Function

Data Sequencing - Allows user application to sequence, in storage, a block of data items or to collate, in storage, data items from two separate blocks into a third block, according to a parameter list.

Set Diskette - Allows user applications to reset the temporary files, to specify the type of start-up (i.e., warm or cold) to be performed on the next load, and/or to initiate a load of the controller.

Priority Dispatching - Provides the ability to specify the order in which workstations are dispatched. This function consists of the LCHAP instruction which activates or deactivates the dispatching priority specified in the table(s) generated by the PRIDSP macro.

Translate - The LTRT instruction processes an input data stream against user specifiable translate table(s) to generate a translated output data stream. The LTRTBEG, LTRTENT and LTRTGEN instructions assist the user application programmer in specifying the translate table(s).

Multiple Block I/O - Diskette -Permits multiple blocks to be accessed with a single execution of the LREAD and REPLACE instruction for permanent file and absolute addressing accesses. This may also result in enhanced performance when more than 3 blocks are read or 4 blocks are written.

LSEEKP - Locates a table entry which is "equal to", "greater than or equal to" or "less than or equal to" a search argument using a binary search algorithm. Tables may be included in the instruction section of the controller application program, thereby permitting the tables to reside in extended user programmable storage.

Scratch Pad Function - Provides access to optional global work areas distinct from segment storage which may reside in base or extended user programmable storage.

Data Compression/Compaction - This function allows a controller application program to condense a data stream by compressing repeated characters and compacting frequently occurring characters according to a user defined table. This can reduce the amount of data actually transmitted over a host link or stored in the controller.

Data Decompression/Decompaction - This function allows a controller application program to decompress and/or decompact a data stream which had previously been compressed and/or compacted by a host or a controller application program.

3632 Dynamic Selector Relocate - This facility provides a means of recovery when a write sector CRC check occurs. This facility, in most cases, replaces the off line manual procedure which requires a special test diskette to reassign failing sectors.

Additional Disk Heads (#1010, 1011): (1010 for mdl 1A ... 1011 for mdl 1B) Provides additional disk heads (8) for the disk file as specified by model type selected. **Maximum:** One. **Field Installation:** Not recommended.

Host Communications Features

For communication with the host processor, each 3632 must be equipped with EIA/CCITT Interface - Host (#3701) and one of the following SDLC features: #4502, #6301 or #6302.

EIA/CCITT Interface - Host (#3701): Provides the appropriate cables and interface logic necessary to attach an external modem for communications to the host processor through the 3704/3705, or Communications Adapter on the 4321 or 4331 Processor or for local attachment to the 3704/3705 or Communications Adapter on the 4331 without requiring modems. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** A Communications Feature (#4502, #6301 or #6302).

SDLC Communications Without Business Machine Clocking (#4502): Required for attachment to communication lines through an external modem which provides clocking at speeds up to 9600 bps. **Limitations:** Cannot be installed with #6301 or 6302. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** EIA/CCITT Interface - Host (#3701).

Host Communications With Business Machine Clocking (#6301): Required for attachment to communication lines through any external modem which does not provide clocking for speeds of 600, 1200 and 2400 bps, or for local attachment to the 3704/3705 -- see M3704/3705 pages, feature #4716. **Limitations:** Cannot be installed with #6302 or 4502. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** EIA/CCITT Interface - Host (#3701).

Host Communications Without Business Machine Clocking (#6302): Required for attachment to communication lines through an external modem which provides clocking at speeds up to 4800 bps. **Limitations:** Cannot be installed with #6301 or 4502. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** EIA/CCITT Interface - Host (#3701).

Terminal Attachment

The Data Link Adapter (#3211), Loop Adapter (#4780), and EIA/CCITT Interface (#3703) features enable the 3632 Controller to attach 3640 terminals. Data link terminal attachment capability is provided by

3632 Plant Communication Controller (cont'd)

selection of the EIA/CCITT Interface - Data Link (#3703) with the Data Link Adapter (#3211). Direct terminal attachment capability is provided by selection of the Loop Adapter (#4780) and the Data Link Adapter (#3211). A maximum of two directly attached loops and two data links for attachment of 3842s or 3843s loops may be installed.

The data links are used to provide point-to-point or multipoint facilities for the connection of the 3842 or 3843 Loop Control Units. The 3842 attaches at the remote ends of the data link where it establishes a remote loop. The 3872 modem connects the EIA/CCITT Interface - Data Link (#3703) and the data link at the controller. Other synchronous modems with clocking, transmitting at 2400, 4800, or 9600 bps, and the 3843 Loop Control Unit may replace the 3872 and 3842. The loop operates at the same speed as the data link.

Customer Responsibilities For Loops: The customer must plan, purchase, install, and maintain loops for terminal attachment. See *IBM 3630 Plant Communication System Description* for further information. See *IBM Multi-use Communications Loop Planning Guide* (GA23-0038) and *IBM Multi-use Communications Loop Installation Guide* (GA23-0039) for further planning and installation information on: loop components, loop cable, loop wiring configurations, Continuity and Relay Tester, and maintenance and test procedures. See "Accessories" for bulk cable and accessories. See GI section 71 for FE contracts available to assist the customer with installation.

Data Link Adapter (#3211): Provides the control logic to establish SDLC communications for terminal attachment. **Maximum:** Four. **Field Installation:** Yes. **Prerequisites:** Required once for each Loop Adapter (#4780) and once for each EIA/CCITT Interface - Data Link (#3703).

EIA/CCITT Interface - Data Link (#3703): Provides an EIA/CCITT interface for attachment of a 3872 Modem for the connection of the 3842. Other synchronous modems with clocking, transmitting at 2400, 4800, or 9600 bps, and the 3842 Loop Control Unit may replace the 3872 and 3842. **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** Data Link Adapter #3211.

Loop Adapter (#4780): Allows direct attachment of a loop with one or two lobes to the controller operating at a speed of 9600 bps. **Limitations:**The sum of the bps operating rates for all EIA/CCITT Interface (#3701 and #3703) and the Loop Adapters (#4780) can not exceed 28,800 bps. **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** Data Link Adapter #3211, and a wrap type Loop Station Connector in each connected lobe.

MODEL CONVERSIONS

Model 1A can be changed to Model 1B. **Limitations:** Field installation of the additional disk heads for Model 1B (#1011) concurrently with a model change from Model 1A to Model 1B requires the submission of an RPQ.

Model 1A to 1B requires replacement of the disk storage device. Adequate provision must be made for retaining data contained on the disk and for the removal of any proprietary data prior to the start of any conversion. All replaced parts become the property of IBM.

ACCESSORIES

Cables: Loop Cables may be purchased from IBM or a customer selected source. See *IBM Multi-use Communication Loop Planning and Installation Guide,* GA27-3341, for part numbers, specifications and usage which is necessary for preplanning and ordering.

Bulk Loop Cable Description	P/N
Indoor Cable: UL approved (style 2919) for interconnection of low voltage electronic equipment. Maximum allowable cable temperature range is -34°C to +80°C.	**1657265**
Indoor Cable: UL approved for cable tray installation (NEC Art. 725-40b3). Maximum allowable cable temperature range is -34°C to +90°C.	**7838694**
Indoor Cable: UL approved for duct and plenum installation (NEC Art. 725-2b). Maximum allowable cable temperature range is -34°C to +105°C.	**7838695**
Outdoor Cable: For above ground installation. Maximum allowable cable temperature range is -34°C to +80°C.	**1657267**
Outdoor Cable: For below ground installation. Maximum allowable cable temperature range is -34°C to +80°C.	**1657268**

Ordering Instructions: Interior cable (P/N 1657265, 7838694 and 7838695) should be ordered in lengths of 304.8m to 609.6m (1000 to 2000 feet). Additional lengths up to 609.6m (2000 ft.) can be ordered by specifying the length wanted. Indoor cable splices can be accomplished via P/N 1657300. A minimum order quantity is 304.8M (1000 ft).

Exterior cable (P/Ns 1657267 and 1657268) should be ordered in one continuous length, up to a maximum of 914.4m (3000 feet), by specifying the length wanted.) Outdoor splices with aerial and burial cable should be avoided.

Order from IBM. Specify cable part number and number of feet desired.

Warranty: Loop cable is warranted free from defects of workmanship and materials for 90 days.

Loop Accessories

A group of accessory products are offered to permit plant electricians or contract personnel to install the loops. Refer to *IBM Multi-use Communications Loop Planning and Installation Guide,* GA23-3341, for information necessary to plan the layout and for selection of the loop hardware, for Installation and Testing information.

Loop Splice Plate (LSP): The LSP splices together two segments of indoor cable or provides a connecting point for future expansion of the loop. The LSP consists of a single connector strip, to which the incoming loop cable and the outgoing loop cable can be attached; it is installed in a standard outlet box for business office environments, or weatherproof outlet box for industrial environments.

Loop Station Connector (LSC): The LSC is available as two unique types: Wrap and radial. The wrap LSC attaches an I/O unit or controller directly to the main loop cable; the radial LSC attaches an I/O unit only through an LWC to the loop. The wrap LSC attaches an incoming and outgoing loop cable; the radial LSC attaches at the end of one loop cable from the LWC.

The wrap LSC also offers the isolation feature of wrapping, which allows the customer to wrap the loop away from a loop wiring failure or to reconfigure the loop during alterations. Both wrap and radial LSCs contain bypass relays that bypass the I/O unit when the I/O unit is powered-off or disconnected. These accessories are installed in a standard or weatherproof outlet box.

2 X 4 Adapter Plate (2AP): The 2" X 4" Adapter Plate is used with the Loop Station Connector and accommodates the use of standard outlet boxes that have dimensions smaller than the outlet boxes defined in the Loop Installation and Planning Guide. It is not to be used with the environmental outlet boxes.

Loop Wiring Concentrator (LWC): The LWC provides the facility to attach a cluster of I/O units without a large number of drops on the loop cable. It attaches up to eight radial LSCs at the end of loop cables called *radials.* The point where a radial line terminates at the LWC is called an LWC *port.* Not all ports have to be used; unused ports can be reserved for future expansion.

The LWC has the same wrapping capability as the wrap LSC. In addition, the LWC allows the customer to bypass one or more of the radials by setting a corresponding switch located inside the LWC.

The LWC has its own enclosure or can be mounted in a NEMA-4X environmental equipment cabinet, with minimum measurement of 36x30x15cm (14x12x6 in.).

Loop Surge Suppressor (LSS): The LSS allows the loop to be run across an outdoor space to another building. It attaches two outdoor cables and two indoor cables, allowing the proper termination and grounding for each type of cable. In addition, the LSS contains four surge protectors, one for each twisted pair in the two outdoor cables, to protect from voltage surges caused by near strikes of lightning. There is no protection in the LSS from a direct lightning strike.

The LSS has its own enclosure or can be mounted in an electrical equipment cabinet, with minimum measurement of 36x30x15cm (14x12x6 in).

Continuity and Relay Tester: The Continuity and Relay Tester is used with a customer supplied volt-ohm meter, capable of reading 0.5 ohms and rated at least 5000 ohms/volt, to verify the loop installation, including loop cabling and accessories, after completion. By plugging the tester into any loop station connector and connecting the volt-ohm meter to the tester, the condition of the wire segment being tested can be determined as to conductor and shield continuity (opens or shorts), wrap switch operation, and total lobe resistance.

The loop station connector relays are also activated and their operation verified with this tester.

System Loop Accessories	P/N
Loop Splice Plate (LSP) (indoor)	1657300
Loop Station Connector (Radial LSC)	1657310
Loop Station Connector (Wrap LSC)	1657320
Loop Station Connector Gasket	1657260
Loop Wiring Concentrator (LWC)	1657330
LWC Circuit Board Assy (order instead of LWC-1657330) *	1657332
Loop Surge Suppressor (LSS)	1657350
LSS Circuit Board Assy (order instead of LSS-1657350) *	1657354
Continuity and Relay Tester	1657420

3632 Plant Communication Controller (cont'd)

Wrap Switch Access Cover	1657325
Loop Accessory Keys (10 spares) **	1657379
2 X 4 Adapter Plate (2AP)	7838771
Conventional Box (indoor) 5 x 10cm - (2 x 4 inches)	2102151
Clamp (for cable to indoor box)	2100264
Electrical Box (outdoor) 7 x 11.5cm - (2.75 x 4.5 inches) (For industrial use)	1657280
Clamp - small (for indoor cable to environmental box)	2114285
Clamp - large (for outdoor cable to environmental box)	1657377

* For use with NEMA-4X enclosure and associated parts (used when installing in harsh environments) or as a replacement part for the LWC or LSS.

** 1 package (10 keys) shipped with each 3631. 1 key shipped with each LWC and wrap LSC.

Ordering Instructions: Order from IBM. When ordering, use Machine type 3631. Allow lead time of 120 days.

Warranty: All loop accessories are warranted free from defects of workmanship and materials for 90 days.

Customer Responsibilities: The customer is responsible to provide (purchase, install, test, and maintain) the loop cables and accessories for terminal attachments. However, see GI section 71 for FE contracts available to assist the customer with installation.

The customer is also responsible for procuring and stocking spare cable and spare parts for loop accessories. See *IBM Multi-use Communications Loop Planning and Installation Guide,* (GA27-3341) for a suggested schedule to allow the customer to plan, install, and test the loop cable and accessories prior to delivery of the system.

It is recommended that the customer order additional loop components for spares with the initial order, as spares will not be stocked in the Branch Office.

To enable a customer to test his installed loops it is recommended that the customer order a Continuity and Relay Tester. Testing the loop wiring will require the tester or its equivalent.

SUPPLIES

The customer-owned diskettes may be ordered from IBM for initial and replacement quantities.

Mdl 1A:	IBM Diskette 1, P/N 2305845
Mdl 1B:	IBM Diskette 1, P/N 2305845
	IBM Diskette 2, P/N 2736700 or

For further information consult IBM. None required with machine order.

3641 REPORTING TERMINAL

PURPOSE

The 3641 Reporting Terminal models 1 and 2 are interactive workstations with a wide range of options to meet individual customer requirements for data entry and response.

MODELS

Model 1 001 — Has a 22-character alphameric display. Either a 35-key numeric keyboard or 70-key alphameric keyboard feature must be specified. Optional features include a Magnetic Reader Attachment and a Digital Input/Digital Output with 32 input and 8 output points.

Model 2 002 — Has a 22-character alphameric display. Either a 35-key numeric keyboard or 70-key alphameric keyboard feature must be specified. Optional features include a Magnetic Reader Attachment, a Numeric Punched Hole Badge Reader, an 80-Column Punched Card Reader, and Digital Input/Digital Output with 32 input and 8 output points.

Prerequisites:

1. Either the 35-key numeric keyboard **(#4652)** or the 70-key alphameric keyboard **(#4653)** must be specified on both the 3641 mdls 1 and 2.
2. A Loop Station Connector on a 3631/3632 or 3842/3843 loop, 4331 Loop Adapter or 8100 system loop.
3. The Punched Card/Punched Badge Adapter feature **(#5781)** must be specified if either Numeric Punched Hole Badge Reader **(#5801)** or 80-Column Punched Card Reader **(#5802)** is specified. [Mdl 2 only]
4. Magnetic Reader Attachment **(#4910)** must be specified if either the Magnetic Hand Scanner, Magnetic Slot Reader or Dual Entry Magnetic Slot Reader is ordered.

Note: When ordering this machine for attachment to an 8100 system, "Terminal Requirements" under the appropriate M8130, 8140 or 8101 pages should be reviewed. When ordering this machine for attachment to a 4331 system the appropriate M4331 pages should be reviewed.

Customer Setup (CSU): Machine only.

HIGHLIGHTS

The 3641 is an interactive workstation terminal that is designed to be used on a table, counter, work bench or mounted via an accessory bracket on a wall or column. Its capability includes:

- An easy-to-read display for input verification of keyed data and alphameric operator messages of up to 22 characters.
- Display of alphameric and special characters.
- Function keys for user-defined transactions.
- Special features for fixed data input include: A 10-column numeric punched hole badge reader, an 80-column card reader, and a magnetic reader adapter.
- A Digital Input/Digital Output feature for the exchange of data between the 3641 and customer devices.
- A removable keyboard overlay and function key mask which can be customized by the customer.

Customer Setup: The 3641 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

Customer Responsibilities:

The customer is responsible for:

- Unpacking, placement, setup and checkout of the 3641 at time of delivery or when relocating the 3641.
- Removing and packing of the 3641 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3641 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network. See loop cable and loop accessories in "Accessories".

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: Maintenance of the 3641 terminals will normally be performed at the installed location.

There is no regularly scheduled IBM preventive maintenance. If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Physical Environments: The 3641 mdls 1 and 2 and accessories may be used in the industrialized work zones of a wide range of business, industrial and commercial establishments.

They can resist:

- Concentrations of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with the shipping, operation, and relocation of the terminal for most types of industries.

For environmental specifications refer to the *IBM 3630 Plant Communication System, Installation Manual - Physical Planning,* GA24-3675.

IBM 4331/3640 Information Handbook
IBM 3641 Reporting Terminal Operating Guide, GA24-3679

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (120V AC, 1-phase, 60 Hz): **#9890** for locking plug, or **#9891** for non-locking plug.

  Note: 120V AC is compatible with existing 115V AC systems.

- Power Cable:
  1.8 meter (6 foot) cable - **#9986**
  4.3 meter (14 foot) cable - **#9987**
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct attached or data link attached loop. Specify **#9976** for a 1.8 meter (6 foot) cable or **#9977** for a 4.3 meter (14 foot) cable.
- Color: Classic blue - **#9063** ... charcoal brown - **#9064** ... pebble gray - **#9065.**

MODEL CONVERSIONS

Available at time of manufacture only.

SPECIAL FEATURES

Digital Input/Digital Output (#3251): Provides 32 bits of TTL compatible digital input and 8 bits of TTL compatible digital output on the 3641 mdl 1 and 2. **Maximum:** One. **Field Installation:** Yes.

35-Key Numeric Keyboard (#4652): Provides 15 customer-defined function keys, 5 control keys, 10 numeric keys and 5 special character keys. **Limitations:** Cannot be installed with #4653. **Maximum:** One. **Field Installation:** No.

70-Key Alphameric Keyboard (#4653): Provides 20 customer-defined function keys, 5 control keys, 10 numeric keys, A-Z, and 9 special character keys. **Limitations:** Cannot be installed with **#4652.** **Maximum:** One. **Field Installation:** No.

Magnetic Reader Attachment (#4910): Used to attach a Magnetic Hand Scanner, Magnetic Slot Reader or Dual Entry Magnetic Slot Reader on the 3641 mdl 1 and 2. The two magnetic readers are plug compatible. **Limitations:** Cannot be installed with both **#5801** and **#5802** on mdl 2. **Maximum:** One. **Field Installation:** Yes.

Punched Card/Punched Badge Adapter (#5781): [Mdl 2] Required if either Numeric Punched Hole Badge Reader **(#5801)** or 80-Column Punched Card Reader (#5802) is specified. **Maximum:** One. **Field Installation:** No.

Numeric Punched Hole Badge Reader (#5801): [Mdl 2] Provides a badge reader which can read up to 10 digits of numeric information. **Limitations:** Cannot be installed with both **#4910** and **#5802.** **Maximum:** One. **Field Installation:** No. **Prerequisites: #5781.**

80-Column Punched Card Reader (#5802): [Mdl 2] Allows the reading of 80-column tab cards. **Limitations:** Cannot be installed with both **#4910** and **#5801.** **Maximum:** One. **Field Installation:** No. **Prerequisites: #5781.**

3641 Reporting Terminal (cont'd)

ACCESSORIES

MAGNETIC HAND SCANNER

The Magnetic Hand Scanner (MHS) attaches by a 1.5m coiled cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. It allows the user to read magnetic stripe labels that are attached to shelves, cartons, machines, etc. It can also be used to read magnetic stripe tags which are hand-held or placed on a flat surface. See appropriate unit for prerequisites and possible limitations.

The MHS has three lights and an audible buzzer which provide feedback to the user on the status of the scanned data. With proper encoding the MHS can read a stripe in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the Magnetic Hand Scanner.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Scanners will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare scanners which the customer may want to consider stocking:

Number of Scanners	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Scanner Accessories are warranted free from defects in workmanship and materials for 90 days.

Warranty service will be performed at the FE Repair Center. The customer will fill out a Repair Center Machine Repair *Authorization Form*, GZ27-2981, pack, and mail it and the defective Magnetic Hand Scanner to:

IBM Corporation
Repair Center
321 Route 17
Paramus, NJ 07652

There is no regularly scheduled preventive maintenance recommended by IBM. Primary maintenance will be done by the customer, following the problem determination and parts replacement procedures.

Optionally, the customer can obtain post warranty maintenance on a time and material basis at the IBM Repair Center, Paramus, NJ.

Magnetic Hand Scanner: P/N 4123495 .

MAGNETIC SLOT READER
MAGNETIC SLOT READER, DUAL ENTRY

The Magnetic Slot Reader (MSR) and Dual Entry Magnetic Slot Reader (DEMSR) attach by a 1.5m cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. These slot readers accommodate a wide range (height and length) of magnetic striped card stock and plastic badges including: Magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc.

The MSR and DEMSR have three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. The MSR has a wide opening on one end to facilitate reading of badges or documents. The DEMSR has wide openings on both ends to facilitate reading in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the MSR or DEMSR.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking:

Number of Readers	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days. Warranty service will be performed at the FE Repair Center. The customer will fill out a *Repair Center Machine Repair Authorization Form*, (GZ27-2981), pack, and mail it and the defective Magnetic Hand Scanner to:

IBM Corporation
Repair Center
321 Route 17
Paramus, NJ 07652

There is no regularly scheduled preventive maintenance recommended by IBM. Primary maintenance will be done by the customer, following the problem determination and parts replacement procedures.

Optionally, the customer can obtain post warranty maintenance on a time and material basis at the IBM Repair Center, Paramus, NJ.

MAGNETIC READER/SCANNER EXTENSION CABLES

These cable assemblies can be used to extend the Magnetic Hand Scanner **P/N 4123495** or Magnetic Slot Reader **P/N 4123500** distances. Additional Extension Cable lengths other than those listed below are available.

MHS/MSR Extension Cables are warranted free from defects of workmanship or materials for 90 days. **Limitations:** Extension cables cannot be plugged into other extension cables.

Ordering Instructions: See IBM.

Cable 6 meters (19.7 feet): P/N 4832986, .

Cable 12 meters (39.4 feet): P/N 4832987

MAGNETIC READER/SCANNER REPLACEMENT ASSEMBLIES

Description	P/N
MHS Sensor Head Assembly	**4832721**
MHS Handle and Feedback Assembly	**4832701**
MHS Amplifier Card and Cable Assembly	**4832727**
DEMSR/MSR Arm and Sensor Head Assembly	**4832963**
DEMSR/MSR Base and Feedback Assembly	**4832973**
DEMSR/MSR Amplifier Card and Cable Assembly	**4832962**
MSR Cover	**4832964**
DEMSR Cover	**4123486**

The following tables list the number of Magnetic Reader/Scanner replacement assemblies which the customer may want to consider stocking.

Magnetic Hand Scanner

Number of MHSs # 4123495	Sensor Head Assemblies # 4832721	Handle and Feedback Assembly # 4832701	Amplifier Card and Cord Assembly # 4832727
50	2	1	2
100	3	1	3
150	4	1	4
200	5	2	5

Magnetic Slot Reader

3641 Reporting Terminal (cont'd)

Ordering Instructions: See IBM.

Warranty: Magnetic scanner replacement assemblies are warranted free from defects of workmanship or materials for 90 days.

WALL MOUNTING BRACKETS

A two piece mounting bracket is available to mount the 3641 Reporting Terminal to a wall, column, or other vertical surface.

One piece mounts on the 3641 and the other mounts on the vertical surface. There are four bracket holes on the back of the 3641 and four mounting screws supplied with the brackets. The customer is responsible for supplying the fasteners for the wall bracket.

Ordering Instructions: See IBM.

Warranty: Wall mounting brackets are warranted free from defects of workmanship and materials for 90 days.

Wall Mounting Brackets: P/N 4151768 or feature code **#9450.**

SUPPLIES (None)

None required with machine order. Supplies may be ordered through-IBM.

3642 ENCODER PRINTER

PURPOSE

A workstation printer and magnetic stripe encoder which produces turn around documents. The magnetic stripe on the documents encoded by the 3642 can be read by the Magnetic Hand Scanner and the Magnetic Slot Reader.

MODELS

Model 1	001	Has ten print lines and allows hand feed operation.
Model 2	002	Has ten print lines and allows the automatic feeding of continuous forms as well as hand feed operation.

Prerequisites: A Loop Station Connector installed on an IBM Multiuse Communications Loop. See *Loop Accessories - 3630, 8100 Systems* in the M10000 pages.

Note: When ordering this machine for attachment to an 8100 system, the appropriate M8130, 8140 or 8101 pages titled "Terminal Requirements" should be reviewed. When ordering this machine for attachment to a 4331 system the appropriate M4331 pages should be reviewed.

Customer Setup: Machine only.

HIGHLIGHTS

The 3642 is designed to produce magnetic stripe documents at a workstation. Its capability includes:

- Prints and encodes magnetic striped cards and labels.
- Prints 10 lines of up to 70 alphameric characters each.
- Encodes alphameric data.
- Hand feed or automatic feed documents.
- Large printed-character option.

Automatic Feeding And Bursting: The mdl 2 Automatic Feed and Burst capability permits unattended operation. It provides a forms burster and a hopper which holds up to 400 continuous forms. A forms stacker which holds up to 400 cut forms is standard on both mdls. All continuous forms on the mdl 2 are automatically burst prior to encoding and printing.

The Automatic Feed and Burst capability is designed to burst 99 pound card stock and adhesive backed labels. It is not designed to burst 150-pound tag stock.

Document Speed: The document speed of the 3642 depends on the data printed and the forms size and will have to be evaluated for each application. The machine speed for a typical document is eight documents per minute.

Document Description: The 3642 contains a printer and magnetic stripe encoder that can print and encode on the following documents.

Document Sizes: Height: 8.26cm (3.25 in.) ... Length, Min: 12.7cm (5.00 in.) ... Length, Max: 18.733cm (7.375 in.).

Document Types: 99 pound Card Stock ... 150 pound White Tag Stock ... Pressure Sensitive Labels.

Document Thickness: Min.: 0.018cm (0.007 in.) ... Max.: 0.030cm (0.011 in.).

See *Forms Design Reference Guide,* GA24-3488, for more details on the 3642 Encoder Printer forms.

Character Sets: The 48 printed character set consists of 0-9, A-Z, and special characters period (.), single quote ('), plus (+), ampersand (&), dollar sign ($), asterisk (*), hyphen or minus (-), slash (/), comma (,), percent (%), at sign (@), and number sign (#).

A special (Large Character) 48-character set available at time of manufacture provides 0-9, A-Z, slash (/), minus (-), and decimal (.), and 9 special characters for creating large printed characters. See *3630 Plant Communications System Description* for details.

The large character set has two options:

- Large-character printing on the first 4 lines only - normal character printing on the last 6 lines.
- Large-character printing on all 10 lines.

The 63-character magnetically encoded character set consists of 0-9, A-Z, and 27 special characters.

Customer Setup: The 3642 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility. For additional information on CSU refer to the General Information section.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup and checkout of the 3642 at time of delivery or when relocating the 3642.
- Removing and packing of the 3642 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3642 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network (see M10000).

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: The standard maintenance agreement as described in the General Information section applies to the 3642 terminals.

Maintenance of the 3642 terminals will normally be performed at the installed location. See "Use of IBM Equipment in Industrial Environments" in GI section.

There is no regularly scheduled IBM preventive maintenance.

If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Physical Environments: The 3642 mdls 1 and 2 may be used in the industrialized work zones of a wide range of business, industrial and commercial establishments.

They can resist:

- Concentrations of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with the shipping, operation, and relocation of the terminal for most types of industries.

For environmental specifications refer to the *IBM 3630 Plant Communication System, Installation Manual - Physical Planning,* GA24-3675.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (120V AC, 1-phase, 60 Hz): **#9890** for locking plug, or **#9891** for non-locking plug.

  Note: 120V AC is compatible with existing 115V AC systems.

- Power Cable:
  1.83 meter (6 foot) cable - **#9986**
  4.3 meter (14 foot) cable - **#9987**
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct attached or data link attached loop. Specify **#9976** for a 1.8 meter (6 foot) cable or **#9977** for a 4.3 meter (14 foot) cable.
- Color: Classic blue - **#9063** ... charcoal brown - **#9064** ... pebble gray - **#9065.**
- Character Set Groups:

  #2956 - For standard size character set
  #9402 - Large-Char. lines 1-10
  #9401 - Large-Character lines 1-4

SPECIAL FEATURES (None)

3642 Encoder Printer (cont'd)

TERMS and CONDITIONS

Plan Offering: Plan B
Purchase Option: 55%
Non-field Installable Feat/Mdl Conversions: Yes
Machine Group:
Warranty: B
Per Call: 1
Termination Charge Percent: 20%
Termination Plan Months: 6
Upper Limit Percent: 5%
Base Term: 60 mos
Deferred Central Facilities Maintenance: Yes*

* Deferred Central Facility Maintenance (DCFM) Service. Minimum number of machnines - 4. Any combination of 3641s, 3642s,3643s, 3644s,3645s,3646s and 3647s may be intermixed to satisfy the minimum required for service. For each 3642 mdl 1 under DCFM amendment, MMC or MLC will be reduced $5.00 ... for each 3642 mdl 2, $6.00.

MODEL CONVERSIONS

Available at time of manufacture only.

ACCESSORIES

None required with machine order.

SUPPLIES

None required with machine order. Supplies may be ordered through your IBM SSD Sales Representative for initial and replacement quantities.

3643 KEYBOARD DISPLAY

PURPOSE

A combination keyboard and gas panel display terminal for input and output in interactive 3630 Plant Communication System applications and when attached to a 4331 processor or an 8100 system.

MODELS

Model 2	002	Displays 240 characters -- six rows of 40 characters. Keyboard consists of alphameric, control, and function keys.
Model 3	003	Displays 480 characters -- twelve rows of 40 characters. Keyboard consists of alphameric, control, and function keys.
Model 4	004	Displays 1024 characters -- sixteen rows of 64 characters. Keyboard consists of alphameric, control, and function keys.

Prerequisites:

1. Either the Alphameric Keyboard **(#4772)** or the Expanded Alphameric Keyboard **(#4774)** must be selected to complete the orde, see "Special Features".
2. A Loop Station Connector installed on an IBM Multiuse Communications Loop, see "Accessories".
3. Magnetic Reader Attachment **(#4910)** must be specified if either the Magnetic Hand Scanner, Magnetic Slot Reader or Dual Entry Magnetic Slot Reader is to be attached.

   When ordering this machine for attachment to an 8100 system, section "Terminal Requirements" in the appropriate M8130, 8140 or 8101 pages should be reviewed. When ordering this machine for attachment to a 4331 system the appropriate M4331 pages should be reviewed.

Customer Setup (CSU): Machine only.

HIGHLIGHTS

- Gas panel display with buffer.
- Keyboard options to meet input requirements.
- Operates with manufacturing application programs.
- Accesses control functions.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup and checkout of the 3643 at time of delivery or when relocating the 3643.
- Removing and packing of the 3643 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3643 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network, see "Accessories".

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: Maintenance of the 3643 terminals will normally be performed at the installed location.

There is no regularly scheduled IBM preventive maintenance.

If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Physical Environments: The 3643 mdls 2, 3 and 4 may be used in industrialized work zones of a wide range of business, industrial and commercial establishments.

They can resist:

- Concentrations of certain common, corrosive gases.
- Concentrations of dust, grit and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with shipping, placement, operation and relocation of the terminal for most types of industries.

For environmental specifications refer to the *IBM 3630 Plant Communication System, Installation Manual - Physical Planning,* GA24-3675.

Guide to the IBM 4331 Processor, GC20-1878
IBM 4331/3640 Information Handbook
IBM 3643 Keyboard Display Operating Guide, GA24-3681.

Customer Setup: The 3643 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (120V AC, 1-phase, 60 Hz): **#9890** for locking plug, or **#9891** for non-locking plug.

  Note: 120V AC is compatible with existing 115V AC systems.

- Power Cable:
  1.8 meter (6 foot) cable - **#9986**
  4.3 meter (14 foot) cable - **#9987**
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct attached or data link attached loop. Specify **#9976** for a 1.8 meter (6 foot) cable or **#9977** for a 4.3 meter (14 foot) cable.
- Color: Classic blue - **#9063** ... charcoal brown - **#9064** ... pebble gray - **#9065**.

SPECIAL FEATURES

Keyboards -- All keyboards will have a combination of preengraved and non-engraved keytops. For the non-engraved function keys; each 3643 will be provided with 3 sets of self-adhesive keytop labels. One set will be preprinted with commonly-used function nomenclature and will have a protective plastic coating applied. Also, a set of blank labels will be provided so that the user may create his own labels. A clear plastic overlay set will provide a protective cover for the blank label set.

Alphameric Keyboard (#4772): A 54 key-character alphameric section pre-engraved as a typewriter keyboard to the left of a function/transaction keypad. The function/transaction keypad consists of 12 engraved and 8 non-engraved keys. **Limitations:** Cannot be installed with Expanded Numeric Keyboard **(#4774). Maximum:** One on mdl 2, 3 or 4. **Field Installation:** No.

Expanded Alphameric Keyboard (#4774): Same as #4772; except that function/transaction keypad has 20 additional non-engraved keys. **Limitations:** Cannot be installed with keyboard **(#4772). Maximum:** One on mdl 2, 3 or 4. **Field Installation:** No.

Magnetic Attachment (#4910): Permits attachment of Magnetic Hand Scanner or Magnetic Slot Reader. The Magnetic Hand Scanner, Magnetic Slot Reader and Dual Entry Magnetic Slot Reader are plug compatible. **Limitations:** Cannot be installed with Magnetic Badge and Document Encoder **(#4920). Maximum:** One. **Field Installation:** Yes.

Magnetic Badge And Document Encoder (#4920): Provides a magnetic slot reader/encoder unit that records aiphameric data on magnetic striped badges and documents. Also has the capability to read data from magnetic striped media. **Limitations:** Cannot be installed with Magnetic Attachment **(#4910). Maximum:** One on Mdl 2, 3 or 4. **Field Installation:** Yes, on machines shipped after July 1981

MODEL CONVERSIONS

Available at time of manufacture only.

ACCESSORIES

MAGNETIC HAND SCANNER

The Magnetic Hand Scanner (MHS) attaches by a 1.5m coiled cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. It allows the user to read magnetic stripe labels that are attached to shelves, cartons, machines, etc. It can also be used to read magnetic stripe tags which are hand-held or placed on a flat surface. See appropriate unit for prerequisites and possible limitations.

The MHS has three lights and an audible buzzer which provide feedback to the user on the status of the scanned data. With proper encoding the MHS can read a stripe in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the Magnetic Hand Scanner.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the

3643 Keyboard Display (cont'd)

media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Scanners will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare scanners which the customer may want to consider stocking:

Number of Scanners	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Scanner Accessories are warranted free from defects in workmanship and materials for 90 days.

Warranty service will be performed at the FE Repair Center. The customer will fill out a Repair Center Machine Repair *Authorization Form,* GZ27-2981, pack, and mail it and the defective Magnetic Hand Scanner to:

IBM Corporation
Repair Center
321 Route 17
Paramus, NJ 07652

There is no regularly scheduled preventive maintenance recommended by IBM. Primary maintenance will be done by the customer, following the problem determination and parts replacement procedures.

Optionally, the customer can obtain post warranty maintenance on a time and material basis at the IBM Repair Center, Paramus, NJ.

Magnetic Hand Scanner: P/N 4123495 .

MAGNETIC SLOT READER
MAGNETIC SLOT READER, DUAL ENTRY

The Magnetic Slot Reader (MSR) and Dual Entry Magnetic Slot Reader (DEMSR) attach by a 1.5m cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. These slot readers accommodate a wide range (height and length) of magnetic striped card stock and plastic badges including: Magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc.

The MSR and DEMSR have three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. The MSR has a wide opening on one end to facilitate reading of badges or documents. The DEMSR has wide openings on both ends to facilitate reading in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the MSR or DEMSR.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking:

Number of Readers	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days. Warranty service will be performed at the FE Repair Center. The customer will fill out a *Repair Center Machine Repair Authorization Form,* (GZ27-2981), pack, and mail it and the defective Magnetic Hand Scanner to:

IBM Corporation
Repair Center
321 Route 17
Paramus, NJ 07652

There is no regularly scheduled preventive maintenance recommended by IBM. Primary maintenance will be done by the customer, following the problem determination and parts replacement procedures.

Warranty: Magnetic scanner replacement assemblies are warranted free from defects of workmanship or materials for 90 days.

SUPPLIES None

3644 AUTOMATIC DATA UNIT

PURPOSE

The 3644 Automatic Data Unit attaches to the 3631 or 3632 controller, an 4331 MDL Group 1 or 2 or an 8100 system via their loop features to provide system connection to a variety of distributed sensors, actuators, and production and laboratory equipment.

MODELS

Model 1 001

Limitations: The analog input function requires multiple Sensor I/O cards. If analog input or current loop is installed, some card-socket usage restrictions exist. The Analog Amplifier card should be installed only in 3644s containing the necessary prerequisite EC. Analog input and RS-232-C/CCITT V.24 Communications cannot both be installed in the same 3644. The Communications Adapter Card is not supported by the 3630 host services 3644 translation services program. See M10000 pages for details.

Prerequisites:

1. When the 3644 is installed on the 8100 system via the IBM Multiuse Communications Loop, the 8100 system will generate the parameter tables.

   Note: When ordering this machine for attachment to an 8100 system, the appropriate 8101, 8130 or 8140 pages titled "Terminal Requirements" should be reviewed. When ordering this machine for attachment to a 4331 system the appropriate M4331 pages should be reviewed.

2. A Loop Station Connector installed on an IBM Multiuse Communications Loop. See "Loop Accessories" in the 3630 or 8100 machine pages.
3. When the 3644 is installed on the 4331 Loop Adapter the 4331 processor will generate the parameter tables.

Customer Setup: Machine only.

HIGHLIGHTS

Provides:

- Power and housing for Sensor I/O cards
- Distributed attachment of user equipment
- Analog and digital attachments
- Bit serial asynchronous current loop and RS-232-C/CCITT V.24/V.28
- User-defined scan controls, data transmission and logic processing.

Customer Setup: The 3644 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup and checkout of the 3644 at time of delivery or when relocating the 3644; this includes the Sensor I/O cards.
- Removing and packing of the 3644 at time of discontinuance.
- Using and following the problem determination procedures of the 3644 and filling out the trouble report prior to calling for service.
- Executing the problem determination procedures for the Sensor I/O cards, determining the failing card, and mailing it to the honoring IBM location.
- Maintenance of the process sensors, actuators, and wiring.
- Determining requirements for and stocking spare Sensor I/O cards.
- Creating the parameter tables that direct the operation of the 3644.
- Installation and physical planning for the 3644. IBM assistance in determining the suitability of the industrial environment for the 3644 installation is available.
- Relocation of the 3644 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network.

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, or sensor I/O cards are at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: Maintenance of the 3644 terminals will normally be performed at the installed location. There is no regularly scheduled IBM preventive maintenance.

Warranty service of the Sensor I/O cards will be performed at the honoring IBM location.

If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Physical Environments:

The 3644 mdl 1 and its Sensor I/O cards may be used in the industrialized work zones of a wide range of business, industrial and commercial establishments.

They can resist:

- Concentrations of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with the shipping, operation, and relocation of the terminal for most types of industries.

For environmental specifications refer to the and *IBM 3630 Plant Communication System, Installation Manual - Physical Planning,* GA24-3675.

SPECIFY

Unless otherwise indicated, these specify features are only available at of manufacture.

- Voltage (120V AC, 1-phase, 60 Hz): **#9890** for locking plug, or **#9891** for non-locking plug.

  Note: 120V AC is compatible with existing 115V AC systems.

- Power Plug: If **#2802**, **#2804**, or **#2730** voltage is specified, then **#2714** (non-locking plug) or **#2715** (locking plug) must be specified.
- Power Cable:
  1.8 meter (6 foot) cable - **#9986**
  4.3 meter (14 foot) cable - **#9987**
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct attached or data link attached loop. Specify **#9976** for a 1.8 meter (6 foot) cable or **#9977** for a 4.3 meter (14 foot) cable.
- Color: Classic blue - **#9063** ... charcoal brown - **#9064** ... pebble gray - **#9065**.
- Distribution of 3644 Microcode: The 3644 microcode is required at each S/370, 4331 or 8100 system location. The address for the initial shipment must be supplied as shown below.

The following four steps are to be taken when ordering 3644 microcode:

1) To identify what the 3644 is attached to specify:
   #9415 - when attached to 8100
   #9416 - when attached to 3631, 3632
   #9417 - when attached to 4331 Loop Adapter
2) To specify the desired media when attached to a 3631, 3632, or 4331 Loop Adapter specify:

   #9412 - 9/800 magnetic tape
   #9413 - 9/1600 magnetic tape
   #9414 - 9/6250 magnetic tape
3) To indicate the presence of the MIO feature (#4905) when attached to a 3631, 3632, or 4331 loop adapter, specify:

   #9491 - for initial 3644 on the system without MIO feature
   #9492 - for initial 3644 on the system with MIO feature (#4905).
   #9493 - for any additional 3644s on the system.
4) For 3644's attached to an 8100 specify:

   #9493 - for any additional 3644s.
   #9494 - for the first 3644

   Shipping address for 3644 microcode must be supplied exactly as follows:

3644 Automatic Data Unit (cont'd)

1. When the host is not an 8100 system, send to the host (for example, S/370) location:

   Line 1 - IBM Programming Support Representative
   Line 2 - c/o (Customer Name)
   Line 3 - Street Address (or P.O. Box)
   Line 4 - City, State, Zip
   Line 5 - Attention: Data Processing Manager

2. When the host is an 8100 system, send to the 8100 location:

   Line 1 - Customer Name
   Line 2 - Street Address (or P.O. Box)
   Line 3 - City, State, Zip
   Line 4 - Attention: Data Processing Manager

The above address is where the 3644 initial microcode will be sent automatically. All microcode ECs will be sent to the TPC# (Teleprocessing Control Number) address. The TPC# address is controlled and supplied by the FE Branch Office.

SPECIAL FEATURES

Manual I/O (#4905): Provides a 22-character display and a 35-key numeric/function keypad. Allows inquiry into customer data and status contained in 3644 storage when online to the 3630, 4331 or 8100 system. When offline, additionally allows modification of customer data locations to effect operator control of 3644 operation. **Maximum:** One. **Field Installation:** Not recommended.

MODEL CONVERSIONS (None)

ACCESSORIES

SENSOR I/O CARDS

16-Point Non-Isolated DI: Provides 16 non-isolated input points for connection to user voltage or contact sense signals. Each point provides a high level and a low level sense capability. Input parameters are:

Contact Sense	Low Level	High Level
Logical 1	≤ 2K Ohms	≤ 5K Ohms
Logical 0	≥ 50K Ohms	≥ 100K Ohms

Voltage Sense	Low Level	High Level
Logical 1	- 24.0 to + 1.0V DC	0 to + 9.0V DC
Logical 0	+ 2.5 to + 24.0V DC	+ 22.5 to + 52.8V DC

16-Point Isolated DI: Provides 16 points of optically isolated digital input for connection to user signals. 250V DC isolation is provided between user signals and the 3644. Each point provides a high level and a low level voltage - sense capability. Input parameters are:

	Low Level	High Level
Logical 1	+ 2.0 to +12.0V DC	+12.0 to +52.8V DC
Logical 0	- 12.0 to + 0.8V DC	- 52.8 to + 0.8V DC

16-Point Non-Isolated DO: Provides 16 NPN transistor switches in a grounded emitter configuration for switching user-provided DC power to user-provided devices. Each switch is capable of sinking .250 amps from a 52.8 volt source through a resistive load. A logical 1 written into the control register will cause the transistor to turn on. Maximum voltage drop in the on state is 0.4 volts at load currents up to 20 milliamperes and 0.6 volts at load currents up to .250 amps. If no user voltage source is attached, the card will supply an off state voltage of 5.5 volts maximum at 0 amps, and 2.4 volts minimum at .001 amps.

16-Point Isolated DO: Provides 16 NPN transistor switches in an open collector, open emitter configuration for switching user-provided DC power to user-provided devices. 250V DC or peak AC isolation is provided between each switch and the 3644. Each transistor switch is capable of switching up to .250 amp from a 52.8 volt source to a resistive load. A logical 1 written into the control register will cause the switch to turn on. Maximum voltage drop in the on state is 0.4 volts at load currents up to 20 milliamps and 0.6 volts at load currents up to 250 milliamps. Consult *3644 Component Description Manual* for limitations on the number of Isolated DO cards per 3644.

Analog/Digital Converter: Provides an 11-bit plus sign (12 bit total), 5 volt bi-polar successive approximation analog to digital converter with a zero correction logic section that reduces errors caused by component aging and temperature induced offset drift. Note that the ADC must be used in conjunction with at least one multiplexer card to provide for connection of signal wires. Additional multiplexer cards may be installed to provide a greater multiplexing capability. The ADC card must be installed in the 3644 card socket 1 if it is used. Analog Input Subsystems cannot be installed if Communication Adapter Card(s) are installed.

Analog 7 Range Amplifier: Provides a 7 range programmable gain instrumentation amplifier for low level analog input signals. Gains of 1, 10, 25, 50, 100, 250 or 500 may be selected for each analog input point. This extends the range of the ADC to ±10mv, ±20mv, ±50mv, ±100mv, ±200mv, ±500mv or ±5v full scale. The Analog Amplifier also converts the 16-point Solid State Multiplexer card from single ended to differential operation. The Analog Amplifier must be installed in Socket 2 if it is used.

The Analog Amplifer should be installed only in 3644's having the prerequisite noise reduction EC's. These EC's are factory installed in 3644's starting at Serial 0010077. Earlier 3644's may be upgraded with field installable EC 755840.

Note: A calibration tool to aid in ADC and Analog Amplifier calibration is available as RPQ S00399.

8-Point Reed Relay Multiplexer: Provides eight 3-wire connections for shielded differential analog input signals. Provides eight-way multiplexing for the ADC. Flying capacitor switching is used to provide + or - 200 volt common mode tolerance and reduce the influence of common mode voltage to unmeasurable levels at reference conditions. The reed relay multiplexer can switch signal voltages ranging from -0.5 to +5 volts. Multiplexer cards must be installed in contiguous socket locations, starting with socket 2 if no Analog Amplifier is installed, or with socket 3 if an Analog amplifier is installed. Reed Relay and Solid State Multiplexers may be intermixed.

16-Point Solid State Multiplexer: Provides sixteen 3-wire connections for shielded analog input signals. Provides 16-way multiplexing for the ADC. Solid state FET switches can handle signals ranging from -5 to +5 volts. If used without the Analog Amplifier, single ended operation is provided with the analog signals referenced to 3644 ground. If used with the Analog Amplifier, differential input operation is provided with a common mode tolerance of ±10 volts. Multiplexer cards must be installed in contiguous socket locations, starting with socket 2 if no Analog Amplifier is installed, or with socket 3 if an Analog Amplifier is used. Reed Relay and Solid State Multiplexers may be intermixed.

Current Loop Receiver/Transmitter: Provides two transmitters and two receivers for modulating and demodulating a 20 milliamp current flow. Switches are provided on the card to select speed (110, 150, 300, 600, 1200 baud), number of data bits (5, 6, 7, 8), parity (odd, even, none), and number of stop bits (1, 2). A variety of start/stop codes over a wide range of speeds is available to allow connection to bit-serial devices. Consult the *3644 Component Description Manual* for limitations on the number of Current loop cards per 3644.

Communications Adapter: Provides two bidirectional asnychronous RS-232-C/CCITT V.24/V.28 compatible attachment points for RS-232/CCITT V.24/V.28 compatible terminal equipment. Switches are provided on the card to select speed (110/134.5, 150, 300, 600, 1200 Baud), number of data bits (5, 6, 7, 8) parity (odd, even, none), and number of stop bits (1, 1.5, 2). 3644 support is provided for simplex, half duplex, and duplex channel configurations. The Communications Adapter Card cannot be installed in 3644's using the Analog Input Subsystem. The Communications Adapter Card is not supported by the 3630 Host Services 3644 Translation Services program.

FEATURE SUMMARY

Description	P/N
16-Point Non-Isolated DI Card	4152582
16-Point Isolated DI	4152581
16-Point Non-Isolated DO	4152583
16-Point Isolated DO	8333198
Analog/Digital Converter(ADC)	4152586
Analog 7 Range Amplifier	4152587
8-Point Reed Relay Multiplexer	4152584
16-Point Solid State Multiplexer	4152585
Current Loop Receiver/Transmitter	4152580
Communications Adapter	5680857

Ordering Instructions: For ordering for delivery with machine, see appropriate "Machines" pages.

Warranty: Each 3644 Sensor I/O card is warranted to be free from defects in materials and workmanship for a period of 90 days, starting either on date of shipment or on date of installation or 30 days after installation, whichever comes first. IBM at its option will repair or replace the defective accessory. Warranty service will be performed at the FE Repair Center. The customer is responsible for executing the problem determination procedures for the Sensor I/O cards, determining the defective card and mailing it to:

IBM Corporation
Repair Center
321 Route 17
Paramus, N.J. 07652

Cards that have been modified and cards that have been damaged through improper installation, handling, or failure to provide a suitable installation environment will not be accepted for warranty service. IBM shall be the sole judge of whether or not a card meets warranty requirements.

3644 Automatic Data Unit (cont'd)

Spare unit requirements are a function of the customer's application, the total number of 3644s installed, and the range of Sensor I/O card types installed. Spare unit stocking considerations are:

1. At least one spare for each type of Sensor I/O card installed at a customer site.
2. Where multiples of a single Sensor I/O card are installed, one spare for each eight active cards.

Each customer will have to determine his own unique spare requirements.

SENSOR I/O CARDS ATTACHMENT ACCESSORIES

Process Termination Block: Attaches to the end of the Sensor I/O card to provide a screw-down termination facility for process signals and to retain the card in the 3644 housing. Each installed card with the exception of the analog-digital converter must be equipped with a process termination block.

Accessory Socket Cover: Covers unused sensor card locations in the 3644 to minimize entry of airborne contaminants. One cover is required for each unused sensor card location. A cover is also used to retain the ADC.

Communications Adapter Cable: Provides translation at the 3644 process termination block to a standard EIA connector. The Adapter Cable is 20 inches (508 cm) long with ring connectors on one end and a female EIA DB-25 connector on the other end.

Description	P/N
Process Termination Block	**4152588**
Accessory Socket Cover	**4152589**
Communications Adapter Cable	**5680861**

Ordering Instructions: For ordering for delivery with machine, see appropriate "Machines" pages. A

Warranty: The 3644 Attachment Accessories are warranted free from defects in workmanship and materials for 90 days.

SUPPLIES (None)

3645 PRINTER

PURPOSE

A receive-only printer for printed output in interactive 3630 Plant Communication System, 4331 processor and 8100 Information System applications.

MODELS

Model 1 001 — 120 cps maximum bidirectional printer
Note: Actual printer throughput is dependent on system and application characteristics.

Customer Setup: Machine only.

Prerequisites: A Loop Station Connector installed on an IBM Multiuse Communications Loop. See "Loop Accessories" in the 3630 and 8100 machine pages.

Either Character Print - Standard **(#1501)** or Character Print - Large **(#1502)** must be specified.

Note: When ordering this machine for attachment to an 8100 system, the appropriate M8130, 8140 or 8101 pages titled "Terminal Requirements" should be reviewed. When ordering this machine for attachment to a 4331 system the appropriate M4331 pages should be reviewed.

HIGHLIGHTS

The 3645 Printer provides a hard-copy output on a variety of forms to meet plant floor printing requirements. The printer is a bidirectional matrix printer with electronic tabulation and indexing. Line spacing is 6 lines per inch. Up to 4 part cut forms can be used with standard friction feed. For continuous forms, the Forms Tractor **(#8700)** or the Forms Tractor with Separator Bar **(#8701)** is recommended. Card stock forms are not recommended.

Two printing feature options are provided:

Character Print - Standard **(#1501)** provides a basic character size printing (approximately 0.072 inch wide by 0.117 inch high). The printer character dot matrix is four of seven wide by eight high giving high legibility. The maximum print line is 132 positions. Character spacing is ten to the inch.

Character Print - Large **(#1502)** provides four character size printing options under program control:

Basic character size (approximately 0.072 inch wide by 0.117 inch high), and approximately two times basic size, four times basic size, and eight times basic size.

Intermix of printing sizes on a single line is not permitted.

The 3645 has been designed to operate in most industrial and commercial environments. The 3645 attaches to the 3631 or 3632 Plant Communication Controller via a local 9600 bps loop. The 3645 also attaches to the 3842 or 3843 Loop Control Unit via a 2400 bps loop, 4331 Loop Adapter or 8100 system loop.

Two variable width forms tractors are available. See "Special Features".

Forms Specification: Refer to *Form Design Reference Guide for Printers,* GA24-3488. (Use 3767 specifications.)

Customer Setup: The 3645 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup, and checkout of the 3645 at the time of delivery or when relocating the 3645.
- Removing and packing of the 3645 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3645 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network.

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: Maintenance of the 3645 Printer will normally be performed at the installed location. There is no regularly scheduled IBM preventive maintenance.

If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Maintenance courses are offered to the customer for a separate charge.

Physical Environments: The 3645 Printer may be used in industrialized work zones of a wide range of business, industrial, and commercial establishments.

It can resist:

- Concentration of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with shipping, placement, operation, and relocation of the terminal for most types of industries.

For environmental requirements refer to the *IBM 3630 Plant Communication System, Installation Manual - Physical Planning,* GA24-3675.

Publications:

IBM 3630 Plant Communication System, System Description, GA24-3652
Introduction to the IBM 8100 Information System, GA27-2875
Guide to the IBM 4331 Processor, GC20-1878
IBM 4331/3640 Information Handbook
IBM 3645 Printer Operating Guide, GA24-3711

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (120V AC, 1-phase, 60 Hz): **#9890** for locking plug, or **#9891** for non-locking plug.

  Note: 120V AC is compatible with existing 115V AC systems.

- Power Cable:
  1.8 meters (6 foot cable) - **#9986**
  4.3 meters (14 foot cable) - **#9987**
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct attached or data link attached loop. Specify **#9976** for a 1.8 meter (6 foot) cable or **#9977** for a 4.3 meter (14 foot) cable.
- Color: Classic blue - **#9063** ... charcoal brown - **#9064** ... pebble gray - **#9065.**

SPECIAL FEATURES

Character Print - Standard (#1501): Provides dot matrix character size approximately 0.072 inch wide by 0.117 inch high at 10 characters per inch. **Limitations:** Cannot be installed with Character Print - Large **(#1502). Maximum:** One. **Field Installation:** Yes.

Character Print - Large (#1502): Provides four character size printing options under program control: Standard-approximately 0.072 inch wide by 0.117 inch high at 10 characters per inch, and approximately two times standard size, four times standard size, and eight times standard size. Intermix of printing sizes on a single line is not permitted. **Limitations:** Cannot be installed with Character Print - Standard **(#1501). Maximum:** One. **Field Installation:** Yes. **Prerequisites: #8700** or **#8701.**

Variable Width Forms Tractor (#8700): A forms feeding device for continuous edge-punched fan-fold forms. Up to 6 parts (total thickness - 0.46mm (0.018 inch) may be used. Five and six part continuous forms should be tried on an individual basis for acceptable feeding, registration, and print quality. Overall forms width from 76mm to 381mm (3 to 15 inches) can be fed. End of forms detection is provided. **Maximum:** One. **Field Installation:** Yes. **Note:** If this feature is ordered by MES, you must specify color **#9063** classic blue, **#9064** charcoal brown, **#9065** pebble gray.

Variable Width Forms Tractor With Separator (#8701): Forms feeding device for continuous edge punched fan-fold forms. A separator bar permits tearing off continuous forms at the perforation to within 40mm (1.5 inches) of the top printing line without misalignment of subsequent forms. Forms should have perforated carrier strips on both sides. Up to 4 part continuous forms total thickness 0.3mm (0.012 inch) may be used. Forms without perforated carrier strips and/or greater than 4 parts are not recommended. Form widths from 127mm to 378mm (5 to 14-7/8 inches) can be used. End of forms detection is provided. **Maximum:** One. **Field Installation:** Yes. **Note:** If this feature is ordered by MES, you must specify color **#9063** classic blue, **#9064** charcoal brown, **#9065** pebble gray.

MODEL CONVERSIONS (None)

ACCESSORIES

Forms Stand (#4450): Permits placement of continuous forms on the stand above floor level and provides for stacking after printing. This accessory is a two-shelf forms stand.

3645 Printer (cont'd)

SUPPLIES

None required with machine order. Supplies may be ordered through your IBM SSD Sales Representative for initial and replacement quantities.

3646 SCANNER CONTROL UNIT

PURPOSE

The 3646 Scanner Control Unit allows attachment of the Magnetic Hand Scanners or the Magnetic Slot Readers for rapid, accurate data collection.

MODELS

The standard 3646 can attach up to two magnetic readers, Magnetic Hand Scanners or Magnetic Slot Readers. Two additional magnetic readers can be attached via the optional Magnetic Reader Attachment **(#6351)**. Each magnetic reader can be addressed for independent operation.

Prerequisites: A Loop Station Connector installed on an IBM Multiuse Communications Loop, see "Accessories" Magnetic Hand Scanner, Magnetic Slot Reader or Dual Entry Magnetic Slot Reader.

Note: When ordering this machine for attachment to an 8100 system, "Terminal Requirements" on the appropriate M8130, 8140 or 8101 pages should be reviewed. When ordering this machine for attachment to a 4331 system the appropriate M4331 pages should be reviewed.

Customer Setup (CSU): Machine only.

HIGHLIGHTS

The 3646 is a compact terminal designed to bring magnetic scanning capability to the workstation. Its capability includes:

- Free standing on a table, counter, work bench, etc.
- Wall or column mounted via accessory brackets.
- Up to 4 magnetic readers.
- Readers can be Magnetic Hand Scanners or Magnetic Slot Readers in any combination.

Customer Setup: The 3646 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility. For additional information on CSU refer to the General Information section.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup and checkout of the 3646 at time of delivery or when relocating the 3646. A Magnetic Hand Scanner or Magnetic Slot Reader is required for checkout.
- Removing and packing of the 3646 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3646 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network, see "Accessories".

Problem Determination Procedures: Terminal problem determination procedures (PDPs) prompt retry and recovery actions and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: Maintenance of the 3646 terminals will normally be performed at the installed location. The standard maintenance agreement as described in the General Information section applies to the 3646 terminals.

See "Use of IBM Equipment in Industrial Environments" in the GI section.

For maintenance of 3646 accessories, see "Accessories".

There is no regularly scheduled IBM preventive maintenance.

If purchased, the terminals are eligible for maintenance coverage immediately following expiration of the warranty period at a monthly charge.

Physical Environments: The 3646 mdl 1 and accessories may be used in the industrialized work zones of a wide range of business, industrial and commercial establishments.

They can resist:

- Concentrations of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal operational sites for most industries.
- Most industrial types of electromagnetic interference associated with terminal operational sites.
- Vibration and shock associated with the shipping, operation, and relocation of the terminal for most types of industries.

For environmental specifications refer to the *IBM 3630 Plant Communication System, Installation Manual - Physical Planning,* GA24-3675.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (120V AC, 1-phase, 60 Hz): **#9890** for locking plug, or **#9891** for non-locking plug.

  Note: 120V AC is compatible with existing 115V AC systems.

- Power Cable:
  1.83 meter (6 foot) cable - **#9986**
  4.27 meter (14 foot) cable - **#9987**
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct attached or data link attached loop. Specify **#9976** for a 1.8 meter (6 foot) cable or **#9977** for a 4.3 meter (14 foot) cable.
- Color: Classic blue - **#9063** ... charcoal brown - **#9064** ... pebble gray - **#9065**.

SPECIAL FEATURES

Magnetic Reader Attachment (#6351): Allows two additional Magnetic Hand Scanners, Magnetic Slot Readers or Dual Entry magnetic Slot Readers to be attached to the 3646 mdl 1. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSION (None)

ACCESSORIES

MAGNETIC HAND SCANNER

The Magnetic Hand Scanner (MHS) attaches by a 1.5m coiled cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. It allows the user to read magnetic stripe labels that are attached to shelves, cartons, machines, etc. It can also be used to read magnetic stripe tags which are hand-held or placed on a flat surface. See appropriate unit for prerequisites and possible limitations.

The MHS has three lights and an audible buzzer which provide feedback to the user on the status of the scanned data. With proper encoding the MHS can read a stripe in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the Magnetic Hand Scanner.

Ordering Instructions: To order via MES, order via MSORDER (Category = Supplies/ Accessories; Group Code = DP Supply Order). When ordering, use Machine Type 3646

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Scanners will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare scanners which the customer may want to consider stocking:

Number of Scanners	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Scanner Accessories are warranted free from defects in workmanship and materials for 90 days.

Warranty service will be performed at the FE Repair Center. The customer will fill out a Repair Center Machine Repair *Authorization Form,* GZ27-2981, pack, and mail it and the defective Magnetic Hand Scanner to:

IBM Corporation
Repair Center
321 Route 17
Paramus, NJ 07652

3646 Scanner Control Unit (cont'd)

There is no regularly scheduled preventive maintenance recommended by IBM. Primary maintenance will be done by the customer, following the problem determination and parts replacement procedures.

Optionally, the customer can obtain post warranty maintenance on a time and material basis at the IBM Repair Center, Paramus, NJ.

Magnetic Hand Scanner: P/N 4123495 .

MAGNETIC SLOT READER
MAGNETIC SLOT READER, DUAL ENTRY

The Magnetic Slot Reader (MSR) and Dual Entry Magnetic Slot Reader (DEMSR) attach by a 1.5m cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. These slot readers accommodate a wide range (height and length) of magnetic striped card stock and plastic badges including: Magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc.

The MSR and DEMSR have three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. The MSR has a wide opening on one end to facilitate reading of badges or documents. The DEMSR has wide openings on both ends to facilitate reading in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the MSR or DEMSR.

Ordering Instructions: To order via MES, order via MSORDER (Category = Supplies/ Accessories; Group Code = DP Supply Order). When ordering, use Machine Type 3646

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking:

Number of Readers	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days. Warranty service will *be performed at the FE Repair Center. The customer will fill out a Repair Center Machine Repair Authorization Form* (GZ27-2981), pack, and mail it and the defective Magnetic Hand Scanner to:

IBM Corporation
Repair Center
321 Route 17
Paramus, NJ 07652

There is no regularly scheduled preventive maintenance recommended by IBM. Primary maintenance will be done by the customer, following the problem determination and parts replacement procedures.

Optionally, the customer can obtain post warranty maintenance on a time and material basis at the IBM Repair Center, Paramus, NJ.

MAGNETIC READER/SCANNER EXTENSION CABLES

These cable assemblies can be used to extend the Magnetic Hand Scanner **P/N 4123495** or Magnetic Slot Reader **P/N 4123500** distances. Additional Extension Cable lengths other than those listed below are available. See RPQ Reference List.

MHS/MSR Extension Cables are warranted free from defects of workmanship or materials for 90 days. **Limitation:** Extension cables cannot be plugged into other extension cables.

Ordering Instructions: To order via MES, order via MSORDER (Category = Supplies/ Accessories; Group Code = DP Supply Order). When ordering, use Machine Type 3646.

Cable 6 meters (19.7 feet): P/N 4832986, .

Cable 12 meters (39.4 feet): P/N 4832987 .

MAGNETIC READER/SCANNER REPLACEMENT ASSEMBLIES

Description	P/N
MHS Sensor Head Assembly	**4832721**
MHS Handle and Feedback Assembly	**4832701**
MHS Amplifier Card and Cable Assembly	**4832727**
DEMSR/MSR Arm and Sensor Head Assembly	**4832963**
DEMSR/MSR Base and Feedback Assembly	**4832973**
DEMSR/MSR Amplifier Card and Cable Assembly	**4832962**
MSR Cover	**4832964**
DEMSR Cover	**4123486**

The following tables list the number of Magnetic Reader/Scanner replacement assemblies which the customer may want to consider stocking:

Magnetic Hand Scanner

Number of MHSs # 4123495	Sensor Head Assemblies # 4832721	Handle and Feedback Assembly # 4832701	Amplifier Card and Cord Assembly # 4832727
50	2	1	2
100	3	1	3
150	4	1	4
200	5	2	5

Magnetic Slot Reader

Number of MSRs # 4123500	Arm and Sensor Head Assembly # 4832963	Base and Feedback Assembly # 4832973	Amplifier Card and Cord Assem # 4832962	Cover # 4832964
50	2	1	2	1
100	3	1	3	1
150	4	1	4	1
200	5	2	5	1

Dual Entry Magnetic Slot Reader

Number of DEMSRs # 4123520	Arm and Sensor Head Assembly # 4832963	Base and Feedback Assembly # 4832973	Amplifier Cardand Cord Assem # 4832962	Cover # 4123486
50	2	1	2	1
100	3	1	3	1
150	4	1	4	1
200	5	2	5	1

Ordering Instructions: Order using DP Supply Order form Z170-6173 from Mechanicsburg.

Warranty: Magnetic scanner replacement assemblies are warranted free from defects of workmanship or materials for 90 days.

WALL MOUNTING BRACKETS

A two piece mounting bracket is available to mount the 3646 Scanner Control Unit to a wall, column, or other vertical surface.

One piece mounts on the 3646 and the other mounts on the vertical surface. There are four bracket holes on the back of the 3646 and four mounting screws supplied with the brackets. The customer is responsible for supplying the fasteners for the wall bracket.

Ordering Instructions: To order via MES, order via MSORDER (Category = Supplies/ Accessories; Group Code = DP Supply Order). When ordering, use Machine Type 3646. When ordering, specify machine type.

Warranty: Wall mounting brackets are warranted free from defects of workmanship and materials for 90 days.

Wall Mounting Brackets: P/N 4151768 or feature code **#9450.**

SUPPLIES (None)

3647 TIME AND ATTENDANCE TERMINAL

PURPOSE

A data entry terminal designed for attendance and other data entry labor reporting applications.

MODELS

Model 1 001

Prerequisites: A loop station connector installed on an IBM Multiuse Communications Loop. For magnetic stripe reading, a Magnetic Slot Reader, Dual Entry Magnetic Slot Reader, or a Magnetic Hand Scanner is required.

When ordering this machine for attachment to a 4331 processor the appropriate M4331 pages should be reviewed.

Customer Setup(CSU): Machine only.

HIGHLIGHTS

The 3647 Time and Attendance Terminal is designed for attendance, labor reporting, and other data entry applications. The base 3647 has a magnetic scanner adapter and a four-digit display that can be used for time of day. Two optional features are available:

- **Function Switch** - A six-position rotary switch that is customer definable.
- **Control Feature** - Provides control signals to allow door openings, audible alarms, etc.

An optional magnetic slot reader mounting bracket accessory (P/N 8632451) provides attachment for a slot reader. This mounting bracket is firmly attached to the 3647 via a keylock. The slot reader cable is coiled within the bracket.

The 3647 can be table- or wall-mounted. An optional wall mounting bracket accessory (P/N 4151768) is available.

The 3647 provides:

- **Time of Day Clock** - The initial time is set under program control and can be set for a 12- or 24-hour clock with time displayed in hours and minutes or hours and hundredths of hours.
- **Input Buffer** - An input buffer mode of operation can selected to store multiple input messages. This provides a high walk-by rate and allows input when the controller, loop, or data link is inoperative. A no-buffer mode of operation can also be selected to permit interactive processing on each input message.
- **Invalid Document Code** - An invalid document code option can be selected that allows input messages to be checked for the presence of a non-numeric character. Input without this character is rejected by the 3647.
- **Time Stamping** - A time stamping option can be selected that sends the displayed time of day with each input message transmitted to the controller.

Customer Setup: The 3647 is designated customer setup (CSU) thereby offering the customer early availability and relocation flexibility.

Customer Responsibilities: The customer is responsible for:

- Unpacking, placement, setup, and checkout of the 3647 at the time of delivery or when relocating the 3647.
- Removing and packing of the 3647 at time of discontinuance.
- Using and following the problem determination procedures and filling out the trouble report prior to calling for service.
- Relocation of the 3647 (if required) to allow IBM service access.
- Procurement, installation and maintenance of the loop network, see "Accessories".

Problem Determination Procedures: Terminal problem determination procedures (PDPs), prompt retry and recovery actions, and the analysis of operations to determine:

- Whether or not continued operation is possible.
- Whether terminal, loop, controller, accessory, or media is at fault.

Proper terminal operator use of PDPs will result in maximum terminal and system availability.

Maintenance: The standard maintenance agreement as described in the General Information section applies to the 3647 Time and Attendance Terminal; however, there is no regularly scheduled IBM preventive maintenance. Maintenance of the 3647 Time and Attendance Terminal will normally be performed at the installed location. If purchased, the terminals are eligible for Maintenance Agreement service immediately following expiration of the warranty period.

Physical Environments: The 3647 Time and Attendance Terminal may be used in industrialized work areas of a wide range of business, industrial, and commercial establishments.

It can resist:

- Concentration of certain common, corrosive gases.
- Accumulations of dust, grit, and dirt.
- Temperature and relative humidity extremes that are common to terminal,operational sites for most industries.
- Most industrial types of electromagnetic interference associated with the terminal operational sites.
- Vibration and shock associated with shipping, placement, operation, and relocation of the terminal for most types of industries.

For environmental specifications refer to the *IBM 3630 Installation Manual - Physical Planning,* GA24-3675.

On-Site Testing Allowance: The 3647 Time and Attendance Terminal will be eligible designated units when the 3630, 4331 Loop Adaptor or 8100 controller to which they are attached qualifies for an on-site testing allowance.

Systems Engineering Services: Systems Engineering Services are available upon customer request and at a charge to assist the customer in the use of the 3647.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (120V AC, 1-phase, 60 Hz): **#9890** for locking plug, or **#9891** for non-locking plug.

  Note: 120V AC is compatible with existing 115V AC systems.

- Power Cable:
  1.8 meters (6 foot) cable - **#9986**
  4.3 meters (14 foot) cable - **#9987**
- Communication Cable: A communication cable (Loop Station Connector (LSC) cable) is provided for attachment to a direct attached or data link attached loop. Specify **#9976** for a 1.8 meter (6 foot) cable or **#9977** for a 4.3 meter (14 foot) cable.
- Color: Classic blue - **#9063** ... classic brown - **#9064** ... pebble gray - **#9065.**

SPECIAL FEATURES

Control Feature (#1501): Provides one point of TTL compatible input, one point of TTL compatible output, and two TTL compatible control signals. **Maximum:** One. **Field Installation:** No.

Function Switch (#3950): Provides a six-position rotary switch that can be be set by the operator. Five switch settings each transmit a unique function code when a magnetic stripe is scanned. One switch setting is set to "null." The meaning of the switch position is left to the customer and space is provided for a customer printed definition label near the switch. **Maximum:** One. **Field Installation:** No.

MODEL CONVERSION (None)

ACCESSORIES

MAGNETIC HAND SCANNER

The Magnetic Hand Scanner (MHS) attaches by a 1.5m coiled cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. It allows the user to read magnetic stripe labels that are attached to shelves, cartons, machines, etc. It can also be used to read magnetic stripe tags which are hand-held or placed on a flat surface. See appropriate unit for prerequisites and possible limitations.

The MHS has three lights and an audible buzzer which provide feedback to the user on the status of the scanned data. With proper encoding the MHS can read a stripe in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the Magnetic Hand Scanner.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Scanners will be done by the customer following the problem determination and part replacement procedures.

3647 Time and Attendance Terminal (cont'd)

The following are a recommended number of spare scanners which the customer may want to consider stocking:

Number of Scanners	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Scanner Accessories are warranted free from defects in workmanship and materials for 90 days.

Warranty service will be performed at the FE Repair Center. The customer will fill out a Repair Center Machine Repair *Authorization Form,* GZ27-2981, pack, and mail it and the defective Magnetic Hand Scanner to:

IBM Corporation
Repair Center
321 Route 17
Paramus, NJ 07652

There is no regularly scheduled preventive maintenance recommended by IBM. Primary maintenance will be done by the customer, following the problem determination and parts replacement procedures.

Optionally, the customer can obtain post warranty maintenance on a time and material basis at the IBM Repair Center, Paramus, NJ.

Magnetic Hand Scanner: P/N 4123495 .

MAGNETIC SLOT READER
MAGNETIC SLOT READER, DUAL ENTRY

The Magnetic Slot Reader (MSR) and Dual Entry Magnetic Slot Reader (DEMSR) attach by a 1.5m cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. These slot readers accommodate a wide range (height and length) of magnetic striped card stock and plastic badges including: Magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc.

The MSR and DEMSR have three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. The MSR has a wide opening on one end to facilitate reading of badges or documents. The DEMSR has wide openings on both ends to facilitate reading in either direction. A magnetic reader attachment feature on the appropriate machine is required to use the MSR or DEMSR.

Ordering Instructions: See IBM.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regularly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking:

Number of Readers	Number of Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days. Warranty service will *be performed at the FE Repair Center. The customer will fill out a Repair Center Machine Repair Authorization Form,* (GZ27-2981) pack, and mail it and the defective Magnetic Hand Scanner to:

IBM Corporation
Repair Center
321 Route 17
Paramus, NJ 07652

There is no regularly scheduled preventive maintenance recommended by IBM. Primary maintenance will be done by the customer, following the problem determination and parts replacement procedures.

Optionally, the customer can obtain post warranty maintenance on a time and material basis at the IBM Repair Center, Paramus, NJ.

MAGNETIC READER/SCANNER EXTENSION CABLES

These cable assemblies can be used to extend the Magnetic Hand Scanner **P/N 4123495** or Magnetic Slot Reader **P/N 4123500** distances. Additional Extension Cable lengths other than those listed below are available.

MHS/MSR Extension Cables are warranted free from defects of workmanship or materials for 90 days.

Limitation: Extension cables cannot be plugged into other extension cables.

Ordering Instructions: See IBM.

Cable 6 meters (19.7 feet): P/N 4832986, .

Cable 12 meters (39.4 feet): P/N 4832987 .

MAGNETIC READER/SCANNER REPLACEMENT ASSEMBLIES

Description	P/N
MHS Sensor Head Assembly	**4832721**
MHS Handle and Feedback Assembly	**4832701**
MHS Amplifier Card and Cable Assembly	**4832727**
DEMSR/MSR Arm and Sensor Head Assembly	**4832963**
DEMSR/MSR Base and Feedback Assembly	**4832973**
DEMSR/MSR Amplifier Card and Cable Assembly	**4832962**
MSR Cover	**4832964**
DEMSR Cover	**4123486**

The following tables list the number of Magnetic Reader/Scanner replacement assemblies which the customer may want to consider stocking.

Magnetic Hand Scanner

Number of MHSs # 4123495	Sensor Head Assemblies # 4832721	Handle and Feedback Assembly # 4832701	Amplifier Card and Cord Assembly # 4832727
50	2	1	2

Dual Entry Magnetic Slot Reader

Number of DEMSRs # 4123520	Arm and Sensor Head Assembly # 4832963	Base and Feedback Assembly # 4832973	Amplifier Card and Cord Assem # 4832962	Cover # 4123486
50	2	1	2	1
100	3	1	3	1
150	4	1	4	1
200	5	2	5	1

Ordering Instructions: See IBM.

Warranty: Magnetic scanner replacement assemblies are warranted free from defects of workmanship or materials for 90 days.

WALL MOUNTING BRACKETS

A two piece mounting bracket is available to mount the 3647 Time and Attendance Terminal to a wall, column, or other vertical surface.

One piece mounts on the 3647 and the other mounts on the vertical surface. There are four bracket holes on the back of the 3647 and four mounting screws supplied with the brackets. The customer is responsible for supplying the fasteners for the wall bracket.

Ordering Instructions: See IBM.

Warranty: Wall mounting brackets are warranted free from defects of workmanship and materials for 90 days.

Wall Mounting Brackets: P/N 4151768 or feature code **#9450 .**

MAGNETIC SLOT READER MOUNTING BRACKET

The Mounting Bracket is used to firmly attach the MSR or DEMSR to the 3647. It locks to the front cover of the 3647 by a key lock. The magnetic reader cable is coiled under the bracket.

Ordering Instructions: See IBM

Magnetic Slot Reader Mounting Bracket: P/N 8632451 .

3647 Time and Attendance Terminal (cont'd)

SUPPLIES

None required with machine order. Supplies may be ordered through IBM for initial and replacement quantities. For further information consult .

3651 STORE CONTROLLER MDLS 25, 75

PURPOSE

The control unit for a 3650 Programmable Store System. Using standard retail functions tailored by the customer to his own requirements, and/or customer-supplied supermarket application programming, the 3651 controls the operation of the 3650 Programmable Store System and its related terminals and provides for communications with an appropriate S/370, 30XX, or 4300 virtual storage processor.

MODELS

Model B25 — 9.2 megabyte integral disk storage. Limited features and processing capability. Supported by Programmable Store System Host Support only. Attaches 3275 model 3, 3653 model 1 and 1P, 3683 model 1, and 3663 all models terminals.

Model C25 — Same as model B25 except has 18.4 megabyte integral disk storage. The model C25 is physically larger than the B25.

Model A75 — 5 megabyte integral disk storage. Many features, full processing capability. Supported by Programmable Store System Host Support only. Attaches 3275 model 3, 3653 model 1 and 1P, 3683 all models, 3657 model 1, and 3663 model 1P, 2 and 3P terminals.

Model B75 — Same as model A75 except has 9.3 megabyte integral disk storage.

Model C75 — Same as model A75 except has 18.6 megabyte integral disk storage. The model C75 is physically larger than the model A75 and B75.

Model D75 — Same as model A75 except has 27.9 megabyte integral disk storage. The model D75 is the same physical size as the model C75.

Note: The 3651 model B25 and C25 Store Controller provide a lower entry system for those users who do not require the internal processing capability of the 3651 model A75, B75, C75 and D75. The effect of the different internal processing capability upon overall system performance is dependent upon the total system configuration and workload. To establish a supportable system configuration for any model Store Controller, systems design must be performed using the performance models and configuration aids available from IBM.

HIGHLIGHTS

The 3651 is a modular, programmable unit that provides the link between its attached terminals and the host data processing center. The 3651 is normally used to collect data from the various parts of the system, perform edit, logic, and arithmetic operations on that data and then log and/or forward it to its ultimate destination within the overall system - terminal or data processing center. The 3651 mdl 75 can also communicate with another mdl 75. Application functions for retail operations via 3653 mdl 1 terminals or 3653 mdl 1P terminals, when functioning as 3653 mdl 1 terminals are provided as standard. All other applications are performed by customer-supplied application programming. In mdls B25, C25, A75, B75, C75 and D75, customer-supplied supermarket and/or retail application programs may be used along with, or instead of, the standard retail operations. Standard features include the following:

Loop Adapter

Mdl 25 — Provides for attachment of one in-store local loop.

Mdl 75 — Provides for attachment of one in-store local loop and one additional loop which may be specified as local or remote (see Figure 1).

Controller Storage: The basic 3651 contains storage optionally expandable via special features (see "Special Features"). System configuration as well as user programs determine if additional storage increments are required.

	Basic Storage	Maximum Storage
All Models	61,440 bytes	126,976 bytes

Integral Disk Storage: The Integral Disk Storage is used for storage of selected controller functions, user-written application programs, system configuration data, data logging and data sets (files).

Models	A75	B25/B75	C25/C75	D75
Bytes per Track	15,360	15,360	15,360	15,360
Tracks per Cylinder	2	2	2	2
Bytes per Cylinder	30,720	30,720	30,720	30,720
Cylinders per IDS	167	301	602	903
Storage Capacity				
Movable Head	5,130,240	9,246,720	18,493,440	27,740,160
Fixed Head (M75)	122,880	122,880	245,760	368,640

Host Communications Adapter: [Mdl 75] and Mdl 25 with External Modem Interface (#9150)] Provides for transmission to and from a properly equipped S/370, 30XX, or 4300 processor. The basic transmission rate is 2400 bps over switched or nonswitched networks with 4800 bps as a specify option. Also provides for communications with 8100 processors over nonswitched lines using SDLC. This adapter interfaces to appropriate IBM modems or to the local Attachment Interface of the 4331 processor or to the Direct Connection interface of 8100 processors. With the appropriate features available on mdl 75, only the Host Communications Adapter can communicate with another 3650 Programmable Store System or locally attach a 3704, 3705 or 3725. (Mdl 25 with 1200 bps Integrated Modem #9512 provides for transmission to and from a properly equipped S/370, 30XX, or 4300 processor. The basic transmission rate is 1200 bps over switched network using an IBM integrated modem. See "Communications Facilities" below and M2700 pages.

To communicate with another 3650 system or local attachment to a 3704, 3705, or 3725 see "Special Features" below.

Audible Alarm: Activated when predetermined events require operator attention or intervention for system operation. A contact closure to which the customer can attach his remote alarm is available as an option with 3669/3689 Attachment. (See "3669/3689 Attachment" in "Special Features" below)

Controller Storage Save: [Mdl 75 only] Critical areas of controller storage are automatically written on the integral disk unit when power is turned off or a power failure is detected.

Terminal Devices: The terminals which are identified above under the different mdls of the 3651 are attached to the 3651 via Local/Remote Loop Adapter. Only the 3683 terminal, all mdls, will attach to 4800 bps Local Loop Adapter. Remote Loop Adapter available at 2400 bps only. A maximum of 191 terminals can be addressed by the 3651. However, the number of terminals which can be supported depends upon traffic volumes, desired response times, applications to be performed, and the mdl of the 3651.

One 3784 Line Printer mdl 1 may be attached to the 3651 Control Unit mdl 75.

Communications Facilities: The Host Communications Adapter (mdls 25 and 75), Auxiliary Communications Adapter (available on mdl 75 only) and 3669/3689 attachment (available on mdl 75 only) permit operation at the speeds indicated, over the facilities shown below, when using the appropriate DCE. For information concerning the facilities, see M2700 pages.

At 1200 bps - on facility CA2 (switched)
At 2400 or 4800 bps - on the public switched telephone network, a nonswitched voice grade line or a nonswitched data network. **Note:** The 3669 attachment cannot operate at 4800 bps.

Prerequisites: At the host location, a virtual storage S/370, 30XX, or 4300 processor with properly equipped 3704, 3705, 3725 or communications adapter. See M2700, 3704, 3705, and 3725 pages.

SPECIFY

- Power (AC, 1-phase, 60 Hz): Locking plug -- **#9884** for 208V or **#9886** for 230V. Non-locking plug -- **#9885** for 208V or **#9887** for 230V.
- Modem Attachment Host Communications Adapter: One IBM modem can be attached to this adapter on the 3651. The 3651 (except mdl 25) provides a cable and interface for connection of IBM modems at transmission rates of 2400 or 4800 bps for communications with the S/370, 30XX, 4300 processor or 8100 System. Can also be attached without modem to the local Attachment Interface (#4801) of a 4331 processor, mdl group 1 or 2. Can also be attached without modem at 4800 bps to the Direct Connection interface (SDLC FAC 16) of an 8101, 8130, or 8140 processor. The 3651 mdl 25 is featured to provide either a switched 1200 bps integrated modem (#9512) or an external modem interface (#9150) for connection of IBM modems at transmission rates of 2400 or 4800 bps for communications with the S/370, 30XX, 4300 processor or 8100 System. If switched network is selected, auto answer capability is standard. If leased operation is selected, dial backup is provided on a manual dial basis using the 3863, 3864, 3872 or 3874 Modem with appropriate special features. 4-wire Switched Network Backup is available with the 3863 mdl 1 and 3864 mdl 1.
- External Modem Interface (**#9150**): [Mdl 25] Provides a cable and interface on the Host Communications Adapter for connection of an IBM modem at transmission rates of 2400 or 4800 bps for communications over switched or leased networks. If switched network is selected, auto answer capability is standard. **Limitations:** Not available with 1200 bps Integrated Modem (**#9512**). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** A 3863, 3864, 3872 or 3874 modem.
- 1200 bps Integrated Modem (**#9512**): [Mdl 25] Provides an integrated modem for operation over switched communication facilities at 1200 bps. Auto answer is provided. The cable provided is compatible with the IBM Protective Coupler (CBS type)

3651 Store Controller Models 25, 75 (cont'd)

available as P/N 1649100 (see RPQ 8Q0130 for description). For Canada, an additional cable is provided for attachment to the Canadian protective coupler. **Limitations:** Not available with External Modem Interface (**#9150**). **Field Installation:** Yes. **Maximum:** One. **Prerequisites:** A FCC registered protective device (DAA) of the CBS type is to be provided by the user.

If a non-IBM modem is used, Specify Code **#9770** Wrap Cable is available to facilitate problem determination. The non-IBM modem must provide the clocking, an RS-232-C Type D or E interface and must operate at speeds of 4800 bps or less on the Host Communications Adapter and the Auxiliary Communications Adapter.

Service (bps)	Specify Code
2400	**#9120**
4800	**#9126**

Notes:

(1) For communications capabilities product description and special features, see M2700, 3863, 3864, and 3872 pages.
(2) Specify codes **#9120** and **#9126** are not applicable with 1200 bps Integrated Modem (**#9512**).

- Controller Designation: Specify **#9491** on the first 3651 mdl 25 or 75 to be used with a host system location requiring 3650 Programmable Store System Host Support. Specify **#9492** on each additional 3651 mdl 25 or 75 in the network. Specification of **#9491** will provide IBM control code for the controller and all its attached devices (except the 3683 terminal) via a DTR sent to the designated host location.

  In addition, if **#9491** is specified, also specify **#9493** if any 3683 or 3685 terminals are attached to the 3651 controller and if a 3680 system is not attached to the same host system as the 3651. Specification of **#9493** will provide 3683 and 3685 control code. (If a 3680 system is attached to the same host system, the 3683 and 3685 control code is provided by a specify code on the 3684.) When **#9491** is specified, additional information must be specified as follows:

  1) Specify one of the following to indicate magnetic tape density (media) used at the host system location. The tape media is available under DOS/VS, OS/VS1 and OS/VS2 only.

     #9412 -- 9-track 800 bpi
     #9413 -- 9-track 1600 bpi
     #9414 -- 9-track 6250 bpi

     The 3651 controller data will be sent via the specified media to the IBM Programming Systems Representative at the host system location for installation.

  2) Supplemental Specs (via Terminal Entry) are to be entered exactly as follows to indicate mailing address of host system location:

     Line 1 - IBM Programming Systems Rep.
     Line 2 - c/o (Name of Customer)
     Line 3 - Street Address (or P.O. Box)
     Line 4 - (etc) - City, State, Zip Code

     This is the address to which the first controller data tape will be automatically shipped for the first controller ordered (with specify code **#9491**). Whenever controller data is updated by an EC, the EC will be shipped to the most current Microcode Control (MC) address.

  In addition, if **#9493** is specified with **#9491**, specify **#9490** if there is a storage requirement that prevents 3683 operation with the current level of 3683 control code (i.e., EC 320560 or later). **#9490** provides 3683 control code level EC 320503 which operates in the same control code storage allocation as is required for 3683 control code level EC 320502. It is strongly recommended that new 3683 customers and 3687 customers do not take this specify option.

- Specify the following:

  #9504 - for 3650 BSC or SDLC Programmable Store Systems host support under DOS/VS VTAM or BTAM, OS/VS1 VTAM or BTAM, and OS/VS2 VTAM or BTAM.

  Note: The corresponding release of 3650 PSS Host Support must be ordered from IBM. See SCP pages.

- Store Loop Polarity Tester: One is furnished at each site at no charge.

  Notes: The customer must provide (purchase, install and maintain) all necessary 3650 communication lines within the store. (Bulk Loop cable is available from IBM; see "Accessories".)

- Second Loop Adapter (mdl 75 only): Specify **#9442** to designate the second loop adapter as local or specify **#9552** to designate the second loop adapter as remote. Do not use these specify features if ordering 4800 bps local loop adapter for loop positions 1 and 2 (#4895). See Figure 1 below.

  Note: Specify **#9552** not allowed with 3669/3689 Attachment (#8069).

- RFI Standard: The RFI Standard (Specify **#2759**) is now provided on all machines as standard.

SPECIAL FEATURES

Control Storage Features: The amount to be ordered is dependent upon the number and type of terminals attached to the system as well as system configuration and user programs. For available storage configurations, see Table A below.

Storage Increment - Type II (#1564): Each #1564 provides the 3651 with an additional 16,384 positions of storage. **Maximum:** Three (see Table A). **Field Installation:** Yes. **Prerequisites:** The 3651 must be equipped with Storage Expansion Feature (#1570) and First Storage Increment (#1571).

Table A

Storage Configuration		Feature Distribution		
	Total Storage	Storage Expansion (#1570)	First Storage Increment (#1571)	Storage Increment Type II (#1564)
(A)	61440	0	0	0
(B)	77824	1	1	0
(C)	94208	1	1	1
(D)	110592	1	1	2
(E)	126976	1	1	3

Storage Expansion Feature (#1570): Provides the capability of expanding storage beyond 61,440 bytes. **Maximum:** One. **Field Installation:** Yes. **Note:** First Storage Increment (#1571) or First Storage Increment (#1571) and Storage Increment - Type II (#1564) are required to provide the appropriate additional positions of storage (see Table A).

First Storage Increment (#1571): Provides the 3651 with the first 16,384 additional positions of storage. See Table A. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1570.

Direct Attachment 3704/3705 (#2863): [Mdls A75, B75, C75, D75] Provides clocking from the Host Communications Adapter allowing the direct attachment to a local 3704 or 3705 at 2400 bps. **Limitations:** Not allowed with 3669/3689 attachment (#8069) with specify **#9200**. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** The 3704 or 3705 must be equipped with Line Set, Type 1F (#4716). **Note:** A 6m (20 ft) external cable is provided which connects to the 3704/3705 cable.

IML-Write Adapter (#4633): Provides the 3651 with the ability to write an IML (Initial Machine Load) tape on a user provided tape cassette recorder to be read by a Point-of-Sale terminal equipped with the appropriate IML-Read Adapter (#4632 or #4634) feature. (Refer to *IBM 3650 Programmable Store System Introduction Manual*, GA27-3163, for cassette recorder interface requirement.) **Maximum:** One. **Field Installation:** Yes.

Local Loop Adapter, Add'l (#4882): [Mdls A75, B75, C75, D75] Provides an additional Local Loop Adapter as the Third Loop on the 3651. The actual number of terminals that can be attached will depend upon the program capacity and time requirements of the 3651 to service the Loops as well as the communications link to the S/370. See "Terminal Devices" above. **Specify:** See Figure 1. **Limitations:** Not available on the 3651 if 9600 bps Loop Adapter (#4890), 4800 bps Loop Adapter (#4900) or Remote Loop Adapter (#6111) is installed. **Maximum:** One. **Field Installation:** Yes.

9600 bps Loop Adapter (#4890): [Mdls A75, B75, C75, D75] Provides a 9600 bps local Loop Adapter as the Third Loop. The feature provides for the attachment of 3275 Display Station mdl 3s with 9600 bps Transmission Speed (#7825) feature installed. The actual number of 3275 Display Station mdl 3s installed will depend upon program capacity and time requirements of the 3651 to service the Loops and the communications link to the S/370. See "Terminal Devices" above. **Limitations:** Not available if Local Loop Adapter, Add'l (#4882), 4800 bps Loop Adapter (#4900) or Remote Loop Adapter (#6111) is installed. Only 3275 Display Station mdl 3s with 9600 bps Transmission Speed (#7825) can be attached to this Loop adapter. **Specify:** See Figure 1. **Maximum:** One. **Field Installation:** Yes.

4800 bps Loop Adapters (#4895): [Mdls A75, B75, C75, D75] Provides 4800 bps Loop Adapters in Loop Adapter positions 1 and 2. The actual number of 3683 terminals that can be attached will depend upon the program capacity and time requirements of the 3651 to service the loops as well as the communication link to the S/370. See "Terminal Devices" above. **Limitations:** Not allowed with add'l 2400 bps Local Loop Adapter (**#9442**) or 2400 bps Remote Loop Adapter (**#9552**). **Specify:** See Figure 1. **Maximum:** One. **Field Installation:** Yes.

4800 bps Loop Adapter (#4900): [Mdls A75, B75, C75, D75] Provides a 4800 bps local loop adapter as the third loop adapter on the

3651 Store Controller Models 25, 75 (cont'd)

3651. The actual number of 3683 terminals that can be attached will depend upon the program capacity and time requirements of the 3651 to service the loops as well as the communications link to the S/370. See "Terminal Devices" above. **Specify:** See Figure 1. **Limitations:** Not available on the 3651 if 2400 bps Local Loop Adapter (#4882) or 9600 bps Local Loop Adapter (#4890) or 2400 bps Remote Loop Adapter (#6111) is installed. **Maximum:** One. **Field Installation:** Yes.

Remote Loop Adapter (#6111): [Mdls A75,B75, C75, D75] Provides a Remote Loop Adapter as the third loop on the 3651 for online service for up to twelve remote sites per Remote Loop Adapter. The feature provides an interface to a 3872 Modem on site which via leased line connects to a 3659 Remote Communications Unit at each remote site. This allows for the extension of the Loop to up to (1) three remote locations, with a 3659 mdl 1 at each site, (2) twelve remote locations, with a 3659 mdl 2 (multipoint) at each site, (see "Terminal Devices" above). The 3651 treats the remote Loop as if it were a local Loop. **Specify:** See Figure 1. **Limitations:** Not available if Local Loop Adapter, Add'l (#4882), 9600 bps Loop Adapter (#4890) or 4800 bps Loop Adapter (#4900) is installed. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** One 3872 with #6101 or #6102 per Remote Loop Adapter at 3651 site and a 3659 Remote Communications Unit at each remote site. When more than one remote site is attached using 3659 mdl 1, a half-duplex 2-wire terminated, nonswitched voice grade line is required between the 3651 and the first remote site between successive remote sites, and from the last remote site back to the 4-wire terminated nonswitched voice grade line is required. When using the 3659 mdl 2 for more than one remote site, 4-wire duplex multipoint service is required. The 3659 mdl 2 requires that the 3872 be a basic control station (no special features) or equipped with #6302.

Auxiliary Communications Adapter (#6185): [Mdls A75, B75, C75, D75] Provides a separate 2400 bps or 4800 bps communications interface which can operate independently of the Host Communications Adapter. It can be used for either one of the following but not both: (1) 3651 mdl 75 to mdl 75 communications, or (2) Communications with another 3650 system via a 3669 Store Communications Unit at 2400 bps or a 3689 Store Communications Unit at 4800 bps. **Limitations:** Only one Auxiliary Communications Adapter (#6185 or #6188) allowed per 3651 mdl 75, not allowed with 3669/3689 Attachment (#8069) with specify **#9200** for Host Communications Adapter. The 4800 bps Auxiliary Communications Adapter cannot operate concurrently with 4800 bps Host Communications Adapter and the three 4800 bps Loop Adapters (#4895 and #4900). Only four of the five may operate concurrently at greater than 2400 bps. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** (1) For 3651 mdl 75 to mdl 75 communications: A 3863, 3864, 3872, or 3874 plus another 3651 mdl 75 similarly equipped. (2) For backup with another 3650 system: #8069 with **#9210**, or a 3669 Store Communications Unit at 2400 bps or a 3689 Store Communications Unit at 4800 bps.

Auxiliary Communications Adapter Synchronous Clock (#6188): [Mdls A75, B75, C75, D75] Provides a 2400 bps communications interface which operates independently from the Host Communications Adapter to allow direct communications with another 3651 mdl 75 with the same feature without the use of modems. **Limitations:** Only one Auxiliary Communications Adapter (#6185 or #6188) allowed per 3651 mdl 75, not allowed with 3669/3689 attachment (#8069). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Another 3651 mdl 75 with (#6188).

Synchronous Clock - Host (#7708): [Mdls A75, B75, C75, D75] Provides clocking from the Host Communications Adapter allowing the direct attachment to a local 3704 or 3705 at 2400 bps. **Limitations:** Not allowed with 3669/3689 attachment (#8069) with specify **#9200**. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** The 3704 or 3705 must be equipped with Line Set, Type 1F (#4716). **Note:** A 6 meter (20 foot) external cable is provided which connects to the 3704/3705 cable.

3669/3689 Attachment (#8069): [Mdls A75, B75, C75, D75] Provides the capability to attach one 3669 Store Communications Unit, which allows communications over switched networks at 2400 bps; or one 3689 Store Communications Unit, which allows communications over switched networks at 4800 bps with another 3650 system, and alternately with a S/370 host processor. This feature can be provided for use with either the Host Communications Adapter or the Auxiliary Communications Adapter (#6185), but not with both. If the Auxiliary Communications Adapter is present, however, then this feature must be installed for use with the Auxiliary Communications Adapter. **Limitations:** When used with Auxiliary Communications Adapter, (#6185), it cannot communicate with a host processor. **#9210** not allowed with Auxiliary Communications Adapter Synchronous Clock (#6188). **#9200** not allowed with synchronous Clock - Host (#7708). **Specify:** (1) **#9200**, for use with Host Communications Adapter, **#9210** for use with Auxiliary Communications Adapter #6185. (2) **#9220** if local audible alarm is desired, **#9230** if contact closure is desired when operator attention is required. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** (1) Local Loop Adapter, specify **#9442** for 2400 bps; or 4800 bps Local Loop Adapter, specify **#4895**. (2) a 3669 Store Communications Unit or a 3689 Store Communications Unit. (3) Auxiliary Communications Adapter (#6185) if **#9210** is specified.

3784 Adapter (#8154): [Mdls A75, B75, C75, D75] Provides the capability to directly attach one 3784 Line Printer mdl 1 to the 3651 controller. Fixed length cables are supplied as standard. Refer to *3650 PSS Installation Manual -- Physical Planning*, GA27-3167. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Specify **#9716** on the 3784 mdl 1 for attachment of the 3784 to the 3651 mdl A75 and B75 and **#9717** for attachment to the 3651 mdl C75 or D75.

Figure 1

Loop Adapter Position *	Loop Adapter	Special Feature	Specify Code
1	Local (2400 bps)	Standard	
1&2	Local (4800 bps)	#4895	
2	Add'l Local (2400 bps)		**#9442**
	Remote (2400 bps)		**#9552**
3	Add'l Local (2400 bps)	#4882	
	Add'l Local (4800 bps)	#4900	
	9600 bps	#4890	
	Remote (2400 bps)	#6111	

Unless the 4800 bps Local Loop Adapter feature (#4895) is ordered for positions 1 and 2, Loop Adapter Position 1 is occupied by the standard Local Loop Adapter (2400 bps) and Loop Adapter Position 2 is also standard and must be specified as 2400 bps local (**#9442**) or 2400 bps remote (**#9552**). If loop adapter position 2 is specified as remote, see Remote Loop Adapter (#6111) for prerequisites which will apply. For Loop Adapter Position 3, either a 2400 bps Add'l Local (#4882) or a 4800 bps Add'l Local (#4900) or 2400 bps Remote (#6111) or 9600 bps Local (#4890) Loop Adapter may be ordered. **Limitations:** Host communications, Auxiliary Communications, and Loop Adapters 1-3 cannot operate at 4800 bps or greater simultaneously. One adapter must be 2400 bps or less to allow all communications to operate simultaneously.

MODEL CONVERSIONS

The following model changes can be made in the field:

From	To A75	B75	C75	D75
A50	X	X*		
A60	X	X*		
A75		X*		
B25		X*		
B50		X		
B60		X		
C25			X*	X*
C75				X

* These model changes require the replacement of the integral disk storage. Adequate provision must be made for retaining data contained on the replaced disk storage at the host location so it can be transmitted to the new disk storage.

On purchased model 25 to model 75 changes, External Modem Interface (#9150) is a prerequisite on the model 25.

On purchased model 50 to model 75 changes, either Local Loop Adapter, Add'l (#4882 with **#9442** or **#9443**) or Remote Loop Adapter (#6111 with **#9552** or **#9553**) is a prerequisite on the mdl 50.

ACCESSORIES

Cables (P/N 5165886): Bulk Indoor Loop Cable to attach 3650 units may be purchased from IBM or a customer-selected source. See *Physical Planning Manual*, GA27-3074, for bulk loop specifications. The customer is responsible for installation and maintenance of these cables. The bulk loop cable may be purchased from IBM. Bulk Indoor Loop Cable is available for duct or plenum installation. The following information pertains to this cable only: Indoor Cable: UL approved for duct and plenum installation. (NEC Art. 725-2b). Maximum allowable cable temperature range is -34 C to +105 C.
Ordering Instructions: Interior cable (P/N 7838695) should be ordered in multiple lengths of 304.8m (1,000 ft). **Warranty:** Loop Cable is warranted free from defects of workmanship and materials for 90 days.

SUPPLIES

Contact IBM.

3651 STORE CONTROLLER MDLS A50, B50

[NO LONGER AVAILABLE]

PURPOSE

Through its standard functions, tailored by the customer to his own requirements, the 3651 controls the operation of the 3650 Retail Store System and its related terminals and provides for communication with an appropriate S/370, 30XX, or 4300 virtual storage processor.

MODELS

Model A50 5 megabytes of integral disk storage

Model B50 9.3 megabytes of integral disk storage

HIGHLIGHTS

The 3651 is a modular, programmable unit that provides the link between point-of-sale (3653), receiving-marking (3275 mdl 3 and 3657), management (via 3275 mdl 3), and the host data processing center. The 3651 collects data from the various parts of the retail system, performs edit, logic, and arithmetic operations on that data and then logs and/or forwards it to its ultimate destination within the overall system-terminal or data processing center. The 3651 also communicates with its attached terminals on an interactive basis and processes inquiries against its files. Standard features include the following:

Local Loop Adapter: Provides for the attachment of one in-store loop.

Controller Storage: The basic 3651 contains storage optionally expandable via special features to 106,496 bytes (see "Special Features"). System configuration as well as user programs determine if additional storage increments are required. Operation with many user programs will require the additional storage increments.

Integral Disk Storage: The Integral Disk Storage is used for storage of selected controller functions, user written application programs, system configuration data, data logging and data sets (files).

	Mdl A50 (5MB)	Mdl B50 (9.3MB)
Bytes per Track	15,360	15,360
Tracks per Cylinder	2	2
Bytes per Cylinder	30,720	30,720
Cylinders per IDS	167	301
Storage Capacity		
Movable Head	5,130,240	9,246,720
Fixed Head	122,880	122,880

Host Communications Adapter: Provides for transmission to and from a properly equipped S/370, 30XX, or 4300 Processor. The basic transmission rate is 2400 bps over nonswitched or switched networks with 4800 bps as a specify option. This adapter interfaces to appropriate IBM modems (see "Communication Facilities" below and M2700 pages). For local attachment to 3704/3705 or communication adapter on a 4321/4331 processor, see "Special Features".

Audible Alarm: Is activated when predetermined events require operator attention or intervention for system operation.

Controller Storage Save: Critical areas of controller storage are automatically written on two areas of the integral disk unit when power is turned off or a power failure is detected.

Terminal Devices: The following terminals are attached to the 3651 Store Controller via Local/Remote Loop Adapter: 3653 Point of Sale Terminal, 3275 mdl 3 Display Station, and the 3657 Ticket Unit. Local Loop adapter number one can address 63 terminals and the other two Loop adapters (local or remote) can each address 64 terminals. However, the number of terminals which can be supported on each Loop depends upon traffic volumes, desired response times, and applications to be performed.

One 3784 Line Printer mdl 1 may be attached to the 3651 controller unit.

To establish a supportable systems configuration, systems design should be performed using the performance models and configuration aids available from IBM.

Communication Facilities: The communications adapter permits operation at the speeds indicated, over the facilities shown below, when using the appropriate modem. For information concerning the facilities, see M2700 pages. The alphameric communication facility references below correspond to those shown on the charts on those pages.

At 2400 bps: on facility C5, C5M, D4, D4M, D4SB or X1M
At 4800 bps: on facility C6, C6M, D5, D5M or X2M.

Prerequisites: A 3704 or 3705 in 2701, 2703 Emulation Mode for BSC systems and in NCP/VS mode for SDLC systems (with appropriate features; see M3704 and 3705 pages) attached to any virtual storage S/370 or 4300 processor . Also attaches via a Communications Adapter feature on the 4321 or 4331 processor. See M4321 or 4331 pages for details.

Bibliography: *IBM 3650 Retail Store System Introduction,* GA27-3075.

SPECIFY

- Voltage (AC, 1-phase, 60 Hz): locking plug, **#9884** for 208V and **#9886** for 230V; non-locking plug, **#9885** for 208V and **#9887** for 230V.

- Modem Attachment Host Communications Adapter: One IBM modem can be attached to this adapter on the 3651. The 3651 provides a cable and interface for connections of IBM modems at transmission rates of 2400 or 4800 bps for communications with the S/370, 30XX, or 4300 processor. Attachment can also be without modem to the local Attachment Interface (#4801) of a 4331 processor. If switched network is selected, auto answer capability is standard. If leased point-to-point operation is selected, dial backup is provided on a manual dial basis using the 3863, 3864, 3872, or 3874 Modem with appropriate special features.

  If a non-IBM modem is used, Specify Code **#9770** Wrap Cable is available to facilitate problem determination. The non-IBM modem must provide the clocking, an RS-232-C Type D or E interface and must operate at speeds of 4800 bps or less.

Specify Code	Speed (bps)	IBM Modem
#9120	2400	3863 or 3872
#9121	2400 (2)	3863 or 3872
#9122	2400 (3)	3863 or 3872
#9124	4800 (2)	3864 or 3874
#9125	4800 (3)	3864 or 3874
#9126	4800	3864 or 3874

  Notes:
  1) For communications capabilities, product description and special features, see M2700, 3863, 3864, and 3872 pages.
  2) Point-to-point network.
  3) Multipoint network.

- Controller Designation: Specify **#9491** on first 3651 to be used with a host system location requiring RSS/Host support and **#9492** on each additional 3651 in the network.

  When **#9491** is specified, additional information must be specified as follows:

  1) Specify one of the following to indicate magnetic tape density (media) used at the host system location. The tape media is available under DOS/VS, OS/VS1 and OS/VS2 only.

     #9412 -- 9-track 800 bpi
     #9413 -- 9-track 1600 bpi
     #9414 -- 9-track 6250 bpi

     The 3651 controller data will be sent via the specified media to the IBM Programming Systems Representative at the host system location for installation.

  2) Supplemental Specs (via Terminal Entry) are to be entered exactly as follows to indicate mailing address of host system location:

     Line 1 -- IBM Programming Systems Rep
     Line 2 -- c/o (Name of Customer)
     Line 3 -- Street Address (or P.O. Box)
     Line 4 (etc.) -- City, State, Zip Code

     This is the address to which the first controller data tape will be automatically shipped for the first controller ordered (with specify code **#9491**). Whenever controller data is updated by an EC, the EC will be shipped to the most current TPC address.

- Specify **#9503** for 3650 SNA Retail Store Systems requiring Release 3 RSS/Host Support under DOS/VS VTAM, OS/VS1 VTAM and OS/VS2 VTAM. All controllers shipped to new customers after March, 1976 require RSS/Host Release 3 and should be specified with **#9503.** **Notes:** (1) **##9503** is a prerequisite for #1559, #1560 and #1564. (2) The corresponding release of 3650 RSS Host Support must be ordered. See SCP pages.

- Store Loop Polarity Tester: One is furnished at each site at no charge.

  Notes: The customer must provide (purchase, install and maintain) all necessary 3650 communication lines within the store. (Bulk Loop cable is available from IBM; see "Accessories".)

- RFI Standard: The RFI Standard **(#2759)** is now provided on all machines as standard.

SPECIAL FEATURES

Control Storage Features: The amount to be ordered is dependent upon the number and type of terminals attached to the system as well as system configuration and user programs. For available storage configurations, see Table A below.

Storage Increment - Type I (#1559): #1559 provides the 3651 with an additional 8,192 positions of storage. **Maximum:** One. **Field Installation:** Yes. (See Table A) **Prerequisites: #9503.**

3651 Store Controller Mdls A50, B50 (cont'd)

Storage Expansion (#1560): Contains 16,384 positions of storage to provide the capability of expanding storage beyond 57,344 positions to a maximum of 106,496 positions. **Maximum:** One. **Field Installation:** Yes. (See Table A) **Prerequisites: #9503.**

Storage Increment - Type II (#1564): Each #1564 provides the 3651 with an additional 16,384 positions of storage. **Maximum:** Three. **Field Installation:** Yes. **Prerequisites: #9503.** (See Table A)

Table A

Storage Configuration		Feature Distribution		
	Total Storage	Storage Increment - Type I (8,192 Pos.)	Storage Increment - Type II (16,384 Pos.)	Storage Expansion (16,384 Pos.)
(A)	40,960	0	0	0
(B)	49,152	1	0	0
(C)	57,344	0	1	0
(D)	65,536	1	0	1
(E)	73,728	0	1	1
(F)	81,920	1	1	1
(G)	90,112	0	2	1
(H)	98,304	1	2	1
(I)	106,496	0	3	1

Notes:

1. Field installation of Storage Increment - Type I is only recommended in changing from configurations A, E and G. Storage Increment - Type II is not used in configuration A, B and D.

   Customers who elect to purchase Storage Increment - Type I and later order additional storage should consider purchase of Storage Increment - Type II initially because some field upgrades of storage may require replacement of initial feature and installation of new feature.

Direct Attachment 3704/3705 (#2863): This feature, which operates at 2400 bps, provides the user (whose 3651 Store Controller, mdl A50 or B50 is located within 100 feet of a 3704 or 3705 Communications Controller with the ability to cable-connect these units without modems and a carrier communication line. **Prerequisites:** 3704 or 3705 must be equipped with Line Set, Type 1F (#4716). **Field Installation:** Yes. **Note:** With this feature, a 6m (20 ft) external modem cable is provided which is connected to the cable from the 3704 or 3705.

IML-Write Adapter (#4633): Provides the 3651 with the ability to write an IML (Initial Machine Load) tape on a user-provided tape cassette recorder (refer to *IBM 3650 Retail Store System Introduction Manual,* GA27-3075), to be read by a Point-of-Sale terminal equipped with the IML-Read Adapter (#4632) feature. **Maximum:** One. **Field Installation:** Yes.

Local Loop Adapter, Add'l (#4882): This feature provides a second or third Local Loop Adapter on the 3651. Up to a maximum of 64 terminals can be attached to each additional Loop. The actual number of terminals will depend upon the program capacity and time requirements of the 3651 to service the Loops as well as the communication link to the Host processor (see "Terminal Devices" above). **Limitations:** Cannot exceed a total of three Loop Adapters (local or remote) per 3651. **Maximum:** Two. **Field Installation:** Yes. **Specify:** See Figure 1.

9600 bps Loop Adapter (#4890): Provides a 9600 bps local Loop Adapter. Available in lieu of a second or third Local Loop Adapter. The feature provides for the attachment of 3275 Display Station mdl 3s with 9600 bps Transmission Speed (#7825) feature installed. The actual number of 3275 Display Station mdl 3s installed will depend upon program capacity and time requirements of the 3651 to service the Loops and the communication link to the Host processor (see "Terminal Devices" above). **Limitations:** Cannot exceed a total of three Loop adapters (local or remote) per 3651. Only 3275 Display Station mdl 3s with 9600 bps Transmission Speed (#7825) can be attached to this Loop adapter. **Maximum:** One. **Field Installation:** Yes. **Specify:** See Figure 1.

Remote Loop Adapter (#6111): Provides online service for up to twelve remote sites per Remote Loop Adapter. Available in lieu of a second or third Local Loop Adapter. The feature provides an interface to a 3872 Modem on site which via leased line connects to a 3659 Remote Communications Unit at each remote site. This allows for extension of the Loop to up to (1) three remote locations, with a 3659 at each site, (2) twelve remote locations, with a 3659 mdl 2 (multipoint) at each site, with a total of 64 terminals per Loop (see "Terminal Devices" above). The 3651 treats the remote Loop as if it were a local Loop. **Limitations:** Cannot exceed a total of three Loop adapters (local or remote) per 3651. **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** One 3872 Modem with Point-to-Point (#6101 or #6102) feature per Remote Loop Adapter at 3651 site and a 3659 Remote Communications Unit at each remote site. When more than one remote site is attached using 3659 mdl 1, a half-duplex 2-wire terminated, nonswitched voice grade line is required between the 3651 and the first remote site, between successive remote sites, and from the last remote site back to the 3651. When only one remote site is to be attached, a duplex, 4-wire terminated nonswitched voice grade line is required. When using the 3659 mdl 2 for more than one remote site, 4-wire duplex multipoint service is required. The 3659 mdl 2 requires that the 3872 be a basic control station (no special features) or equipped with Second Modem (#6302). **Specify:** See Figure 1.

Synchronous Clock (#7708): Provides clocking for the Host Communications Adapter allowing for direct attachment to a local 3704, 3705 at 2400 bps. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** The 3704 or 3705 must be equipped with #4716. **Note:** A 6m (20 ft) external cable is provided which connects to the 3704, 3705 or 4331 cable.

3784 Adapter (#8154): Provides the capability to directly attach one 3784 Line Printer mdl 1 to the 3651 controller. Fixed length cables are supplied as standard. Refer to *3650 PSS Installation Manual -- Physical Planning,* GA27-3167. **Maximum:** One. **Field Installation:** Yes. **Prerequisites: #9716** on the 3784. Minimum storage required on the 3651 is 48K. **Note:** For attachment of the 3784 Line Printer, the controller must have EC 349850 applied and operating under RSS/Host Support Release 3. New 3651 controllers must have **#9503** specified.

Figure 1

Loop Adptr Position*	Loop Adapter	Special Feature	Specify Code
	Add'l Local	#4882	**#9442**
2	Remote	#6111	**#9552**
	9600 bps	#4890	**#9662**
	Add'l Local	#4882	**#9443**
3	Remote	#6111	**#9553**
	9600 bps	#4890	**#9663**

*Loop Adapter Position 1 is occupied by the standard Local Loop Adapter. For Loop Adapter Position 2 and 3, either an Add'l Local (#4882) or Remote (#6111) or 9600 bps (#4890) Loop Adapter may be ordered. For each one ordered, also specify the applicable **#9XXX** code from the chart above. The 9600 bps Loop Adapter (#4890) may be ordered only once.

MODEL CONVERSIONS

The following model changes can be made in the field:

From	To B50	To A75	To B75
A50	X*	X	X*
B50			X

* These model changes require the replacement of the integral disk storage. Adequate provision must be made for retaining data contained on the replaced disk storage at the host location so it can be transmitted to the new disk storage.

On purchased model 50 to model 75 changes, either Local Loop Adapter, Add'l (#4882 with **#9442** or **#9443**) or Remote Loop Adapter (#6111 with **#9552** or **#9553**) is a prerequisite on the model 50.

Customers who elect to purchase the 3651 model A50 or B50 and Storage Increment Type I (#1559) should consider the model A75 or B75 initially as field conversions to the model A75 or B75 require the replacement of this feature.

ACCESSORIES

Cables (P/N 5165886): Bulk Indoor Loop Cable to attach 3660 units may be purchased from IBM or a customer-selected source. See *Physical Planning Manual,* GA27-3074, or *3680 Site Planning and Site Preparation Guide,* GA27-3201, for bulk loop specifications. The customer is responsible for installation and maintenance of these cables. The bulk loop cable may be purchased from IBM. Bulk Indoor Loop Cable is available for duct or plenum installation. The following information pertains to this cable only: Indoor Cable: UL approved for duct and plenum installation. (NEC Art. 725-2b). Maximum allowable cable temperature range is -34 C to +105 C.
Ordering Instructions: Interior cable (P/N 7838695) should be ordered in multiple lengths of 304.8m (1,000 ft). **Warranty:** Loop Cable is warranted free from defects of workmanship and materials for 90 days.

SUPPLIES

Contact IBM.

3651 STORE CONTROLLER MDLS A60, B60

PURPOSE

The control unit for a 3660 Supermarket System. Controls all functions of the 3663 Supermarket terminals. A 3669 adapter is included, which allows communication at 2400 bps over appropriate communication facilities with a properly equipped S/370, 30XX, or 4300 processor. For backup purposes, the control unit, through the 3669 Store Communications Unit, can also communicate with and control 3663 Supermarket terminals in one other preassigned location. See "Communication Facilities" and "Prerequisites".

MODELS

Model A60 5 megabytes of integral disk storage

Model B60 9.3 megabytes of integral disk storage

HIGHLIGHTS

Up to 24 3663 Supermarket terminal stations can be attached to a 3651 mdl A60 or B60 in one store. Each 3663 mdl 1 or each 3663 mdl 2 counts as 1 out of the 24. In addition, for backup purposes, a 3651 mdl A60 or B60 can control all the 3663 Supermarket terminals that are normally controlled by the other preassigned 3651 mdl A60 or B60 (normally at another location).

The 3651 mdl A60 or B60 (using the 3663 Supermarket Terminal) supports the following functions, in most combinations.

Customer Checkout

- Automatic pricing through code lookup in a master price file
- Automatic handling of multiple priced items
- Automatic handling of mix and match group pricing
- Automatic distribution of net sales by department (up to 54)
- Automatic application of transaction discounts
- Automatic computation of sales taxes with automatic handling of taxable and non-taxable items
- Provision for tax exempt transactions
- Automatic control of maximum value of food stamps that should be accepted
- Check authorization facilities (positive or negative) through lookup against a check authorization record
- Computation of change due

All functions can be controlled to inhibit initiation by unauthorized personnel.

Store Support

- Preparation of the following accounting reports:
  - -- store summary
  - -- individual cashier performance and tender reconciliation
  - -- store office tender reconciliation
  - -- sales by department (up to 54)
  - -- distribution of miscellaneous income and disbursements by account
- Current inquiries for department sales, cashier performance and cash position, and store cash position
- Inquiries and changes to master price records and operator authorization control records
- Setting time and date for the internal clock
- Customer checkout training mode
- Printing miscellaneous messages received previously from the host S/370, 30XX, or 4300 processor
- Entry of miscellaneous messages for subsequent retrieval by the host S/370, 30XX, or 4300 processor
- Reporting of items returned by customers which are returned to stock
- Updating the system with data received from the host S/370, 30XX, or 4300 processor
- Shelf Label preparation

The above functions are compatible with variable length reconciliation periods, e.g., daily or weekly, and they are compatible with 24 hour store operation. All functions are individually controlled to inhibit initiation by unauthorized personnel.

Data Accumulation: The 3651 mdl A60 or B60 accumulates the following by-product data for subsequent retrieval by the host: Item movement totals, all accounting and performance totals used in store reports, totals of taxes and taxable sales, productivity totals for each terminal station in 15 minute increments, check authorization data requested, and individual logged entries covering coupons received, exception events, and security sensitive events.

Host S/370, 30XX, or 4300 Processor Transmission: The 3651 mdl A60 or B60 can transmit to the host, upon receiving a request, all of the data shown under "Data Accumulation," and other data, or records in the 3651. The 3651 will clear out data or records upon request by the host. The 3651 can receive records, record changes, commands or other pertinent data from the host.

Communication Facilities: For in-store operation, two store loops provide the communications linkage to the 3663 Supermarket terminals. See *Installation Manual - Physical Planning* (GA27-3079).

The communications adapter permits operation at 2400 bps over communications common carrier facility type C5 for out-of-store communications. For information concerning that facility, see M2700 pages.

Prerequisites:

- A 3669 Store Communications Unit mdl 1 must be attached.
- A 3663 Supermarket Terminal mdl 1 must be attached.
- Any virtual storage S/370, 30XX, or 4300 processor (3158 or 3168 VTAM only). For minimum configuration requirements, refer to Host S/370, 30XX, or 4300 Processor System Programming pages.

One of the following must be used: a 3704, 3705, or 3725 Communications Controller or Communications Adapter on 4331 Processor. For S/370 mdls 115, 125 or 135, 135-3, 138, this may be an ICA equipped with the proper BSC and switched network features. The modem that is used by the 3704, 3705, 3725 or Communications Adapter on the 4331 Processor must be either a 3872 or equivalent or an IBM 2400 bps Integrated Modem with switched network features. .@SS@

One of the following must be utilized:

- 3704, 3705, or 3725 Communications Controller, equipped with appropriate features.
- ICA feature on S/370 mdls 115, 125, 135, 135-3, 138.
- Communication Adapter Feature on 4331 Processor.

Limitations: The modem used by the 3704, 3705, 3725 or Communications Adapter on 4331 Processor must be either a 3872 or equivalent, an IBM 2400 bps Integrated modem or equivalent, 3976 mdl 3 or a PTT mandatory modem with switched network features.

The Dual Communications Adapter is required if 600/1200 bps switched host communications and 2400 bps nonswitched backup communication is to be used.

Bibliography: GA27-3076

SPECIFY

- Voltage (AC, 1-phase, 60 Hz): Locking plug -- **#9884** for 208V, **#9886** for 230V. Non-locking plug -- **#9885** for 208V, **#9887** for 230V.
- RFI Standard: The RFI Standard **#2759)** is now provided on all machines as standard.
- Communications: **#9071** for Binary Synchronous Communication, or **#9072** for Synchronous Data Link Control Communication.
- Controller Designation: Specify **#9491** on the first 3651 to be used with a host system location and **#9492** on each additional 3651 in the network. When **#9491** is specified, additional information must be specified as follows:

  1) Specify one of the following to indicate magnetic tape density (media) used at the host system location. This tape media is available under DOS/VS, OS/VS1 and OS/VS2 only.

     #9412 -- 9-track 800 bpi
     #9413 -- 9-track 1600 bpi
     #9414 -- 9-track 6250 bpi

     The 3651 controller data will be sent via the specified media to the IBM Programming Systems Representative at the host system location for installation.

  2) Supplemental Specs (via Terminal Entry) are to be entered exactly as follows to indicate mailing address of host system location:

     Line 1--IBM Programming Systems Representative
     Line 2--c/o (Name of Customer)
     Line 3--Street Address (or P.O. Box)
     Line 4 (etc) -- City, State, Zip

     This is the address to which the first controller data tape will be automatically shipped for the first controller ordered (with specify code **#9491**). Whenever controller data is updated by an EC, the EC will be shipped to the most current TPC address.

     Note: The 3660 Supermarket System Host Support must be ordered from PID.

- Cable: A 10 foot cable to the 3669 is provided as standard. If a longer cable is required, specify **#9021**, indicating length as a quantity of 20, 30 or 40.
- Store Loop Polarity Tester: One is furnished at each site at no charge.

  Notes: The customer must provide (purchase, install and maintain) all necessary 3650 communication lines within the store. (Bulk Loop cable is available from IBM; see "Accessories".)
- Add'l DAA Cable: Specify **#9101** if second DAA Cable is required in configuration (forlusing switched 3872 modem to reload

3651 Store Controller Mdls A60, B60 (cont'd)

controller from host while system is being backed up from another store).

Codes: SIU = 3651 ID = H30

SPECIAL FEATURES

Storage Increment (#7680): Provides the 3651 with 8,192 bytes of additional control storage. **Maximum:** One . **Field Installation:** Yes.

MODEL CONVERSIONS

Model Changes between the model A50 or B50 and the model A60 or B60 are not recommended for field installation. 3651 features cannot be interchanged between model A60 and a model 50 or 75.

Model changes can be made in the field from model A60 to B60, A75 and B75, and from B60 to B75. Changes from A to B models require the replacement of integral disk storage. This change requires replacement of the integral disk storage. Adequate provision must be made for retaining the data contained on the replaced disk storage. All replaced parts become the property of IBM.

The following model changes can be made in the field:

From	To		
	B60	**A75**	**B75**
A60	X	X	X*
B60			X

* These model changes require the replacement of the integral disk storage. Adequate provision must be made for retaining data contained on the replaced disk storage at the host location so it can be transmitted to the new disk storage.

ACCESSORIES

Cables (P/N 5165886): Bulk Indoor Loop Cable to attach 3660 units may be purchased from IBM or a customer-selected source. See *Physical Planning Manual,* GA27-3074, or *3680 Site Planning and Site Preparation Guide,* GA27-3201, for bulk loop specifications. The customer is responsible for installation and maintenance of these cables. The bulk loop cable may be purchased from IBM. Bulk Indoor Loop Cable is available for duct or plenum installation. The following information pertains to this cable only: Indoor Cable: UL approved for duct and plenum installation. (NEC Art. 725-2b). Maximum allowable cable temperature range is -34 C to +105 C.
Ordering Instructions: Interior cable (P/N 7838695) should be ordered in multiple lengths of 304.8m (1,000 ft). **Warranty:** Loop Cable is warranted free from defects of workmanship and materials for 90 days.

SUPPLIES

Contact IBM.

3653 POINT OF SALE TERMINAL

[NO LONGER AVAILABLE]

PURPOSE

An intelligent input/output terminal for the 3650 Programmable and Retail Store System to provide retail point-of-sale data collection, credit authorization, and inquiry functions. Self-contained intelligence allows the 3653 to continue most sales functions when disconnected from the 3650 system after a parameter initialization from either the Store Controller or Magnetic Wand Reader.

MODELS

Model 1 001 — Not customer-programmable. Attaches to 3651 models B25, C25, A50, B50, A75, B75, C75 and D75.

Model 1P P01 — Customer programmable. Optionally will function as a model 1 (non-customer programmable). Attaches to 3651 models B25, C25, A50, B50, A75, B75, C75 and D75. When attached to Model A50 or B50, it can function as a model 1 only. Basic storage is 36K bytes. This may be increased to 60K bytes through installation of Storage Increment features.

HIGHLIGHTS

A solid state, unitized, packaged unit. It features: data entry via the magnetic wand reader feature and a 10 numeric-key, 19 function-key keyboard; step-by-step display of operator instructions; printing of data in response to an inquiry; display of numeric data as it is being key entered; transmission of data to a 3651 for logging over a unique transmission line capable of handling large volumes of short messages from many terminals; and a cash drawer with removable till.

Keyboard: A 10-key numeric pad and nineteen function keys provide entry for variable source data. Types of transactions are indicated through the numeric pad, as well as data fields. Once a field has been entered, the depression of a function key causes one or more of the following functions to happen: editing for minimum and maximum field length; modulo check; price look-up; credit authorization, printing; transmission to the 3651; and, change in guidance or error feedback.

Printer: A 3-station printer which produces a cash receipt or sales-check as well as a journal for each transaction.

Display: An 8-digit numeric display plus"$, ." and "–" with five backlit captions shows numeric data as it is being keyed, extended prices, status codes for credit referrals, subtotals, totals, amount due, change, and refund amounts.

Operator Guidance: Step-by-step instructions are provided to the operator for each transaction by twenty backlit messages. Additional guidance is provided by the type of transactions shown on the numeric keys.

Status Indicators: Advise the operator that the terminal is: ready for use, waiting for a response to an inquiry or transmission to the 3651, offline from its 3651, or that the journal roll take-up spool is full.

Prerequisites: The 3650 system controller is a 3651 Store Controller mdl 25, 50 or 75. See M3651 pages for details.

Proposal/Acknowledgement Letter Statements: Each Proposal and Acknowledgement letter must include the following statement:

> "It is agreed that IBM will have no responsibility to provide warranty or maintenance service on any 3653 which contains cash or other valuables. It will be the customer's responsibility to remove, control, and replace cash or other valuables so that IBM can fulfill its warranty and maintenance obligations.
>
> When a failure occurs in a cash drawer of any 3653 and it cannot be opened prior to maintenance by IBM, the customer will sign one of its personnel to assume responsibility for removal of the cash or other valuables when the drawer is opened."

Maintenance: Installation of 3653s in the immediate sales area may preclude the acceptability of online repair due to the public scrutiny and loss of the selling location for customer service. In these cases, the customer should remove the failing terminal to a repair facility located within the store for subsequent repair. At this location the CE will repair and test the terminal online via a customer provided store loop termination.

Bibliography: *IBM 3650 Retail Store System Introduction,* GA27-3075.

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug.
- Journal Lock: **#9322** if lock is desired on access cover to journal take-up roll, journal tape supply, and cash receipt tape supply. For additional or replacement locks and keys, see "Accessories".
- Till Cover with Lock: **#9770** if top cover for cash drawer till is desired. For additional tills and covers and additional or replacement cash drawer locks and keys, see "Accessories".
- Till with movable bill dividers: **#9799** if movable bill dividers are desired. Otherwise, a till with fixed bill dividers will be supplied.
- Cash Drawer Lock: The 3653 is equipped with a cash drawer lock. A group of 25 unique lock numbers has been reserved to allow a customer to specify identical lock types on all terminals. This allows all cash drawers to be opened with the same key. If this is desired, specify one of the following types on the 3653 order:

#9101	**#9106**	**#9111**	**#9116**	**#9121**
#9102	**#9107**	**#9112**	**#9117**	**#9122**
#9103	**#9108**	**#9113**	**#9118**	**#9123**
#9104	**#9109**	**#9114**	**#9119**	**#9124**
#9105	**#9110**	**#9115**	**#9120**	**#9125**

  If none is specified, a lock will be selected at random from a larger group of lock types; each 3653 will be shipped with two cash drawer keys. For additional or replacement keys, see "Accessories".
- Fractional Quantity Key: Specify **#9188** if the Fractional Quantity Selectable Function is chosen. Provides a key on the 3653 Keyboard with appropriate nomenclature.
- Adding Machine Layout on Modifiable Keyboard: Specify **#2996** provides an "adding machine" layout of the numeric keys instead of the "touch-tone" pad layout normally shipped on the Modifiable Keyboard feature (#4990). Adding machine layout provides a key arrangement of: Top row (7,8,9); middle row (4,5,6); bottom row (1,2,3). **Field Installation:** Not recommended.

SPECIAL FEATURES

Functional Expansion Increment - Type I (#4223): [Mdl 1] Provides the 3653 with the capability to support additional functions. The capability provided by this feature is equal to that provided by Functional Expansion (#4222) (see Note 1 below). **Limitations:** The third Type I Increment (#4223) cannot be Installed on a 3653 with Functional Expansion Increment - Type II (#4224). #4223 is mutually exclusive with #4222 (see Note 2 below for allowable configurations). **Maximum:** Three. **Field Installation:** Yes.

Functional Expansion Increment - Type II (#4224): [Mdl 1] Provides the 3653 with the capability to support additional functions. The capability provided by this feature is twice that provided by Functional Expansion Increment - Type I (#4223) (see Note 1 below). **Limitations:** Cannot be installed on 3653 with third Functional Expansion Increment - Type I (#4223). #4224 is mutually exclusive with #4222. See Note 2 below for allowable configurations. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Must have two Functional Expansion Increment - Type I (#4223) installed.

Storage Increment (#4225): [Mdl 1P] Provides an additional 8,176 bytes of storage. **Maximum:** Three. **Field Installation:** Yes.

IML-Read Adapter (#4632): Provides a means to initialize 3653 terminals when a 3651 Store Controller mdl B25, C25, A75, B75, C75 or D75 is unavailable or unable to provide the IML (Initial Machine Load). An adapter is provided for attaching an external tape cassette recorder (refer to *IBM 3650 Retail Store System Introduction,* GA27-3075) and reading data previously recorded at a 3651 equipped with the IML-Write Adapter (#4633). **Maximum:** One. **Field Installation:** Yes.

Magnetic Wand Reader (#4944): A hand operated wand used to read single track delta distance encoded magnetic merchandise tickets, credit cards, and employee badges. The small lightweight wand attached via a four foot long, flexible cord, allows encoded merchandise tickets to be read without removing them from the merchandise. See Notes 3 and 4 below. **Maximum:** One. **Field Installation:** Yes.

Modifiable Keyboard (#4990): Provides an alternate keyboard designed to aid in faster keying and in customizing to a user's requirements. Provides up to 16 department motor keys. **Maximum:** One. **Field Installation:** Not recommended.

Notes

(1) Order Confirmation of allowable or maximum combination of additional functions to be used with Functional Expansion Increments must be obtained from IBM.

(2) The table below defines Plant Installable configurations and the maximum allowable field upgrades of #4223 and #4224.

(3) The minimum encoding specifications that must be met by suppliers of credit cards, merchandise tickets and employee badges will be furnished upon request.

(4) See "Program Loading at Power-On Time" below for other use of wand.

3653 Point of Sale Terminal (cont'd)

	Number Of Functional Expansion Increments							
If Plant Installed Configuration is:								
Type I (#4223)	0	0	1	1	2	2	2	3
Type II (#4224)	0	0	0	0	0	0	1	0
Is Field Upgrade Possible?	Yes	Yes	Yes	Yes	Yes	Yes	No	*
Maximum Upgrade Above Plant Installed Configuration Allowable is:								
Type 1 (#4223)	2	3*	1	2*	1*	0	0	0
Type II (#4224)	1	0	1	0	0	1	0	1*

* Customers who elect to purchase the third #4223 and anticipate later ordering #4224 should consider purchase of #4224 initially because field upgrade requires the replacement of the third #4223.

Program Loading at Power-On Time

With 3650 Retail Store System Release I:

3651 Available: The IML and Parameter Initialization are loaded from the 3651 Store Controller.

3651 Unavailable: The IML must be obtained from a back-up 3651 Store Controller Parameter Initialization is accomplished by wanding magnetically encoded tickets with the Magnetic Wand Reader (#4944) at each 3653.

With Retail Store System Release II and Release III:

3651 Available: The IML, selectable functions and Parameter Initialization are loaded from the 3651 Store Controller.

3651 Unavailable: The IML, selectable functions and Parameter Initialization requires one 3653 with the IML-Read Adapter (#4632) feature on each local loop and at each remote location.

With 3650 Programmable Store System:

3651 Available: This IML is loaded from the 3651 Store Controller.

3651 Unavailable: The IML requires one 3653 with the IML Read Adapter (#4632) feature on each local loop and at each remote location.

MODEL CONVERSIONS

Model changes from Model 1 to Model 1P can be made in the field. All replaced parts of the base model become the property of IBM. The Functional Expansion features (#4222, #4223 and #4224) cannot be interchanged between the 3653 Model 1 and the 3653 Model 1P and would remain with the customer if a model change is made.

ACCESSORIES

Cash Till and Cover With Lock: Additional cash tills and till covers with locks may be ordered.

Cash Till Cover with Lock and Keys P/N 1851126
Cash Till with Fixed Bill Dividers (without cover) P/N 1860154
Cash Till with Adjustable Bill Dividers (without cover) P/N 2493151

Notes: Assembly of the Adjustable Till is a customer responsibility. The following item is also available but on a purchase-only basis:

Cash Till Cover with Lock and Keys **#9335**

Keyboard Accessories: The following terms are used in the KEYTOP descriptions:

VERSION	STEM NUMBER/KEY ALIGNMENT
OV	One/Vertical
OH	One/Horizontal
OVH	One/Vertical or Horizontal
TV	Two/Vertical
TH	Two/Horizontal
-B	Small raised projection in keytop
-C	Circular, concave top on key button
-M	Minimal concavity of circular keytop
SIZE	**UNITS**
Square	1 x 1
Single	1 x 1-1/3
Long	1 x 2
Double	1-1/3 x 2

Engraved Keytops: Keytops containing pre-defined messages are available for use on the 3653 terminal keyboards. Blank keytops are also available for customer engraving.

Retail Keytops: The following is a list of pre-defined keytops available in the 3650 Retail Store System nomenclature:

NAME	COLOR	SIZE	VERSION	HEIGHT	P/N
1	White	Square	OH	Std	1650742
2	White	Square	OH	Std	1650743
3	White	Square	OH	Std	1650744
4	White	Square	OH	Std	1650745
5	White	Square	OH-B	Std	1650746
6	White	Square	OH	Std	1650747

Universal Keytops: Keyboard accessories are available which allow the customer to define and to change the messages on the keytops on the 3653 Retail terminals. These accessories consist of legendable keytops and sheets of blank labels to use on these keytops.

The universal keytops come in the four standard sizes and in two heights. They consist of two parts; a white bottom button and a clear plastic cover. Blank labels for the various keytop sizes may also be ordered. These labels come in various colors and may be printed with either black or white ink. The user may define unique key button messages, print these messages on the desired color label, affix the printed color label to the white bottom key button and snap on the clear protective cover. Extra clear plastic covers are also available for use as spares.

Key Stops (P/N 1650058): The key stop is a small ring collar which is placed over the stem of a keybutton and under the keytop. The collar holds the keytop in the up position and prevents its use.

Keytop Extractor (P/N 1647720): The keytop extractor is a small plier-like device which fits between rows of keybuttons. By squeezing on the handles, a firm grip is made on the keytop and it may be pulled off its stem. The customer may find this helpful when adding key stops, universal keytops, or in doing any rearranging of the keyboard.

Two keytop extractors are supplied with each 3651 controller. The customer may desire additional extractors.

Locks and Keys: The 3653 is equipped with a cash drawer lock and can be equipped with an optional journal lock **(#9322)**. The terminal is shipped with two cash drawer keys. The cash drawer lock will be randomly selected unless specified otherwise. If the customer wishes to add or replace keys or locks with a specific identification number (stamped on lock and key) he should state the 3653's machine serial number and the key identification number. For replacement keys, the key part number listed below is also required. **Note:** Without a Key Identification Number, the order should state Machine Serial Number and the words "NEW LOCK REQUIRED." If the optional journal lock is specified, the terminal will be shipped with two journal keys also. Additional or replacement keys may be purchased from IBM or a local locksmith. Locks may be changed in the field.

3653 Cash Drawer Lock (including two keys), P/N 1851086
3653 Journal Lock, P/N 5998329
3653 Journal Lock Key, P/N 5182265 (order by machine type and P/N)
3653 Cash Drawer Lock Key, (order by machine type, lock serial number, and key P/N from the following chart):

Lock Serial Number	Lock Key P/N
H2601 - H2800	8549431
H2801 - H3000	8549482
H3001 - H3200	6021144
H3201 - H3400	6021145

SUPPLIES

Ribbons: A black ribbon cartridge, P/N 1136970 or equivalent, should be used for machines installed prior to June, 1975. Machines installed after this date and those machines previously installed that are changed to the new ribbon drive mechanism should use P/N 1136660 or equivalent.

Contact IBM.

3657 TICKET UNIT

PURPOSE

Magnetic Merchandise Ticket Input/Output Unit for the 3650 Programmable and Retail Store System.

MODELS

Model 1 001

Maximum: The maximum number of 3657s that can be attached to a 3651 depends upon the number of positions available and the traffic volumes and response times required.

Prerequisites: An available loop position.

HIGHLIGHTS

The 3657 is an online, high speed batch ticket encoder that can also perform batch ticket reading. Tickets are one inch high and contain a magnetic stripe 1/4-inch wide that runs the length of the ticket. The 3657 encodes this stripe with machine readable data which is read by the 3657 or by a wand reader available on the 3653 Point of Sale Terminal. Tickets also contain two lines of human readable data.

Two general types of tickets are used. For additional ticket types, contact IBM for details.

Two types of tickets used:

(1) **Label** -- 1-inch x 1-inch self-adhering paper stock with a protective backing. The 1-inch x 1-inch label dimension applies to label and backing. The label when detached is approximately 0.940-inch x 0.940-inch.

(2) **Tag** -- 1-inch x 2-inch and 1-inch x 3-inch heavy-duty paper stock attached to merchandise by hanging or stapling.

Input: 1-, 2- or 3-inch roll stock or 2 inch individual tags.

Batch Reading: Individual 2-inch tickets can be read from a cartridge. Tickets are fed from a removable cartridge and, if successfully read, directed to a ticket bin. Tickets that are unsuccessfully read are stacked into an identical cartridge. Additional or replacement cartridges can be ordered.

Output: 1-, 2- or 3-inch roll, strip or 2 inch individual tags.

Rated Speed: Speed is dependent on length of ticket, number of header tickets, output method selected and competing traffic on the Loop.

Header Tickets: Are print-only tickets which may be interspersed in the ticket output stream for batch or purchase order identification. Header tickets are not considered as merchandise identifiers.

Tickets per Minute

Ticket Size	Approximate Speed
1-inch roll	500
2-inch roll	250
3-inch roll	167
2-inch individual	130 (both make mode and read mode)

Printing: The two lines of human readable data are printed with two identical eight wire matrix print heads. Characters are 0.117 inch high spaced 12 characters per inch. A 64-character set oriented to the retail industry is provided. Uses a cassette ribbon replaceable by the customer ... contact IBM.

Ticket Data Content

	No. Characters	
Ticket Size	Encode	Print
1-inch	19	22
2-inch	40	42
3-inch	60	64

SPECIFY

- Voltage (AC, 1-phase, 3-wire, 60 Hz): **#9901** for 115V.

MODEL CONVERSIONS None

ACCESSORIES

Hopper/Stacker Cartridge (P/N 5560620): The 3657 is shipped with two hopper/stacker cartridges. Additional or replacement cartridges may be purchased.

SUPPLIES

Merchandise tickets may be purchased from the Systems Supplies Division. For information pertaining to prices and delivery schedules, contact an SSD sales representative.

3659 REMOTE COMMUNICATIONS UNIT

PURPOSE

The 3659 is a 2400 bps signal converter, used to provide store loop capability to establishments that are remotely located from the 3651 Store Controller model 50 or 75. The 3659 is used at each remote location to interface to common carrier-provided voiceband private line (nonswitched) channels for data transmission and to the store loop for Programmable and Retail Store System operations.

MODELS

Model 1	001	Point-to-point remote communications unit.
Model 2	002	[NO LONGER AVAILABLE] Multipoint remote communications unit.

HIGHLIGHTS

If a single remote site is served, the 3659 mdl 1 operation is duplex over a 4-wire duplex line connecting the store to the 3651. If two or three remote sites are served, the 3659 mdl 1 operation is duplex over 2-wire half-duplex lines connecting the stores to the 3651 in a serial manner. The use of the 3659 mdl 2 can provide service to up to twelve remote sites using a 4-wire duplex multipoint configuration.

Data Rate -- 2400 bps.

Equalization -- manually adjusted by an operator.

Problem Determination Aids: Included in each 3659 Remote Communications Unit are the following problem determination aids accessible to the operator:

- The unit may be wrap tested independently of the attached telecommunication line and store loop.
- The unit may be line tested (with telecommunication lines) and the modem at the 3651 or the adjacent 3659(s) independent of the store loop.

Communication Facilities

Common Carrier Nonswitched Facilities: Voiceband private line (nonswitched) channel type 3002 (or equivalent).

Privately Owned Communications Facility: Equivalent to above.

Attachment to Communication Line -- Via one cable provided by the 3659 and a second cable to interface to the store loop.

Related Equipment -- The 3659 mdl 1 communicates with 3659 mdl 1s at other remote sites and/or a 3872 Modem with #6101 or #6102 which is connected to the first or second Remote Loop Adapter special feature on the 3651 Store Controller mdl 50. The 3872 in this application may require an RPQ. See M3872 pages.

The 3659 mdl 2 communicates with a 3872 Modem without any special features or with #6302 only in a multipoint configuration. The 3872 is the control station modem in the multipoint network.

Customer Responsibilities:

1. The customer must provide (purchase, install, and maintain) all the necessary 3650 communication lines within the store. (Bulk Loop Cable is available from IBM.)
2. See the M2700 pages. The customer is responsible for the following: Obtaining assurance from the local common carrier that the telephone service provided will comply with the facilities described in the Bell System Technical Reference, *Transmission Specifications for Voice Grade Private Line Data Channels,* dated March, 1969, for Type 3002 lines with C-1 conditioning. *Data Communications Using Voiceband Private Line Channels,* PUB 41004, October 1973, for a 3002 channel. Inform the common carrier that the speed of the operation will be 2400 bps.

Bibliography: GA27-3075

SPECIFY

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Locking plug -- **#9880** for 115V, **#9884** for 208V, **#9886** for 230V. Non-locking plug -- **#9881** for 115V, **#9885** for 208V, **#9887** for 230V.

MODEL CONVERSIONS (None)

ACCESSORIES (None)

SUPPLIES

Contact IBM.

3661 STORE CONTROLLER

[NO LONGER AVAILABLE]

PURPOSE

The control unit for a 3660 Supermarket Key-Entry System controls all functions of the 3663 Supermarket terminals and provides for communication with the appropriate Host System. See "Communication Facilities" and "Prerequisites".

MODELS

Model 1	001	A controller that houses a direct access diskette drive with a 1-sided removable diskette.
Model 2	002	A controller with a diskette drive which accommodates a 1- or a 2-sided removable diskette.

Prerequisites: One 3663 Supermarket Terminal mdl 2 must be locally attached.

A properly equipped S/370 or 4300 processor must be available. The S/370 or 4300 processor must contain a virtual storage processor. For minimum configuration requirements, refer to S/370 or 4300 System Programming pages. In addition, either a 3704 or 3705 must be used or an ICA on a S/370 mdl 115, 125, 135, 135-3 or 138, or a Communications Adapter (#1601) feature on the 4331. 1200 bps external modems may be used with 3704, 3705, and ICA on S/370 mdl 115, 125, 135, 135-3 or 138, or a Communications Adapter (#1601) feature on the 4331. 1200 bps internal modems may be used with 3704, 3705, and ICA on S/370 mdl 115 or 125, or a Communications Adapter (#1601) feature on the 4331. For required features, see M2700 pages.

Communication Feature - one of the following arrangements must be used:

(1) Communications Feature With Clocking (#1482), Interface (#3701), and an external modem operating at 1200 bps, or

(2) Communications Feature With Clocking (#1482), 1200 bps Integrated Modem-Switched (#5501), and FCC registered protective circuitry of the CBS type (or equivalent) provided by the user.

IBM has not tested the 3660 Supermarket Key-Entry System on non-virtual IBM Systems. If a customer elects to establish communications with other than a virtual host system, he must understand that IBM does not assume responsibility for the resolution of any programming problems resulting from this system configuration.

HIGHLIGHTS

Up to 12 (optionally 18) 3663 Supermarket Terminals may be included in a 3660 Supermarket Key Entry System. One 3663 mdl 2 must be attached to the 3661 via local attachment, (standard) and a second, or third 3663 mdl 2 may be attached to the 3661 via the optional 3663 mdl 2 Local Attachment Feature. All other 3663 Terminal Stations in the system, up to 11, or optionally up to 17, depending locally upon the number of locally attached stations, are attached via a store loop.

The 3661 with the 3663 Supermarket Terminals provides the following functions:

Customer Checkout

- Automatic pricing through code look-up in a master price file for up to 250 items standard and up to 1,275 items with Add'l Storage (#1222).
- Automatic handling of multiple priced items in master file.
- Automatic handling of mix and match group pricing for items in the master price file.
- Automatic distribution of net sales by department.
- Automatic application of transaction discounts.
- Automatic computation of sales taxes, if applicable, with automatic handling of taxable and non-taxable items.
- Automatic control of maximum value of food stamps that should be accepted.
- Check verification facilities (negative with reason code) through look-up against a check verification record.
- Computation of change due.

All functions can be controlled to inhibit initiation by unauthorized personnel.

Store Support: Preparation of the following accounting reports:

- Store Summary
- Individual cashier performance and tender reconciliation
- Store office tender reconciliation
- Sales by department (up to 9)
- Distribution of miscellaneous income and disbursements by account.
- Current inquiries for department sales, cashier performance and cash position, and store cash positions.
- Maintenance of master price file, check verification file, and operator authorization file.
- Productivity totals for each terminal station and store totals in 60 minute increments.
- Setting time and date for the internal clock.
- Customer checkout training mode.
- Printing miscellaneous messages received previously from from the host.
- Entry of miscellaneous messages for subsequent retrieval by the host.
- Reporting of items returned by customers which are returned to stock.
- Updating the system with data received from the host.
- Shelf Label Preparation.

Most store support functions may be performed concurrently with customer checkout. All functions are individually controlled to inhibit initiation by unauthorized personnel.

Data Accumulation: The 3661 accumulates the following by-product data for subsequent retrieval by the host: Item movement totals, all accounting and performance totals used in store reports, totals of taxes and taxable sales, if applicable, productivity totals for each terminal station in increments of sixty minutes, exception events, and security sensitive events.

Host S/370 Or 4300 Processor Transmission: The 3661 can transmit to the host, upon receiving a request, all of the data shown under "Data Accumulation" and other data or records in the 3661. The 3661 will clear out data or records upon request of the host. The 3661 can receive records, record changes, commands or other pertinent data from the host. See "Programming Support" section for description of host, programming support, and requirements. Host communication cannot be performed concurrently with customer checkout or store support procedures.

Communication Facilities: For in-store operation, a store loop provides the communication link to the 3663 Supermarket Terminals. See *Installation Manual-Physical Planning,* GA27-3079, for further information.

The Communications Adapter permits operation at the speeds indicated over the facilities shown below when using the appropriate modem. For information concerning the facilities, see M2700 pages.

1200 bps ... on the public switched telephone network C2.

SPECIFY

- Voltage (115V AC, 1-phase, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug.
- Communications:

  Binary Synchronous Communication **#9075**
  Synchronous Data Link Control **#9076**
- Modem Cable (external modem): A 10-foot cable to the modem is standard. If a longer cable is required, specify **#9442**, indicating length as a quantity of 20, 30, 40, or 50 feet.
- Store Loop Polarity Tester: Order Store Loop Polarity Tester, P/N 1859559, from plant of manufacture. One is furnished at no charge to each 3660 site for testing Store Loop wiring.

SPECIAL FEATURES

Add'l Storage (#1222): Provides an additional 8,192 bytes of storage to increase the number of item records from a minimum of 250 to a maximum of 1,275. **Maximum:** One. **Field Installation:** Yes.

Communications With Clocking (#1482): Required for attachment to communication facilities through the 1200 bps Integrated Modem (#5501) or any external modem which does not have internal clocking. Also required for CCITT Interface (#3701). **Maximum:** One. **Field Installation:** Yes.

EIA Interface (#3701): Provides the interface logic necessary to attach an external modem for communications to the host processor. Non-IBM modems may be attached subject to the Multiple Suppliers policy. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Cannot be installed with #5501. **Prerequisites:** (1) #9442 for cable length specify quantity of 10, 20, 30, 40 or 50 feet ... (2) #1482.

1200 bps Integrated Modem, Switched (#5501): Provides the point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. **Limitations:** Cannot be installed with Interface (#3701). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1482. The user must provide FCC registered protective circuitry of the CBS type (or equivalent).

3661 Store Controller (cont'd)

Scale Adapter (#6672): Allows attachment of an electronic scale that meets the interface requirements in *Scales Interface to the IBM 3663 Supermarket Terminal* document which is available from Corporate Industry Relations for use with locally attached 3663 mdl 2. **Maximum:** Two. **Field Installation:** Yes. **Specify: #9576** if scale will be used with first 3663 mdl 2, or **#9577** if it will be used with second 3663 mdl 2.

3663 Mdl 2 Local Attachment (#8110): Provides for the local attachment of a second 3663 mdl 2. **Maximum:** One. **Field Installation:** Yes. **Note:** The first 3663 mdl 2 attachment is provided in the basic 3661.

Local Attachment Feature For Third 3663 Mdl 2 (#8111): Provides for the third local attachment of a 3663 mdl 2 terminal station. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #8110.

MODEL CONVERSIONS

Model 1 may be changed to a model 2 by field installation. A mdl change requires the replacement of the diskette storage device. Adequate provision must be made for retaining data contained on the diskette by having the user remove it prior to the start of any conversion.

ACCESSORIES (None)

SUPPLIES

Contact IBM.

3663 SUPERMARKET TERMINAL

PURPOSE

In conjunction with the 3651 mdl B25, C25, A60, B60, A75, B75, C75, D75 Store Controller or the 3661 Store Controller, the 3663 Supermarket Terminal provides the input and output facilities necessary to process transactions in a supermarket environment. It replaces and extends the function of mechanical supermarket registers.

MODELS

Model 1 001 [NO LONGER AVAILABLE] **Station and Control** -- One printer, display, keyboard, cash drawer and control segment for operating one checkstand.

Model 1P P01 [NO LONGER AVAILABLE] **Station and Control** -- One printer, display, keyboard, cash drawer and customer programmable control segment for operating one checkstand.

Model 2 002 [NO LONGER AVAILABLE] **Station Only** -- One printer, display, keyboard, and cash drawer that attaches to a 3663 model 1, 1P , 3 or 3P or the 3661 Store Controller , for operating additional checkstands. One 3663 model 2 must be attached to the 3661, a second and a third 3663 model 2 may be attached via #8110 and #8111 respectively (#8110 is a prerequisite for #8111.)

Model 3 003 [NO LONGER AVAILABLE] **Control Segment Only** -- A control segment for controlling one, or optionally up to three 3663 model 2s. **Note:** The first 3663 model 2 attachment is provided in the basic 3663 model 3.

Model 3P P03 [NO LONGER AVAILABLE] **Control Segment Only** -- A customer programmable control segment for controlling one or optionally up to three, 3663 model 2s. **Note:** The first 3663 model 2 attachment is provided in the basic 3663 model 3P.

Limitations: The mdl 1 is not available in conjunction with the 3651 Store Controller mdl B25, A75, B75, C75, or D75.

The mdl 1P is not available in conjunction with the 3651 Store Controller mdl A60 or B60 - Supermarket or with the 3661 Store Controller.

The mdl 3 is not available in conjunction with the 3651 Store Controller mdl B25, A60, B60, A75, B75, C75, or D75.

The mdl 3P is not available in conjunction with the 3651 Store Controller mdl A60 or B60 - Supermarket or with the 3661 Store Controller.

Prerequisites: One 3663 mdl 2 must be attached to the 3663 mdl 3.

With 3651 Store Controller mdl B25, C25, A75, B75, C75 or D75: (1) An available store loop position ... (2) For attachment of a 3663 mdl 2 to the store loop, a 3663 mdl 1P with a Mdl 2 Attachment Feature is a prerequisite unless the 3663 mdl 2 is attached to a 3663 mdl 3P. For attachment of a 3663 mdl 2 to a 3663 mdl 3P, a Mdl 2 Attachment Feature (#4900) is a prerequisite if it is the second 3663 mdl 2 attached to the 3663 mdl 3P. A 3rd Mdl 2 Attachment Feature (#4901) is a prerequisite if it is the third 3663 mdl 2 attached to the 3663 mdl 3P. **Note:** The first 3663 mdl 2 attachment is provided in the basic 3663 mdl 3P.

With 3651 Store Controller mdl A60 or B60: (1) A 3669 Store Communications Unit and an available store loop position ... (2) A 3663 mdl 1 with a Mdl 2 Attachment (#4900) feature is prerequisite for each 3663 mdl 2 to be added to a store loop.

With 3661 Store Controller: (1) An available local attachment on the 3661 or a store loop position. **Note:** One 3663 mdl 2 must be attached to the 3661 via the standard local attachment. One or two additional 3663 mdl 2s can be locally attached via optional Local Attachment Features) ... (2) For attachment of a 3663 mdl 2 to the store loop a 3663 mdl 1 with a Mdl 2 Attachment Feature is a prerequisite, unless the 3663 mdl 2 is attached to a 3663 mdl 3. For attachment of a 3663 mdl 2 to a 3663 mdl 3, a Mdl 2 Attachment Feature (#4900) is a prerequisite if it is the second 3663 mdl 2 attached to the 3663 mdl 3. A 3rd Mdl 2 Attachment Feature (#4901) is a prerequisite if it is the third 3663 mdl 2 attached to the 3663 mdl 3. **Note:** The first 3663 mdl 2 attachment is provided in the basic 3663 mdl 3.

HIGHLIGHTS

Has a storage area for each station into which keyed (or scanned if a 3667 Checkout Scanner is attached) data is entered prior to being transmitted to the 3651 Store Controller mdl B25, C25, A60, B60, A75, B75, C75 or D75 or the 3661 Store Controller. Checks for code accuracy, sequence control, field length, and correct number of fields. Another storage area at each station is used for receiving a previously entered message after being processed at the 3651 mdl B25, C25, A60, B60, A75, B75, C75 or D75 or the 3661. Upon receiving messages, data is edited and transferred to the printer and display.

With the appropriate special adapter features, the 3663 can attach non-IBM coin and trading stamp dispensers, non-IBM front end scales, and 3667 Checkout Scanners. In addition, a Document Insert feature can be added to the printer to allow "franking" (printing special data) on checks.

Keyboard: Has a ten-key numeric pad plus function keys. In part these include department keys, special item modification keys (for price, quantity and weight entries), tender payment keys, coupon entry keys, and other related supermarket required keys. (See the *IBM 3660 Supermarket System Introduction Manual*, GA27-3076, or the *IBM 3650 Programmable Store System Introduction Manual*, GA27-3163, for details).

Printer: Has two tape print locations as standard. Using a horizontal radial printing technique, the first tape printed is the customer receipt. The second tape is for summary journal data. An optional Document Insert feature position may be added. Alphameric printing is accomplished with a dot matrix print head. Printing in each position is up to 30 characters. Customer receipt tape printing is at 80 lines per minute. Summary journal tape printing is at 50 lines per minute. Document Insert printing is at 35 lines per minute. Shelf labels can be printed at 3-4 labels per minute, depending upon the size of the label.

Cash Drawer: Has a removable and lockable till with five spring-weighted bill compartments and five coin compartments.

A 3-position lock controls power to the station and manually opens the drawer regardless of power status. The key is removable in any position. No terminal function can be initiated with the drawer open.

Display: A variable character display panel allows displaying an alphameric message of up to 22 characters in length. Characters are 0.4 inches high and variable in width.

Communications: Provided over two 2-wire customer-provided loops called store loops. Messages from the 3651 mdl B25, C25, A60, B60, A75, B75, C75 or D75 or the 3661 are monitored by the 3663 Supermarket Terminalvfor terminal destination. A pluggable address scheme is provided for terminal numbering. See the *Installation Manual - Physical Planning*, (GA27-3079) for the 3660 Supermarket System and *Installation Manual - Physical Planning*, (GA27-3167) for the 3650 Programmable Store System.

Packaging: Stations can be specified fully integrated (all I/O segments under a single cover) or integrated with a remote display. An optional special feature with a specify code will provide a distributed station (I/O segments separately covered to allow location flexibility).

Proposal/Acknowledgement Letter Statements: Each Proposal and Acknowledgement Letter must include the following statement: "It is agreed that IBM will have no responsibility to provide warranty or maintenance service on any 3663 which contains cash or other valuables. It will be the customer's responsibility to remove, control, and replace cash or other valuables so that IBM can fulfill its warranty and maintenance obligations.

When a failure occurs in the cash drawer of any 3663 and it cannot be opened prior to maintenance by IBM, the Customer will assign one of its personnel to assume responsibility for removal of the cash or other valuables when the drawer is opened."

Maintenance: Agreement for IBM to install and maintain the 3663 must be reviewed by FE area management prior to making any commitment to the customer.

SPECIFY

- Voltage (115 V AC, 1-phase, 60 cycle): **#9880** for locking plug, or **#9881** for non-locking plug.
- Power (AC, 1-phase): Specify one.
- Packaging: Specify **#9547** for fully integrated, **#9549** for integrated but with remote display. Specify **#9548** for distributed; special feature #3425 (Distributed Station) is a prerequisite. Specify one specify code for each 3663 mdl 1 or mdl 1P and one for each 3663 mdl 2; if **#9548**, feature code #3425 for each 3663 mdl 1, 1P and mdl 2 also. Specify codes need not be the same for all 3663s in a store. Changes in packaging of installed terminals are not permitted in the field.
- Cabling: See cable order form Z120-2516 and refer to *Installation Manual-Physical Planning* (GA27-3079) for the 3660 Supermarket System and *Installation Manual-Physical Planning* (GA27-3167) for the 3650 Programmable Store System.
- TARE key: Specify **#9737** for providing a keytop that has the word "TARE" on it to replace the lower blank key on the 3663. Do not specify if Optional Keyboard (specify code **#9488**) is ordered. Delete this specify on existing orders pending if Optional Keyboard (specify code **#9488**) is to be added. **Note:** The use of Tare capability is mandatory in the State of California.

3663 Supermarket Terminal (cont'd)

- Keytop Arrangement: Specify **#9353** for a reversed keypad (top row -- 7, 8, 9; middle row -- 4, 5, 6; bottom row -- 1, 2, 3). **Limitations:** In the 3660 Supermarket Scanning and Key Entry Systems, if installed on one 3663 mdl 1 or 2, it must be installed on all 3663 mdl 1s and 2s in the store. Do not specify if Optional Keyboard (specify code **#9488**) is ordered. Delete this specify on existing orders pending, if Optional Keyboard (specify code **#9488**) is to be added. In the 3650 Programmable Store System, all 3663 mdl 2 terminals attached to the same 3663 mdl 3P must have the same type of keyboard and the same key assignments -- paired mdl 1P and 2 terminals must have the same type of keyboard and the same key assignments. **Field Installation:** Not recommended.
- Cash Drawer Locks: A separate group of 25 lock numbers has been set aside to allow a customer to use the same key in multiple terminals. If this is desired, specify one of the following locks on the 3663 order:

#9101	**#9106**	**#9111**	**#9116**	**#9121**
#9102	**#9107**	**#9112**	**#9117**	**#9122**
#9103	**#9108**	**#9113**	**#9118**	**#9123**
#9104	**#9109**	**#9114**	**#9119**	**#9124**
#9105	**#9110**	**#9115**	**#9120**	**#9125**

  If this option is not specified, a lock will be randomly selected from another, larger, group of unique lock numbers.
- Till Option: Specify **#9799** for shipment of a till with adjustable bill dividers. If this option is not selected, an assembled till with fixed bill dividers will be shipped.
- Keyboard Type: One keyboard type must be specified for each 3663 mdl 1, 1P and 2. Specify code **#9020** will provide the Regular Keyboard with the 10-key pad positioned on the left. This keyboard may have up to nine department keys. **Limitations:** In the 3660 Supermarket Scanning and Key Entry System, if installed on more than one 3663 in the local or back-up store, all key assignments must be the same. Not compatible with Optional Keyboard (**#9488**). In the 3650 Programmable Store System, all 3663 mdl 2 terminals attached to the same 3663 mdl 3P must have the same type of keyboard and the same key assignments - paired mdl 1P and 2 terminals must have the same type of keyboard and the same key assignments. **Field Installation:** Not recommended.

  Specify code **#9488** will provide the Optional Keyboard with the 10-key pad positioned in the center. The left to right dimension is 16-1/2 inches in the distributed version, special feature code #3425, (no change in the size of the integrated version). An expanded keytop shipping group is included to provide variety in colors, heights and sizes of blank keytops. Also, a means is provided to allow placing single or double sized keys in many locations. **Limitations:** In the 3660 Supermarket Scanning and Key Entry System, this keyboard must be installed on all 3663s in a store and is not compatible with specify code **#9020**, the Regular Keyboard. All key assignments must be the same. In the 3650 Programmable Store System, all 3663 mdl 2 terminals attached to the same 3663 mdl 3P must have the same type of keyboard and the same key assignments - paired mdl 1 and 2 terminals must have the same type of keyboard and the same key assignments. **Field Installation:** Not recommended. **Prerequisites:** In the 3660 Scanning System, special feature #3880 is required on all 3663 mdl 1s in the store if any of the following features are installed in the same store: Coin Dispenser Adapters -- #1821, #1822.

SPECIAL FEATURES

Storage Expansion Feature (#1580): [Mdls 1P, 3P] Provides the capability of installing storage increments 4 through 9. **Limitations:** This feature now applies only to mdls 1P and 3P that were scheduled for shipment prior to August 1, 1980 and lower than EC level 320637. **Maximum:** One. **Field Installation:** Yes.

Checkout Scanner Adapter Type 2 (#1763): [Mdls 1, 1P] Allows attachment of a 3667 checkout Scanner for operation with the 3663 mdl 1 or 1P to which it is attached. **Limitations:** Cannot be installed when 3663 is attached to the 3661 Store Controller. Cannot be installed when #1761 is installed. **Maximum:** One. **Field Installation:** Yes.

2nd Checkout Scanner Adapter Type 2 (#1764): [Mdls 1, 1P] Allows attachment of a 3667 Checkout Scanner for operation with an attached 3663 mdl 2. **Limitations:** Cannot be installed when 3663 is attached to the 3661 Store Controller. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1763, #4900 and the 3663 mdl 2.

Coin Dispenser Adapter Type 2 (#1821): [Mdls 1, 1P, 3, 3P] Allows attachment of an 8-column Coin Dispenser (that meets the interface requirements in "Non-IBM Coin Dispenser Attachment Interfaces to the IBM 3663 Supermarket Terminal" document which is available from Corporate Industry Relations) to any one station of a 3663 mdl 1, 1P , 3 or 3P. **Maximum:** One. **Limitation:** Not available if Coin Dispenser Type 1 (#1811)(no longer available) is installed. **Field Installation:** Yes.

2nd Coin Dispenser Adapter Type 2 (#1822): [Mdls 1, 1P, 3, 3P] Allows attachment of a second 8-column Coin Dispenser (that meets the interface requirements in "Non-IBM Coin Dispenser Attachment Interfaces to the IBM 3663 Supermarket Terminal" document which is available from Corporate Industry Relations). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1821.

3rd Coin Dispenser Adapter Type 2 (#1823): [Mdls 3, 3P] Allows attachment of a third 8-column coin dispenser (that meets the interface requirements in "Non-IBM Coin Dispenser Attachment Interfaces to the IBM 3663 Supermarket Terminal" document which is available from Corporate Industry Relations). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1821, #1822 and a third mdl 2 attachment (#4901).

Distributed Station (#3425): [Mdls 1, 1P, 2] Provides distributed packaging; all I/O segments separately covered to allow location flexibility. **Maximum:** One per 3663 mdl 1, 1P or 2. **Field Installation:** Not recommended. **Prerequisites:** Specify code **#9548** on 3663 mdl 1, 1P, or 2.

Document Insert (#3451): [Mdls 1, 1P, 2] Provides a third location on the printer for printing on an inserted form (refer to *3660 Supermarket Systems Introduction* GA27-3076 for details on forms). **Limitations:** In the 3660 Supermarket Scanning and Key Entry Systems, if this feature is desired for a mdl 1 on the store loop, it must be installed on the attached mdl 2 (if any) or vice versa. In the 3660 Supermarket Scanning and Key Entry Systems, if this feature is desired for a mdl 2 attached to a mdl 3, it must also be installed on all other mdl 2s attached to that mdl 3. **Maximum:** One on each 3663 mdl 1, 1P or 2. **Field Installation:** Not recommended.

Storage Increment (#3880): [Mdls 1, 1P, 3, 3P] Provides 2,048 additional positions of storage. All replaced parts become the property of IBM. **Limitations:** If this feature is required on one 3663 mdl 1 or mdl 3, it must be installed on all 3663 mdl 1s and mdl 3s in the store. This feature is only allowed on mdl 1 and mdl 3 and on mdls 1P and 3P scheduled for shipment prior to August 1, 1980 and lower than EC level 320637. **Maximum:** One on 3663 mdl 1 and mdl 3, nine on mdl 1P and 3P. **Field Installation:** Yes. **Prerequisites:** Installation of more than 3 Storage Increments (mdl 1P and 3P only) requires one Storage Expansion Feature (#1580).

Storage Increment (#4225): [Mdls 1, 1P, 3, 3P] Provides 8,176 bytes of additional storage. **Limitations:** Not compatible with feature #3880 or #1580. This feature is to be used on all mdls 1P and 3P scheduled for shipment subsequent to August 1, 1980 and at EC level 320637 or higher. For mdls 1P and 3P shipped prior to August 1, 1980 an "as required" EC is necessary to allow installation of this feature. **Maximum:** Three. **Field Installation:** Yes.

IML-Read Adapter (#4634): [Mdls 1P, 3P] Provides a means to initialize 3663 terminals when a 3651 Store Controller mdl A25, B25, C25, A75, B75, C75 or D75 is unavailable or unable to provide the IML (Initial Machine Load). An adapter is provided for attaching an external tape cassette recorder (refer to *IBM 3650 Retail Store System Introduction Manual*, GA27-3075) and reading data previously recorded at a 3651 equipped with the IML-Write Adapter (#4633). **Maximum:** One. **Field Installation:** Yes.

Journal Lock (#4660): [Mdls 1, 1P, 2] Provides a locking internal security cover for the summary journal take-up spool. **Maximum:** One. **Field Installation:** Yes.

Mdl 2 Attachment (#4900): [Mdls 1, 1P, 3, 3P] Allows attachment of one 3663 mdl 2 to a 3663 mdl 1 or 1P, or allows attachment of a second 3663 mdl 2 to a 3663 mdl 3 or 3P. **Maximum:** One. **Field Installation:** Yes. **Note:** The basic 3663 mdl 3 or 3P provides for attachment of the first 3663 mdl 2 as a standard feature.

3rd Mdl 2 Attachment (#4901): [Mdls 3, 3P] Allows attachment of the third 3663 mdl 2 to a 3663 mdl 3 or 3P. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #4900 on 3663 mdl 3 or 3P.

Numeric Key Pad Lock (#5330): [Mdls 1, 1P, 2] Provides a lock to prevent depression of the numeric keys or delimiter key when an error condition has been detected. **Maximum:** One. **Field Installation:** Not recommended.

Receipt Station Half Space (#6226): [Mdls 1, 1P, 2] Vertical spacing in the receipt station is modified to provide half normal vertical spacing, i.e., 10 vertical spaces per inch. The spacing may be manually switched to normal (5 lines per inch). This feature also detects end of label and start of label as well as "End of Forms". Depending on label size, approximately 3-4 labels per minute can be printed. **Limitations:** Only one printer per Control Segment can be used when printing shelf labels. 3663s attached locally to the 3661 cannot install this feature. **Maximum:** One. **Field Installation:** Yes.

Scale Adapter (#6671): [Mdls 1, 1P, 3, 3P] Allows attachment of an electronic scale (that meets the interface requirements in "Scales Interface to the IBM 3663 Supermarket Terminal" document which is available from Corporate Industry Relations). **Maximum:** Two on mdl 1 or 1P; three on mdl 3 or 3P. **Field Installation:** Yes. **Prerequisites:** For mdls 1P and 3P, the 3650 Programmable Store System Point of

3663 Supermarket Terminal (cont'd)

Sale Application/Supermarket Environment Program Product (5748-D21) is a mandatory requirement in all states conforming to the *National Bureau of Standards Handbook #44 for Weights and Measures.* **Specify: #9561** if Scale will be used for the station portion of a 3663 mdl 1 or 1P or for the first 3663 mdl 2 attached to a 3663 mdl3 or 3P, or **#9562** if it will be used for a 3663 mdl 2 attached to a 3663 mdl 1 or 1P, or for the second 3663 mdl 2 attached to a 3663 mdl3 or 3P, or **#9563** if it will be used for the third 3663 mdl 2 attached to a 3663 mdl 3 or 3P.

Stand-alone Initial Machine Load (#7555): [Mdl 1, 3] Allows a user-provided tape cassette to be attached to a 3663 Supermarket Terminal mdl 1 or mdl 3 to provide IML capability if required when the 3663 is operating in standalone mode. **Maximum:** One. **Limitations:** The IML feature on a 3663 mdl 1 cannot be used to IML a 3663 mdl 3; therefore, when there is a mixture of mdl 1s and mdl 3s, the feature should be installed on a mdl 3 instead of mdl 1. **Field Installation:** Yes. **Prerequisites:** A 3661 Store Controller. **Note:** One IML feature will support all terminals on the store loop. User-provided tape cassette must meet requirements defined in the *IBM 3660 Supermarket Systems: Key Entry System Introduction,* GA27-3111.

MODEL CONVERSIONS

Not recommended for field installation except from model 1 to 1P and from model 3 to 3P. All replaced parts become the property of IBM.

ACCESSORIES

Cables (P/N 5165886): Bulk Indoor Loop Cable to attach 3660 units may be purchased from IBM or a customer-selected source. See *Physical Planning Manual,* GA27-3074, or *3680 Site Planning and Site Preparation Guide,* GA27-3201, for bulk loop specifications. The customer is responsible for installation and maintenance of these cables. The bulk loop cable may be purchased from IBM. Bulk Indoor Loop Cable is available for duct or plenum installation. The following information pertains to this cable only: Indoor Cable: UL approved for duct and plenum installation. (NEC Art. 725-2b). Maximum allowable cable temperature range is -34 C to +105 C.

Ordering Instructions: Interior cable (P/N 7838695) should be ordered in multiple lengths of 304.8m (1,000 ft). **Warranty:** Loop Cable is warranted free from defects of workmanship and materials for 90 days.

Keyboard Accessories: The following terms are used in the KEYTOP descriptions:

Version	Stem Number/Key Alignment
OV	One/Vertical
OH	One/Horizontal
OVH	One/Vertical or Horizontal
TV	Two/Vertical
TH	Two/Horizontal
-B	Small raised projection in keytop
-C	Circular, concave top on key button
-M	Minimal concavity of circular keytop

Size	Units
Square	1 x 1
Single	1 x 1-1/3
Long	1 x 2
Double	1-1/3 x 2

Engraved Keytops: Keytops containing pre-defined messages are available for use on the 3663 terminal keyboards. Blank keytops are also available for customer engraving. Keytops can be ordered by P/N . Specify P/N and quantity.

The following is a list of pre-defined keytops available in the 3660 Supermarket System nomenclature:

NAME	COLOR	SIZE	VERSION	HEIGHT	P/N

UNIVERSAL KEYTOPS: Keyboard accessories are available which allow the customer to define and to change the messages on the keytops on the 3663 Supermarket terminals. These accessories consist of legendable keytops and sheets of blank labels to use on these keytops.

The universal keytops come in the four standard sizes and in two heights. They consist of two parts; a white bottom button and a clear plastic cover. Blank labels for the various keytop sizes may also be ordered. These labels come in various colors and may be printed with either black or white ink. The user may define unique key button messages, print these messages on the desired color label, affix the printed color label to the white bottom key button and snap on the clear protective cover. Extra clear plastic covers are also available for use as spares.

Accessories can be ordered by P/N . Specify P/N and quantity.

Labels	Red	Double (28 decals/sheet)	5194908
Labels	Blue	Double (28 decals/sheet)	5194909

Key Stops (P/N 1650058): The key stop is a small ring collar which is placed over the stem of a keybutton and under the keytop. The collar holds the keytop in the up position and prevents its use. These stops may be ordered by P/N Specify P/N and quantity.

Keytop Extractor (P/N 1647720): The keytop extractor is a small plier-like device that fits between rows of keybuttons. By squeezing on the handles, a firm grip is made on the keytop and it may be pulled off its stem. The customer may find this helpful when adding key stops, universal keytops, or in doing any rearranging of the keyboard. Two keytop extractors are supplied with each 3651 controller and one extractor with each 3684 Point of Sale - Control Unit. If the customer desires additional extractors, they may be ordered by P/N .

Locks and Keys: The 3663 Stations are equipped with three locks and a complement of keys as follows:

- Cash Drawer Lock -- different for each station unless specified otherwise. The Cash Drawer Keylock (P/N 1851086) is shipped with two keys as standard.
- Till Lock -- One standard key (P/N 1851268) fits all tills. One key shipped as standard per till.
- Summary Journal Lock (optional feature #4660) -- One standard key (P/N 1851372) fits all summary journals. One key shipped as standard per summary journal.

Additional or replacement keys may be purchased from IBM or a local locksmith. Locks may be changed in the field. A customer authorization letter with key identification number (stamped on key and lock) must accompany the order. If the customer does not specify a specific key number, a new lock with keys will be selected randomly. Allow 6 to 7 weeks for shipment. **Note:** To order extra keys, specify machine serial number and the key identification number being replaced. Without a key identification number, a new lock must be ordered with the words "NEW LOCK REQUIRED".

3663 Cash Drawer Key - **Specify:** Machine serial number, key identification number, machine type, lock serial number, and key P/N from the following chart:

Lock Serial Number	Lock Key P/N
H2601 - H2800	8549431
H2801 - H3000	8549482
H3001 - H3200	6021144
H3201 - H3400	6021145

3663 Till Key - **P/N 1851268 ***
3663 Summary Journal Key - **P/N 1851372 ***
3663 Cash Drawer Keylock (with 2 keys) - **P/N 1851086 ***

*** Specify:** Machine serial number and the key identification number being replaced.

Tills: The 3663 Supermarket terminal stations are equipped with a removable till and locking cover. Additional tills with locking covers may be ordered . Specify P/N and quantity. See 3663 Till Key under "Locks and Keys".

Note: The Adjustable Till is pre-assembled for the customer.

3663 Till with Fixed Bill Slots, **P/N 1851117**
3663 Till with Adjustable Bill Slots, **P/N 1990616**

SUPPLIES

Ribbons: A black ribbon, P/N 1136970, or equivalent, is recommended; should be used for machines installed prior to June, 1975. Machines installed after this date and those machines previously installed that are changed to the new ribbon drive mechanism should use P/N 1136660 or equivalent. Contact IBM. See *3660 Supermarket System Introduction,* GA27-3076, for roll paper and Document Insert forms specifications.

3667 CHECKOUT SCANNER

PURPOSE

Fixed head optical reader for the 3650 Programmable Store System and the 3660 Supermarket System. The 3667 is 71.1cm (28 inches) high and it is particularly adaptable to:

- Checker unload mode of checkout
- Seated checker operation

MODELS

Model 1 001 [NO LONGER AVAILABLE] Checkout Scanner

HIGHLIGHTS

Reads the regular (Version "A") and the zero suppression (Version "E") industry standard Universal Product Code (UPC) symbols on manually-fed supermarket items placed symbol down on the scanner window. When used with the 3650 Programmable Store System, can also read industry standard European Article Numbering (EAN-13) symbols. (When used with the 3650 Programmable Store System, interpretation of all symbols is done by the user application program.) Item velocity meets the industry's Symbol Standardization Subcommittee requirement for up to 100 inches per second. Packaged as the front end of a total checkstand design, one 3667 can operate with one 3663 Supermarket Terminal mdl 1, 1P or 2. The 3667 contains a laser system which complies with the safety standards of the United States Department of Health, Education, and Welfare (Performance Standard for Laser Products, August 2, 1976 -- Class I, 21 CFR Subchapter J) only when properly attached to a 3663 mdl 1 or 1P with feature #1763, #1764 or equivalent.

The scanner reads the new Universal Product Code symbol (Version A & E), announced by the USA Uniform Grocery Product Code Council or the European EAN Universal Product Code via RPQ 7S0250 on the 3663.

Alternate product codes, which may result from national and/or international harmonization efforts, will be addressed by IBM following adoption and publication of the corresponding agreed specifications.

Prerequisites: If the 3667 is to operate with a 3663 mdl 1 or 1P, the 3663 mdl 1 or 1P requires Checkout Scanner Adapter Type 2 (#1763).

If the 3667 is to operate with a 3663 mdl 2, the 3663 mdl 1 to which that 3663 mdl 2 is attached requires Checkout Scanner Adapter Type 2 (#1763) and 2nd Checkout Scanner Adapter Type 2 (#1764).

Customer Responsibilities : Refer to *Installation Manual - Physical Planning,* GA27-3079, for the 3660 Supermarket System for correct ambient light intensity requirement. A number of states presently have, and others are considering the adoption of, regulations governing the use of laser products. Users should determine the extent of regulation in their state. New York state currently requires an attachment to the checkstand. This user-supplied feature must be in place prior to installation of the 3667. Details are available from the N.Y. State Department of Labor, Division of Safety and Health, Two World Trade Center, New York, N.Y. 10047. Window replacement is a customer responsibility.

The 3667 Scanner must be mechanically restrained in its final mounted position. During maintenance, the 3667 can be tipped forward by a downward force in the extended components drawer. The customer must provide this restraint. Unless the 3667 is restrained from tipping by the geometry of the checkstand, an IBM-provided Safety Clip or Safety Bracket must be ordered for each 3667. It is the responsibility of the customer to locate and install the restraining hardware (see "Specify").

Copies of the UPC Symbol Specifications and the UPC Guidelines are available at a charge from the UPC Council. Write to:

Uniform Product Code Council, Inc.
7061 Corporate Way, Suite 106
Dayton, Ohio 45459
513-435-3870

For copies of the General Specifications for the Article Symbol Marking (EAN) write to:

Secretary General E.A.N.
Rue Des Colonies 54, Bte 8
1000 Bruxelles - Belgique

SPECIFY

- **Cable Requirements:** See M3663 pages.
- **Packaging/Labels:** Certain states require special packaging and/or labels to be legally in compliance with the current regulations. Machines installed in these states must have the appropriate specify code:

  State of New York **#9550**

- **Scan Direction:** Specify **#9604** for Normal Scan Direction. This is typically used for Over the Counter (OTC) operation, sometimes referred to as checker unload.

  Optional Scan Direction: Specify **#9605** for optional scan direction. This is typically used for Over the End (OTE) operation, sometimes referred to as customer unload.

  See *IBM 3650 Programmable Store System Installation Manual - Physical Planning,* GA27-3167, or *IBM 3600 Supermarket Systems; Installation Manual - Physical Planning,* GA27-3079, for illustration of scan direction options.

- **Item Sensor Position:** Prior to the availability of of specify **#9301** and **#9302**, the item sensors were shipped in the low position.

  Specify: #9301 for Item Sensor-High Position. This position may be desired with Specify **#9604** (Normal Scan Direction). (Caution: Small flat items may not be sensed in this position causing re-scans or possibly missed items. Contact your Market Support Center for more information.)

  Specify: #9302 for Item Sensor-Low Position. This position may be desired with Specify **#9605** (Optional Scan Direction).

- **Restraining Hardware:** See *3660 System Installation Manual - PhysicalPlanning,* GA27-3079, to determine type of restraining hardware desired. Order one of the following for each 3667 to be installed:

  1) Safety Clip - for each 3667, order (1) B/M 5194716 to secure one rear 3667 leg to the customers' stationary horizontal mounting surface, or
  2) Safety Bracket - for each 3667, order (1) B/M 5194758 to secure the 3667 lower rear cabinet extension to the customers' stationary vertical checkstand surface.

  Order the Safety Clip or Safety Bracket on MES. This is a no-charge item to the customer and a quantity sufficient for three months' installation may be submitted on a single MES order for a given customer.

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES

Window (P/N 556123): The 3667 Checkout Scanner is equipped with a replaceable window. With use, it will tend to get scratched and need to be replaced periodically. Window replacement is a customer responsibility. Specify P/N and quantity.

SUPPLIES

Contact IBM.

3669 STORE COMMUNICATIONS UNIT

PURPOSE

To provide communications for the 3650 Programmable Store System and the 3660 Supermarket System over common carrier network facilities between a 3651 Store Controller mdl A60, B60, A75, B75, C75 or D75 and:

- The host S/370, 30XX or 4300 Processor via a 3872 Modem or 2400 bps Integrated Modem of a 3704, 3705 or 3725 Communications Controller with switched line features or a Communications Adapter (#1601) feature on a 4321 or 4331.
- The store loops at another predesignated store location via another 3669 at that location, to provide backup operation for that store in case its 3651 Store Controller mdl A60, B60, A75, B75, C75 or D75 is inoperative.
- The 3651 Store Controller mdl A60, B60, A75, B75, C75 or D75 in the predesignated store via the 3669 in that store for the purpose of data reconciliation when the backup operation is terminated. If both Store Controllers are 3650 mdl 75, communication can also be performed for purposes other than backup data reconciliation.

The 3669 is designed to operate at 2400 bps over a switched telephone network. This unit is equipped with Automatic Answering facility but requires manual dialing. The connection to the telephone network is made through FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. See "Accessories" for information on IBM's offering pertaining to an FCC Registered CBS type protective coupler.

MODELS

Model 1 001 Switched Network

Prerequisites: A 3650 Programmable Store System or a 3660 Supermarket System (equipped with a 3651 Store Controller mdl A60, B60, A75, B75, C75 or D75)... A switched line communications facility with FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. See"Accessories" for information on IBM's offering pertaining to an FCC Registered CBS type protective coupler. ... A store loop equipped with at least one 3663 Supermarket Terminal mdl 1 or 1P ... Communications with any virtual storage S/370 or 4300 processor (4321, 4331, 4341, 4361, 4381, 3033, 3033MP, 3158MP, 3168, 3168MP VTAM only), (165II BTAM only) or 3081 via the 3704, 3705 or 3725, or an ICA (BTAM only) on a S/370 mdl 115, 125, 135, 135-3 or 138 or a Communications Adapter (#1601) feature on a 4321 or 4331 or 4361.

HIGHLIGHTS

The 3669 is a synchronous signal converter designed to connect, under switched control, either a 3651 Store Controller mdl A60, B60, A75, C75 or D75 or two store loops to the common carrier network. Diagnostic test functions are normally under control of the 3651 mdl A60, B60, A75, B75, C75 or D75 during initial power on. An additional switch setting allows the performance of manual diagnostic test. Auto answer is included as a standard feature.

Attachment: One cable is provided to FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. See "RPQ" section below for additional ordering information. One cable is provided to interface to the store loop.

Customer Responsibilities: (1) See M2700 pages ... (2) Customer is responsible for obtaining, installing, and testing the store loops. See *Installation Manual - Physical Planning* (GA27-3079) for the 3660 Supermarket System.

SPECIFY

- Voltage (AC, 1-phase, 60 cycle): Locking plug -- **#9880** for 115V, **#9884** for 208V, or **#9886** for 230V. For non-locking plug -- **#9881** for 115V, **#9885** for 208V, or **#9887** for 230V.
- Cable: RPQ 8Q0129 Cable - Modem to Protective Coupler (DAA). This N/C RPQ provides a cable which is compatible with the IBM Protective Coupler (CBS Type) available as P/N 1649100 (see RPQ 8Q0130 for description).

SPECIAL FEATURES

Direct Line Attachment (#2939): Available in some countries to meet PTT specifications to have the 3669 homologated. Consult your Teleprocessing Coordinator to determine if whether it is required. **Maximum:** One. **Field Installation:** Yes.

RPQs

PTT (RPQ 7B0211): Mandatory Interface on 3669 Store Communication Unit.

3683 POINT OF SALE TERMINAL

PURPOSE

A user-programmable input/output terminal for the 3650 Programmable Store System or the 3680 Programmable Store System which provides the point of sale transaction, data collection, credit authorization, price look-up and other inquiry and data entry functions. The self contained programmable segment allows the 3683 to continue most sales functions when disconnected from the 3651 Store Controller or the 3684 Point of Sale Control Unit, and after receiving a program load from the 3651 or the 3684.

MODELS

A description of each available model of the 3683 is as follows. 3683 models 1, 2, and 3 are supported under the 3650 Programmable Store System and the 3680 Programmable Store System. The 3683 models 1A, 2A, and 3A are supported under the 3650 Programmable Store System but are not supported on the 3680 Programmable Store System.

Model 1 001 — Comprised of a base unit with 32K bytes of base storage and an integrated printer. The cash receipt station is standard. Additional print stations, journal, validation or label printer may be added as features for a maximum of three print stations.

Model 1A A01 — Same as the 3683 model 1 except that the 3683 model 1A has 56K bytes of base storage and provides for the attachment of a 3687 Checkout Scanner. **Limitations:** Cannot install Magnetic Wand Reader (#4945), non-IBM OCR Hand-Held Reader Adapter (#5422), non-IBM EAN/UPC Wand Attachment (#4946), Storage Increment-8K (#7710), Storage Increment-24K (#7730) or Expansion Feature I (#3880).

Model 2 002 — Comprised of a base unit with 56K bytes of base storage and a 1- or 2-station distributed printer. The printer is contained in a separate set of covers cable connected to the base unit. The cable length is 3.6m (12 ft). The cash receipt station is standard. Only the journal print station may be added to allow for a maximum configuration of two print stations. All other I/O (cash drawer, displays or keyboards) must be distributed or remote when used with this unit. **Limitations:** Cannot install Label Printer (#8726), Validation Printer (#8725), Integrated Cash Drawers (#1571 and #1573), Storage Increment-8K (#7710), and Storage Increment-24K (#7730).

Model 2A A02 — Same as the 3683 model 2 except that the 3683 model 2A enables attachment of a 3687 scanner. **Limitations:** In addition to those listed under 3683 model 2, cannot install Magnetic Wand Reader (#4945), non-IBM OCR Hand-Held Reader Adapter (#5422), non-IBM EAN/UPC Wand Attachment (#4946), or Expansion Feature I (#3880).

Model 3 003 — Comprised of a base unit with 56K bytes of base storage and a 1-, 2-, or 3-station distributed printer. The printer is contained in a separate set of covers cable connected to the base unit. The cable length is 3.6m (12 ft). The cash receipt station is standard. Additional print stations, journal, validation or label printer may be added as features for a maximum configuration of three print stations. All other I/O (cash drawers, displays or keyboards) must be distributed or remote when used with this unit. **Limitations:** Cannot install Integrated Cash Drawers (#1571 or 1573), Storage Increment- 8K (#7710) or Storage Increment-24K (#7730).

Model 3A A03 — Same as the 3683 model 3 except that the 3683 model 3A provides for the attachment of a 3687 Scanner. **Limitations:** In addition to those listed under 3683 model 3 cannot install Magnetic Wand Reader (#4945), non-IBM OCR Hand-Held Reader Adapter (#5422), non-IBM EAN/UPC Wand Attachment (#4946), or Expansion Feature-1 (#3880).

Limitations: On 3683 mdls 1, 2 or 3, when six of the following features are installed, Storage Retention (#7785) is required.

IML Read Adapter	#4633
Magnetic Wand Reader	#4945 *
Non-IBM EAN/UPC Wand Attachment	#4946 *
Non-IBM OCR Hand-Held Reader Adapter	#5422 *
Non-IBM Coin Dispenser Adapter	#5431
Non-IBM Scale Adapter	#5433
Storage Expansion-POS	#6991
Totals Retention	#8010

* mutually exclusive

3683 mdls 1A, 2A or 3A will allow up to a maximum of three of the following featues to be installed in the base unit before Expansion Feature-II (#3881) is required. When the features are installed, the sum of the unit values should not exceed 3. When the unit value exceeds 3 or if Storage Expansion-POS (#6991) is required, then Expansion Feature-II (#3881) must be installed.

Feature	Unit/Value
Non-IBM Coin Dispenser Adapter (#5431)	1
Non-IBM Scale Adapter (#5433)	1
IML Read Adapter (#4633)	1

Prerequisites: 1) A 3651 Store Controller mdl 25 or 75 or 3684 Point of Sale Control Unit model 2 provides the control segment for the 3683. See M3651 or 3684 pages for details. 2) A keyboard, #4921, #4922, or #4923 , and a display, #3331, #3332, #3336 or #3337, must be ordered for each 3683. If a 3683 mdl 2, 2A, 3 or 3A is ordered, a distributed display (#3335 or #3338) or a remote display (#3333 or #3337) are the only type of display that can be attached. A distributed keyboard attached by Distributed Keyboard Attachment (#3240) is the only keyboard that can be attached, and if a cash drawer is attached, it can only be attached by Cash Drawer -- Distributed (#1575) or non-IBM Cash Drawer Attachment (#1577).

Proposal/Acknowledgement Letter Statements: Each Proposal and Acknowledgement Letter must include the following statement:

> "It is agreed that IBM will have no responsibility to provide warranty or maintenance service on any 3683 which contains cash or other valuables. It will be the customer's responsibility to remove, control, and replace cash or other valuables so that IBM can fulfill its warranty and maintenance obligations.
>
> When a failure occurs in the cash drawer of any 3683, and it cannot be opened prior to maintenance by IBM, the customer will assign one of its personnel to assume responsibility for removal of the cash or other valuables when the drawer is opened."

Customer Setup: The 3683 will be shipped with customer setup instructions. The customer is responsible for:

- Unpacking, placement, set up and checkout of the 3683 at time of delivery, or when relocating the 3683.
- Relocation of the 3683 (if required) to allow IBM service access.
- Using and following the 3683 Problem Determination Procedures.

Maintenance: 3683s located in the immediate sales area may preclude the customer acceptability of online repair due to the public scrutiny and loss of the selling location for customer service. In these cases, the customer should remove the failing terminal to a repair facility located within the store for subsequent repair. At this location the CE will repair and test the terminal online via a customer-provided store loop termination.

HIGHLIGHTS

A modular input/output unit with features and mdls that provide for an integrated or distributed terminal. It features data entry by keyboard or from a Magnetic, EAN/UPC or a non-IBM OCR Hand-Held Reader or from a 3687 Checkout Scanner and data output via an 8-digit numeric display, with up to 32 indicators for operator guidance and machine status conditions, or an alphameric display with 36 character positions and printing of data under program control. The minimum configuration must include a base unit plus a Keyboard and a Display (see "Prerequisites"). The 3684 mdl 2, as well as the 3651 mdl 25 or 75, is capable of transmitting or receiving data with several 3683s over a 2400 bps loop. The 3683 mdls 1A, 2A or 3A are not program-supported for attachment to the 3684 mdl 2 loop. The 3651 mdl 75 is capable of transmitting or receiving data with several 3683s, all mdls, over a 4800 bps loop. Separate printer-based mdls (2, 2A, 3, and 3A) of the 3683 are available to provide the ability to distribute the printer from the bases unit. All I/O devices (cash drawers, displays, keyboards) must be distributed when these mdls are designated.

Base Unit: Provides (1) the base electronic storage and intelligence and an audible alarm; and, (2) a matrix printer with cash receipt station. Basic storage for the 3683 mdl 1 is 32K bytes. This can be increased to 56K bytes by Storage Increment features and to 120K bytes via the Storage Expansion feature. The base storage for the 3683 mdls 1A, 2, 2A, 3, and 3A is 56K bytes. They also can be increased to 120K bytes via the Storage Expansion feature. An audible alarm, activated when predetermined events require operator attention or intervention for system operation, is also part of the base unit.

3683 Point of Sale Terminal (cont'd)

Printer: A matrix, bidirectional printer which prints a 38-character print line at 15 characters per 25.4mm (inch) spacing. Vertical spacing is 6.3 lines per 25.4mm (inch) at a line space rate of 20 lines per second. It uses an easily replaceable cartridge ribbon. In addition to the standard character sets, an all-points addressable capability allows (by customer programming) printing of customer logo and special graphics. Additional print stations can be ordered as features. The cash receipt station will accept 88.9mm (3.5 in.) diameter roll paper, 69.85mm (2.75 in.) wide.

Storage Increments: When storage on a 3683 mdl 1 is upgraded from 40K to 48K or to 56K by field installation, the new Storage Increment feature displaces the old. Removed parts belong to the customer. Prior to using a removed module in another 3683 the compatibility of the part should be verified and an RPQ must be submitted to allow reinstallation on another machine.

SPECIFY

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): **#9890** for locking plug or **#9891** for non-locking plug. If the standard 2.8m (9 ft) power cable is not desired, specify **#9511** for 1.8m (6 ft) cable.

  Note: 120V AC, 60 Hz is compatible with existing 115V systems.

- Loop Speed: Specify **#9420** for 2400 bps loop speed or **#9430** for 4800 bps loop speed.

- Controller Designation: Specify **#9493** on the 3651 controller for 3683 control code if 3683 terminals are attached to the 3651 controller and if a 3680 system is not attached to the same host system. See "Specify" in M3651 pages.

SPECIAL FEATURES

Cash Drawer-Integrated-First (#1571): [Mdls 1, 1A] Provides a cash drawer with housing with removable till that is integrated with the 3683 base unit. The cash drawer has a media slot that will accommodate approximately a 25.0mm (inch) stack of documents. Opening the cash drawer is under program control. A cash drawer lock is provided. See note below for special ordering instructions for lock and removable bill dividers. **Maximum:** One. **Limitations:** Only one additional cash drawer may be ordered - either Cash Drawer Integrated-Second (#1573), Cash Drawer Distributed (#1575) or non-IBM Cash Drawer Attachment (#1577). **Field Installation:** Yes.

Cash Drawer-Integrated-Second (#1573): [Mdls 1, 1A] Provides a second Integrated Cash Drawer with housing and removable till that is installed directly below Cash Drawer-Integrated-First (#1571). Functionally equivalent to Cash Drawer-Integrated-First (#1571). **Maximum:** One. **Prerequisites:** #1571. **Field Installation:** Yes.

Cash Drawer-Distributed (#1575): Provides a distributed cash drawer with housing and removable till that can be located up to 3.6m (12 ft) from the 3683 base. Functionally equivalent to Cash Drawer-Integrated-First (#1571). **Maximum:** Two, if no other drawer is ordered. One, if Cash Drawer Integrated-First (#1571) or non-IBM Cash Drawer Attachment (#1577) is ordered. **Field Installation:** Yes.

Non-IBM Cash Drawer Attachment (#1577): Provides an IBM-defined interface with cable and plug for attaching a non-IBM Cash Drawer. **Maximum:** Two, if no IBM Cash Drawer is ordered. One, if a Cash Drawer Integrated-First (#1571) or Cash Drawer Distributed (#1575) is ordered. **Limitations:** An attached non-IBM Cash Drawer must meet the IBM-defined interface. **Field Installation:** Yes.

Notes:

- For cash drawer tills and covers, see "Accessories".
- Specify **#9799** for each IBM cash drawer ordered (#1571, #1573 or #1575) if a till with movable bill dividers is desired.
- Cash Drawer Lock: Each IBM cash drawer (#1571, #1573 or #1575) is equipped with a lock. A group of 25 unique lock numbers has been reserved to allow a customer to specify identical lock types on all terminals. This allows all cash drawers to be opened with the same key. If this is desired, specify one of the following features on the cash drawer order:

#9101	**#9106**	**#9111**	**#9116**	**#9121**
#9102	**#9107**	**#9112**	**#9117**	**#9122**
#9103	**#9108**	**#9113**	**#9118**	**#9123**
#9104	**#9109**	**#9114**	**#9119**	**#9124**
#9105	**#9110**	**#9115**	**#9120**	**#9125**

  If none is specified, a lock will be selected at random from a larger group of lock types. Each cash drawer will be shipped with two cash drawer keys.

Distributed Keyboard Attachment (#3240): Provides for locating the keyboard up to 3.6m (12 ft) from the 3683 base. **Prerequisites:** #4921 or #4922 or #4923. **Maximum:** One. **Field Installation:** Yes.

Display, One-Sided (#3331): An operator display and guidance unit consisting of an 8-digit numeric display and 32 indicators for operator guidance and machine status. The display is used to display numeric input or output data such as item number, totals, amount due, etc. The 32 indicator lights point to labels that describe machine status or guidance. The unit will be shipped with the indicators labeled . However, the customer may relabel all but five indicators and, under customer program control, define their use. A legend sheet, with a variety of legends, will be shipped with each machine. **Maximum:** One. **Limitations:** Cannot be ordered with Display-Two Sided (#3332), Alphameric Display (#3336), Remote Second Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). **Field Installation:** Yes.

Display, Two-Sided (#3332): An operator and customer display guidance unit which contains all the functions of Display, One-Sided (#3331) plus an 8-digit numeric display with 6 indicators on the back of the unit for customer viewing. **Maximum:** One. **Limitations:** Cannot be installed with Display-One Sided (#3331), Display-Customer Remote (#3333), Alphameric Display (#3336), Remote Second Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). **Field Installation:** Yes.

Display-Customer Remote (#3333): A customer display and status indicator unit that is connected to the 3683 by a 3.6m (12 ft) cable. The unit consists of an 8-digit numeric display and 12 indicators (6 are shipped with labels and 6 without). All are relegendable. The display and indicators are under customer program control. **Maximum:** One. **Prerequisites:** #3331. **Limitations:** Cannot be installed with the Display-Two Sided (#3332), Alphameric Display (#3336), Remote Second Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). **Field Installation:** Yes.

Distributed Display Attachment (#3335): Provides for distributing Display-One Sided (#3331) or Display-Two Sided (#3332) up to 3.6m (12 ft) from the 3683 base. **Maximum:** One. **Prerequisites:** #3331 or #3332. **Limitations:** Cannot be installed with Alphameric Display (#3336), Remote Second Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). **Field Installation:** Yes.

Alphameric Display (#3336): An operator/customer display consisting of two rows of 18 characters, each for a total of 36 characters. The display is used to display numeric as well as alphabetic data such as item number, description, guidance information, etc. The display is connected locally to the 3683. **Maximum:** One. **Limitations:** Cannot be installed with a numeric display (#3331, #3332, #3333 or #3335). **Field Installation:** Yes.

Remote Second Alphameric Display (#3337): A customer display that is connected to the 3683 by a 3.6m (12 ft) cable. The display consists of two rows of 18 characters each, for a total of 36 characters and is used to display numeric as well as alphabetic data such as item number, description, etc. **Maximum:** One. **Prerequisites:** #3336. **Limitations:** Cannot be installed with a numeric display (#3331, #3332, #3333 or 3335). **Field Installation:** Yes.

Distributed Alphameric Display Attachment (#3338): Provides for distributing the Alphameric Display (#3336) up to 3.6m (12 ft) from the 3683 base. **Maximum:** One. **Prerequisites:** #3336. **Limitations:** Cannot be installed with numeric display (#3331, #3332, #33333 or #3335). **Field Installation:** Yes.

Expansion Feature-I (#3880): [Mdls 1, 2, 3] Provides facilities to accommodate additional features that cannot be installed on the base unit. **Prerequisites:** On 3683 mdls 1, 2 or 3, this feature is a prerequisite to install any of the following: IML Read Adapter (#4633), Magnetic Wand Reader (#4945), Non-IBM EAN/UPC Wand Attachment (#4946), Non-IBM OCR Hand-Held Reader Adapter (#5422), Non-IBM Coin Dispenser Adapter (#5431), Non-IBM Scale Adapter (#5433). **Maximum:** One. **Limitations:** Cannot be installed with Expansion Feature-II (#3381) or with Storage Expansion-POS (#6991). This feature will allow installation of up to a maximum of four of the following features. When the features are installed the sum of the unit values should not exceed 4. **Field Installation:** Yes.

Feature	Unit Value
Non-IBM Coin Dispenser Adapter (#5431)	1
Non-IBM Scale Adapter (#5433)	1
*Non-IBM OCR Hand-Held Reader Adapter (#5422)	1
*Magnetic Wand Reader (#4945)	1
IML Read Adapter (#4633)	1
*Non-IBM EAN/UPC Wand Attachment (#4946)	2

* mutually exclusive

Expansion Feature-II (#3881): Provides expanded facilities on the 3683 to permit installation of features not accommodated by the base unit (all mdls) or by the addition of Expansion Feature I (#3880) on 3683 mdls 1, 2 or 3. **Prerequisites:** This feature is a prerequisite to install Storage Expansion-POS (#6991) and displaces Expansion Feature-I (#3880), if installed on 3683 mdls 1, 2 or 3. This feature is a prerequisite if both the non-IBM EAN/UPC Wand Attachment (#4946) and the IML Read Adapter (#4633) are to be installed. **Limitations:** Cannot be installed with Expansion Feature-I (#3880). **Maximum:** One. **Field Installation:** Yes.

IML Read Adapter (#4633): Provides a means to initialize 3683 terminals when a 3684 mdl 2 is unavailable or unable to provide the IML (Initial Machine Load), or provides a means to initialize 3683, 3653 mdls 1 (EC 349653 or higher is prerequisite) and IP, or 3663 mdls IP and 3P

3683 Point of Sale Terminal (cont'd)

terminals when a 3651 Store Controller mdl 25 or 75 with a 3683 attached to its loop is unavailable or unable to provide the IML. An adapter is provided for attaching an external user-provided tape cassette recorder and reading data previously recorded at a 3684 mdl 2 with the IML Write Adapter (#4634), or at a 3651 mdl 25 or 75 with the IML Write Adapter (#4633). (Refer to *IBM 3680 Planning and Site Preparation Guide,* GA27-3213, for cassette recorder interface requirement.) **Prerequisites:** On 3680 mdls 1, 2 or 3, #3880 or #3881. Expansion Feature II (#3881) is a prerequisite to this feature if the non-IBM EAN/UPC Wand Attachment (#4946) is installed. **Maximum:** One. **Field Installation:** Yes. **Note:** The 3651 mdl 25s and 75s do not have the capability to create an IML tape that can be used with this feature.

Journal Lock (#4690): Provides a special lock and security cover over the printed journal. See note below for special lock selections. **Maximum:** One. **Prerequisites:** #4695. **Field Installation:** Yes.

Journal Printer (#4695): Provides a journal print station with a journal roll take-up mechanism. Print line length is 38 characters at 15 characters per 25.4mm (inch) spacing. Vertical line spacing is 6.3 lines per 25.4mm (inch) at a line space rate of 20 lines per second. The all-points addressable characteristics of the printer permit the customer to highlight exceptions through special graphics designed and controlled by user programming. A 12.7mm (0.5 in.) signature window is provided. The journal station will accept 88.9mm (3.5 in.) diameter roll paper, 69.85mm (2.75 in.) wide. **Maximum:** One. **Field Installation:** Yes.

Manager Keylock (#4905): Provides a keylock mounted on the keyboard that allows customer programming to interrogate the position of the keylock when the key is operated. Possible uses include the enforcement of a manager override to a restricted security function. See note below for special lock selection. **Maximum:** One. **Prerequisites:** #4921 or #4922 or #4923 . **Field Installation:** Yes.

Note: Two groups of ten unique specify numbers have been reserved to allow a customer to order a specific journal lock or manager keylock for each terminal. (The 3683 and 3684 use the same journal lock and manager keylock numbers, therefore all terminals within a store could have the same lock if desired.) If the same lock is desired on the journal and manager keylock, specify the respective locks with the same value in the last digit. That is, if **#9203** and **#9303** are specified, the same lock (**#9203**) will be installed at both locations.

Journal Lock	Manager Keylock
#9201	#9301
#9202	#9302
#9203	#9303
#9204	#9304
#9205	#9305
#9206	#9306
#9207	#9307
#9208	#9308
#9209	#9309
#9210	#9310

If none is specified, a lock will be selected at random from a larger group of lock types. Each lock feature will be shipped with two keys. For additional or replacement keys, see "Accessories".

Keyboards, General: All keyboards have customer legendable keybuttons except for 11 keybuttons which have molded legends. All single and double function keys are under customer program control. Double keys may be moved, added or deleted by the user. Several colors and sizes of decal sheets with common legends will be shipped with the 3683. See "Accessories" for released keybuttons that may be ordered for any unique customer requirement. **Maximum:** One keyboard (#4921 or #4922 or #4923). **Field Installation:** Yes.

35-Key Modifiable Keyboard (#4921): A 35-key keyboard that includes:

- 5-Legended system control keys.
- 19-Unlegended function keys.
- 11-Keys with dual legends on each keybutton, "numeric" and "transaction types", in the data entry arrangement.

48-Key Modifiable Keyboard (#4922): [Data Entry] A 48-key keyboard that includes:

- 5-Legended system control keys.
- 32-Unlegended function keys.
- 11-Keys with dual legends on each keybutton, "numeric" and "transaction type", in the data entry arrangement.

48-Key Modifiable Keyboard (#4923): [Adding Machine] A 48-key keyboard that includes:

- 5-Legended system control keys.
- 32-Unlegended function keys.
- 11-Keys with round numeric legended keybuttons in the adding machine arrangement.

Magnetic Wand Reader (#4945): [Mdls 1, 2, 3] A hand operated wand used to read single track delta distance encoded magnetic merchandise tickets, credit cards, employee badges, etc. The small lightweight wand attached via a 1.2 meter (4 foot) long, flexible cord allows encoded merchandise tickets to be read without removing them from the merchandise. See note. **Prerequisites:** On 3683 mdls 1, 2 or 3, #3880 or #3881. **Limitations:** Cannot be installed with a non-IBM EAN/UPC Wand Attachment (#4946) or a non-IBM OCR Hand-Held Reader Adapter (#5422). **Maximum:** One. **Field Installation:** Yes. **Note:** The minimum encoding specifications that must be met by suppliers of credit cards, merchandise tickets and employee badges will be furnished upon request.

Non-IBM EAN/UPC Wand Attachment (#4946): [Mdls 1, 2, 3] Provides an adapter to support the attachment of a non-IBM EAN/UPC Bar Code hand-held wand reader. This feature provides an external connector to attach the non-IBM wand reader. The types of wand readers that can attach to this feature are either analog output wand readers (Intermec 1233R or equivalent) or digital output wand readers (Hewlett-Packard HEDS 3000 or equivalent) that meet the requirements stated in the non-IBM EAN/UPC Wand Attachment, Product Attachment Information for the 3650/3680. This document can be ordered by the salesman after FCS from Industry Relations/Product Information Corporate Headquarters Armonk. **Prerequisites:** On the 3683 Mdls 1, 2 or 3 Expansion Feature #3880 or #3881. Also on the 3683 Mdls 1, 2 or 3 Expansion Feature II (#3881) is a prerequisite to this feature if the IML Read Adapter (#4633) is installed. The IBM Multiple Supplier Systems Bulletin (GI20-6648) applies to the non-IBM wand reader. **Limitations:** When this attachment is used with an analog output wand reader, it is possible that this feature may experience failures if operated within five miles of a high power AM transmitter of the type used for television broadcasting. Cannot be installed with the Magnetic Wand Reader (#4945) or non-IBM OCR Hand Held Reader Adapter (#5422). **Maximum:** One. **Field Installation:** Yes. **Specify: #9660** for analog wand interface or **#9661** for digital wand interface.

Non-IBM OCR Hand-Held Reader Adapter (#5422): [Mdls 1, 2, 3] Provides an adapter to support the attachment of a non-IBM OCR hand-held wand reader that meets the requirements stated in the "Non-IBM OCR Wand Reader to IBM 3653 Product Attachment Information" document. This feature provides a 1.83 meter (6 foot) cable with an ITT--Cannon DBC-25S type connector to attach the non-IBM OCR Hand-Held Reader unit. **Prerequisites:** On 3683 mdls 1, 2 or 3, #3880 or #3881. **Limitations:** Cannot be installed with a non-IBM EAN/UPC Wand Attachment (#4946) or a Magnetic Wand Reader (#4945). **Maximum:** One. **Field Installation:** Yes.

Non-IBM Coin Dispenser Adapter (#5431): Provides an IBM-defined serial interface for attaching a non-IBM-manufactured coin dispenser that meets the requirements stated in the "IBM 3680 PSS System non-IBM Coin Dispenser Adapter Product Attachment Information" document which is available from Corporate Industry Relations. For further information on the attachment, refer to the Market Support Center. **Prerequisites:** On 3683 mdls 1, 2 or 3, #3880 or #3881. There is no prerequisite feature on a 3683 mdl 1A, 2A or 3A. **Maximum:** One. **Field Installation:** Yes.

Non-IBM Scale Adapter (#5433): Provides an IBM defined serial or parallel interface for attaching a non-IBM manufactured scale that meets the requirements stated in the "IBM 3680 PSS System non-IBM Scale Adapter Product Attachment Information" document which is available from Corporate Industry Relations. For further information on the attachment, refer to the Market Support Center. **Specify: #9385** if Serial Interface is to be installed; **#9386** if Parallel Interface is to be installed. On Parallel Interface also specify **#9387** if scale is a 10kg Metric scale. On Serial Interface specify **#9388** is scale is a 5-digit scale. Otherwise, scale is assumed to be a 4-digit scale. **Prerequisites:** On 3683 mdls 1, 2 or 3, #3880 or #3881. There is no prerequisite feature on a 3683 mdl 1A, 2A or 3A. The IBM 3650 Programmable Store System Point of Sale Application/ Supermarket Environment Program Product (5748-D21) is a mandatory requirement in all states conforming to the National Bureau of Standards Handbook #44 for Weights and Measures. **Maximum:** One. **Field Installation:** Yes.

Storage Expansion-POS (#6991): Provides the capability for expanding the storage capacity of a 3683 from a maximum of 56K to a maximum of 120K bytes. This feature permits installation of up to four 16K Storage Increments (#7720) on 3683s. **Prerequisites:** Expansion Feature II (#3881) must be installed. In addition, the 3683 mdl 1 must have Storage Increment--24K (#7730) installed. **Maximum:** One. **Field Installation:** Yes.

3683 Point of Sale Terminal (cont'd)

3683 MDL 1 STORAGE CONFIGURATOR

32K	**Base Storage**
40K	8K - #7710, or
48K	16K - #7720, or
56K	24K - #7730
	Expansion Feature II - #3881
	Storage Expansion-POS-#6991 (#7730 and #3881 are prerequisites)
72K	16K - #7720
88K	16K - #7720 (2)
104K	16K - #7720 (3)
120K	16K - #7720 (4)

3683 MDL 1A, 2, 2A, 3, OR 3A STORAGE CONFIGURATOR

56K	**Base Storage**
	Expansion Feature II - #3881
	Storage Expansion-POS-#6991
72K	16K - #7720
88K	16K - #7720 (2)
104K	16K - #7720 (3)
120K	16K - #7720 (4)

Storage Increment--8K (#7710): [Mdl 1] Provides an additional 8,192 bytes of storage. **Maximum:** One. **Limitations:** Cannot be installed with Storage Increments--16K (#7720) or Storage Increment--24K (#7730) or on a 3683 mdl 1A, 2, 2A, 3 or 3A. **Field Installation:** Yes.

Storage Increment--16K (#7720): Provides an additional 16,384 bytes of storage. **Maximum:** One, if Storage Expansion-POS (#6991) is not installed; four, if Storage Expansion-POS (#6991) is installed. **Limitations:** Cannot be installed with Storage Increment--8K (#7710) or 24K (#7730) or on the 3683 mdls 1A, 2, 2A, 3 or 3A unless Storage Expansion-POS (#6991) is installed. **Field Installation:** Yes. **Note:** If Storage Increment--8K (#7710) is installed, it must be removed to install this feature.

Storage Increment--24K (#7730): [Mdl 1] Provides an additional 24,576 bytes of storage. **Maximum:** One. **Limitations:** Cannot be installed with #7710 or #7720. **Field Installation:** Yes. **Note:** If Storage Increment--8K (#7710) or Storage Increment--16K (#7720) is already installed, it must be removed to install this feature.

Storage Retention (#7785): Provides an internal battery and charger to power storage during a power interruption. All data and programs are protected so that a transaction in process when power was interrupted will continue when primary power is restored. The duration of storage retention depends on the charged state of the battery. When fully charged, storage will be retained for approximately 12 minutes. The number of times the battery is discharged greatly affects battery life; therefore, facilities are provided to allow the customer through programming, to deactivate the battery for scheduled power off conditions such as store closing. Replacement batteries are to be provided, installed, and removed by the customer. IBM will replace the battery if requested by the customer on a time and material basis. Replacement batteries may be ordered through IBM (see "Accessories") or through other sources that meet the supply battery specifications as defined by IBM. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Storage Retention (#7785) had to be specified on 3683 mdls 1, 2 or 3 when six of the following features are installed:

#4633	#5431
#4945*	#5433
#4946*	#6991
#5422*	#8010

* mutually exclusive

Totals Retention (#8010): Provides an additional 240 bytes of customer programmable storage that are powered by its own battery to protect loss of information such as totals, transaction number, terminal address, etc. when power is turned off or power interruptions occur. An early warning status condition will be given to the program when the battery needs replacing. Replacement batteries are to be provided, installed, and removed by the customer. IBM will replace the battery if requested by the customer on a time and material basis. (See "Accessories" for battery life characteristics and types of batteries required for replacement.) **Maximum:** One. **Field Installation:** Yes.

Validation Printer (#8725): [Mdls 1,1A, 3, 3A] Provides a flatbed document validation station for printing on inserted forms. Prints 38 characters per line at 15 characters per 25.4mm (inch). Vertical line spacing is 6.3 lines per 25.4mm (inch) at a line space rate of 20 lines per second. The all-points addressable characteristics of the printer allow logos, special graphics and highlighting to be designed and printed by user programming. **Maximum:** One. **Limitations:** Cannot be installed with Label Printer (#8726). **Field Installation:** Yes.

Label Printer (#8726): [Mdls 1,1A, 3, 3A] Provides a flatbed station capable of printing on inserted forms or labels. Includes the capabilities of the Validation Printer Feature (#8725) and in addition includes the capability of printing labels. Prints 38 characters per line at 15 characters per 25.4mm (inch). Vertical line spacing is 6.3 lines per 25.4mm (inch) at the rate of 20 lines per second. The all points addressable characteristics of the printer allow logos, special graphics, and highlighting to be designed and printed by user programming. Label printing capabilities include "card stock"; shelf labels and gummed labels on a carrier. **Maximum:** One. **Limitations:** Cannot be installed with Validation Printer (#8725). **Field Installation:** Yes. **Note:** If the Label Printer feature is to be field installed in place of the Validation Printer (#8725), removed parts belong to the customer.

MODEL CONVERSIONS

Only upgrades to the "A" model designation from the same base model are available in the field (e.g., 1 to 1A). Customer Price Quotations and Customer Order Acknowledgement letters for purchase MESs must state: "Installation of this base mdl change involves the removal of parts which become the property of IBM." **Prerequisites:** When upgrading a 3683 model 1 to a 3683 model 1A, Storage Increment-24K (#7730) is required.

ACCESSORIES

Battery, Storage Retention (P/N 8543856): A nickle cadmium battery that will provide power to retain data and programs in main storage and registers during a primary power interruption. A 12.5 volt battery is shipped with the intial order for Storage Retention Feature **#7785.**

Battery, Totals Retention: Provides power for 240 bytes of storage to secure totals, transaction sequence number, terminal address, and other user-defined data against power off or power interruptions. This power source (Eveready #E134, Mallory TR134R or equivalent) is customer replaceable. The capacity rating of this type of battery when new is approximately 1,000 milliamp hours. The life of the battery is determined by the shelf life which is approximately 9,000 hours. This means if a battery is installed in a 3683 six months after manufacture, its useful machine life will be six months on the average. It is recommended that the user's program test the battery state at least once per day. When the battery condition reaches the low threshold state, there are approximately 72 hours of battery life left. Procurement and replacement of the battery is the customer's responsibility. The customer must ensure that the power is "On" on the terminal when the battery is replaced or all information will be lost.

Cash Till and Cover With Lock: Additional cash tills and till covers with locks may be ordered.

Cash Till with Fixed Bill Dividers (without cover) **P/N 1860154**
Cash Till with Adjustable Bill Dividers (without cover) **P/N 2493151**
Cash Till Cover with Lock and Keys **P/N 1851126**

Notes: Assembly of the Adjustable Till is a customer responsibility. The following item is also available but on a purchase-only basis:

Cash Till Cover with Lock and Keys **#9335**

Console Table (#1560): An operator workstation for the 308X processor complex, which provides a durable melamine working surface for up to two operators and their display consoles. The table has a color accented front modesty panel, internal cable channels for routing phone lines and display cables and is designed for a raised floor environment. A raised accessory panel designed to accommodate wall mountable equipment such as tackboards, telephones or intercoms is attached to either one end or the other of the console table. The table measures 1780 mm x 815 mm and the end accessory panel is 265 mm higher than the 720 mm table height.

Specify end attachment of accessory panel:
#9441 for right end attachment.
#9442 for left end attachment.

Specify color code:
#9161 for Willow Green.
#9162 for Garnet Rose.
#9163 for Sunrise Yellow.
#9164 for Classic Blue.
#9165 for Charcoal Brown.
#9166 for Pebble Gray.
#9167 for Pearl White.

Keyboard Accessories: The following terms are used in the KEYTOP descriptions:

VERSION	STEM NUMBER/KEY ALIGNMENT
OV	One/Vertical
OH	One/Horizontal
OVH	One/Vertical or Horizontal
TV	Two/Vertical
TH	Two/Horizontal
-B	Small raised projection in keytop
-C	Circular, concave top on key button
-M	Minimal concavity of circular keytop
SIZE	UNITS

Universal Keytops: Keyboard accessories are available which allow the customer to define and to change the messages on the keytops on the 3683 Point of Sale terminal (and the 3684 Point of Sale control unit). These accessories consist of legendable keytops and sheets of blank labels to use on these keytops.

The universal keytops come in the four standard sizes and in two heights. They consist of two parts; a white bottom button and a clear plastic cover. Blank labels for the various keytop sizes may also be ordered. These labels come in various colors and may be printed with either black or white ink. The user may define unique key button messages, print these messages on the desired color label, affix the printed color label to the white bottom key button and snap on the clear protective cover. Extra clear plastic covers are also available for use as spares.

Key Stops (P/N 1650058): The key stop is a small ring collar which is placed over the stem of a keybutton and under the keytop. The collar holds the keytop in the up position and prevents its use.

Keytop Extractor (P/N 1647720): The keytop extractor is a small plier-like device which fits between rows of keybuttons. By squeezing on the handles, a firm grip is made on the keytop and it may be pulled off its stem. The customer may find this helpful when adding key stops, universal keytops, or in doing any rearranging of the keyboard.

Two keytop extractors are supplied with each 3651 controller and one extractor with each 3684 Point of Sale - Control Unit. The customer may desire additional extractors.

Locks and Keys: The 3683 is equipped with a cash drawer lock and can be equipped with an optional journal lock **#4690** and optional Manager Keylock **#4905**. The cash drawer lock and all other locks ordered will be shipped with two keys. The cash drawer lock, journal lock, manager lock, and diskette cover will be randomly selected unless specified otherwise (see "Special Features"). If the customer wishes to replace a unique lock, the order should state the 3683 machine serial number, lock name and the lock identification number (stamped on lock). **Note:** Without an identification number, the order should state machine serial number, lock name and the words "NEW LOCK REQUIRED". Additional or replacement keys may be purchased from a local locksmith or from IBM. Locks may be purchased from IBM and may be changed in the field. The following randomly selected locks (with two keys) may be ordered by P/N:

3683/3684 Cash Drawer Lock	**P/N 8543281**
3683/3684 Journal Lock	**P/N 8543620**
3683/3684 Manager Lock	**P/N 8547992**

Magnetic Slot Reader (P/N 4123500 or Feature code #9441): The Magnetic Slot Reader (MSR) attaches by a 1.5m cable to a number of data entry and reporting devices that have an appropriate magnetic adapter feature. This slot reader accommodates a wide range (height and length) of magnetic striped card stock and plastic badges including: Magnetic striped 80-column cards, operator identification badges, large and small credit cards, etc.

The MSR has three lights and an audible buzzer which provide feedback to the user on the status of scanned data. Holes in the bottom of the MSR allow optional attachment to an appropriate flat surface. The MSR has a wide opening on one end to facilitate reading of badges or documents. A magnetic reader attachment feature on the appropriate machine is required to use the MSR.

Maintenance: High densities of hard particulates may decrease scanner head life. In this environment, the customer should consider protecting the media to reduce the frequency of head assembly replacement. Where there are high densities of corrosive gases, more frequent head assembly replacement may be required. There is no regurlarly scheduled preventative maintenance recommended by IBM. Primary maintenance for the Magnetic Readers will be done by the customer following the problem determination and part replacement procedures.

The following are a recommended number of spare readers which the customer may want to consider stocking:

Readers	Spares
50	2
100	3
150	4
200	5

Warranty: The Magnetic Reader Accessories are warranted free from defects in workmanship and materials for 90 days. Warranty service will be performed at the FE Repair Center. The customer will fill out a Repair Center Machine Repair Authorization Form (GZ27-2981), pack, and mail it and the defective Magnetic Hand Scanner to:

IBM Corporation
Repair Center
321 Route 17
Paramus, NJ 07652

Optionally, the customer can obtain post-warranty maintenance on a time and material basis at the IBM Repair Center, Paramus, NJ.

Note: A Magnetic Reader attachment feature on the appropiate machine is required to use the Magnetic Slot Reader.

SUPPLIES

Ribbons: A black ribbon cartridge, P/N 7034640 or equivalent, is required.

Paper: Roll paper 88.9mm (3.5 in.) diameter, 69.85mm (2.75 in.) wide is required at the cash receipt and journal print stations.

Contact IBM.

3684 POINT-OF-SALE CONTROL UNIT

PURPOSE

A user-programmable input/output, data collection and processing terminal with a 985,088 byte integrated diskette for the 3680 Programmable Store System. Model 1 of the 3684 is designed for single terminal stores. The 3684 model 1 contains a single programmable segment with appropriate features to allow the user to perform the point-of-sale, data collection, credit authorization, price look-up, inquiry, data entry and host communication functions. The point-of-sale features and functions are similar to the 3683 Point-of-Sale Terminals.

Model 2 of the 3684 is designed to perform the Point of Sale function and to act as a master control in multiple terminal stores. There are two self-contained programmable segments, one to perform the point-of-sale function similar to the 3683, and the second to perform the control function for communication with its own point-of-sale segment and with additional loop-attached 3683 (models 1, 2 or 3) terminals. In addition, the control segment controls the diskette and host communication input/output functions. The 3683 models 1A, 2A or 3A are not program-supported for attachment to the 3684 model 2 loop.

MODELS

Model 1	001	Single unit
Model 2	002	Master unit

Prerequisites:

1. A 3704, 3705 or 3725 in 2701, 2703 Emulation Mode (or Integrated Communications Adapter) for BSC system and in NCP/VS mode for SDLC systems (with appropriate features ... see M3704, 3705 and 3725 pages) attached to any virtual storage S/370 or 4300 processor.
2. A Keyboard (#4921 or #4922 or #4923)
   and a display (#3331, #3332, #3336 or #3337) must be ordered for each 3684.

HIGHLIGHTS

A modular input/output unit with features that provide for an integrated or a limited distributed (cash drawer and display) package. It features data entry by keyboard or from a magnetic, non-IBM EAN/UPC, or non-IBM OCR hand-held reader and data output by an 8-digit numeric display, with up to 32 indicators for operator guidance and machine status conditions, or an alphameric display with 36 character positions and printing of input or output data under program control. It features a cash drawer with removable till and adjustable divider option. An integrated diskette is used for customer program storage, data and table storage, diagnostic programs and error logging. The minimum configuration must include a base unit plus a keyboard and a display. (See "Prerequisites".)

Base Unit: Consists of [1] programmable segments and storage (56K for mdl 1; mdl 2 has 32K for the point-of-sale segment and 56K for the control segment.); [2] a matrix printer with a cash receipt station; and [3] a 985,088 byte diskette drive. An audible alarm, activated when predetermined events require operator attention or intervention for system operation, is also part of the base unit.

Printer: A matrix, bidirectional printer which prints a 38-character print line at 15 characters per 25.4mm (inch) spacing. Vertical line spacing is 6.3 lines per 25.4mm (inch) at a line space rate of 20 lines per second. It uses an easily replaceable cartridge ribbon. In addition to the standard character sets, an all-points addressable capability allows (by customer programming) printing of logos and special graphics . Additional print stations can be ordered by special feature. The cash receipt station will accept 88.9mm (3.5") diameter roll paper, 69.85mm (2.75") wide.

Diskette: A 985,088 byte Diskette 2D is used on both mdls. The diskettes are formatted to 256 byte blocks. The diskette is removable and interchangeable.

Communications: All 3684 mdls may have BSC or SDLC communication capability. Depending on customer selection at system generation, either or both protocols may reside in the terminal and either may become active when loaded from the diskette.

System Attachment: The 3684 mdls 1 and 2 attach to any virtual storage S/370 or 4300 processor via a 3704, 3705 or 3725 Communications Controller in 2701, 2703 Emulator Mode (or Integrated Communications Adapter) for BSC systems and in NCP/VS mode for SDLC systems. Attachment is over communication lines at speeds of 1200, 2400 or 4800 bps. The 3684 has the capability of concurrent host communication and point-of-sale function, which allows store operations to continue when transmitting or receiving data from the host processor.

The 3684 mdl 1 and 2 can communicate with the 8100 System over nonswitched communication facilities using SDLC, and with the Series/1 over switched, nonswitched point-to-point or multipoint facilities using BSC. The Host Command Processor (HCP) Facility in the 3684 can communicate with a user program in the 8100 executing at the Data Stream Interface, or with a user program in the Series/1 using Read/Write support of the Realtime Programming System. A user-written program in the 3684 can communicate with a user program in the 8100 at the DSI level or in the DPPX/DTMS environment, or with a user program in the Series/1 using RPS Read/Write communications support.

Communications Facilities: The 3684 operates in data half-duplex point-to-point or multipoint mode on half-duplex or duplex facilities at transmission speeds of 1200/600, 2400/1200, 4800/2400 bps on nonswitched facilities. In addition, the 3684 also operates in half-duplex point-to-point mode at transmission speeds of 1200/600, 2400/1200 and 4800/2400 bps on switched facilities. See M2700 pages.

Modems: A 1200 bps Integrated Modem feature (#5530) or an external modem may be attached to a 3684. External modems require the External Modem Interface feature (#3701).

IBM Modem	Speed (bps)
3863 mdl 1, mdl 2	2400/1200
3864 mdl 1, mdl 2	4800/2400
3872 mdl 1	2400/1200

Switched network backup mode of operation is possible using an appropriately featured external modem. For communications capabilities, product utilization and special features, see M2700, 3863, 3864, 3872 pages.

In-Store Communications: The 3684 mdl 2 performs a master control function for 3683s that are attached to the 3684 by a 2400 bps loop. Interactive communication capability exists between the 3684 and 3683s for data collection, price look-up, credit, and diagnostic facilities.

All mdls of the 3684 receive their initial machine load (IML) from a S/370 or 4300 host processor either by physical diskette transport or by teleprocessing. The 3684 IML and the IMLs for 3683s associated with a 3684 mdl 2 are maintained on the diskette. The 3684 mdl 2 transmits the 3683 IML when requested by the 3683.

Limitations: The 3684 mdl 2 has a limited number of optional feature positions available to the customer. If Storage Expansion-POS (#6991) is required by your customer, then a maximum of two feature positions are available. When selecting the features to be installed, the sum of their unit values should not exceed 2 and specify code **#9444** should be indicated. If Storage Expansion-POS (#6991) is not required, then a maximum of four feature positions are available. When selecting the features to be installed, the sum of their unit values should not exceed 4 and specify code **#9445** should be indicated.

If your customer does not initially install Storage Expansion-POS (#6991) and specifies **#9445** to provide additional feature capability and decides after installation that he required Storage Expansion-POS (#6991), then the feature capability provided by **#9445** will have to be replaced at customer expense. When this occurs you must recalculate the unit value to ensure you have not exceeded a sum total of 2.

Feature	Unit Value
Non-IBM Coin Dispenser Adapter (#5431)	1
Non-IBM Scale Adapter (#5433)	1
*Non-IBM OCR Hand-Held Reader Adapter (#5422)	1
*Magnet Wand Reader (#4945)	1
IML Write Adapter (#4634)	1
*Non-IBM EAN/UPC Wand Attachment (#4946)	2

* = Mutually Exclusive

See RPQ 8Q0322 for additional feature position configurations applicable to the External Storage Attachment Feature #4500.

Customer Responsibilities:

Proposal/Acknowledgement Letter Statements: Each proposal and acknowledgement letter must include the following statement:

> "It is agreed that IBM will have no responsibility to provide warranty or maintenance service on any 3684 which contains cash or other valuables. It will be the customers' responsibility to remove, control and replace cash so that IBM can fulfill its warranty and maintenance obligations.
>
> When a failure occurs in the cash drawer of any 3684 and it cannot be opened prior to maintenance by IBM, the Customer will assign one of its personnel to assume responsibility for removal of the cash or other valuables when the drawer is opened."

Customer Setup: The 3684 will be shipped with customer setup instructions. The customer is responsible for:

- Unpacking, placement, set up and checkout of the 3684 at time of delivery, or when relocating the 3684.
- Relocation of the 3684 (if required) to allow IBM service access.
- Using and following the problem determination procedures.
- Physical set up and connection of cables to TP lines/modems and loop.

Maintenance: 3684s located in the immediate sales area may preclude the acceptability of repair due to the public scrutiny and loss of the selling location for customer service. In these cases, the customer

3684 Point-of-Sale Control Unit (cont'd)

should remove the unit to a repair facility located within the store for subsequent repair. At this location the CE will repair and test the unit.

Storage Increments

Note: 1. Storage Increments--8K (#7710) and 24K (#7730) apply to the Point-of-Sale segment of the 3684 mdl 2 only. Storage Increment--16K (#7720) applies to the 3684 mdl 1 and 2 when Storage Expansion (#6990) is installed. If #6990 is not installed, then #7720 applies only to the Point-of-Sale segment of the 3684 mdl 2.

2. When storage is upgraded by field installation, the new Storage Increment feature displaces the old. Removed parts belong to the customer. Prior to using a removed module in another 3684, the compatibility of the part should be verified and an RPQ must be submitted to allow reinstallation on another machine.

SPECIFY

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): **#9890** for locking plug or **#9891** for nonlocking plug. If standard 2.8 meter (9 foot) power cable is not desired, specify **#9511** for 1.8 meter (6 foot) cable.

  Note: 120V AC, 60 Hz is compatible with existing 115V Systems.

- Store Loop Polarity Tester: Order Store Loop Polarity Tester, P/N 1859559, on MES (group 91) from Raleigh Order Department.

  One is furnished at no charge to each 3684 mdl 2 site for testing store loop wiring.

  Note: The customer must provide (purchase, install and maintain) all necessary 3680 store loop communication lines within the store. Bulk loop cable is available from IBM.

- Controller Designation: Specify **#9491** on the first 3684 to be used with a host system location and specify **#9492** on each additional 3684 in the network. Specification of **#9491** will result in 3684 controller and 3683 terminal code (DTR) being sent to specified host location.

  When **#9491** is specified, additional information must be specified as follows:

  1) Specify one of the following to indicate magnetic tape density (media) used at the host system location. This tape media is available under DOS/VS, OS/VS1 and OS/VS2 only.

     #9412 -- 9 track, 800 bpi
     #9413 -- 9 track, 1600 bpi

     #9414 -- 9 track, 6250 bpi

     The 3684 controller and 3683 terminal data will be sent via the specified media to the IBM Programming Systems Representative at the host system location for installation.

  2) Supplemental Specs (via Terminal Entry) are to be entered exactly as follows to indicate mailing address of host system location:

     Line 1 -- IBM Programming Systems Representative
     Line 2 -- c/o (Name of Customer)
     Line 3 -- Street Address (or P.O. Box)
     Line 4 -- City, State, Zip Code

     This is the address to which the first controller data tape will be automatically shipped for the first controller ordered (with specify code **#9491**). Whenever controller data is updated by an EC, the EC will be shipped to the most current microcode control (MC) address.

- Storage Expansion: If Storage Expansion-POS (#6991) is required specify **#9444** ... if Storage Expansion-POS (#6991) is not required, specify **#9445**. See "Limitations" above.

- If **#9491** is specified and there is a storage requirement that prevents 3683 operation with the current level of control code, specify **#9490** with **#9491**. **#9490** provides 3683 Control Code level EC 320503 which operates in the same control storage allocation as is required for 3683 Control Code level EC 320502. It is strongly recommended that new customers and 3687 customers do not take this specify option.

SPECIAL FEATURES

NON-COMMUNICATIONS FEATURES

Cash Drawer Integrated - 1st (#1572): Provides a cash drawer with removable till that is contained within the 3684 base unit. The cash drawer has a media slot that will accommodate approximately a 25mm (1 inch) stack of documents. Opening the cash drawer is under program control. A cash drawer lock is provided. See note below for special ordering instructions for lock and till with adjustable dividers. **Maximum:** One. **Limitations:** Only one additional cash drawer may be ordered - either Cash Drawer Integrated-2nd (#1573), Cash Drawer-Distributed (#1575) or non-IBM Cash Drawer Attachment (#1577). **Field Installation:** Yes.

Cash Drawer Integrated - 2nd (#1573): Provides a second Integrated Cash Drawer with housing and removable till and is installed directly below Cash Drawer Integrated-1st (#1572). Functionally equivalent to Cash Drawer Integrated-1st (#1572). **Maximum:** One. **Prerequisites:** #1572. **Field Installation:** Yes.

Cash Drawer-Distributed (#1575): Provides a distributed cash drawer with housing and removable till that can be located up to 3.6 meters (12 feet) from the 3684 base. Functionally equivalent to Cash Drawer Integrated-1st (#1572). **Maximum:** Two if no other cash drawer is ordered. One if Cash Drawer Integrated-1st (#1572) or one non-IBM Cash Drawer Attachment (#1577) is ordered. **Field Installation:** Yes.

Non-IBM Cash Drawer Attachment (#1577): Provides an IBM-defined interface with cable and plug for attaching an non-IBM Cash Drawer. **Maximum:** Two if no IBM Cash Drawer is installed. One if a Cash Drawer Integrated-1st (#1572) or Cash Drawer-Distributed (#1575) is ordered. **Limitations:** An attached non-IBM Cash Drawer must meet the IBM-defined interface. **Field Installation:** Yes.

Notes:

(1) For cash drawer tills and covers, see "Accessories" in the M3683 and 3684 pages.

(2) Cash Drawer Lock: Each IBM Cash Drawer (#1572, #1573 or #1575) is equipped with a lock. A group of 25 unique lock numbers has been reserved to allow the customer to specify identical lock types on all terminals. This allows all cash drawers to be opened with the same key. If this is desired, specify one of the following features on the cash drawer order:

(3) Specify **#9799** for each IBM Cash Drawer ordered (#1572, #1573 or #1575) if a till with movable bill dividers is desired.

#9101	**#9106**	**#9111**	**#9116**	**#9121**
#9102	**#9107**	**#9112**	**#9117**	**#9122**
#9103	**#9108**	**#9113**	**#9118**	**#9123**
#9104	**#9109**	**#9114**	**#9119**	**#9124**
#9105	**#9110**	**#9115**	**#9120**	**#9125**

If none is specified, a lock will be selected at random from a larger group of lock types. Each cash drawer will be shipped with two cash drawer keys.

Distributed Keyboard Attachment (#3240): Provides for locating the keyboard up to 3.6 meters (12 feet) from the 3684 base. **Prerequisites:** #4921 or #4922 or #4923 . **Maximum:** One. **Field Installation:** Yes.

Diskette Cover Lock (#3310): Provides a lock for the diskette cover. (See Note below for special lock selection.) **Maximum:** One. **Field Installation:** Yes.

Note: Three groups of 10 unique specify numbers have been reserved to allow a customer to order a specific journal lock, manager keylock or diskette cover lock for each terminal. (The 3683 and 3684 uses the same journal lock and manager lock numbers, therefore all terminals within a store could have the same lock if desired.) If the same lock is desired on the journal, manager keylock and diskette cover, specify the respective locks with the same value in the last digit. That is, if **#9203**, **#9303** and **#9213** are specified, the same lock **#9203** will be installed at all locations.

Journal Lock	Manager Keylock	Diskette Cover Lock
#9201	**#9301**	**#9211**
#9202	**#9302**	**#9212**
#9203	**#9303**	**#9213**
#9204	**#9304**	**#9214**
#9205	**#9305**	**#9215**
#9206	**#9306**	**#9216**
#9207	**#9307**	**#9217**
#9208	**#9308**	**#9218**
#9209	**#9309**	**#9219**
#9210	**#9310**	**#9220**

If none is specified, a lock will be selected at random from a larger group of lock types. Each lock feature will be shipped with two keys. For additional or replacement keys, see "Accessories".

Display, 1-Sided (#3331): An operator display and guidance unit consisting of an 8-digit numeric display and 32 indicators for operator guidance and machine status. The display is used to display numeric

3684 Point-of-Sale Control Unit (cont'd)

input or output data such as item number, credit number, totals, amount due, etc. The 32 indicator lights point to labels that describe: (1) machine status such as: Ready, Wait, Offline, etc. (2) step-by-step guidance to lead the operator through a transaction or procedure. The unit will be shipped with the indicators labeled. However, the customer may relabel all but five indicators and, under customer program control, define their use. A legend sheet with a variety of legends will be shipped with each machine. **Maximum:** One. **Limitations:** Cannot be installed with Display, 2-Sided (#3332), Alphameric Display (#3336), Remote 2nd Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). **Field Installation:** Yes.

Display, 2-Sided (#3332): An operator and customer display guidance unit which contains all the functions of Display, One-Sided (#3331) plus an 8-digit numeric display with six indicators on the back of the unit for customer viewing. **Maximum:** One. **Limitations:** Cannot be installed with Display, 1-Sided (#3331), Display-Customer Remote (#3333), Alphameric Display (#3336), Remote 2nd Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). **Field Installation:** Yes.

Display-Customer Remote (#3333): A customer display and status indicator unit that is connected to the 3684 by a 3.6 meter (12 foot) cable. The unit consists of an 8-digit numeric display and 12 indicators (six are shipped with labels and six without). All are relegendable. The display and indicators are under customer program control. **Maximum:** One. **Prerequisites:** #3331. **Limitations:** Cannot be ordered with Display, 2-Sided (#3332), Alphameric Display (#3336), Remote 2nd Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). **Field Installation:** Yes.

Distributed Display Attachment (#3335): Provides for distributing Display, 1-Sided (#3331) or Display, 2-Sided (#3332) up to 3.6 meters (12 feet) from the 3684 base. **Maximum:** One. **Prerequisites:** #3331 or #3332. **Limitations:** Cannot be installed with Alphameric Display (#3336), Remote 2nd Alphameric Display (#3337) or Distributed Alphameric Display Attachment (#3338). **Field Installation:** Yes.

Alphameric Display (#3336): An operator/customer display consisting of two rows of eighteen characters each for a total of thirty-six characters. The display is used to display numeric as well as alphabetic data such as item number, description, guidance information, etc. The display is connected locally to the 3684. **Maximum:** One. **Limitations:** Cannot be installed with a numeric display (#3331, #3332, #3333 or #3335). **Field Installation:** Yes.

Remote 2nd Alphameric Display (#3337): A customer display that is connected to the 3684 by a 3.6 meter (12 foot) cable. The display consists of two rows of eighteen characters, each for a total of thirty-six characters and is used to display numeric as well as alphabetic data such as item number description, etc. **Maximum:** One. **Prerequisites:** #3336. **Limitations:** Cannot be installed with numeric display (#3331, #3332, #3333 or #3335). **Field Installation:** Yes.

Distributed Alphameric Display Attachment (#3338): Provides a cable for distributing the Alphameric Display (#3336) up to 3.6 meters (12 feet) from the 3684 base. **Maximum:** One. **Prerequisites:** #3336. **Limitations:** Cannot be installed with numeric display (#3331, #3332, #3333 or #3335). **Field Installation:** Yes.

External Modem Interface (#3701): Provides an EIA interface for attachment of an IBM or other external modem. **Limitations:** Cannot be ordered with 1200 bps Integrated Modem (#5530). **Maximum:** One. **Field Installation:** Yes. Specify the following as applicable:

1. Specify **#9695** if the 3684 is required to provide clocking (1200 bps maximum).
2. Specify **#9126** if the 3683, 3684, 3872 Modem is to be attached.

Expansion Feature (#3890): Provides additional facilities on the 3684 mdl 1 to accommodate features that cannot be installed on the base unit. **Maximum:** One. **Limitations:** Applies to 3684 mdl 1 only. **Prerequisites:** This feature is a prerequisite to install #4945, #4946, #5422, #5431 or #5433. **Field Installation:** Yes. **Note:** No expansion feature is required on the 3684 mdl 2 to install its applicable features.

External Storage Attachment (#4500) : Provides the ability to attach the External Disk Drive Feature (#4501). **Maximum:** One. **Limitations:** Mutually exclusive with IML-Write adapter (#4634). Applies to 3684 mdl 2 only. **Field Installation:** Yes.

External Disk Drive (#4501) : Provides a 10MB file for attachment to the 3684 mdl 2 for storage of user data files. Cable attached to the 3684. **Limitations:** Applies to 3684 mdl 2 only. **Prerequisites:** #4500. **Field Installation:** Yes. When this feature is field installed the customer is responsible for performing the customer set up procedure.

IML-Write Adapter (#4634): Provides the 3684 mdl 2 with the ability to write an IML (Initial Machine Load) tape on a user-provided tape cassette recorder (refer to *IBM 3680 Planning and Site Preparation Guide,* GA27-3213, for Cassette Recorder interface requirement) which can be read by a 3683 Point-of-Sale terminal equipped with an IML-Read Adapter (#4633) feature. **Maximum:** One. **Limitations:** Applies to 3684 mdl 2 only. Mutually exclusive with 4800 bps Loop (#4710) and with External Storage Attachment (#4500). **Field Installation:** Yes.

Journal Lock (#4690): Provides a special lock and security cover over the printed journal. (See Note below for special lock selection.) **Maximum:** One. **Prerequisites:** #4695. **Field Installation:** Yes.

Journal Printer (#4695): Provides a journal print station with a journal roll take-up mechanism. Print line length is 38 characters at 15 characters per 25.4mm (inch) spacing. Vertical line spacing is 6.3 lines per 25.4mm (inch) at a line space rate of 20 lines per second. The all-points addressable characteristics of the printer permit the customer to highlight exceptions through special graphics designed and controlled by user programming. A 12.7mm (.5") signature window is provided. **Maximum:** One. **Field Installation:** Yes. The journal station will accept 88.9mm (3.5") diameter roll paper, 69.85mm (2.75") wide.

4800 bps Loop (#4710): Provides a 3684 mdl 2 loop speed of 4800 bps in place of the standard loop speed of 2400 bps. Loop speed for 3683s to be attached must be specified as same speed. **Maximum:** One. **Limitations:** The sum of the communication speeds of all operational communications attachments to a 3684 mdl 2 must not exceed 7200 bps. These attachments include the store loop, host communications, and Serial I/O RPQ MN2257. Mutually exclusive with IML-Write adapter (#4634). Applies to 3684 mdl 2 only. **Field Installation:** Not recommended.

Manager Keylock (#4905): Provides a keylock mounted on the keyboard that allows customer programming to interrogate the position of the keylock when the key is operated. Possible uses include the enforcement of a manager override to a restricted security function. (See note below for special lock selection.) **Maximum:** One. **Prerequisites:** #4921 or #4922 or #4923. **Field Installation:** Yes.

Keyboards, General: All keyboards except Feature #4922 and #4923 with Specify **#9250** have customer-legendable keybuttons except for the 11 keybuttons which have molded legends. All single- and double-function keys are under customer program control. Double keys may be moved, added or deleted by the user. Several colors and sizes of decal sheets with common legends will be shipped with the 3684. See "Accessories" section for released keybuttons that may be ordered for any unique customer requirement. **Maximum:** One #4921 or #4922 or #4923. **Field Installation:** Yes.

Specify Option: An option is available for #4922 and #4923 that provides pre-defined keytops with the 3663/3683/3684 Supermarket nomenclature. The keytops provided with this option are the engraved type and are not customer-legendable. For a description of the nomenclature of the keytops provided, refer to *IBM 3680 Programmable Store System Introduction Manual,* GA27-3199. Specify: **#9250.**

35-Key Modifiable Keyboard (#4921): A 35-key keyboard that includes:

5-Legended system control keys.
19-Unlegended function keys.
11-Keys with dual legends on each keybutton, "numeric" and "transaction type" in the data entry arrangement.

48-Key Modifiable Keyboard (#4922): [Data Entry] A 48-key keyboard that includes:

5-Legended system control keys.
32-Unlegended function keys.
11-Keys with dual legends on each keybutton, "numeric" and "transaction type" in the data entry arrangement.

48-Key Modifiable Keyboard (#4923): [Adding Machine] A-48 key keyboard that includes:

5-Legended system control keys.
32-Unlegended function keys.
11-Keys with round numeric legended keybuttons in the adding machine arrangement.

Note: No Expansion Feature is required on the 3684 mdl 2 to install any applicable features.

Magnetic Wand Reader (#4945): A hand-operated wand used to read single track delta distance encoded magnetic merchandise tickets, credit cards, employee badges, etc. The small lightweight wand attached via a 1.2 meter (4 foot) long flexible cord allows encoded merchandise tickets to be read without removing them from the merchandise. See Note. **Prerequisites:** #3890 must be installed on 3684 mdl 1. **Limitations:** Cannot be installed with an non-IBM EAN/UPC Wand Attachment (#4946) or an non-IBM OCR Wand Adapter (#5422). **Maximum:** One. **Field Installation:** Yes. **Note:** The minimum encoding specifications that must be met by suppliers of credit cards, merchandise tickets and employee badges will be furnished upon request.

3684 Point-of-Sale Control Unit (cont'd)

Non-IBM EAN/UPC Wand Attachment (#4946): Provides an adapter to support the attachment of a non-IBM EAN/UPC Bar Code hand-held wand reader. This feature provides an external connector to attach the non-IBM wand reader. The types of wand readers that can attach to this feature are either analog output wand readers (Intermac 1233R or equivalent) or digital output wand readers (Hewlett-Packard HEDS 3000 or equivalent) that meet the requirements stated in the non-IBM EAN/UPC Wand Attachment Product Attachment Information for the 3650/3680. This document can be ordered by the marketing representative after FCS from IBM. **Prerequisites:** On the 3684 mdl 1, Expansion Feature #3890. The IBM Multiple Supplier Systems Bulletin (G120-6648) applies to the non-IBM wand reader. **Limitations:** When this attachment is used with an analog output wand reader, it is possible that this feature may experience failures if operated within five miles of a high power AM transmitter of the type used for television broadcasting. Cannot be installed with the Magnetic Wand Reader (#4945), non-IBM OCR Hand-Held Reader Adapter (#5422). **Maximum:** One. **Field Installation:** Yes. **Specify: #9660** for analog wand interface or **#9661** for digital wand interface.

Non-IBM OCR Hand-Held Reader Adapter (#5422): Provides an adapter to support the attachment of a non-IBM OCR hand-held wand reader that meets the requirements stated in the *Non-IBM OCR Wand Reader to IBM 3653 Product Attachment Information* document. This feature provides a 1.83 meter (6 foot) cable with an ITT--Cannon DBC-25S type connector to attach the non-IBM OCR Hand-Held Reader unit. **Prerequisites:** #3890 must be installed on 3684 mdl 1. **Limitations:** Cannot be installed with an non-IBM EAN/UPC Wand Attachment (#4946) or a Magnetic Wand Reader (#4945). **Maximum:** One. **Field Installation:** Yes.

Non-IBM Coin Dispenser Adapter (#5431): Provides an IBM-defined serial interface for attaching a non-IBM Manufactured Coin Dispenser that meets the requirements stated in the "3680 PSS System non-IBM Coin Dispenser Adapter Product Attachment Information" document which is available from IBM. For further information on the attachment, contact IBM. **Prerequisites:** #3890 for 3684 mdl 1 only. **Maximum:** One. **Field Installation:** Yes.

Non-IBM Scale Adapter (#5433): Provides an IBM-defined serial or parallel interface for attaching a non-IBM Manufactured Scale that meets requirements stated in the "IBM 3680 PSS non-IBM Scale Adapter Product Attachment Information" document which is available from Corporate Industry Relations. For further information on the attachment, contact IBM. Specify: **#9385** if Serial Interface is to be installed; **#9386** if Parallel Interface is to be installed. On Parallel Interface, specify **#9387** if scale is a 10K metric scale. On Serial Interface, specify **#9388** if scale is a 5-digit scale. Otherwise, scale is assumed to be a 4-digit scale. **Prerequisites:** #3890 for 3684 mdl 1 only. **Maximum:** One. **Field Installation:** Yes.

COMMUNICATIONS FEATURES

A 3684 may be equipped with either the External Modem Interface (#3701) or the 1200 bps Integrated Modem (#5530) features.

Note: A 6.1 meter (20 foot) communication cable is provided for attachment to a standalone modem or to a communications facility when an integrated modem is used. If a standard 6.1 meter communication cable is not desired, specify **#9061** for 3.0 meter (10 foot) cable, **#9062** for 9.1 meter (30 foot) cable or **#9063** for 12.2 meter (40 foot) cable.

1200 bps Integrated Modem (#5530): Provides an integrated modem for operation over switched or nonswitched communication facilities at 1200 bps. Auto answer is provided when operating over switched network. No external modem is required. **Limitations:** Cannot be installed with External Modem Interface (#3701). **Maximum:** One. **Field Installation:** Yes. Specify the following when ordering this modem:

Specify one:

#9481 for Switched Network
#9482 for Nonswitched Network

If **#9481** Switched Network is specified, also specify (one):

#9777 for 2025 Hz answer tone frequency required for operation at 1200 bps with non-IBM modems with Automatic Calling features.

#9778 for 2100 Hz answer tone frequency required for operation with host IBM 1200 bps integrated modems with Automatic Call Originate function.

If **#9482** Nonswitched Network is specified, also specify (one):

#9651 for 4-wire facility
#9652 for 2-wire facility

Note: If Switched Network (**#9481**) is specified, FCC registered protective circuitry of the CBS type (or equivalent) provided by the user is required. See "Accessories" section for additional information.

Storage Expansion (#6990): Provides the capability of expanding the storage capacity of the 3684 mdl 1 and the control segment of the 3684 mdl 2 from a maximum of 56K to a maximum of 120K bytes. See configurator chart for maximum storage. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Applies only to the 3684 mdl 1 and to the control segment of the 3684 mdl 2.

Storage Expansion-POS (#6991): [Mdl 2] Provides the capability of expanding the storage capacity of the point-of-sale segment of the 3684 mdl 2. The storage capacity of the point-of-sale segment is expanded from a maximum of 56K bytes to a maximum of 120K bytes. This feature permits the installation of up to four Storage Increment-16K (#7720) per #6991. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Storage Retention (#7785) cannot be installed on a 3684 mdl 2 that has Storage Expansion (#6990) and Storage Expansion-POS (#6991) installed at the same time. **Note:** This limitation is removed for machines shipped after August 1981. **Prerequisites:** #7730.

Storage Increment--8K (#7710): Provides an additional 8,192 bytes of storage. **Maximum:** One. **Limitations:** Cannot be installed with Storage Increments--16K (#7720) or Storage Increment--24K (#7730). **Field Installation:** Yes.

Storage Increment--16K (#7720): Provides an additional 16,384 bytes of storage. **Maximum:** One per 3684 mdl 2 point-of-sale segment; without Storage Expansion-POS (#6991) installed; four with Storage Expansion-POS (#6991) installed; four per 3684 mdl 1 or 2 control segment with Storage Expansion (#6990). **Limitations:** Cannot be installed with Storage Increment--8K (#7710) or Storage Increment--24K (#7730) in point-of-sale segment of 3684 mdl 2. Cannot be installed in the 3684 mdl 1 or the control segment of the 3684 mdl 2 without #6990. **Specify: #9588** if increment is to be installed in point-of-sale segment of 3684 mdl 2; **#9589** if increment is to be installed in control segment of 3684 mdl 2. **Field Installation:** Yes.

Storage Increment--24K (#7730): Provides an additional 24,576 bytes of storage. **Maximum:** One. **Limitations:** Cannot be installed with Storage Increment--8K (#7710) or Storage Increment--16K (#7720). **Field Installation:** Yes.

3684 Mdl 1 Storage Configurator

56K	Base Storage
	Storage Expansion #6990
72K	16K - #7720
88K	16K - #7720 (2)
104K	16K - #7720 (3)
120K	16K - #7720 (4)

3684 Mdl 2 Storage Configurator

Total Stge Size	Storage Increment Feature	POS Segment					Control Segment	
		w/o #6990 or #6991		with #6990 Only		with #6991	w/o #6990	with #6990
		Stge Incre Only	Stge Incre and #9588	Stge Incre Only	Stge Incre and #9588	Stge Incre and #9588	Stge Incre	Stge Incre and #9589
32K	–	Base	Base	Base	Base	Base		
40K	8K-#7710	x	–	x	–	–		
48K	16K-#7720	–	x	–	x	–		
56K	24K-#7730	x	–	x	–	Req'd x	Base	Base
72K	16K-#7720					x		x
88K	16K-#7720 (2)					x		x
104K	16K-#7720 (3)					x		x
120K	16K-#7720 (4)					x		x

Note: The number of #7720s must equal the sum of specify code **#9588s** and **#9589s** when #6990 and/or #6991 is ordered.

Storage Retention (#7785): Provides an internal battery and charger to power storage during a power interruption. All data and programs are protected so that a transaction in process when power was interrupted will continue when primary power is restored. The duration of storage retention depends on the charged state of the battery. When fully charged, storage will be retained for approximately 12 minutes for mdl 1 and approximately six minutes for mdl 2. If Storage Expansion (#6990) and Storage Expansion-POS (#6991) are installed on the same 3684 mdl 2, a fully charged battery will retain storage for approximately three minutes. The number of times the battery is discharged greatly affects battery life; therefore, facilities are provided to allow the customer through programming, to deactivate the battery for scheduled power off conditions such as store closing.

Replacement batteries are to be provided, installed, and removed by the customer. IBM will replace the battery if requested by the customer on a time and material basis. Replacement batteries may be ordered

3684 Point-of-Sale Control Unit (cont'd)

through IBM or through other sources that meet the battery specifications as defined by IBM. **Maximum:** One. **Limitations:** Cannot be installed on a 3684 mdl 2 that has Storage Expansion on both the point-of-sale segment and control segment. This limitation is removed for machines shipped after August 1981. If Storage Retention (#7785) is required on machines installed prior to August 1981, an RPQ will have to be submitted. Any parts removed due to this RPQ will be retained by IBM as property of IBM. **Field Installation:** Yes.

Totals Retention (#8010): Provides an additional 240 bytes of customer programmable storage that are powered by its own battery to protect loss of information such as totals, transaction number, terminal address, etc., when power is turned off or power interruptions occur. An early warning status condition will be given to the program when the battery needs replacing. Replacement batteries to be provided, installed, and removed by the customer. IBM will replace the battery if requested by the customer on a time-and-material basis. See "Accessories" for battery life characteristics and the types of batteries required for replacement. **Maximum:** One. **Limitations:** Applies to 3684 mdl 1 and to the Point-of-Sale segment of the 3684 mdl 2. **Field Installation:** Yes.

Validation Printer (#8725): Provides a flat-bed document validation station for printing on inserted forms. Prints 38 characters per line at 15 characters per 25.4mm (1 inch). Vertical line spacing is 6.3 lines per 25.4mm (1 inch) at a line space rate of 20 lines per second. The all-points addressable characteristics of the printer allow logos, special graphics and highlighting to be designed and printed by user programming. **Maximum:** One. **Limitations:** Cannot be installed with Label Printer (#8726). **Field Installation:** Yes.

Label Printer (#8726): Provides a flat-bed station capable of printing on inserted forms or labels. Includes the capabilities of the Validation Printer Feature (#8725) and in addition includes the capability of printing labels. Prints 38 characters per line at 15 characters per 25.4mm (1-inch). Vertical line spacing is 6.3 lines per 25.4mm (1-inch) at the rate of 20 lines per second. The all points addressable characteristics of the printer allow logos, special graphics, and highlighting to be designed and printed by user programming. Label printing capabilities include "card stock" shelf labels and gummed labels on a carrier. **Maximum:** One. **Limitations:** Cannot be installed with Validation Printer feature (#8725). **Field Installation:** Yes. **Note:** If the Label Printer is to be field installed in place of the Validation Printer (#8725), removed parts belong to the customer.

MODEL CONVERSIONS

Field installable. The parts removed for a model change become the property of IBM.

ACCESSORIES

Cables (P/N 5165886): Bulk Indoor Loop Cable to attach 3680 units may be purchased from IBM or a customer-selected source. See *Physical Planning Manual,* GA27-3074, or *3680 Site Planning and Site Preparation Guide,* GA27-3201, for bulk loop specifications. The customer is responsible for installation and maintenance of these cables. The bulk loop cable may be purchased from IBM. Bulk Indoor Loop Cable is available for duct or plenum installation. The following information pertains to this cable only: Indoor Cable: UL approved for duct and plenum installation. (NEC Art. 725-2b). Maximum allowable cable temperature range is -34 C to 105 C.
Ordering Instructions: Interior cable (P/N 7838695) should be ordered in multiple lengths of 304.8m (1,000 ft). **Warranty:** Loop Cable is warranted free from defects of workmanship and materials for 90 days.

The following items are available on a purchase-only basis. For shipment concurrent with the machine, order the Feature Number as shown below.

Item	Feature Number	Maximum Quantity
Protective Coupler (DAA)	**#9344**	No maximum
Cash Till Cover (with lock and key)	**#9355**	No maximum

Note: The Protective Coupler (DAA) will not be shipped from the same location, but concurrent ship dates can now be scheduled.

Protective Coupler (DAA) (#9344 P/N 1649100): The Protective Coupler (DAA) #9344 is an FCC registered device that can be used to connect the 3684 to the public switched network facilities. The coupler is powered by a provided transformer (calculator type) which plugs into a 110 volt, 60 Hz, wall outlet and is attached to the unit with a 6 foot cord. The coupler connects to the switched network facilities via an USOC RJ41S data jack provided by the telecommunication common carrier service supplier. The modem, to which the coupler is attached, is required to transmit at -2.0dBM. The FCC registration number is AA9987-62186-PC-E and the ringer equivalence is 0.8B. **Prerequisites:** Switched Network **(#9481). Field Installation:** Yes. **Note:** See above for Customer Responsibilities, Site Preparation and Repair Center information.

For other available accessories, see "Accessories" in the M3683 pages.

SUPPLIES

Ribbons: A black ribbon cartridge, P/N 7034640 or equivalent, is required.

Diskette: Diskette 2D, P/N 1766872, or equivalent, formatted with 256 byte blocks, is required for 3684 mdls 1 and 2.

Paper: Roll paper, 88.9mm (3.5 inch) diameter, 69.85mm (2.75 inch) wide, is required at the Cash Receipt and Journal print stations.

3687 CHECKOUT SCANNER

PURPOSE

A fixed head optical reader which attaches to the 3683 (mdls 1A, 2A and 3A) in the 3650 Programmable Store System. It is particularly adaptable to all modes of checkout and it accommodates both standing and seated operators.

MODELS

Model 1 001

HIGHLIGHTS

The 3687 is 216.0mm (8.50 in) high, not including the rails; 508.0mm (20.00 in) wide; and 278.0mm (10.94 in) deep, and reads the UPC regular (Version "A"), UPC zero suppression (Version "E"), EAN-13, and EAN-8 bar code symbols on supermarket items that are manually fed past the window of the 3687. Packaged as part of the total checkstand design, one 3687 can operate with one 3683 Supermarket Terminal mdl 1A, 2A or 3A.

The 3687 is a Class 1 laser product which complies with the safety standards of the United States Department of Health, Education, and Welfare (Performance Standard for Laser Products, August 2, 1976 - Class 1, CFR Subchapter J).

The product reads the Universal Product Code (UPC) which has been adopted in the United States as an industry specification for supermarket items identification. It also reads the European Article Numbering (EAN) symbol which has been adopted in World Trade countries as an industry specification for merchandise identification.

Prerequisites: Each 3687 requires a 3683 mdl 1A, 2A or 3A, and operates only under the 3650 Programmable Store System.

Customer Responsibilities: Window replacement is a customer responsibility. See S3650 pages for general description of customer responsibilities.

Copies of the UPC Symbol Specifications and the UPC Guidelines are avilable at a charge from the UPC Council. Write to:

Uniform Product Code Council, Inc.
7061 Corporate Way, Suite 106
Dayton, Ohio45459
513-435-3870

For copies of the General Specifications for the Article Symbol Marking (EAN), write to:

Secretaire General, E.A.N.
Rue Des Colonies 54, BTE 8
1000 Bruxelles, Belgigue

For each 3687, the customer must provide a switchable on and off power outlet for locking plug. A 1.8m (6 ft) power cord and locking plug will be shipped with each machine.

Refer to *IBM 3650 PSS Installation Manual - Physical Planning,* GA27-3167, for requirements for mounting the 3687 in a checkstand.

A number of states presently have, and others are considering the adoption of, regulations governing the use of laser products. Users should determine the extent of regulation in the states where the 3687 is to be installed.

SPECIFY

- Voltage 120V AC, 1-phase, 3-wire, 60 Hz.
- Packing: If machine is to be installed in N. Y. State, specify **#9550** for additional labeling to meet current regulations. If machine is to be installed in Texas, specify **#9551** for additional labeling to meet current regulations.

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES

Scratch-Resistant Window Kit (P/N 7032261): A scratch-resistant window in an installation kit. Intended to be permanently installed by the user. User installable only. Replaces the expendable window with which the 3687 is equipped. It fits the 3687 only.

Window (P/N 1749143): The 3687 Checkout Scanner is equipped with a replaceable window. With use, it will get scratched and need to be replaced. Window replacement is a customer responsibility.

SUPPLIES

Contact IBM.

3689 STORE COMMUNICATIONS UNIT

PURPOSE

To provide communications for the 3650 Programmable Store System over common carriersupplied communications network facilities.

MODELS

Model 1 001

Prerequisites:

A 3650 Programmable Store System with (minimum requirements):

- A 3651 Store Controller mdl A75, B75, C75 or D75 with the 4800 bps Loop Adapter (#4895) and the 3669/3689 Attachment (#8069).
- Access to an appropriate switched network communications facility.
- A store loop equipped with at least one 3683 Point of Sale terminal with 4800 bps specify feature **#9430**.
- Communications with any virtual storage S/370 or 4331 or 4341 processor via a properly equipped 3704 or 3705 or a Communications Adapter on a 4321 or 4331.

Customer Setup: The 3689 is designated for Customer Setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance.

HIGHLIGHTS

The 3689 mdl 1 provides communications between a 3651 Store Controller mdl A75, B75, C75 or D75 and:

- The host S/370 or 4331 or 4341 processor via a 3864 Modem mdl 2 attached to a 3704, 3705 or 3725 Communications Controller with switched line features or a Communications Adapter feature on a 4321 or 4331.
- The store loops at another predesignated store location via another 3689 mdl 1 at that location, to provide backup operation for the store in case its 3651 Store Controller mdl A75, B75, C75 or D75 is inoperative.
- The 3651 Store Controller mdl A75, B75, C75 or D75 via another 3689 mdl 1 in another predesignated store in a controller-to-controller operation via Auxiliary Communications Adapters (#6185) for the purpose of data transfer or data reconciliation when the backup operation is terminated.

Addtional characteristics of the 3689 mdl 1 are:

- Operates in half-duplex mode over 2-wire switched telecommunication networks. Operating mode is point-to-point.
- A microprocessor for signal processing.
- Auto Answer: Automatic Answering of Switched Network calls.
- Automatic Speed Selection: The transmission speed of the 3689 mdl 1 follows the transmission speed (4800/2400 bps) of the Host 3684 mdl 2. **Note:** There is no Automatic Speed Selection when loop communication is involved.
- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt in data mode.
- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- When operating with a Host S/370 or 4331 or 4341 processor via a 3864 mdl 2, the modem diagnostic functions, referred to as Link Problem Determination Aid (LPDA), operate with Systems Network Architecture (SNA) and associated program products. Under control of these programs, the modems accept commands and initiate tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provide the network operator with the most probable cause of network problems. These program products are:
  1. Network Communication Control Facility (NCCF) Release 1 or 2 (5735-XX6).
  2. Network Problem Determination Application (NPDA) Release 2 (5735-XX8).
  3. ACF/NCP Release 2.1 (5735-XX1).
- The protective circuits required for FCC Registration are built into the 3689 mdl 1 to allow direct attachment to the Public Switched Network.

Diagnostics: Built-in diagnostics - The 3689 mdl 1 will respond to diagnostic commands from the Host system and provide its status and the quality of the received signal over the communication facility. Test requests and responses utilize the same data path and controls that are used by S/370 for data transmission. This diagnostic status/test requests can be interspersed with data requests without interrupting 3651 sessions.

The Network Problem Determination Application (NPDA) program product is an example of an IBM program product offering the capability to utilize the modem diagnostic functions for the collection, storage and retrieval of network error/management data. NPDA implemented under the Network Communication Control Facility (NCCF) program product has both summary and detailed level information for determining probable cause of network errors. Probable cause differentiates between errors in the communications controller, line, modem or modem interface.

NPDA will utilize the modem facilities to provide alert messages on error threshold and display formatted modem test results.

In addition, tests can also be executed from the 3689 operator panel. These manual tests include:

- Self-test -- this includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Modem/line transmit and receive tests -- allow testing of modem and line for switched network.
- Lamp test -- tests all indicator lights on the operator panel.

Communication Facilities

Public Switched Networks: The customer must be informed that satisfactory transmission of data depends upon the characteristics of the particular switched network connection being used. Refer to M2700 pages for further details.

Privately-owned Communication Facilities: Equivalent to above.

International Facilities: Transmission of data between the United States and Canada on switched facilities is supported.

Attachment to Facilities: Attachment of the 3689 mdl 1 to the public switched network is by a cable, supplied with the 3689 mdl 1 which is terminated with a miniature 8-position keyed plug for connection to a programmed data jack (USOC RJ45 or RJ41 or equivalent) which is provided by the telecommunications service supplier. (A data jack is installed only on a dedicated data line; not on customer-owned switching equipment.) The protective circuitry required by the FCC for direct attachment to the public switched network is contained in the modem. The FCC registration number is:

3689 mdl 1 AN09SA-67992-DP-N

The ringer equivalence is 0.8B.

Note: Telephone sets (handsets) are required with switched facilities at all 3689 mdl 1 locations.

Customer Responsibilities: The customer must be informed of his responsibilities as detailed in the M2700 pages, and in the site preparation section of the *3650 Programmable Store System Installation Manual - Physical Planning* (GA27-3167).

The customer is also responsible for:

1) Arrangements for price quotations, installation, and all costs of common carrier equipment and services.
2) Switched Telecommunication Network -- arranging for the telecommunication service supplier to install the appropriate communication service equipped with the required connecting device as described in "Attachment to Facilities" and for attaching the IBM-provided cable to the connecting device. The customer must also inform the telecommunication service supplier that the rate of data transmission will be faster than 1200 bps.
3) If the 3689 is to be attached to a non-IBM product, the interconnecting cable between the business machine and the modem must be supplied by the business machine.
4) Unpacking and placing of the 3689, physical setup, and connection of cables at setup time.
5) Notifying IBM of intent to relocate the unit, and following IBM instructions for relocation.
6) Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be supplied by IBM.
7) All three of the following program products at the current release must be installed for LPDA to function between the Host and the 3689 mdl 1 if the customer requires the LPDA function.

   NCCF (5735-XX6)
   NPDA (5735-XX8)
   ACF/NCP (5735-XX1)

8) Obtaining, installing and testing the store loops.

3689 Store Communications Unit (cont'd)

SPECIFY

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): **#9890** for locking plug, **#9891** for non-locking plug. If standard 3.0 meter (10 foot) power cable is not required, specify **#9986** for 1.8 meter (6 foot) cable.
- Telecommunication Cable (modem to telecommunication line): Specify **#9710** for 3m (10 foot) cable .

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES (None)

SUPPLIES (None)

3694 DOCUMENT PROCESSOR

PURPOSE

A programmable MICR Reader-Inscriber-Sorter for remote processing of documents used primarily in the Finance Industry. As a member of the 3600 Finance Communication System, the 3694 combines the programming and host communication facilities of the 3601 Finance Communication Controller with MICR document handling capabilities.

Can attach to S/370 or 4300 processors via a 3705 or 3725 Communications Controller (to 4331 also via the Communications Adapter) using Synchronous Data Link Control (SDLC) transmission over various common carrier or user-owned transmission facilities.
Can attach to System/34 or System/36 Processors via communications adapter using Synchronous Data Link Control (SDLC) transmission over various common carrier or user-owned transmission facilities.
Application support for System/34 is provided by the following Check Processing Executive/General Support FDPs, or user supplied programming. Document Control Section Edit (5698-RFL), Table Preparation Facility (5798-RFK), Allitems File Translation Facility (5798-RFJ), and Communication Support Facility (5798-RKH).
Note: See "Programming" and "SCP" pages for attachment capability.

The 3262 models 3 and 13 line printers may be attached to a 3694 for high-speed report printing. The 3287 models 1 and 2 and 3268 model 2 printers may also be attached for lower volume printing.

The 3694 is available in eight models: Models 1A, 1B, 1C and 1D and models 2A, 2B, 2C and 2D. They perform identical functions except that the model 2s have an automatic document feed and high-speed sorter path for program controlled sorting and/or data capture at up to 400 6-inch documents per minute.

Multiple 3694s can be attached to a given 3694 or to a 3602 Finance Communication Controller for data concentration and control.

MODELS

Model 1A	A01	One Distribution Stacker Module - 6 pockets
Model 1B	B01	Two Distribution Stacker Modules - 12 pockets
Model 1C	C01	Three Distribution Stacker Modules - 18 pockets
Model 1D	D01	Four Distribution Stacker Modules - 24 pockets (Pockets are also known as Stackers)

All models include a compact diskette drive supporting Diskette 1 or Diskette 2, an operator console, a master list printer, a keyboard, MICR read and inscribe capability, a document correction station, item identification and numbering capability, an endorser, and approximately 81,000 bytes of user-programmable storage. User storage can be expanded, optionally, up to a maximum of approximately 113,000 bytes. A second compact diskette drive can also be added, optionally, providing an additional 270,000 or 568,000 bytes of storage, depending upon whether Diskette 1 or Diskette 2 is used.

Model 2A	A02	One Distribution Stacker Module - 6 pockets
Model 2B	B02	Two Distribution Stacker Modules - 12 pockets
Model 2C	C02	Three Distribution Stacker Modules - 18 pockets
Model 2D	D02	Four Distribution Stacker Modules - 24 pockets

All models also have a compact diskette drive supporting Diskette 1 or Diskette 2, an operator console, a master list printer, a keyboard, MICR read and inscribe capability, a document correction station, item identification and numbering capability, an endorser, approximately 81,000 bytes of user-programmable storage, plus an automatic feeding device and high-speed document path for operations at rates up to 400 documents per minute for 6-inch documents. User storage can be expanded, optionally, up to a total of approximately 113,000 bytes. A second compact diskette drive can also be added, optionally, providing an additional 270,000 or 568,000 bytes of storage, depending upon whether Diskette 1 or Diskette 2 is used.

HIGHLIGHTS

Combines document inscribing (E13B), reading, sorting, identifying and endorsing functions with data capture and storage accumulation, and communication capabilities under program control. Can communicate with a host system using any one of two SDLC communication features and an EIA Interface feature with an external modem, or by direct attachment to a 3705 or 3725 or 4331 or System/34 Communications Adapter.

Houses a diskette drive which can accommodate 2-sided diskettes offering storage of user data and programs, i.e., sort table, all items file and cluster summary data.

Accommodates up to four Distribution Stacker Modules with each containing six distribution pockets. Each distribution pocket has a capacity of approximately 400 documents. Depending upon the mdl, a 3694 can have one, two, three or four such modules. Optional distribution list printers may be dynamically assigned under program control to individual pockets to list the contents of each pocket as the document enters, or on a deferred basis.

An optional microfilm feature is available to record images of documents processed on the full function path (mdls 1 and mdls 2) and documents processed on the sorter path (mdls 2). Film image format is duplex mode (front and rear of documents recorded adjacent to each other). Film record includes header data, item sequence numbers and frame marks (blips). An optional PAID stamp feature is available on 3694 mdls 2 for face cancelling items as PAID for items processed on the sorter path.

A 3694 mdl 2A, 2B, 2C or 2D is equipped with an automatic feed/high-speed path. It can capture data and fine-sort documents at a rate of up to 400 documents per minute (for 6-inch documents).

The 3262 (mdls 3 and 13), 3287 (mdls 1 and 2) printers and 3268 (mdl 2) may be attached to offer, with appropriate programming support, an ability to print host, diskette or program-supplied print line images.

Clusters of up to four 3694s may be attached to another 3694 for communications concentration and control. Depending upon the applications and operational considerations, up to 18 3694s may be attached to a 3602 Finance Communication Controller for large cluster concentration and control. (For attachment of more than eight 3694s to a controlling 3602, Systems Assurance approval is required.)

Transmission: The 3694 can operate over common carrier-provided or equivalent customer-owned facilities. For information concerning these facilities, see the M2700 pages.

Modems: External modems operating at up to 9600 bps may be attached when used with SDLC feature #4502. For information concerning modem attachment support, see the M2700 pages.
Prerequisites: If Host Connected - a communications controller with appropriate features -- see M3705, 3725 or 4331 (for Communications Adapter #1601 on the 4331) 5340, or 5360 pages.

Typical Configuration Guideline: As a reference, the most typical 3694 featured machine configuration is as follows:

3694 mdl 2B	Base machine with 12 pockets and Autofeed/Sorter path
#1015	Additional diskette storage
2X #3201	Two distribution list printers
#3701	EIA Interface
#4502	SDLC communication without clocking

Other features commonly ordered are:

#5121	Microfilm
#5450	PAID Stamp

Required Specify's must also be ordered.

The following is a more detailed guide to configuring specific 3694 machines. It is based upon the operational diskette levels provided by the IBM 3694 application program product, CHX/3694 (PP 5748-F53):

Basic 3694 Configuration: This configuration is for 3694s which communicate directly with S/370, System/34, System/36 or 4300 processors.
This configuration also applies to a 3694 which is attached to another controlling 3694 or 3602 controller (clustered configurations).

Cluster Controller 3694 Configuration: This configuration is for 3694s which communicate directly with S/370 or 4300 processors, and have other 3694s attached for concentration and control.

3694 Document Processor (cont'd)

Required Feature/Mdls		
Application/Use	Basic 3694	3694 Cluster Controller
Communication to host through modem which does not have internal clocking, or for direct attachment to 3705 or 3725 at speeds of 1200 or 2400 bps.	#3701 and #4501	#3701 and #4501
Communication to host through modem which has internal clocking speeds up to 9600 bps, to 4331 Communication Adapter without modems, System/34 Communication Adapter or to controlling 3694 or 3602 without modems.	#3701 and #4502	#3701 and #4502
Cluster control	–	#1015,#4401, #1007,**#9601** and #1007,**#9602**
Attachment of printers (See note, 3262, 3287s, 3268s)	#3101	#3101
Additional disk storage for increased MICR item data storage.	#1015	–
In-line Microfilming.	#5121	#5121
Paid Stamping (mdl 2 only).	#5450	#5450
Printing of pocket distribution list: – Typical application uses one printer per six stacker/pockets.	#3201 (multiple)	#3201 (multiple)
High-speed sorter path: – Typical application uses twelve or more pockets (mdls 2B, 2C or 2D).	Mdl 2s	Mdl 2s
Pocket-full lights: – Typical application uses one such feature per six stacker/pockets.	#5540 (multiple)	#5540 (multiple)

Note: Printer mdl description
(Not for use with System/34 and System/36 host systems).

3262-13	325 lpm
3262-3	650 lpm
3287-1	80 cps
3287-2	120 cps
3268-2	340 cps

Bibliography: GC20-0370, *IBM S/370 Bibliography,* and GC27-0001, *IBM 3600 Finance Communication System, System Summary.*

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (1-phase, 60 Hz): **#9884** for 208V, **#9914** for 240V. Specifications on the voltage level available at the location where the 3694 is to be installed should be obtained prior to selecting one of the previous voltages. This is necessary in order to avoid having to re-wire the 3694 after delivery, thereby introducing delays in the installation of the unit.
- Power Cord: Select appropriate length power cord, and specific type of cord.
  - 1.83m (6 foot) cord, specify **#9986** with one of the following:

    #9080, water-tight plug (Russell and Stoll 3720-U2) for below-floor power installation.

    #9081, locking plug (L6-15P Nema).
  - 4.27m (14 foot) cord, specify **#9987** with one of the following:

    #9080, water-tight plug (Russell and Stoll 3720-U2) for below-floor power installation.

    #9081, locking plug (L6-15P Nema).
- Controller Designation: Media distribution of controller data. Specify **#9491** to identify the initial controller (3601, 3602 or 3694) ordered for use with a host system location, or specify **#9492** to identify additional controllers (3601, 3602 or 3694s) per host system. **#9491** should only be ordered when host media DTR tape containing microcode is required. If a pre-configured diskette is specified when ordering the CHX/3694 Application Program Product (PP 5748-F53), then specify **#9492** for the controller designation.

The following specify numbers (**#9493**, **#9494** and **#9495**) are provided to enable the user to attach a 3614 or a 3624 to additional 3601 or 3602 controllers, when the initial controller is a 3694.

If the initial controller (with specify **#9491**) is a 3694, and if there is a 3614 with a first position designator and a specify **#9002** attached to any 3601 or 3602 on the same host system, then specify **#9493** is required.

If the initial controller (with specify **#9491**) is a 3694, and if there is no 3614 or 3624 with a first position designator attached to any 3601 or 3602 on the same host system, then specify **#9494** is required.

If the initial controller (with specify **#9491**) is a 3694, and if there is a 3614 with a first position designator and a specify **#9001**, or a 3624 with a first position designator attached to any 3601/3602 on the same host system, or if encryption capability via the data encryption standard (DES) is desired on a 3601 or 3602 on the same host system, then specify **#9495** is required.

Both specify **#9493** and **#9495** may be ordered with the initial 3694 (with specify **#9491**).

If **#9491** is specified, select the specify number of the desired media:

#9412 9/800 Magnetic Tape
#9413 9/1600 Magnetic Tape
#9414 9/6250 Magnetic Tape

If magnetic tape is not available on designated CPU, then select one of the following media (DOS/VS or VSE users only):

#9431 80-column cards
#9432 96-column cards

If card or tape inputs are not available at the host location, contact Finance Industry Marketing for guidance.

When feature **#9491** is specified, additional shipping information is required.

Supplement Spec (via AAS entry) is to be entered exactly as follows to indicate shipping address of the Host System location:

Line 1 -- IBM Programming Support Representative (PSR)
Line 2 -- c/o (Name of customer)
Line 3 -- Street address (or P.O. Box)
Line 4 -- (etc.) -- City, State, Zip

This is the address to which the first controller (3601, 3602 or 3694) data tape will be automatically shipped for the first controller ordered (with specify **#9491**). Whenever controller data is updated by an EC, it will be shipped to the most current MC address.

- Cables: See "Accessories" for ordering instructions for 3262 or 3237 printer cables. Communication cables for the 3694 are provided without charge when feature #3701 (EIA Interface) is ordered through the normal AAS procedure. Also see *Installation Manual - Physical Planning,* GC31-2010.
- **#9571** to request shipping of a 3694 in three frames (four if a 3- or 4-stacker module configuration was ordered), **#9570** to request shipping of a 3694 in two frames. Specify **#9570** requires considerably less time to install than specify **#9571**, however, specify **#9570** should only be used when the customer's physical facilities will accommodate access for the larger shipping cartons. See the *IBM 3694 Document Processor Installation Manual Physical Planning*, GC31-2010, for details.
- **#9580** to request shipping by air (required for areas outside Canada and the Continental U.S.). All air shipments are in three frames (four, if a 3- or 4-stacker module configuration is ordered, mdls C and D).

  If air shipment is required within the Continental U.S. or Canada, the branch office must send a request for premium transportation to the IBM Charlotte plant of manufacture (form #625-3433-01).
- **#9481** for system operation without host CPU, host 3694, or host 3602 attachment. **Note:** MANDATORY for all orders without hosts.
- Tool Kits: Required for CE Maintenance. For Rental Customer -- specify on first 3694 order for each customer site. If required for multiple machine sites, an additional Tool Kit(s) is available on a no-charge MES. For Purchase Customers -- specify on each 3694 order. When installed rental 3694s are purchased, a Tool Kit is to be ordered on a no-charge MES for each machine. Specify **#9766** for Base Machine Service tools.

  Specify **#9441** for microfilm feature service tools. The microfilm tool kit consists of a 3694 microfilm cassette, a set of test documents, and a roll of film. Individual microfilm tool kit parts are available from Mechanicsburg.

3694 Document Processor (cont'd)

SPECIAL FEATURES

NON-COMMUNICATION FEATURES

Add'l Storage (#1007): Provides an additional 32,768 bytes of control storage or additional 32,768 bytes of user-programmable storage. Specify **#9601** for control storage, or **#9602** for user storage. A maximum of one additional storage feature for control storage (**#9601**), and a maximum of one additional storage feature for user programming (**#9602**) may be ordered for a 3694 mdl 1 or 2.

Auxiliary Compact Diskette Drive (#1015): The Auxiliary Compact Diskette Drive supporting Diskette 1 and Diskette 2 provides an additional storage capacity of approximately 270,000 or 568,000 bytes. No area on the auxiliary (or secondary) drive will be reserved for the control program. **Maximum:** One. **Field Installation:** Yes. **Note:** Support for feature #1015 is provided by Extended Diskette Access Method (EDAM) Base, EDAM Allocate/Deallocate (LDKT instruction), and EDAM Temporary File Support. Refer to "Device Attachment Factors Table" and "Attachment Factor Functions" section.

Device Cluster Adapter (DCA) (#3101): Permits attachment of any combination of one or two 3262 (mdls 3, 13), 3268 (mdl 2) or 3287 (mdls 1, 2) printers to a 3694.
Limitations: Maximum distance from 3694 to terminal is 1,500m (4,920 feet). Not for use with System/34 and System/36 host systems.
Note: Attachment of two printers requires Systems Assurance Review. **Maximum:** One. **Field Installation:** Yes.

Distribution List Printer Module (#3201): The Distribution List Printer (DLP) prints two distribution lists, each containing up to 18 characters per line. Independent paper movement allows either list, or both, to be printed at up to 180 lines per minute. Each list is dynamically assignable to distribution pockets to print, under program control, data from, or relative to, documents selected to corresponding distribution pockets. **Maximum:** Six distribution list printers (for up to 12 distribution lists) may be ordered per 3694. The maximum is dependent upon the number of Stacker Modules. **Field Installation:** Yes.

One "Drawer Position" is available in the base of each of the first three stacker modules for installation of distribution list printer drawers. Drawers can contain one or two distribution list printers (providing 2 or 4 distribution lists).

The positioning options of the distribution list printers modules is as follows, and is predetermined by the quantity ordered:

	Stacker Module 1	Stacker Module 2	Stacker Module 3	Stacker Module 4
Position	1A 1B	2A 2B	3A 3B	N/A

N/A = Not available

Quantity of Printers Installed	Required Positioning of Installed Printers
1	1A
2	1A,1B
3	1A,1B,2A
4	1A,1B,2A,2B
5	1A,1B,2A,2B,3A
6	1A,1B,2A,2B,3A,3B

Controller Attachment (#4401): Required to attach up to four 3694s to a controlling 3694 at a link speed of 9600 bps. This feature is required in the controlling 3694 only. **Limitations:** Attached 3694s must each be placed within 100 cable-feet of the controlling 3694. **Note:** Support for feature #4401 is provided by Alternative Line Attachment Base, SDLC Link Diagnostics, SDLC/SNA Attachment Part 1, and SDLC/SNA Attachment Part 2. Refer to "Device Attachment Factors Table" for the 3694. **Maximum:** One. **Field Installation:** Yes.

Microfilm (#5121): Provides for filming front and rear of documents processed on 3694 mdls 1 and mdls 2 in duplex format (front and rear of item recorded adjacent to each other on film). Item sequence number is recorded (exposed) on film for every other item filmed. Frame marks (blips) are recorded on film for each item filmed. Indicative data can be recorded on film as header film records. Minimum image resolution is 110 lines per millimeter. Camera reduction is 50:1. Users specify that microfilming is active on a 'per-run' basis. Rated filming speed is the same as processing speed for the mdl 2 sorter path (400 documents per minute for 6-inch documents). A film cassette to house the film supply and film take-up reel is provided with the feature. Additional film cassettes can be ordered from "Accessories" below. The microfilm feature uses 16mm, medium- to high-speed, unperforated film, and can accept either 100-foot (thick-base) or 215-foot (thin-base) film supply reels. Capacity of film is approximately 13,300 items (front and rear) per 100 feet of film. **Maximum:** One **Field Installation:** Yes. **Note:** A CE microfilm tool kit is required to install this feature. Refer to "Tool Kit" description under "Specify" for ordering information.

Paid Stamp (#5450): Provides for face cancelling items as PAID on 3694 mdl 2 only. Stamping mechanism is located on sorter path of mdl 2s and is activated on a user-specified 'per-run' basis. At least one full stamping of the word PAID will appear on each document, and additional partials may also appear. **Limitations:** 3694 mdl 2s only. **Maximum:** One #5450 per 3694 mdl 2s. **Field Installation:** Yes. **Prerequisites:** #5121.

Stacker Lights (#5540): This feature provides six individual pocket lights per Stacker Module which may be installed on any Module as required. An individual light on a pocket illuminates when a pocket is approximately three quarters full. The light is switched off when the pocket is cleared. If the transport has stopped due to a full pocket, the operator must restart via the green start button. **Limitations:** Can only be installed on machine serial number 10023 and above. **Maximum:** One per Stacker Module. **Field Installation:** Yes. **Prerequisites:** Specify **#9501** on Stacker Module 1 ... **#9502** on Stacker Module 2 ... **#9503** on Stacker Module 3 ... **#9504** on Stacker Module 4.

Control Storage (#9601): Used for attachment of certain device types, functions, and features which have associated attachment factors. See "Device Attachment Table" below. Some combinations of device types, functions, and features can be accommodated with no additional control storage. Other combinations require additional control storage as provided by the Add'l Storage feature #1007 with the Control Storage specify **#9601**. Refer to Attachment Factor Functions and Device Attachment Table sections for a further explanation of attachment factors and required control storage.

User-Programmable Storage (#9602): Used for the instruction sections of application programs and a limited amount of configuration data and application program constants. Most configuration data and application program constants cannot reside in this additional user-programmable storage. **Maximum:** One. **Field Installation:** Yes.

COMMUNICATION FEATURES

For operation without attachment to either a host processor or a controlling 3602 or 3694, specify **#9481** must be used.

For communications with a controlling 3602 or 3694, each attached 3694 must be equipped with the EIA Interface (#3701) and the SDLC Communications Feature without Business Machine Clocking (#4502).

For communications with a S/370, System/34, System/36 or 4300 series host processor, each 3694 must be equipped with one of the following SDLC features and the EIA Interface (#3701).

EIA Interface (#3701): Provides the appropriate cables and interface logic necessary to attach an external IBM modem for communications to the host processor through the 3704, 3705 or 3725 the Communications Adapter (#1601) feature on the 4331 Processor ... or the Communication Adapter onthe System/34 or System/36 ... or for direct local attachment to the 3705, 3725 4331 Communications Adapter or a controlling 3602 or 3694 without requiring modems ... see M3602, 3705, 3725 (#4716), 4331 or System/34 pages.
Non-IBM modems may be attached subject to the Multiple Supplier Systems Policy. **Maximum:** One. **Field Installation:** Yes. Cable length from this feature to the controlling 3602/3694 cannot exceed 30.4m (100 feet). Cable length for attachment to an external modem cannot exceed 8.1m (20 feet). See the *3694 Installation Manual - Physical Planning,* GC31-2010, for details. **Prerequisites:** #4501 or #4502.

SDLC Communications With Business Machine Clocking (#4501): Required for attachment to communication lines through the EIA Interface (#3701) at 1200 bps or 2400 bps with any external modem which does not have internal clocking, or for local attachment to a 3705 or 3725 Communications Controller at 1200 or 2400 bps (feature #4716). **Limitations:** Cannot be installed with #4502. **Maximum:** One. **Field Installation:** Yes.

SDLC Communications Without Business Machine Clocking (#4502): Required for attachment to communication lines through an external modem which does have internal clocking at speeds up to 9600 bps or for local attachment to a 4331 or System/34 Communications Adapter without Modems. It is also required in 3694s which attach to a controlling 3694 or 3602. **Limitations:** Cannot be installed with #4501. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #3701.

> **Note:** SDLC as used in the 3694 Document Processing system conforms to a subset of both the ISO HDLC and NASI ADCCP Standards. For details of the conformance, see *IBM Synchronous Data Link Control General Information Manual,* GA27-3093-2.

MODEL CONVERSIONS

3694 model 1s shipped beginning November 13, 1982 can be field upgraded to model 2s. Model 1s shipped prior to November 13, 1982 cannot be upgraded to model 2s but model 2s cannot be field-changed to model 1s. Model 2s can be changed to model 1s at time of manufacture only. Model suffix upgrades and downgrades (e.g., 1A to 1B, 2A to 2B, 1B to 1A, 2B to 2A, etc.), can be field-changed.

3694 Document Processor (cont'd)

ATTACHMENT FACTOR INFORMATION

A 'base' attachment factor capability of 26 and an 'expanded' attachment factor capability of 24 is standard on all mdls of the 3694. An 'expanded' attachment factor capability of 49 can be obtained by adding feature #1007 with specify **#9601**.

To determine if feature #1007 with specify **#9601** is required, the attachment factor for each device type, function, or feature required must be allocated, one time only, against either the 'base' or the 'expanded' attachment factor sum, but not both. (The 'base' and 'expanded' attachment factor sums must be calculated separately.)

The 'base' attachment factor sum may not exceed 26. If the 'expanded' attachment factor sum is 24 or less, feature #1007 with specify **#9601** is not required. If the 'expanded' attachment factor sum is greater than 24, but does not exceed 49, feature #1007 with specify **#9601** is required. An 'expanded' attachment factor sum of greater than 49 is not allowed. **Maximum**: One. **Field Installation**: Yes.

Device Attachment Table: In the following table, attachment factors in the column labeled BASE are applicable to the 'base' attachment factor calculation only. Attachment factors in the column labeled BASE OR EXPANDED are applicable to either the 'base' or 'expanded' attachment factor calculation.

The 3694 loads support for devices/features into control storage *in the sequence* indicated by the following table. The 3694 will *always* attempt to load each device or feature into 'base' control storage. If a device or feature is encountered that will not fit into 'base' control storage and it is applicable to 'expanded' control storage, the controller will load it into 'expanded' control storage if space is available.

Refer to the *IBM 3694 Document Processor Description and Configuration,* GC31-2009, for a comprehensive list of attachment factors and additional information regarding calculation of base and expanded attachment factors.

A description of attachment factor functions not associated with a specify, machine or feature is given later in this section. See "Attachment Factor Functions".

Device Attachment Factors Table

DEVICE TYPE/FEATURE/FUNCTION	ATTACHMENT FACTOR BASE	ATTACHMENT FACTOR BASE OR EXPANDED
3694 Operator Console	2.8	
SDLC (#4501 or #4502)	0.7	
Multiple Block I/O - Diskette	3.0	
Optional Instruction Locator	0.3	
Instruction Enhancements	1.7	
3694 Document Processor Base [Note 1, 4]		21.5
Alternative Line Attachment Base [Note 3]		5.4
Dynamic Control [Note 5]		1.5
SDLC Link Diagnostics [Note 3]		0.8
SDLC/SNA Attachment Part 1 [Note 3]		8.0
SDLC/SNA Attachment Part 2 [Note 3]		5.8
Device Cluster Adapter [Note 2]		5.0
LSEEKP Instruction [Note 1]		1.8
Translate Instruction (LTRT) [Note 1]		1.2
Data Decompression/Decompaction [Note 1]		1.2
Data Compression/Compaction [Note 1]		1.6
SCRPAD Instruction [Note 1]		1.7
Priority Dispatching (LCHAP) [Note 1]		0.3
Data Sequencing		1.6
Extended Statistical Counter Recording [Note 1]		1.3
Extended Diskette Access Method (EDAM) Base		5.5
EDAM Allocate/Deallocate (LDKT Instruction) [Note 6]		1.7
EDAM Temporary File Support [Note 7]		1.5
3262/3287 Part 1 [Note 2]		3.0
3262/3287 Part 2 [Note 2]		1.5
Set Diskette		0.9

Notes:

(1) The Optional Instruction Locator must be included if this function is used. If more than one function requiring the Optional Instruction Locator is used, the attachment factor for the Locator need be included only once.

(2) The device cluster adapter, 3262/3287 Part 1, and 3262/3287 Part 2 must be included if a 3262 and/or 3287 is used.

(3) The Alternative Line Attachment Base, SDLC Link Diagnostics, SDLC/SNA Attachment Part 1 and SDLC/SNA Attachment Part 2 together comprise the SNA Primary interface support required in the controlling 3694 for controller-to-controller (3694-to-3694) communication via an SNA/SDLC interface. When used, these functions must all be loaded into the same controller storage (i.e., base or expanded). This SNA primary function is used in conjunction with the controller attachment feature (#4401).

(4) The 3694 Operator Console function must be included if the 3694 Document Processor Base function is included.

(5) The Alternative Line Attachment Base must be included and loaded into the same controller storage (i.e., base or expanded) if Dynamic Control is used.

(6) The EDAM Base must be included if the Allocate/Deallocate function is used.

(7) The EDAM Base must be included if EDAM Temporary File Support is used.

ATTACHMENT FACTOR FUNCTIONS

Data Sequencing: Allows user applications to sequence, in storage, a block of data items or to collate, in storage, data items from two separate blocks into a third block, according to a parameter list.

Extended Statistical Counter Recording: Allows user applications, via the STATS instruction, to access the basic statistical counters of the 3694 and attached devices.

Set Diskette: Allows user applications to reset the temporary files, to specify the type of start-up (i.e., warm or cold) to be performed on the next load, and/or to initiate a load of the controller.

Instruction Enhancements: Provides the user application with the following instructions:

Bit Manipulating - Test and Branch (LIFON, LIFOFF) -- provide a test, set and branch function in a single instruction. This reduces the 3600 AP processing and memory requirements when processing single bits.

Logical Compare Data Immediate (CCDI) -- compares immediate data to data in a specified field.

Move Data Immediate (MVDI) -- moves immediate data to a specified field.

Load Data Immediate (LDDI) -- loads immediate data into specified register.

Scale -- formats an input string of characters into a conveniently processable numerical format. When used in processing monetary input, functions such as the removal of the monetary symbol, commas, and periods from the input data are automatically done. In the event that cents were not in the input data, zero padding is optionally provided. Scale should significantly reduce the number of instructions required to process monetary input.

Segment Indexing (SETX, TESTX, SETXREG) -- provides an alternate method of referencing data within a segment. Only fixed operands of 3600 instruction may be indexed. This function can be used to reduce the number of SETFPL instructions executed by the AP, thereby enhancing performance and reducing AP size. This function also provides a pseudo DSECT facility, thereby enabling an AP to more readily reference: (1) Variably displaced data within segments and/or (2) data beyond 4K bytes from the beginning of a segment.

Branch on Index (BRANX) -- provides an index increment, compare and branch function in a single instruction. This instruction is used to control the number of times a series of AP instructions will be executed. Since the instruction algebraically increments a register, BRANX can be used in conjunction with the Segment Indexing facility to simplify the processing of tables.

Execute (LEXEC) -- provides a function similar to the S/370 EXECUTE instruction. The amount of data logically ORed into the target instruction may be 2, 4 or 6 bytes.

Priority Dispatching: Provides the ability to dynamically specify the order in which controller workstations are dispatched. This function consists of the LCHAP instruction which activates or deactivates the dispatching priority specified in the table(s) generated by the PRIDSP configuration macro.

Translate: The LTRT instruction processes an input data stream against user-specifiable translate table(s) to generate a translated output data stream. The LTRTBEG, LTRTENT and LTRTGEN instructions assist the user application programmer in specifying the translate table(s).

Multiple Block I/O - Diskette: Permits multiple blocks to be accessed with a single execution of the LREAD and REPLACE Instruction for permanent file and absolute addressing accesses. This may also result in enhanced performance when more than three blocks are read or four blocks are written.

Data Compression/Compaction: This function allows a controller application program to condense a data stream by compressing repeated characters and compacting frequently-occurring characters according to a user-defined table. This can reduce the amount of data actually transmitted over a host link or stored in the controller.

Data Decompression/Decompaction: This function allows a controller application program to decompress and/or decompact a data

3694 Document Processor (cont'd)

stream which had previously been compressed and/or compacted by a host or a controller application program.

Extended Diskette Access Method (EDAM) Base: Provides the capability to open, access and close data sets on the primary or auxiliary diskette drive.

EDAM Allocate/Deallocate (LDKT Instruction): Provides, via the LDKT instruction, capability to allocate and deallocate data sets in either the primary or auxiliary diskette drive.

EDAM Temporary File Support: Permits processing of a data set defined with a temporary file structure on the auxiliary diskette drive.

Dynamic Control: Provides additional LCNTRL instruction functions to assist in controlling access to devices attached to the 3694 through the SNA Primary interface.

LSEEKP Instruction: Locates a table entry which is 'equal to', 'greater than or equal to', or 'less than or equal to' a search argument using a binary search algorithm. Tables may be included in the instruction section of the controller application program.

SCRPAD Instruction: Provides access to optional global work areas distinct from segment storage.

ACCESSORIES

Belts - Ink Roll - Ribbons: These Accessories may be purchased from IBM or a customer-selected source. Allow a lead time of 120 days.

7032508	MLP/PLP Ribbon-Purple
7032562	MLP/PLP Ribbon-Blue/Black
7032505	MLP/PLP Ribbon-Black
423653	Endorser Ink Roll-Red
423654	Endorser Ink Roll-Black
423656	Endorser Ink Roll-Purple
7034365	ID Printer Ribbon Assembly
7032878	MICR Ribbon
7032759	Restraint Belt
7032760	Picker Belt
7032761	Feed Drum Belt
7032763	Read-Head Belt

Cables: Cables are provided without charge when EIA Interface (#3701) is ordered. Detailed information about these cables is provided in *IBM 3694 Document Processor Installation Manual - Physical Planning*, GC31-2010. The cables are ordered through the normal ordering procedure. See the 3287 or 3262 Printers Accessories section for cable attachment to the 3694.

Microfilm Cassette - MES Orders (P/N 5682436): This cassette provides space for both microfilm supply reel and take-up spool. Cassette utilizes standard 16mm supply reels (100-foot or 215-foot film length). Cassette includes one take-up spool. **Note:** A single cassette is provided with the ordering of the microfilm feature (#5121).

Documents: E13B magnetic characters, print quality and codeline arrangement on the documents must meet the specifications recommended by the American Bankers Association. Intermixed paper and card documents within the following specifications can be processed:

Length: 146.05 to 225.4mm (5.75 to 8.875")
Width: 66.68 to 107.95mm (2.625 to 4.25")
Document Thickness: 0.09 to 0.14mm (0.0035 to 0.0055")

Carrier Envelope: Carrier envelopes containing mutilated documents should not exceed total thickness of 0.356mm (0.014"). **Note:** The use of carrier documents may cause a higher than normal jam stop frequency.

Base Weights: 75 to 120 grams per square meter (basic weight is the weight of 500 sheets of 17" x 22" paper), 20 to 32 pounds. Standard column card stock may also be processed (must meet ABA RS-147-R3 specification). **Note:** Insertion of an occasional 16 pound document is allowed. Insertion of concentrations of 16 pound documents is not recommended.

Grain: Preferably long grain.

SUPPLIES

To ensure that consumables are on-hand when the 3694 is shipped and received at the installation, care should be taken to have the customer submit an order to IBM for 3694 supplies well ahead of installation time. **Customer Responsibilities:** The customer is responsible for changing all consumable supplies listed above. If the customer desires to have an IBM CE replace or install any of the consumable supplies, the CE time involved will be billed to the customer. Special note should be taken of Section 5, Belts ... the customer must be informed of the need to keep spares on hand and have his operators trained in their replacement.

Consult IBM for information regarding the following consumable supplies required for the 3694:

1. Diskette 1 (128 Bytes) P/N 2305830
   Diskette 2 (128 Bytes) P/N 1766870
   Diskette 2 (256 Bytes) P/N 2736700

2. Ribbons: **Note:** Ribbon inks for the Master List Printer and Distribution List Printer ribbons are formulated to minimize printer wire damage.

   Master List Printer Ribbons:
   Ribbon - Purple P/N 7032508
   Ribbon - Blue/Black P/N 7032552
   Ribbon - Black P/N 7032505

   Distribution List Printer Ribbons:
   Ribbon - Purple P/N 7032508
   Ribbon - Blue/Black P/N 7032552
   Ribbon - Black P/N 7032505

   Sequence Number Printer Ribbon Assembly:
   Ribbon Assembly P/N 7034635

   MICR Ribbon:
   MICR Ribbon P/N 7032878

3. Endorser and PAID Stamp Ink Rolls:
   Red P/N 423653
   Black P/N 423654
   Purple P/N 423656

4. Endorser Plates: Endorser plates are made to the customer's specifications. See IBM for ordering procedures and prices.

5. Belts:
   Restraint Belt P/N 7032759
   Picker Belt P/N 7032760
   Feed Drum Belt P/N 7032761
   Read-Head Belt P/N 7032763

6. Vacuum Cleaner Supplies:
   Vacuum Bags P/N 1245561
   Filter P/N 1245562

7. Microfilm Lamps:
   Package of 4 Lamps P/N 7032252

8. 3694 Customer
   Convenience Kit: P/N 7032998

   Starter Supply Kit, approximately 6 months supply of all consumables. See IBM for details.

9. Paper Specifications:
   Master List Printer:
   Single-part Fan Fold P/N 7034710
   *Width: 89mm +/- 1mm (3.5")
   Weight: 16 lb Bond
   Length of Fold: 140mm (5.5")
   Number of Folds/Pack: 500

   Master List Printer:
   Single-part Roll P/N 7034714
   Double-part Roll P/N 7034713
   *Width: 89mm +/- 1mm (3.5")
   Weight: 16 lb Bond
   Max. Dia.: 83mm (3.27")
   Thickness: 0.07-0.20mm (max.) (0.0028-0.0079")

   Distribution List Printer:
   Single-part roll (only) P/N 7034712
   *Width: 44.5mm +/- 0.5mm (1.75")
   Weight: 16 lb Bond
   Max. Dia.: 83mm (3.27")
   Thickness: 0.07-0.20mm (max.) (0.0028-0.0079")

* Use of paper less than 88.9mm (3.5") wide on the MLP and 44.45mm (1.75") wide on the DLP may damage the print mechanism.

Paper Roll Core: Paper sensing mechanisms require that the core of the paper roll have an inside diameter of 11.10mm +/- 1.01mm (0.437" +/- 0.04") and an outside diameter of 22.25mm +/- 1.01mm (0.875" +/- 0.04").

3704 COMMUNICATIONS CONTROLLER

The 3704 is one of a series of Communications Controllers. The following is a brief summary of the Communications Controllers.

Comm Controller	Maximum Lines *	Maximum Storage	Host Program	Comm Control Program
3704	32	64K	BTAM	EP
3705 II	255 352	512K 512K	BTAM VTAM/TCAM	EP ACF/NCP-PEP
3705-80	16 16	256K 256K	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3725-1	256	1024K	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3725-2	24	512K	VTAM/TCAM BTAM	ACF/NCP-PEP EP

* Maximum lines that can physically attach, CF3705 is required to determine actual line attachment capabilities.

See individual pages for each Communications Controller for information on additional features.

PURPOSE

The 3704 attaches to any S/370, 4300 Processor, or in 2701/2702/2703 Emulation Mode only, to S/360 models 30 (submodels E or F), 40, 50, 65, 67 (in 65 mode), 75 and 195 for communication with local or remote I/O devices over various common-carrier provided or customer-owned communication facilities.

Note: See "Programming" and "SCP" pages for attachment capabilities.

MODELS

The 3704 is available in four models:

Model		Storage (bytes)	Maximum Communication Lines
A1	A01	16K	32
A2	A02	32K	32
A3	A03	48K	32
A4	A04	64K	32

Prerequisites: The 3704 requires a control unit position on a processor's Byte Multiplexer Channel. See the machine pages of the processor to which the 3704 will attach.

HIGHLIGHTS

The 3704 is a modular, programmable unit which greatly expands the communications capabilities of S/360, S/370, 30XX, 4300 Processors. By virtue of its modularity and programmability, the 3704 boasts a high degree of flexibility in tailoring to a teleprocessing system's requirements.

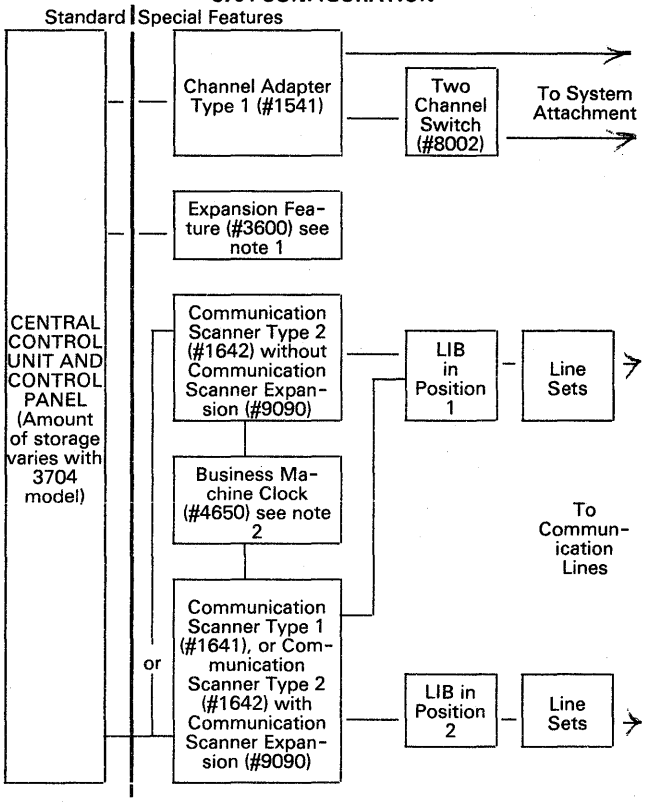
The 3704 is housed in a 36x24x57-inch cabinet which contains the Central Control Unit (CCU), the Control Panel (CP), storage (as indicated above), a Channel Adapter (CA), a Communication Scanner (CS), Line Interface Bases (LIB), and Line Sets (LS) to allow attachment of up to 32 communications lines.

The maximum number of communication lines attachable is a function of the speed of the lines, the CS installed and the mode of operation.

The HONE Configurator is available to assist in configuring the 3704 to the requirements of a specific TP network.

Customer Responsibilities: See the M2700 pages. Also see the 3704/3705 Programming pages for attachment capability, and the host systems programming pages for possible restrictions to the above.

3704 CONFIGURATION



Notes:

1) Required for mdls A2, A3 and A4, or CS Type 2 (#1642) on mdl A1.

2) A minimum of one Business Machine Clock (#4650) is required. See "Special Features".

Communication Facilities : The 3704 operates over common-carrier-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

3704 Local Attachment (Start/Stop): In addition to terminals being attached to the 3704 through common carrier-provided facilities, they may also be connected directly to the 3704 using LS Type 1C (#4713). The cable groups selected from the *Physical Planning Manuals* or the device must have the 25-pin data set interface. LS Type 1C (#4713) allows only two terminals to be attached; one per 3704 25-pin data set interface. There must be corresponding Business Machine Clocks (BMC) in both the terminal and the 3704.

3704 Local Attachment (Synchronous): In addition to the synchronous terminals being attached to the 3704 throughcommon-carrier-provided facilities, they may also be connected directly to the 3704 using LS Type 1F #4716. The cable groups selected from the *Physical Planning Manuals* for the device must have the 25-pin data set interface. LS Type 1F #4716 allows only two terminals to be attached; one per 3704 25-pin data set interface. There must be corresponding BMCs in both the terminal and the 3704.

3704 Line Interface Bases: Communication lines are attached to the 3704 through 'LIBs', of which there are several different types, to accommodate the various types of line terminations. Depending on type, these LIBs will house from one to eight "Line Sets" each, which will allow the attachment of from one to 16 communication lines. The 3704 will accommodate a maximum of two of these LIBs, allowing up to 32 lines to be attached. **Note:** The LIB position in the 3704 must be specified. See 'LIB Position Designator' following special feature #1642.

Bibliography: S/360 -- GC20-0360 ... S/370 -- GC20-0001

SPECIFY

- Voltage (AC, Single phase, 3-wire, 60 Hz): **#9902** for 208V or **#9904** for 230V. If a 4.3 meter (14 foot) power cable is not desired, specify **#9986** for a 1.8 meter (6 foot) power cable. **Field Installation:** Not recommended.
- For mdls A2, A3 or A4, Expansion Feature **#3600** is required. See "Special Features".

3704 Communications Controller (cont'd)

- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, **#9046** for white. **Field Installation:** Not recommended.
- Prior to submitting an MES order, the FE Branch Manager should be consulted for any software/hardware compatibility requirements resulting from order.
- Cabling: Specify **#9080** for below floor, or **#9081** for on the floor.

SPECIAL FEATURES

NON-COMMUNICATIONS FEATURES

Two-Channel Switch (#8002): Provides for the attachment of a 3704 CA Type 1 (#1541) to two S/360, S/370, 303X, 4331 or 4334 Processor channels (which may be on the same processor, or on two different processors). The CA so equipped will, however, be capable of operation on only one channel at a time. A manual switch on the CP selects the channel which is to be made operable. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1541.

Unit Protection (#8510): Provides a lock on the 3704 which deactivates all switches (except power-off and power-on) when key is removed. Two keys are included. For additional or replacement keys, see "Accessories". **Maximum:** One. **Field Installation:** Yes.

COMMUNICATIONS FEATURES

Channel Adapter Type 1 (#1541): Provides for communication with a S/360, S/370, 303X, 4300 Processor Byte Multiplexer Channel. All such communications are accomplished via 1, 2, 3 or 4-byte transfers, with de-selection and re-selection between each transfer. Data transfer rates are primarily dependent on the 3704's internal processing requirements. **Maximum:** One. **Field Installation:** Yes.

Communication Scanner Type 1 (#1641): Provides the interface between the communication line attachment features and the Central Controller. The CS Type 1 (#1641) uses the 3704 interrupt facilities to allow the program to perform character assembly and disassembly, and allows for program control of line control, control character recognition, code translation and error recovery functions. **Limitations:** This Scanner may not be installed if a CS Type 2 is to be installed. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** At least one #4650.

Communication Scanner Type 2 (#1642): Provides the interface between the communication line attachment features and the Central Controller. The CS Type 2 (#1642) assembles and disassembles characters automatically, provides character buffering for each line and allows for program control of line control, control character recognition, code translation and error recovery functions. The basic scanner is operational with one LIB Type A1 only. **Limitations:** This scanner may not be installed if a CS Type 1 is to be installed. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** At least one #4650 and #3600. **Specify:** CS Expansion (**#9090**) to permit installation of two LIBs of any types except two LIB Type 1s (#4701). **Note:** See "Specify" section for CSB II additional attachment capability.

LIB Position Designator: The position of the LIBs within the 3704 must be specified in accordance with the table below:

	Communication Scanner Type 1 (#1641)		Communication Scanner Type 2 (#1642)	
LIB TYPE	Position 1	Position 2	Position 1	Position 2
1	----	----	#9501	#9502
1	#9311	#9312	#9511	#9512
8	#9381	#9382	#9581	#9582
9	#9391	#9392	#5991	#5992
10	#9401	#9402	#9701	#9702

The LIBs *should* be assigned to position in numerical order: that is, LIB Type A1s *should* be assigned to the lowest numbered positions, LIB Type 1s next lowest, etc., so that the highest type numbered LIB is in the highest numbered position. Each order submitted must indicate the Feature number for each LIB desired plus a location specify code (position number, from above table) based on the LIB Type.

The positions of the line sets within the LIB will be automatically assigned.

Cables: The cables that are included in each line set (except **#4719**) are listed in the *IBM Input/Output Equipment Installation Manual - Physical Planning*, GC22-7064. These cables must be ordered separately from the 3704 order on a cable order.

To obtain cables longer than 15 meters (50 feet), select the required cable below and order the cable assembly P/N and the required cable length in meters. These longer cables are ordered by P/N on an MES. The cable price includes installation charges. Maintenance charges are included in the associated Line Sets. Inquire into the QSLM file for prices.

To order a cable for a RS-232-C/CCITT V.24 Modem Interface Attachment:

Duplex (Line Set Type 1H **#4714**)
Order cable assembly P/N **1785928**
(See Note 1)

Half Duplex (Line Set Type 1D **#4714**)
Order cable assembly P/N **1785929**
(See Note 1)

To order a cable for a Autocall Originate (RS-366-A/CCITT V.25) Attachment:

(Line Set Type 1E **#4715**)
Order cable assembly P/N **1753439**
(See Note 2)

Note 1: Maximum Length: 30 meters (100 feet).

Note 2: Maximum Length: 45 meters (150 feet).

Expansion Feature (#3600): Required for mdls A2, A3, and A4 or CS Type 2 (#1642) on mdl A1. **Maximum:** One. **Field Installation:** Yes.

Business Machine Clock (#4650): Provides clocking when the attached external modem or internal IBM line adapter does not provide this clocking. The speed of this clocking must be specified for each Business Machine Clock (#4650) ordered from the following table:

Speed (bps)	Specify
100	**#2716**
110	**#9605**
134.5	**#9606**
200	**#2717**
300	**#9612**
600	**#9607**
1200	**#9608**
2400	**#9610**

Limitations: Required only when modem does not provide clocking except that each CS requires at least one BMC, which must be at a speed less than one-half that of the lowest speed modem clocked line. **Maximum:** Four per CS Type 1 (#1641) or Type 2 (#1642). **Field Installation:** Yes. **Prerequisites:** #1641 or #1642. **Note:** Individual BMCs may be assigned by the program to one or more communication lines.

Line Interface Base Type A1 (#4700): For attachment of up to four LSs 1A, 1C, 1F, 1E, or 1D in any combination. **Limitations:** See CS Type 2 (#1642). When installed in combination with other type LIBs, the maximum of two applies to the total number of LIBs. **Maximum:** Two if CS Expansion (**#9090**) is specified with CS Type 2 (#1642). Without (**#9090**), maximum is one. **Field Installation:** Yes. **Prerequisites:** #1642.

Line Interface Base Type 1 (#4701): Provides for the attachment of up to eight LS 1A, 1C, 1D, 1F. **Limitations:** When installed in combination with other type LIBs, the maximum of two applies. **Maximum:** Two with CS Type (#1641); one with CS Type 2 (#1642). **Prerequisites:** #1641 or #1642 with **#9090. Field Installation:** Yes.

Line Interface Base Type 8 (#4708): Provides for the attachment of up to two Modem Attachment Bases - 1200 bps (**#5103**). **Limitations:** When installed in combination with other type LIBs, the maximum of two applies to the TOTAL number of LIB. **Maximum:** Two per 3704. **Field Installation:** Yes. **Prerequisites:** #1641 or #1642 with CS Expansion (**#9090**).

Line Set Type 1A (Low-Speed External Line Interface) (#4711): Provides for the attachment of two start/stop communication lines at speeds up to 1200 bps, each of which has an EIA RS-232-C interface for attachment to an external modem. **Limitations:** When installed in combination with other type LSs, the maximum above applies to the total number of LSs. **Maximum:** Eight per LIB Type 1 (#4701), or four per LIB Type A1 (#4700). **Field Installation:** Yes. **Prerequisites:** #4701 or #4700 and a Business Machine Clock (or clocks) (#4650), assigned by the program to this LS.

Line Set Type 1C (Low-Speed Local Attachment) (#4713): Provides for the local attachment of two half-duplex IBM Start/Stop terminals at speeds up to 1200 bps via IBM-provided cables. Modems are not required. **Note:** The attached terminal must provide a BMC and external modem cable to which the 3704 LS 1C cable will connect. Total cable length must not exceed 200 feet. **Limitations:** When installed in combination with other type LSs, the maximum above applies to the total number of LSs. **Maximum:** Eight per LIB Type 1 (#4701), or four per LIB Type A1 (#4700). **Field Installation:** Yes. **Prerequisites:** #4701 or #4700 and a Business Machine Clock (or clocks) (#4650) specified for the same speed as the terminal's clock.

Line Set Type 1D (Medium-Speed External Line Interface) (#4714): Provides for the attachment of two start/stop or synchronous communication lines at speeds up to 9600 bps, each of which has an EIA RS-232-C interface for attachment to an external modem. **Limitations:** When installed in combination with other type LSs, the maximum above applies to the total number of LSs. **Maximum:** Eight per LIB Type 1 (#4700) or four per LIB Type A1 (#4701). **Field**

3704 Communications Controller (cont'd)

Installation: Yes. **Prerequisites:** #4701 or #4700. **Note:** For speeds in excess of 4800 bps, see Address Substitution and Scan Limits under "Specify" .

Line Set Type 1E (Auto Call Unit) (#4715): Provides two RS-366 interfaces for attachment of external automatic calling units. **Limitations:** When installed in combination with other type LSs, the below maximums apply to the total number of LSs per LIB. **Maximum:** Eight per LIB Type 1 (#4701) or four per LIB Type A1 (#4700). **Field Installation:** Yes. **Prerequisites:** #4701 or #4700.

Line Set Type 1F (Medium-Speed Local Attachment) (#4716): Provides for the local attachment of two half-duplex, synchronous IBM terminals at speeds up to 2400 bps via IBM-provided cables. Modems are not required. This LS requires different cable groups depending upon terminal type. For cabling information, see *IBM System/370 Installation Manual - Physical Planning,* GC22-7004; for Remote, see *Multiplexers,* GA27-3006. **Note:** The attached terminal must be equipped with a BMC, and must provide a standard external modem cable to which the 3704 LS 1F external cable will connect. Total cable length must not exceed 100 feet. **Limitations:** When installed in combination with other LSs, the maximum below applies to the total number of LSs per LIB. **Maximum:** Eight per LIB Type 1 or four per LIB Type A1. **Field Installation:** Yes. **Prerequisites:** #4701 or #4700 and a Business Machine Clock (or clocks) (#4650) specified for the same speed as the terminal's BMC.

Line Set Type 1J (#4719): [External Mil Std 188C Modem] For attachment of one start/stop or synchronous communication line at a speed of up to 50.0K bps via an external modem having an interface that conforms to the requirements in Section 7.2.1 of Mil Std 188C. **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** #4700 and #1642. CS Type 2 (#1642). If CS Expansion **#9090** is ordered with #1642, see "Address Substitution" under "Specify".

Line Set Type 8A (1200 bps Leased Integrated Modem) (#4781): Provides for the attachment of one start/stop line up to 600 bps or one synchronous line at 1200 bps. This line set includes one 1200 bps Integrated Modem. No external modems are required. This integrated modem must communicate with another 1200 bps Integrated Modem. **Limitations:** When installed in combination with LS Type 8B, the maximum below applies to the total number of lines per Modem Attachment Base (#5103). **Maximum:** Two per Modem Attachment Base - 1200 bps (#5103). **Field Installation:** Yes. **Prerequisites:** #5103 and a Business Machine Clock (#4650) assigned by the program to this LS.

Line Set Type 8B (1200 bps Switched Integrated Modem) (#4782): For attachment of one start/stop switched line at speeds up to 600 bps or one synchronous switched line at speeds of 600 bps or 1200 bps. This feature is to be used in conjunction with the Public Switched Network via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. This LS includes one 1200 bps Switched Line Modem with Automatic Answer capability ... no external modem is required. *This integrated modem must communicate with another 1200 bps Integrated Modem.* **Limitations:** When installed in combination with LS Type 8A, the maximum of two applies to the total number of lines per Modem Attachment Base (#5103). **Maximum:** Two per Modem Attachment Base - 1200 bps (#5103). **Field Installation:** Yes. **Prerequisites:** #5103 and a Business Machine Clock (#4650) assigned by the program to this LS.

Modem Attachment Base 1200 bps (#5103): Provides for the attachment of up to two of LSs 8A, 8B, or 8D (in any combination). **Maximum:** Two per LIB Type 8 (#4708). **Field Installation:** Yes. **Prerequisites:** #4708.

MODEL CONVERSIONS

May be made in the field.

ACCESSORIES

Keys: A 3704 with Unit Protection (#8510) is shipped with two keys. Additional or replacement keys may be purchased only from IBM. A customer letter of authorization with key identification number (stamped on key) must accompany each order. Allow 6 to 7 weeks for shipment.

SUPPLIES (None)

3705 COMMUNICATIONS CONTROLLER

[*3705-I Models A, B, C, D are no longer available*]

The 3705 is one of a series of Communications Controllers. The following is a brief summary of the Communications Controllers.

Comm Controller	Maximum Lines *	Maximum Storage	Host Program	Comm Control Program
3705-II	255 352	512K 512K	BTAM VTAM/TCAM	EP ACF/NCP-PEP
3705-80	16 16	256K 256K	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3704	32	64K	BTAM	EP
3725-1	256	1024K	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3725-2	24	512K	VTAM/TCAM BTAM	ACF/NCP-PEP EP

* Maximum lines that can physically attach, CF3705 is required to predict actual line attachment capabilities.

See individual pages for each Communications Controller for information on additional features.

PURPOSE

The 3705-II attaches to all S/370, 30XX, 4331 or 4341 Processors or, in 2701/2702/2703 Emulation Mode only, to S/360 models 40, 50, 65, 67 (in 65 mode), 75 and 195 for communication with local or remote I/O devices over various common carrier-provided or customer-owned communication facilities.

MODELS

The 3705 consists of the following models based on either the number of frames and/or the storage capacity:

Model E1 - H8	Storage
E1, F1, G1, H1	32K
E2, F2, G2, H2	64K
E3, F3, G3, H3	96K
E4, F4, G4, H4	128K
E5, F5, G5, H5	160K
E6, F6, G6, H6	192K
E7, F7, G7, H7	224K
E8, F8, G8, H8	256K
J1, K1, L1	320K
J2, K2, L2	384K
J3, K3, L3	448K
J4, K4, L4	512K

3705-II models E01 through H08 consists of monolithic storage with a cycle time of 1.0 microseconds. 3705-II models J01 through L04 consists of monolithic storage with a cycle time of 900 nanoseconds.

The model numbering of the 3705 is 'x' 'y'. The 'x' is an alpha code designating the number of frames in a 3705; E represents one frame, F or J two, G or K three, and H or L is four frames for 3705-II; 'y' is numeric code designating the storage size.

In the 3705-II (models E, F, G and H), the storage is housed only in the first frame, which has up to eight increments of monolithic storage. The 3705-II, models J, K and L have 256K of storage in the first frame and 64K in the second frame. Additional storage in 64K increments may be installed in the second frame for a maximum of 512K bytes.

Prerequisites:

Note: The HONE Configurator (AID CF3705) must be used to prepare the DP Order Guide before entering an order.

Host Processor Attachments:

The 3705-II requires a control unit position on a system channel, unless only the Remote Program Loader (RPL) feature is installed.

S/360 mdls 40, 50: Multiplexer Channel (standard). Attachment to S/360 is in 2701, 2702, 2703 emulation mode only.

S/360 mdls 65, 67 (65 mode), 75, 195: Multiplexer Channel of 2870. See M2870 pages. Attachment to S/360 is in 2701, 2702, 2703 emulation mode only.

S/370 mdls 115, 125: Multiplexer Channel (special feature). See M3115, M3125 pages.

S/370 mdl 135: Byte Multiplexer Channel (standard), Selector or Block Multiplexer Channel (special features). See M3135 pages.

S/370 mdl 135-3: Byte Multiplexer Channel (standard), or Block Multiplexer Channels (special feature). See M3135-3 pages.

S/370 mdl 138: Byte Multiplexer Channel (standard), or Block Multiplexer Channels (standard). See M3138 pages.

S/370 mdl 145: Byte Multiplexer or Selector Channel (standard), or Block Multiplexer Channel (special feature). See M3145 pages.

S/370 mdl 145-3: Byte Multiplexer Channel (standard), or Block Multiplexer Channels. See M3145-3 pages.

S/370 mdl 148: Byte Multiplexer Channel (standard), or Block Multiplexer Channels (standard). See M3148 pages.

S/370 mdls 155, 155-II, 158 and 158-MP: Byte Multiplexer or Block Multiplexer Channels (standard). See M3155, 3158 pages.

S/370 mdls 165, 165-II, 168, 168-MP, and 195: Selector Channel of 2860, Multiplexer Channel of 2870. Selector Subchannels (special features) of 2870, or Block Multiplexer Channel of 2880. See M2860, 2870, 2880 pages.

3031 Processor: Byte Multiplexer Channel (one is standard), Block Multiplexer Channels (five are standard). See M3031 pages.

3032 Processor: Byte Multiplexer Channel (one is standard), Block Multiplexer Channels (five are standard). See M3032 pages.

3033 Processor: Byte Multiplexer Channels (two are standard), Block Multiplexer Channels (ten are standard). See M3033 pages.

3081, 3083, 3084 Processor: Byte Multiplexer Channels, Block Multiplexer Channels. See M3081, 3083, 3084 pages.

4331 Processor: Byte Multiplexer Channel (special feature). See M4331 pages.

4341 Processor: Byte Multiplexer Channel (standard). See M4341 pages.

Note: The 3705-II attaches to a S/360 with a minimum of 128K bytes of storage.

Note: See "Programming" and "SCP" pages for attachment capability.

HIGHLIGHTS

A modular, programmable unit which expands the communications capabilities of S/360, S/370, 30XX, 4331 or 4341 Processors. By virtue of its modularity and programmability, the 3705 boasts a high degree of flexibility in tailoring to a teleprocessing system's requirements. Also, it can relieve the Processor of many TP functions, including, but not limited to, line control, polling, addressing, code translation and error recovery. The maximum number of communication lines which can be physically attached to a 3705 is 352 lines; but, the maximum number of communication lines capable of concurrent operation is a function of the speed of the lines, the type of Channel Adapter (CA), memory size, the Communication Scanner (CS) installed and the programming mode of operation. The maximum number of lines which can be physically installed can exceed the operational capability, see "Specify" for "special scheduled" systems. The 3705-II mdls E01 through H08 have a 1.0 microsecond storage cycle time, the 3705-II mdl J01 through L04 have a 900 nanosecond storage cycle time.

The 3705-II mdls J, K, and L require ACF/NCP/VS Release 2 and all following releases unless otherwise specified.

Communication Facilities: The 3705 operates over common carrier-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

3705 Local Attachment (Synchronous): In addition to the synchronous terminals being attached to the 3705 through common carrier -provided facilities, they may also be connected directly to the 3705 using LS Type 1D (LS1D) (#4714). addition to the synchronous terminals being attached to There must be corresponding Business Machine Clocks (BMC) in both the terminal and the 3705.

3705 Local Attachment (V.35): Terminals may be attached locally to the 3705 using LS1W (#4727) (half-duplex) or LS1Z (#4728) (duplex) V.35 interfaces. No BMC is required in the attached device since clocking signals are provided by BMC(#4651) in combination with (#4727) or (#4728).

Customer Responsibilities:

See M2700 pages. See also the 3704/3705 Programming pages for attachment capability and refer to Host Systems Programming pages for possible restrictions to the above attachments.

Machine Organization: The basic machine consists of the Central Control Unit (CCU) with storage (32K in the 3705-II) and an operator's control panel.

A minimum machine configuration must have, in addition to the base unit, the following features:

(1) Either a Channel Adapter (CA) feature or the Remote Program Loader (RPL) feature. The CA requires different levels of processing overhead and thus yield different performance capabilities.

(2) A Communication Scanner (CS) feature to provide for the connection between the Attachment Base (AB) feature and the Line Interface Base(s) (LIBs) features. Like the CAs, the various

3705 Communications Controller (cont'd)

CSs have varying degrees of performance due to the different levels of processing overhead.

(3) An AB which provides a common connection between the CSs and the CCU.

(4) A LIB which provides the connection between the CS and the various LSs. The LIB provides the hardware for the mounting of the individual LSs. Each LIB is designed for a certain set of functions in conjunction with the various LS.

(5) A LS which provides the electronics and external cables to interface to a communication facility.

Note: Both the external cables and the LSs are individually ordered. The number of LSs that can be contained in a LIB is contingent upon the electronic hardware of the LS required to perform the functions supporting the communications facilities. See Figure 3.

(6) A BMC which provides clocking of data in and out of CS.

Attachment Bases: The Attachment Base (AB) provides the physical and logical connection between the CA1 and the CCU, and between the CCU and the various CSs. There are two ABs. A 3705 must have at least one AB, and in some instances have two ABs.

Channel Adapter: The CA provides the logical interface between a 3705 and with defined host processor. Every 3705 must have at least one CA in the first frame (except those units having the RPL (#6260). CA1 can only be placed in the first frame of a 3705. When the second CA is a Type 2 or Type 3, then "ROS Substitution" must be specified on the first frame (3705), specify **#9754.** When there are two or more CA4s and the ACF/NCP/VS Program Product or EP/VS with PRPQ #P85032 is installed, then "N ROS Substitution" must be specified in every frame in which a CA4 is present, specify **#9566.**

When ordering or removing a CA, use the specify to indicate total number of CAs in the 3705 and 3706 combined and place this specify on the first 2 frames (3705 and first 3706).

if 1 CA, specify **#9201** if 3 CAs, specify **#9203**
if 2 CAs, specify **#9202** if 4 CAs, specify **#9204**

These "specifies" are required on the first two (2) frames whenever a CA is *added to* or *removed from* either frame.

External Cables: All CAs need external cables which must be ordered separately from the CA features. **Limitations and Prerequisites:** The 3705-I (first frame) can contain one CA Type 1, 2, 3, or 4. The 3706 (second frame) can contain one CA Type 2, 3, or 4.

3705-II (first frame) can contain two CSs. The 3706 (second frame) can contain two CSs.

When operating with ACF/NCP/VS the 3705-II (first frame), can contain two CAs. The 3706 (second frame) can contain two CAs. If two CSs are in one frame (3705-II), at least one of the adapters must be CA4. When operating with greater than one CA4 and EP/VS with PRPQ #P85032, two CA4s can be in the same frame. Note: EP 3.0 standalone only supports one CA4 in each frame.

No CSs are allowed in the third or fourth frame.

The CSs can be mixed with the following exceptions:

- When CA4 is in the same machine with either a CA2 or a CA3, then the CA4 would be in the first frame.
- The CA1 cannot be in a machine with either a CS3, CS3HS, or CA4. The CA1 is not available on a 3705 mdl J, K, or L.
- Emulation Mode requires either a CA1 or a CA4 connected to a byte multiplexer channel.
- CA2 and CA3 are used only with Network Control mode of the Network Control Program.
- For the 3705-II, if greater than two CAs are installed, the CAs must all be CA4s. Up to four CA4s are allowed.
- For the 3705-II, up to four I/O Channel Attachments are allowed (two per frame).
- For the 3705-II, Remote Program Load-II Feature (#6261) can coexist with a CA.
- For the 3705-II, if two CAs in the same frame, then no Two-Channel Switch (#8002) is allowed.
- Dual ROS need not be removed when total CAs are reduced to a single CA in the entire machine.

CA1 requires the AB1 as a prerequisite. CA2, CS3, and CS4 contain the AB function within their respective features.

The placement of various RPL/CA and CA configurations is as follows:

3705		3706	
LIB Pos. 3 RPL CA-4 (B1)	LIB Pos. 2 (A1)	LIB Pos. 3 (B1)	LIB Pos. 2 (A1)
LIB Pos. 4 CS-3 CS-3HS (B2)	LIB Pos. 1 (A2)	LIB Pos. 4 CS-3 CS-3HS (B2)	LIB Pos. 1 (A2)
CCU (B3)	CS-2 CS-3 CS-3HS (A3)	LIB Pos. 5 (B3)	CS-2 CS-3 CS-3HS (A3)
CCU (B4)	CA-1 CA-2 CA-3 CA-4 (A4)	CA-4 LIB Pos. 6 (B4)	CA-2 CA-3 CA-4 (A4)

Note: CS-3 takes two positions.

Allowable Hardware Channel Adapter Configurations:

1st CA Type	2nd CA Typ	3rd CA Type	4th CA Type	ROS Type	Frame Location 1st CA	2nd CA	3rd CA	4th CA	ROS Specify Code
1**	-	-	-	1	3705	-	-	-	-

4	4	4	4	N	* 3705	3705	3706	3706	**#9566**

* Available only on 3705-II.
** Not available on a 3705-II J, K, L mdls.

Definition of the different ROS types:

(1) "1" ROS type 1 is used to IPL over one channel either a CA1 or CA4. In addition, when 2 CA4s are installed, the IPL Source Switch must be used to select which channel is to do the IPL with a ROS type 1. No specify code is required for ROS type 1. See N ROS to allow for IPL over any CA4.

(2) "2" - used to IPL over only one channel, either a CA2 or CA3. No specify code is required for the Type 2 ROS.

(3) DUAL ("ROS Substitution") - used to IPL over one of two channels, using any appropriate combination shown above. Specify code **#9754** is required for DUAL ROS.

(4) N ("N ROS SUBSTITUTION") to be used only with CA4s. ACF/NCP/VS, or EP/VS allows for IPL over any CA4. (PRPQ #85032 is needed to go beyond 2 CA4s in EP). Specify code **#9566** is required for "N" ROS.

(5) RPL - used to IPL remotely. There is a separate ROS for the 3705-II remote. (Although remote is not mentioned on this page, it is listed here for convenience). No specify code is required for RPL ROS.

3705 Communications Controller (cont'd)

Allowable Hardware Channel Adapter Combinations with RPL/CA installed:

3705-II only

RPL	1st CA Type	2nd CA	3rd CA Type	ROS Type	Type	Frame Location 1st CA RPL	2nd CA	3rd CA
1	1	-	-	RPL/1	3705	3705	-	-
1	1	2	-	RPL/Dual	3705	3705	3706	-
1	1	3	-	RPL/Dual	3705	3705	3706	-
1	2	-	-	RPL/2	3705	3705	-	-
1	2	2	-	RPL/Dual	3705	3705	3706	-

1	4	-	-	RPL/1	3705	3705	-	-
1	4	2	-	RPL/Dual	3705	3705	3706	-
1	4	3	-	RPL/Dual	3705	3705	3706	-
1	4	4	-	RPL/N	3705	3705	3706	-
1	4	4	4	RPL/N	3705	3705	3706	3706

Communication Scanner Features: The CS features provide the common logical connection between the various LIBs with their respective LSs and the CCU. Each frame of a 3705 must have a CS if LSs are placed within the frame. There are three CSs, each with a different performance capability.

Limitations:

1. One CS per frame. CS2 and CS3 can be placed within a 3705 in any combination.
2. A CS1 (#1641) can only be placed in the first frame of a 3705-I (cannot be placed in a 3705-II).
3. CS1 cannot be in a 3705 with a CS3 or CS3.
4. Each CS1 or CS2 must have at least one BMC, but not more than four BMCs. CS3 must have at least one BMC (specify **#9615**), and may have one additional clock (specify **#9609** or **#9610**).
5. CS3 only supports attachment of LIBs 1, 8,, 9 and 10.
6. CS3 cannot be in the first frame of a 3705-I.
7. A CS is required in a frame containing LIBs.
8. CS1 (#1641), cannot be installed with the NCP/VS Program Product.
9. CS3HS must have BMC, specify (**#9615**); no other clock is allowed.
10. CS3HS allows for the attachment of only LS1GA (#4722) or LS1TA(#4723).
11. Address Substitution is not allowed in a 3705 with a CS3HS (#1644). HSS is not allowed in conjunction with LS1GA and/or LS1TA.
12. The CS3 does not support Tributary support in EP 3.0.
13. The CS3HS can only be installed on a 3705-II.

Prerequisites: CS1 must have an AB1 in the 3705. CS2 and CS3, and CS3HS must have an AB2 in the 3705. A CS located in a particular frame requires a CS in each preceding frame. **Field Installation:** All scanners can be field installed.

Line Interface Base (LIB): LIBs are used to provide for the physical attachment of LSs in the 3705. LIB Type 1 must be placed in LIB position 1 if Address Substitution or HSS is to be required in the 3705. The LIBs with the highest speed lines should be placed in the lowest LIB positions (Position 1 is the lowest).

Maximum LIB Attachment Capability per Module ... figure 1

3705-I

	1st Module	2nd	3rd	4th	
CS 1	4	N/A	N/A	N/A	(Note 1)
CS 2	4	6	6	6	(Note 1)
CS 3	N/A	4	4	4	(Note 2)

3705-II

	1st Module	2nd	3rd	4th	
CS 2	4	6	6	6	(Note 3)
CS 3	3	4	4	4	(Note 2)
CS 3 H.S.	1	1	1	1	(Note 6)

Note 1: LIBs 1 through 12 can be attached to CSs Types 1 and 2 on the 3705-I.

Note 2: LIBs 1, 8, 9, and 10 will attach to the CS3 on the 3705-I or 3705-II (excluding LSs 1A, 1B and 1C).

Note 3: LIBs 1 through 12 will attach to the CS2 on the 3705-II.

Note 4: LIB capacity is limited by the number of CAs and/or the RPL feature. See RPL/CA Placement chart for available LIBs.

Note 5: LSs operating over 10K bps must be in LIB position 1.

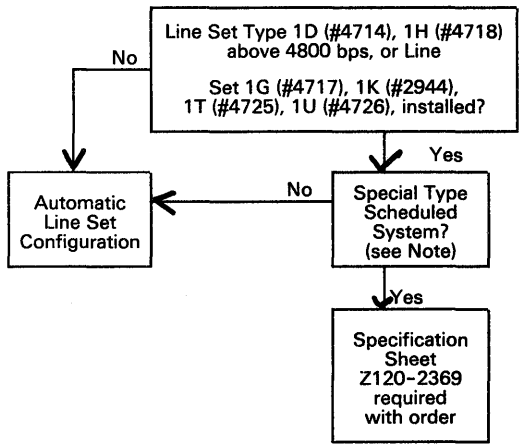
Note 6: The LS addresses for CS3 HS are 0 and 2. *ONLY* one LIB Type 1 can operate with a CS3 HS.

Limitations: When installed with other LIBs of the same or different type, the maximum cannot be exceeded. There are no restrictions on intermixing LIBs. **Prerequisites:** A CS is required in each frame containing LIB(s). **Field Installation:** All LIBs are field installable.

The LIBs must be assigned to a position in numerical order: that is, LIB Type 1s must be assigned to the lowest numbered positions, LIB Type 2s next lowest, etc., so that the highest type-numbered LIB is in the highest numbered position. The order as submitted then must specify a feature code *and* location specify code for each LIB to be installed.

The positions of the LSs within the LIB will, in most cases, be automatically assigned. To determine whether this automatic assignment is applicable, use the following flowchart:

(Normally the Specification Sheet, Z120-2369, should be used only if required by the flowchart below. If, however, specific positions for LSs are desired, even when the Automatic LS Configuration is suggested, fill out the Specification Sheet and submit it).



Note: A "Special Type Scheduled System" is one in which the 3705 is effectively servicing two different TP networks on a scheduled basis. That is, one set of communication lines is serviced in one time period and a second set of lines is serviced in a second time period *and there is no overlap of the two systems in time.*

Line Sets: LSs provide the electronic logic to meet the individual requirements of the communication facility. (See Figures 2 and 3 for attachment capability of LSs with respect to LIBs).

Note: All LSs require cables (except #4719). See "Cables" for further details. The numeric portion of the LS type number indicates the LIB type. Each LS type shown is for only one LS.

FIGURE 3: LIB-LINE SET CONFIGURATION CHART

SPECIFY

- All 3705-IIs are to be ordered as follows:

  "E" mdls - order one 3705 mdl E1 through E8.

  "F or J" mdls - order one 3705 (any F or J mdl) *and* one 3706 (mdl code same as 3705) with **#9755** to designate first 3706.

  "G or K" mdls - order one 3705 (any G or K mdl) *and* two 3706s (mdl code same as 3705). Each 3706 must be ordered separately. On one 3706 order, specify **#9755** to designate the first 3706 and on the other one, specify **#9756** to designate second 3706.

  "H or L" mdls - order one 3705 (any H or L mdl) *and* three 3706s (mdl code same as 3705). Each 3706 must be ordered separately. On one 3706 order, specify **#9755** to designate first 3706, on another 3706, specify **#9756** to designate second 3706 and on third 3706, specify **#9757** to designate the third 3706.

  Note: The 3706 type number is to be specified at no charge, and is to be used only for internal IBM ordering and control purposes. Order the 3705 and each 3706 separately with all its associated features. Specify items for voltage, color, and cabling must be ordered on the 3705 and each 3706. The 3706 type number should never appear on any agreement.

  Note: When doing a model conversion, the Mdl I Frame Specify Code must translate to a Mdl II Frame Specify Code. The position must not be changed.

Position	Mdl I	Mdl II
2	**#9751**	**#9755**
3	**#9752**	**#9756**
4	**#9753**	**#9757**

  For Power Compatibility: RPQ S30251 (no charge) must be ordered with a 3706, if the 3705 to which it will attach is installed and has a serial number higher than 40000; otherwise, specify **#9820**.

  When transferring a 3706 in the field from a 3705 with a serial number lower than 40000 to a 3705 with a serial number higher than 40000, RPQ S30251 and removal of specify code **#9820** must be ordered for the 3706.

  When transferring a 3706 in the field from a 3705 with a serial number higher than 40000 to a 3705 with a serial number lower than 40000, specify code **#9820** and removal of RPQ S30251 must be ordered for the 3706.

  Note: The above will result in appropriate installation and removal of BM 1644026, which is required on 3706s with serial numbers lower than 50000 only when attached to a 3705 with a serial number higher than 40000.

  3705 Feature Change: To relocate LSs and/or LIBs from one frame to another on a leased machine, concurrently submit a MES order for each frame, and specify **#9544** on any order which contains reinstallations. Because specify code **#9544** cause all LSs and LIBs on an order to be shipped as documents only, any outright adds should be ordered on a separate order than one containing specify code **#9544**. The LIB positions must be kept contiguous on each frame.

  To relocate a LIB (and its associated LSs) within the same frame on a leased machine, indicate removal of that LIB position code, and indicate add of the desired LIB position code. Specify code **#9544** is not required for reinstallations within the same frame.

  If non-standard LS positioning is desired, specify **#9545**, submit a specification sheet (Form Z120-2369) and indicate same to the system when entering the order.

  Note: An MES may be a mix of LSs and/or LIB moves, moves within the same frame, moves to and/or from other frames in the same machine. If a specification sheet is submitted, enter the installed LIBs and LSs in the "F/C" column, enter the Add F/Cs in the "Required" column, and enter the Remove F/Cs in the "Not Required" column.

- Voltage (AC, 3 phase, 4 wire, 60 Hz): **#9903** for 208V, or **#9905** for 230V. Field Conversion: Yes.

  If a 4.3 meter (14 feet) cable is not required, specify **#9986** for 1.8 meter (6 feet) cable.

- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, or **#9046** for white. Not recommended for field installation.

- Address Substitution/Upper Limit Scan: For 3705s with a CS2, there are two methods of address modification: Upper Scan Limits

3705 Communications Controller (cont'd)

and Address Substitution, which allow the CS2 to operate a line set at speeds greater than 4800 bps. For information on USL, see the *IBM 3704 and 3705 Principles of Operation,* GC30-3004.

Address Substitution (#9001, #9002, #9003, #9004) : May be required when lines at speeds greater than 4800 bps are to be installed. Associated with the invocation by software, the Address Substitution capability allows multiple scanning of an LS's address at the expense of *not* scanning other LS addresses. The specify feature blocks the installation of a LS in those address positions that are *not* scanned by address substitution. The choice of which of the four following specify features is to be ordered should be based on the number of high-speed lines to be installed and their relative LS positions within the first LIB position. The lowest position (**#9001**) is always specified first, followed by each succeeding number. For those positions within a LIB where Address Substitution is invoked, only the even addresses are scanned. To allow installation of LSs in the "blocked positions", so that LSs can be used on a part time basis, do not specify the Address Substitution option.

Address Substitutions should not be specified when standard LS placement is desired on special scheduled systems which invoke address substitution SYGEN options only on a part-time basis.

#9001 - Blocks installation of a LS in partition 8 (both 3705 and 3706s) on all Type 1 and Type 2 LIBs. Specify **#9001**

when the *first* LS of the first LIB is to contain the high-speed (greater than 4800 bps) line.

#9002 - Blocks installation of a LS in partition 7 (3705 and 3706s) on all Type 1 and Type 2 LIBs. Specify **#9002** when the *second* LS of the first LIB is to contain the high-speed (greater than 4800 bps) line.

#9003 - Blocks installation of a LS in partition 6 (3705 and 3706s) on all Type 1, Type 2, Type 3 and Type 10 LIBs. Specify **#9003** when the *third* LS of the first LIB is to contain the high-speed (greater than 4800 bps) line.

#9004 - Blocks installation of a LS in partition 5 (3705 and 3706s) on all Type 1, Type 2, Type 3 and Type 10 LIBs. Specify **#9004** when the *fourth* LS of the first LIB is to contain the high-speed (greater than 4800 bps) line.

Maximum: One each of the above per 3705 and 3706. **Limitations:** The same specify feature should be ordered on all associated 3706(s) when a 3705 requires Address Substitution. **Prerequisites:** #1642. **Field Installation:** Yes.

Note: When Address Substitution is specified, it will block LS installation in all LIBs in the 3705 and associated 3706(s), and therefore, will reduce the physical line handling capability of the 3705. See *IBM 3704/3705 Communications Controller, Principles of Operation,* GC30-3004, for further details.

Address Substitution should not be used on a 3705 containing a CS1 or CS3.

Note: When CS3 High-Speed (#1644) is in a 3705, the Address Substitution cannot be used by any scanner in the 3705. High-Speed Select cannot be employed with LS 1TA or 1GA.

High-Speed Select:

For the 3705 with a CS3 there are two methods of address modification: Upper Scan Limits (USL) and High-Speed Select (HSS), which allow the CS3 to operate with LS speeds greater than 4800 bps. For information on USL, see the *IBM 3704 and 3705 Principles of Operation, GC30-3004.*

HSS (**#9011, #9012, #9013, #9014, #9015, #9016, #9017, #9018**) may be required when lines at speeds greater than 4800 bps are to be installed. The specify feature blocks the installation of a LS in a position whose address is not scanned. The choice of which of the eight following specify features is to be ordered should be based on the number of high-speed lines used and their relative positions within a LIB position. For those positions within a LIB where High-Speed Select is invoked, only the even addresses are scanned.

#9011 - Blocks installation of a LS in partition 1 of the additional LIBs within a 3705 or 3706 module. Only the 3705 or 3706 module containing the high-speed line is affected.
#9012 - Blocks installation of a LS in partition 2
#9013 - Blocks installation of a LS in partition 3
#9014 - Blocks installation of a LS in partition 4
#9015 - Blocks installation of a LS in partition 5
#9016 - Blocks installation of a LS in partition 6
#9017 - Blocks installation of a LS in partition 7
#9018 - Blocks installation of a LS in partition 8

Note: When HSS is specified, it will restrict LS installation in all LIBs (except LIB position 1) of the 3705 or 3706 which has the scanner modification implemented. See *IBM 3704/3705 Principles of Operation,* GC30-3004, for further details. **Prerequisites:** CS3 (#1643). **Maximum:** One each of the above per CS3 (#1643). **Limitation:** None. **Field Installation:** Yes.

- Cabling: **#9080** for below floor, or **#9081** for on floor.
- A Communication Cable Order must be submitted for: Each new 3705 or 3706 machine order; each MES order where the added feature requires external cable.
- Prior to submitting an MES order, the FE Branch Manager should be consulted for any software/hardware compatibility requirements resulting from the order.
- 3705 Specification Sheet: A completed sheet (Z120-2369) *may* be required. See "Line Attachment Configurator" in the Special Features section.
- Cables: The cables that are included in each line set (except **#4719**) are listed in the *IBM Input/Output Equipment Installation Manual - Physical Planning,* GC22-7064. These cables must be ordered separately from the 3705 order on a cable order.

To obtain cables longer than 15 meters (50 feet), select the required cable below and order the cable assembly P/N and the required cable length in meters. Theselonger cables are ordered by P/N on an MES.

The cable price includes installation charges. Maintenance charges are included in the associated Line Sets. Inquire into the QSLM file

for prices.

To order a cable for a CCITT V.35 Interface Modem Attachment:

Duplex (Line Set Type 1U **#4726**)
Order cable assembly P/N **1648394**
(See Note 1)

Half-Duplex (Line Set
1S **#4720**)
Order cable assembly P/N **5997479**
(See Note 1)

To order a cable for a Autocall Originate (RS-366-A/CCITT V.25) Interface Attachment:

(Line Set Type 1E **#4715**)
Order cable assembly P/N **1753439**
(See Note 2)

Note 1: Maximum Length: 30 meters (100 feet)

Note 2: Maximum Length: 45 meters (150 feet)

To order a cable for a EIA RS-232-C/CCITT V.24 Interface Modem Attachment:

The 3705 can now support a cable length of up to 100 meters when connecting to a 3863, 3864 or 3865 modem or equivalent. Cable lengths up to 15 meters (50 feet) are supported when connected to any modem that complies with the EIA/CCITT Interface Specifications.

To connect a cable longer than 15 meters (50 feet) the following must be done:

1. Determine the suffix level (the two alpha characters on the date tag) of each 3863, 3864 or 3865 modem to be interconnected. If the suffix is "FG" or later, no further action is required.
2. If the suffix is "DG" or earlier:

   A 3863 or 3864 or 3865 modem which does *not* have Data Multiplexer #3260 installed must have EC **344120** installed.

   A 3865 modem with Data Multiplexer #3260 installed must have EC **323406** installed.
3. Order a Duplex or Half-Duplex Cable:

   Duplex (Line Set 1D or 1H **#4714** or **#4718**, order cable assembly P/N 1785928. (See Note 1.)

   Half-Duplex (Line Set 1D **#4714**, order cable assembly P/N 1785929. (See Note 1.)

   Note 1: Maximum length 100 meters (328 feet).

3705 Communications Controller (cont'd)

SPECIAL FEATURES

NON-COMMUNICATIONS FEATURES

Remote Power - Off (#6250): Provides the capability of turning the 3705-II power off with a command over a communication line. This feature is applicable to the 3705-II when the 3705-II is utilized only as a remote stand-alone. **Maximum:** One per 3705-II. **Field Installation:** Yes. **Prerequisites:** #6261.

Remote Program Loader-II (#6261): Provides the means of remotely loading the NCP with or without a CA on the machine. **Maximum:** One per 3705-II. **Limitations:** For the 3705-II, cannot be installed with four CA4s (#1544), but any other proper CA combination (see CA section) is acceptable; also, the RPL-II feature on the 3705-II cannot be installed with #4705 or #5001 unless there is a CA also installed. **Field Installation:** Yes.

Two-Channel Switch (#8002): To attach either #1541, #1542 or #1544 to two defined host Processor channels, which may be on the same CPU or on two different CPUs. The CA so equipped will, however, be enabled for operation on one channel at a time. Selection of which channel is to be operable is by a manual switch on the control panel. **Maximum:** One per CA. **Limitations:** If two CAs are in the same frame, then no #8002 is allowed; otherwise, one #8002 per CA. **Field Installation:** Yes. **Prerequisites:** #1541 or #1542 or #1544.

Unit Protection (#8510): Provides a lock on the 3705 that deactivates all push buttons, mode select switches, and diagnostic rotary switches on the control panel when the key is removed from the lock, channel enable/disable, function select rotary switches and power on/off are unaffected. This is included on all models. For additional or replacement keys, see "Accessories". **Maximum:** One per 3705. **Limitations:** None. **Field Installation:** Yes. **Prerequisites:** None.

COMMUNICATIONS FEATURES

Attachment Base Type 1 (#1301): Provides interface logic for CA1 and/or the CS1. **Limitations:** #1301 is needed on the 3705-II only when used in conjunction with #1541. No more than one #1301 or #1302 per 3705. **Field Installation:** Yes.

Attachment Base Type 2 (#1302): Provides interface logic for CS2, CS3, and CS3HS. **Limitations:** #1302 is required for CS2, CS3 or CS3HS. No more than one #1301 or #1302 per 3705. **Field Installation:** Yes. **Note:** CA2, CA3, and CA4 contain the AB logic within the logic of their respective features.

Channel Adapter Type 1 (#1541): For communication with the defined host processor Byte Multiplexer Channel. All such communications are accomplished via 1, 2, 3 or 4-byte transfers, with deselection and reselection between each transfer. Data transfer rates are primarily dependent upon the 3705's internal processing requirements. **Maximum, Limitations, Prerequisites:** See above general description. **Field Installation:** Yes.

Channel Adapter Type 2 (#1542): A high-performance adapter for NCP mode only, which supports communication with a defined host processor's Byte Multiplexer, Block Multiplexer, or Selector Channel, at data transfer rates of up to 276 KB bytes/second (limited by system channel capability). Transfer is always accomplished in "burst" mode, with a 2-byte "burst" standard on the Byte Multiplexer Channel, full "burst" standard on the Block Multiplexer and Selector Channels. **Maximum, Limitations, Prerequisites:** See general description under "Highlights". **Field Installation:** Yes.

Channel Adapter Type 3 (#1543): An adapter of the same performance characteristics as the Type 2 (#1542) with the additional capability of an automatic two-processor switch. It communicates with a defined host processor's Byte Multiplexer, Block Multiplexer, or Selector Channel (mdls 115 and 125 excepted). The switch, part of the basic adapter, is primarily designed to furnish symmetric support for two tightly-coupled processors; i.e., each side of the switch is connected to one of the two MP CPUs. Additionally, this Adapter can be attached to two channels from one CPU to provide alternate path capability. For either tightly-coupled multiprocessor or single CPU attachments, data transfer occurs on only one path at a time. Included as standard is a remote switch attachment capability to remotely control the switch from the configuration control panel of a S/370 Mdl 158 MP or 168 MP, as well as from the 2925 mdl 10 Remote Switching Console. **Maximum, Limitations, Prerequisites:** See general description under "Highlights". **Field Installation:** Yes.

Channel Adapter Type 4 (#1544): Provides attachment to defined host processor's Byte Multiplexer, Block Multiplexer or Selector Channel. It supports either a high-performance Emulation Program running with a CS3HS, a CS2 or CS3 or a high-performance Network Control Program running the same scanners. When attached to a byte multiplexer channel, the CA4 transfers bytes in "bursts" of up to 32 bytes prior to interrupting the control program when running in EP mode. In ACF/NCP/VS mode, the CA4 transfers in "bursts" up to 16 bytes and can transfer up to 248 bytes prior to interrupting the control program. In ACF/NCP/VS mode, when attached to a defined host processor's Block Multiplexer or Selector Channel, the CA4 "bursts" up to 248 bytes and can transfer up to 248 bytes prior to interrupting the control program. When the CA4 is supported using the ACF/NCP/VS Program Product, the CA operates in a cycle steal mode (data is directly moved to or from storage, and after this is accomplished, the control program resumes its operation at the completion of this stolen cycle unless another "cycle steal" request is pending). The cycle steal operation improves the 3705 throughput when compared with NCP/VS support of CA4 by reducing the number and complexity of control program interrupts. When attached to a byte multiplexer channel and supported by NCP/VS, the CA4 transfers in bursts of 4 bytes per control program interrupt. This CA is necessary when using the CS3 in Emulation Mode. **Maximum, Limitations, Prerequisites:** See general description under "Highlights". **Field Installation:** Yes.

Communication Scanner Type 2 (#1642): Provides a medium performance operation. The Scanner provides for the transfer of data between storage and the LSs on a byte-by-byte basis. The Scanner assembles and disassembles characters. The Scanner interrupts the control program on a byte-by-byte basis. The control program provides for the line control, control character recognition, code translation and error recovery functions. **Maximum:** One Scanner per frame. **Limitations, Prerequisites:** See "Highlights". **Field Installation:** Yes.

Communication Scanner Type 3 (#1643): Provides a high performance operation. This Scanner provides for data transfer between storage and the LSs on a multi-byte (buffer) basis. Data transfer between storage and the CS3 is accomplished on a storage cycle steal basis (the CS3 interrupts execution of the control program for a machine cycle, moves data to or from storage. At the conclusion of the data movement, the control program resumes its operation at the point of the interrupt, unless another "cycle steal" request is pending.) This feature supports only synchronous lines and provides control character recognition for BSC and SDLC line controls. This feature provides ASCII to EBCDIC and EBCDIC to ASCII code translation when operating with BSC line control, in NCP mode only. The CS3 interrupts the control program either on (up to 254 character) buffer boundaries, or by unique control characters, or at certain error conditions. It also provides for an auto-dial operation. **Maximum:** One Scanner per Frame. **Limitations:** If a CS3 on a 3705 mdl L is in the last frame, order RPQ **S30274** (no-charge) for all the frames. **Prerequisites:** See "Highlights". **Field Installation:** Yes.

Communication Scanner Type 3 High-Speed (#1644): Is a modified #1643 which allows line speeds up to 230.4K bps. Only two half-duplex data or one full-duplex data line can be attached to this scanner. **Maximum:** One Scanner per frame. **Limitations and Prerequisites:** See general description under "Highlights". **Field Installation:** Yes.

Line Interface Base Type 1 (#4701): Provides for attaching LSs which interface to external modems, autocall units, or locally (directly) attached terminals. **Maximum, Limitations, Prerequisites:** See Figure 1. **Field Installation:** Yes.

Line Interface Base Type 2 (#4702): Provides for attaching LSs which interface to telegraph circuits. **Maximum, Limitations, Prerequisites:** See Figure 1. **Field Installation:** Yes.

Line Interface Base Type 3 (#4703): Provides for attaching IBM Limited Distance Line Adapters. **Maximum, Limitations, Prerequisites:** See Figure 1. **Field Installation:** Yes.

Line Interface Base Type 8 (#4708): Provides for attaching 1200 bps Integrated Modems. **Maximum, Limitations, Prerequisites:** See Figure 1. **Field Installation:** Yes.

Line Interface Base Type 9 (#4709): Provides for attaching 1200 bps Integrated Modems and Autocall Units. **Limitations, Prerequisites and Maximum:** See Figure 1. **Field Installation:** Yes.

Line Set 1D (#4714): [up to 9600 bps Attachment] Provides for the attachment of external modems or Direct Attachment of terminals. One of the following cable groups must also be ordered.

a. **Modem Attach Half-Duplex, cable group #485:** Two communication lines (up to 9600 bps over nonswitched or switched facilities) transmitting half-duplex data using external modems with EIA RS-232-C/CCITT V.24 Interfaces. This is for Synchronous (BSC/SDLC) or Asynchronous (Start/Stop) Terminals. This function is to be used in place of #4711.

b. **Modem Attach Duplex, cable group #473 for Synchronous Attachment, or cable group #492 for Asynchronous Attachment:** One communication line up to 9600 bps over nonswitched, 4-wire, facilities, transmitting duplex data, using external modems with EIA RS-232-C/CCITT V.24 interfaces. This mode of operation provides for the transmission of data simultaneously in a transmit and receive mode. This function is to be used in place of #4718 or #4712.

c. **Direct Attach Synchronous, cable group #1358, up to 100 feet:** For direct attachment of two half-duplex IBM Terminals up to 2400 bps with IBM-provided cables. Modems are not required. This LS requires different cable groups depending upon terminal type. For cabling information see *IBM System/370 Installation Manual - Physical Planning,* GC22-7064. The attached terminals must be equipped with a BMC and

3705 Communications Controller (cont'd)

must provide a standard external cable to which this cable will attach. This function is to be used in place of #4716.

Note 1: When operating this LS over 4800 bps, refer to Address Substitution and HSS under "Specify".

Note 2: For Asynchronous Direct Attach Operation, order RPQ **8Q0261**.

Line Set Type 1G (#4717): [High-Speed External Modem] For attachment of one synchronous communication line for operation at 19.2K bps, or 50K bps . Has a digital interface for attachment to a switched or leased wideband external modem. See Scan Limits, Address Substitution and High-Speed Select under "Specify". **Maximum, Limitations, Prerequisites:** See Figures 1 and 3. **Field Installation**: Yes.

Line Set Type 1J (#4719): [External Mil Std 188 Interface] Provides for the attachment of one start/stop or synchronous communication line at a speed up to 50K bps via an external modem having an interface that conforms to the requirements in Section 7.2.1 of Mil Std 188C. **Note**: No external cable is provided with this LS. For speeds greater than 7200 bps, #1642 or #1643 is required. **Maximum, Limitations and Prerequisites:** See Figures 1 and 3. **Field Installation**: Yes.

Line Set Type 1S (#4720): [Common Carrier 56K bps attachment] Provides for the attachment of a single synchronous CCITT V.35 type interface to be used on a communication facility up to 56K bps. The 1S LS may be operated at 14.4K bps or 57.6K bps in conjunction with a 1W LS (#4727) in another 3705. See Scan Limits, Address Substitution and High-Speed Select under "Specify". **Maximum, Limitations and Prerequisites:** See Figures 1 and 3. **Field Installation**: Yes.

Line Set Type 2A (#4721): [Telegraph Single Current] For attachment of two single current telegraph lines, each of which may be wired for 20 mA, 40 mA, or 62.5 mA single current termination. **Maximum, Limitations, Prerequisites:** See Figures 1 and 3. **Field Installation:** Yes.

Line Set Type 1GA (#4722): [High-Speed External Modem] For attachment of one synchronous, half-duplex data communication line for operation up to 230.4K bps; has a digital interface for attachment to a leased wideband external modem. **Maximum**: Two per #4701. **Limitations**: Up to two LSs of this type allowed in the same 3705/3706 frame. **Field Installation**: Yes. **Prerequisites**: #1644.

Line Set Type 1TA (#4723): [High-Speed External Modem] For attachment of one synchronous, full duplex data communication line for operation up to 230.4K bps. Has a digital interface for attachment to a leased wideband external modem. **Maximum**: One per #4701. **Limitations**: Only one LS per 3705 or 3706 frame. **Field Installation**: Yes. **Prerequisites**: #1644.

Line Set Type 1T (#4725): [High-Speed Duplex External Modem] 50K bps . This LS will only run with the NCP program product. Provides for the attachment of one duplex synchronous line which has a digital interface for attachment to an external data set for 50K bps , leased or switched wideband facilities (not program supported for switched facilities). The control program must condition this line interface for external clock control. See Scan Limits, Address Substitution and HSS under "Specify". **Maximum, Prerequisites, and Limitations:** See Figures 1 and 3. **Field Installation**: Yes.

Line Set Type 1U (#4726): [High-Speed Duplex External Modem] 56K bps. This LS will only run with the NCP program product. Provides for the attachment of one duplex synchronous line which has a CCITT V.35 interface for attachment to a common carrier communication facility with line speeds up to 56K bps. The control program must condition this line interface for external clock control. The 1U LS may be operated at 14.4K bps or 57.6K bps in conjunction with a #4728 in another 3705. See Scan Limits, Address Substitution and HSS under "Specify". **Maximum, Prerequisites and Limitations:** See Figures 1 and 3. **Field Installation**: Yes.

Line Set Type 1W (#4727): [High-Speed Local Attach] 14.4K bps or 57.6K bps, half-duplex data. Provides for local attachment of a single half-duplex synchronous device which has a CCITT V.35 type interface (similar to the LS Type 1S). Clocking is provided for this LS by #4651; the attached device must be set for external clock control. The total cable length must not exceed 60 meters (200 feet) at 14.4K bps operation, and 30 meters (100 feet) at 57.6K bps operation. The total length includes the attached device cable length. See Scan Limits, Address Substitution, and HSS under "Specify". **Maximum**: Eight per LIB Type 1. **Limitations and Prerequisites:** See Figures 1 and 3. **Field Installation:** Yes.

Line Set Type 1Z (#4728): [High-Speed Local Attach Duplex] 14.4K bps or 57.6K bps duplex data. Provides for the local attachment of a single duplex synchronous device which has a CCITT V.35 interface (similar to LS1U). Clocking is provided for this LS by #4651, such that the attached device must be set for external clock control. The total cable length must not exceed 30 meters (100 feet) at 57.6K bps operation. The total length includes the attached device cable length. See Scan Limits, Address Substitution, and HSS under "Specify". **Maximum**: Four per LIB Type 1. **Limitations and Prerequisites:** See Figures 1 and 3. **Field Installation:** Yes.

Line Set Type 3A (#4731): [Limited Distance Type 1 Line Adapter, 2-wire] For attachment of two half-duplex, start/stop lines at speeds up to 134.5 bps. Includes two IBM Limited Distance Type 1 (2-wire) Line Adapters and no external modems are required. **Note**: Total wire length may not exceed 4.75 wire-miles. See GA24-3435 for further details. **Maximum, Limitations, Prerequisites:** See Figures 1 and 3. **Field Installation:** Yes.

Line Set Type 3B (#4732): [Limited Distance Type 1 Line Adapter, 4-wire] For attachment of two start/stop lines at speeds up to 134.5 bps. Includes two IBM Limited Distance Type 1 (4-wire) Line Adapters; no external modems are required. **Note**: Total wire length may not exceed 4.75 wire-miles. See GA24-3435 for further details. **Maximum, Limitations, Prerequisites:** See Figures 1 and 3. **Field Installation**: Yes.

Line Set Type 8A (#4781): [1200 bps Leased Line Adapter] Provides for the attachment of two start/stop or synchronous lines at speeds up to 600 bps or at 1200 bps. This LS includes two 1200 bps LAs suitable for communication over a leased voice grade channel with similar LAs. No external Modems are required. This integrated modem must communicate with another 1200 bps IBM integrated modem. **Maximum, Limitations, Prerequisites:** See Figures 1 and 3. **Field Installation:** Yes.

Line Set Type 8B (#4782): [1200 bps Switched Network Line Adapter] Provides for the attachment of two start/stop lines at speeds up to 600 bps or two synchronous lines at speeds of 600 bps or 1200 bps. This LS includes two 1200 bps LAs equipped with Auto Answer suitable for communication over the Public Switched Network via *FCC registered protective circuitry of the CBS type (or equivalent) provided by the user* with similar LAs. No external modems are required. This integrated modem must commmunicate with another 1200 bps IBM integrated modem. **Maximum, Limitations and Prerequisites:** See Figures 1 and 3. **Field Installation:** Yes.

Line Set Type 10A (#4784): [1200 bps Leased Duplex Data Integrated Modem] Provides for the attachment of one synchronous line capable of duplex data transmission at speeds up to 1200 bps. This LS includes one 1200 bps integrated modem. No external modem is required. This integrated modem must communicate with another 1200 bps IBM integrated modem. **Maximum, Limitations, Prerequisites:** See Figures 1 and 3 **Field Installation**: Yes.

Line Set Type 9A (#4791): [1200 bps Switched Network Line Adapter with Automatic Call Originate] Provides for the attachment of one synchronous line at a speed of 1200 bps or 600 bps. This LS includes one 1200 bps LA equipped with the Automatic Answering and Automatic Call Originate functions suitable for the automatic dialing of a remote terminal, the automatic answering of an incoming call and for communication over the Public Switched Network via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user with a similar LA (which need not be equipped with the Auto Answer and Autocall Originate features). No external modems or automatic call units are required. This integrated modem must communicate with another 1200 bps IBM integrated modem. **Maximum, Limitations and Prerequisites:** See Figures 1 and 3. **Field Installation:** Yes.

Line Interface Base Type 10 (#5000): Provides for attaching 1200 bps Integrated Modems with duplex data transmission capability. **Maximum, Limitations, Prerequisites:** See Figure 1. **Field Installation:** Yes.

Line Set Type 1N (#5655): [Nonswitched CCITT X.21 Interface] Provides for the attachment of two half-duplex data nonswitched synchronous lines, or one duplex data nonswitched synchronous line at speeds of 2400 or 4800 or 9600 or 48K bps, via a DCE complying with CCITT Recommendation X.21. Operation is allowed with either a #1642 or a #1643. Specify **#9842** for medium speed applications (2400 or 4800 or 9600 bps). Specify **#9843** for high-speed applications (48K bps). Order cable group **#1391** for duplex, or order cable group **#1392** for half-duplex (one for each LS) and order cable group **#1396** (required only one per 3705 or 3706) (Maintenance "Y" Cable). **Limitations and Maximum:** See Figures 1 and 3. **Field Installation:** Yes. **Prerequisites:** #4701 ... #4650 at 2400 bps (specify **#9610**). (This is in addition to the BMC required for all externally clocked LSs.)

Line Set Type 1R (#5656): [Switched CCITT X.21 Interface] Provides for the attachment of one duplex data switched synchronous line at speeds of 2400, or 4800, or 9600 bps, via a DCE complying with CCITT Recommendation X.21. Operation is allowed only on a CS2 (#1642). Specify **#9840** for medium-speed application (2400, 4800, or 9600 bps). Specify **#9841** for high-speed application (48K bps). Order cable group **#1391** for each LS. **Limitations:** May be installed only on a 3705-II and CS2. See Figures 1 and 3. **Maximum:** See Figures 1 and 3. **Field Installation:** Yes. **Prerequisites:** #4701 ... BMC at 2400 bps; (**#4650**, specify **#9610**) ... BMC (**#4650**) at 1/24 or less of the operating speed of the attached Data Communication Equipment; for 2400 bps specify **#2716**, or **#9604**, or **#2715**; for 4800 bps, specify **#2717**, or **#9606**, or **#2716**, or **#9604**, or **#2715**; for 9600 bps, specify **#9612**, or **#2717**, or **#9606**, or **#2716**, or **#9604**, or **#2715**; for 48K bps, specify **#9609**, or **#9608**, or **#9607**, or **#9612**, or **#2717**, or **#9606**, or **#2716**, or **#9604**, or **#2715**.

3705 Communications Controller (cont'd)

Business Machine Clock (#4650): Within each communication channel there must be a clocking mechanism to time the data rate. When this clocking mechanism is not provided by either the communication facility or the modem, then the 3705 must provide the clocking through the use of a BMC. The clock speed should match the data rate in bits per second (bps). The BMCs are contained within the CS. A clock in a CS cannot be used by communication lines attached to a different CS. Each CS1 or CS2 must have at least one BMC, with each scanner limited to a maximum of four clocks. If a CS has at least one communication line attached where either the modem or the communication facility provides the clocking, then one of the possible four clocks in the scanner must be less than one-half the speed of the lowest speed of the externally clocked line attachment. The 1N and 1R LSs each have unique internal clock requirements. See detail descriptions of these LSs for further information. All local attached terminals must have a BMC in the 3705 which matches the transmission rate (bps) of the terminal. **Note:** The BMC is assigned to a given communication line interface under the control of the program operating in the 3705. **Note:** For purposes of determining BMC requirements, LS5A, LS5B, LS6A, and LS11A, and LIB Type 7 provide "modem clocking". **Note:** CS3 must have BMC ... Specify **#9615** and may have one other clock (either specify **#9609** or **#9610**).

The following LSs must have a BMC:

Line Set 1A	**#4711**	
Line Set 1B	**#4712**	
Line Set 1C	**#4713**	
Line Set 1D	**#4714**	when used for direct attach, or start/stop.
Line Set 1F	**#4716**	
Line Set 1N	**#5655**	
Line Set 1R	**#5656**	
Line Set 2A	**#4721**	
Line Set 3A	**#4731**	
Line Set 3B	**#4732**	
Line Set 4A	**#4741**	
Line Set 4B	**#4742**	
Line Set 4C	**#4743**	
Line Set 8A	**#4781**	
Line Set 10A	**#4784**	
Line Set 8B	**#4782**	
Line Set 9A	**#4791**	
Line Set 12A	**#4785**	
Line Set 12B	**#4786**	

The following LSs may require a BMC, if the clocking is not supplied by the modem:

Line Set 1D	**#4714**
Line Set 1H	**#4718**
Line Set 1J	**#4719**

A BMC is required for each speed; specify one of the following speeds for each BMC:

Speed (bps)	Specify	Speed (bps)	Specify
45.5	**#9601**	150.0	**#9611**
50.0	**#9613**	300.0	**#9612**
56.9	**#9602**	600.0	**#9607**
74.2	**#9603**	950.0	**#9614**
75.0	**#9604**	1200.0	**#9608**
110.0	**#9605**	2000.0	**#9609**
134.5	**#9606**	2400.0	**#9610**
150,600,1200	**#9615** *		

* **Note:** #9615 is only available with #1643 and #1644, and is mandatory.

Maximum: Four with CS Type 2. Two with CS3. **Field Installation:** Yes. The above requirements for a BMC can only be satisfied by #4650. These requirements are not satisfied by #4651.

Business Machine Clock (#4651): When either #4727 or #4728 is located in a #4701, then a BMC #4651 must be added to the LIB. **Maximum:** One per 3705/ or 3706 module. **Limitations:** Must be applied to LIB 1 in position one of a 3705 or 3706 module. **Prerequisites:** #4727 or #4728 in LIB position one. **Specify: #9621** for 14.4K bps ... **#9622** for 57.6K bps.

MODEL CONVERSIONS

For an installed or on-order 3705, any required 3706(s) must be ordered on AAS. Any model change on an installed 3705, whether or not an additional 3706 is needed, must have an MES(s) entered for the model conversion on both the 3705 and any installed 3706(s). "Specify" items for voltage, color, and cabling must be included on new 3706 order(s). Also see Specify items for Address Substitution and for Communication Cable Order.

- The change from Models A, B, C, or D to models J, K, or L must be done in two stages. Order the first MES to go from A, B, C, or D to E, F, G, or H and the second MES to go from models E, F, G, or H to Models J, K, or L.
- The model designations for the 3705 and all associated frames (3706s) must be changed whenever memory is added or deleted, and whenever a frame (3706) is added or deleted.

3705 models J, K, or L are not recommended for field downgrade to 3705 models A, B, C, D, E, F, G, H and 3705 models E, F, G, or H are not recommended for field downgrade to 3705 models A, B, C or D.

ACCESSORIES

Locks and Keys: A 3705-II with Unit Protection (#8510) is shipped with two keys. Additional or replacement keys may be purchased only from IBM. A customer letter of authorization with key identification number (stamped on key) must accompany each order. Allow 6 to 7 weeks for shipment.

SUPPLIES (None)

3705-80 COMMUNICATIONS CONTROLLER

The 3705-80 is one of a series of Communications Controllers. The following is a brief summary of the Communications Controllers.

Comm Controller	Maximum Lines *	Maximum Storage	Host Program	Comm Control Program
3705-80	16 16	256K 256K	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3704	32	64K	BTAM	EP
3705-II	255 352	512K 512K	BTAM VTAM/TCAM	EP ACF/NCP-PEP
3725-1	256	1024K	VTAM/TCAM BTAM	ACF/NCP-PEP EP
3725-2	24	512K	VTAM/TCAM BTAM	ACF/NCP-PEP EP

* Maximum lines that can physically attach, CF3705 is required to predict actual line attachment capabilities.

See individual pages for each Communications Controller for information on additional features.

PURPOSE

The 3705-80 will attach to S/370, 303X or 4300 Processors for communication with local or remote I/O devices over various communication facilities. The 3705-80 will also attach to S/360 models 40, 50, 65, 67 (in 65 mode), 75 or 195 in 2701/2702/2703 Emulation mode only.

MODELS

The 3705-80 is available in sub-models to allow easy selection of a communications controller by line attachment capability.

These models are:

M81 – 4 Line Attachments of EIA RS-232-C/CCITT V.24

M82 – 10 Line Attachments of EIA RS-232-C/CCITT V.24

M83 – 16 Line Attachments of EIA RS-232-C/CCITT V.24

HIGHLIGHTS

The 3705 Communications Controller mdl 80 is designed for a user starting in communications. The 3705-80:

- Contains all the required features and functions to run duplex or half-duplex data transmission communication lines to an EIA or CCITT interface in the multiplexer; a channel adapter or RPL must be selected. Cables must be ordered separately.
- 256K bytes of storage are standard on all mdls.
- Uses ACF/NCP/VS R2.1, ACF/NCP/VS R3, NCP/VS for OS/VS with one channel adapter, or EP 3.0.
- Has a common line set for SDLC, BSC and Start/Stop protocols at line speeds up to 9600 bps for Start/Stop and 19.2K bps for SDLC and BSC.
- Provides a basic Business Machine Clock (BMC) of 134.5 bps in all mdls.
- The operator's Panel Key Lock is standard on all mdls.
- Publications: See related publications in the *Introduction to the IBM 3705-80 Communications Controller,* GA27-3004, available from Mechanicsburg.
- Provides for attachment of a duplex or half-duplex line (CCITT V.35) up to 56K bps, or
- Provides a digital interface for attachment of a duplex or half-duplex line up to 50K bps, or
- Allows for attachment of up to two switched or nonswitched CCITT X.21 lines up to 9600 bps, or
- Allows for attachment of a CCITT X.21 high-speed line up to 48K bps Auto Call Units, or
- Allows for high-speed local attachment of devices at 14.4K bps, or 57.6K bps.
- Allows for the attachment of Channel Adapter 1 (byte mode of operation).
- Allows for the attachment of one or two Channel Adapters Type 4 (cycle steal mode or byte mode of operation).
- Allows for the connection of any one of two host channels with the two-channel switch (manual operation).
- Allows for remote operation with the Remote Program Loader with or without a channel adapter.

Machine Organization: The 3705-80 provides all functions necessary to run duplex or half-duplex EIA or CCITT lines up to 9600 bps with EP, NCP or PEP; a channel adapter or RPL must be selected. Cables must be ordered separately. Major components of the 3705-80 are:

- Communications Scanner Type 2 (CS2) modified is standard in all mdls and provides for connection between the line and the Central Control Unit (CCU). The modified CS2 scans the line addresses and places the information into the CCU storage.
- 256K bytes of storage are standard in all mdls.
- Channel Adapter 1 (CA1) provides the interface between the 3705-80 and a S/370, 303X or 4300 Processor. The 3705-80 will also attach to S/360 mdls 40, 50, 65, 67 (in 65 mode), 75 or 195 in 2701/2702/2703 Emulation mode only. The CA1 communicates with the processor byte multiplexer channel. The CA1 is an optional feature. Only one can be installed per machine.
- Channel Adapter 4 (CA4) provides the interface between the 3705-80 and a S/370, 303X or 4300 Processor. The 3705-80 will also attach to S/360 mdls 40, 50, 65, 67 (in 65 mode), 75 or 195 in 2701/2702/2703 Emulation mode only. The CA4 can connect to the byte multiplexer channel (like the CA1), the block, or selector channels.
- Line sets and line attachments provide the electronics to interface to a communications facility.
- BMC provides the clocking of data in and out of the communications scanner. A BMC of 134.5 bps is included in all mdls. A total of four clocks can be included.
- Remote Program Loader (RPL) feature provides the means of loading the NCP into the 3705-80 without using the channel adapter. This is an optional feature.
- The Operator Panel Lock (Unit Protection) provides a keylock that deactivates all push buttons, mode select switches and diagnostic rotary switches on the control panel when the key is removed from the lock. Channel enable/disable, function select rotary switches and power on/off are unaffected. This is included on all mdls. For additional or replacement keys, see "Accessories".
- High-speed line attachment (19.2K bps to 57.6K bps using the CCITT V.35 or digital interface). One high-speed duplex line, or two half-duplex high-speed lines can be attached to the 3705-80. Address Substitution is used in the 3705 program for the Communications Scanner Type 2 (modified) to scan the high-speed even line addresses at a greater frequency.

  Upper Scan Limit of 16 must be used when the EIA RS-232-C/CCITT V.24 is operated at 19.2K bps to scan even and odd line addresses.

Communications Facilities: The 3705-80 operates over common carrier-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

Modems: The following modems are used with the 3705-80. These modems take advantage of the diagnostic capabilities which are contained in the Network Problem Determination Application (NPDA) Release 2 (PP 5735-XX8). The modems are:

3863-1	2400 bps	Nonswitched
3863-2	2400 bps	Switched (except in V.26bis mode)
3864-1	4800 bps	Nonswitched
3864-2	4800 bps	Switched
3865-1	9600 bps	Point-to-point, nonswitched
3865-2	9600 bps	Multipoint, nonswitched
3868-1	2400 bps	Nonswitched
3868-2	4800 bps	Nonswitched
3868-3	9600 bps	Point-to-Point, nonswitched
3868-4	9600 bps	Multipoint, nonswitched

The above modems are supported in ACF/NCP R2.1 (PP 5735-XX1).

3867 – The Link Diagnostic Unit: Allows other modems to use the diagnostic capabilities of a level of ACF/NCP R2.1 in conjunction with NPDA R2.

Other modems are:

3872	2400 bps	Switched
3872	2400 bps	Nonswitched

Non-IBM Modems may be attached subject to the Multiple Supplier Systems Bulletin.

EIA RS-232-C/CCITT V.24 Line Attachments:

Mdl M81 supports 4 Line Attachments

Mdl M82 supports 10 Line Attachments

Mdl M83 supports 16 Line Attachments

The RS-232-C/CCITT V.24 line attachments support lines up to and including 9600 bps using S/S, BSC, or SDLC line protocols. These lines can be duplex or half-duplex using the RS-232-C/CCITT V.24

3705-80 Communications Controller (cont'd)

interface. Half-duplex data transmission requires one address in EP, or NCP; synchronous duplex data transmission requires two addresses in the NCP. For duplex operation (4-wire) specify **#9711**; for half-duplex operation (2- or 4-wire) specify **#9712**.

Synchronous lines can operate at 19.2K bps using upper scan limit of 16. An upper scan limit of 16 will only scan Line Interface Addresses 20 through 2F. Other Line Interface Addresses will not be scanned.

Each specify code **#9711** will cause two line attachments to be installed as duplex and each specify code **#9712** will cause two Line Attachments to be installed as half-duplex on the initial installation of the 3705-80 to the limit of the mdl ordered. If fewer lines are specified than the mdl allows, the remaining lines will be installed as half-duplex.

To change between Duplex and Half-Duplex mode of operation, order a Record Purpose-Only MES:

- Specify **#9720** to change one or more line attachments from duplex to half-duplex.
- Specify **#9721** to change one or more line attachments from half-duplex to duplex.

The CE must be provided the MES number from the Record Purpose-Only MES, the Specify Code(s), the Line Interface Address(es) to be changed with each associated Specify Code and reference the VA000A installation instructions.

Specify Codes **#9712** and **#9711** are not recommended for field installation.

Any line attachment can connect to an external modem or directly to a device with one of the following cables. Each line attachment requires one cable.

– Attachment to one external modem requires Cable Group **#1404** for each modem.

– Direct attachment (HDX) of a device requires Cable Group:
#1399 for S/S, or
#1400 for Synchronous (SDLC & BSC)
for each device. Check clocking requirements and device requirements for each direct attachment.

For 2740 with Station Control and all other Start/Stop Directly Attached devices FE must install jumpers on the machine as defined in the installation instructions.

To change the line attachment to or from Directly Attached Start/Stop operation, order a Record Purpose-Only MES using the appropriate Specify Code for one or more line attachments as follows:

#9722	modem attach or sync direct attach	to	any S/S direct attach
#9722	2740 w/o station control direct attach	to	any other S/S direct attach
#9722	any other S/S direct attach	to	2740 w/o station control direct attach
#9723	any S/S direct attach	to	modem attach or synch direct attach

The CE must be provided the MES number from the Record Purpose-Only MES, the Specify Code(s), the Line Interface Address(es) to be changed with each associated Specify Code and reference the VA000A Installation Instructions.

Line Attachments and Line Sets: The line sets (LS) and line attachments provide the electronics to meet the requirements of specific communications facilities. The following chart indicates by model, the Line placement and mode of operation by Line Interface Address.

MODEL / LINE TYPE	MODE	20	21	22	23	24	25	26	27	28	29	2A	2B	2C	2D	2E	2F

LEGEND:

A	Denotes address used for an autocall interface.
X	Denotes a Transmit/Receive address for a half-duplex line.
.	Denotes an address not used and unavailable.
-	Denotes an address not used and available.
B	Denotes an address blocked by address substitution.
b	Denotes an address not used and available that will be blocked if address substitution used.
TR	is a Transmit Receive address used on a duplex line and uses two adjacent addresses.
T.R.	is a Transmit Receive address used on a duplex line and uses two adjacent even addresses.

To change the mode of operation of an RS-232-C/CCITT V.24 Line Attachment, a CCITT X.21 Line Attachment, or the speed of the High-Speed Direct Attachment, use a Record Purpose-Only MES for leased machines using the Specify Codes as defined in the write-ups for each of these functions. Purchased machines submit RPQs.

These mode change Specify Codes **#9720, #9721, #9722, #9723, #9724** and **#9725** can be ordered only on a Record Purpose-Only MES.

Note: Any change for an optional CCITT V.35 (Line Set 2) or digital (Line Set 3) line attachment must be ordered by MES from the factory. A Record Purpose-Only MES cannot be used.

Direct Attachment: Devices to be connected directly to the 3705-80, without modems, can do so using the EIA RS-232-C/CCITT V.24 line attachment. This line attachment will attach Start/Stop, BSC or SDLC protocols up to 2400 bps. All directly attached devices (at speeds of

3705-80 Communications Controller (cont'd)

2400 bps or less) must have a BMC and the 3705-80 must have a BMC of equal speed.

To attach a device directly to the 3705-80 requires the direct attachment cable group defined under "Line Attachments" and a BMC. The BMC in the 3705-80 must match the speed of the clock in the attached device.

Most devices that attach directly require a feature to be installed in the device. Consult the machines pages of the device for details of the features required.

High-speed Direct Attachment, Line Set 5 (#6715), allows connection of devices to the 3705-80 without modems at speeds of 14.4K bps or 57.6K bps. This LS includes a clock, which is looped out to the device and back to the 3705-80. Therefore, the device does not need a clock.

Submit an RPQ for direct attachment of terminals at 3600/7200 bps or 4800/9600 bps.

Remote Communications Controller: The 3705-80 can be used as a remote communications controller (no channel connection to a host processor). This enables the 3705-80 to become a remote concentrator with a communications link to a local 3705 or 3725 communications controller. The remote communications controller acts as an extension of the local communications controller, passing data over the communications link to the local communications controller and on to the host. For more information on the functions of a Remote Communications Controller, refer to the manual for ACF/NCP/VS.

The Remote Program Loader feature also allows for the 3705-80 to be locally attached with a channel adapter to one host, and attached remotely to another host through a local 3705 or 3725 communications controller. This allows the user to load the NCP from either source, but not at the same time.

Business Machine Clock: A BMC provides the clocking of data in and out of the Communications Scanner. A BMC of 134.5 bps is included in all mdls. Three additional BMCs can be put in the scanner. A BMC is assigned to a specific line attachment under control of the NCP, or EP. The selection of the speed of the BMC is determined with the following rules:

No Clocking in the Modems (usually 1200 bps or less), or a Directly Attached Device:

- All devices that attach to the modems without clocking must have a BMC and the 3705 must have a BMC of equal speed for speeds up to 2400 bps.
- All Directly Attached Devices must have a BMC and the 3705 must have a BMC at equal speed, when the clocking is in the scanner.

Clocking in the Modems (usually greater than 1200 bps):

- When the modem provides the clocking, then the 3705 must have a clock of less than one-half the lowest line speed attached. The BMC of 134.5 bps meets this requirement.

CCITT X.21 Additional Requirements for BMCs:

- **CCITT X.21 Switched:** A switched line must have a BMC speed of less than 1/24th of the operating line speed. At operating speeds of 4800 bps and over, the 134.5 bps basic clock will suffice. At 2400 bps a BMC of 50 bps (**#1409**) is required. A BMC with a speed of 2400 bps (**#1416**) is also required.
- **CCITT X.21 Nonswitched:** A BMC with a speed of 2400 bps (**#1416**) is required for testing. This BMC is in addition to the required BMC which is less than one-half the line speed. The Basic BMC of 134.5 bps meets the requirement of less than one-half the lowest line speed.

BMC Feature Codes:

Feature	Speed (bps)
#1409	50
#1410	110
#1413	300
#1414	600
#1415	1200
#1416	2400

An RPQ may be submitted for other speeds. **Field Installation:** Yes. **Maximum:** Four clocks per machine.

Performance: The 3705-80 is a 4-, 10- or 16-line communications controller. The following is a definition of line parameters and NCP parameters that allow 16 lines to run in the 3705-80 with a CA1. If the communications system matches these parameters, it will run. It is always advisable to run the HONE Configurator (CF3705) to get a performance analysis.

SDLC Operation:

NCP Parameters:
- Dynamic Reconfiguration
- RAS Options:
  - Address trace
  - Auto network shutdown
  - System abend
  - Channel attention delay
- 3863, 3864, 3865 Modems for LPDA
- ACF/NCP/VS R3

Line Parameters:
- Message size: 25 characters in, 256 characters out
- Half-duplex SDLC data transmission
  - (if duplex data transmission then: 16-4800 bps lines, or 8-9600 bps lines)
- Message rate: 0.782 msg/sec
- 9600 bps line speed
- 2-3270 control units per line
- 8-logical units per line
- Parameters as used in CF3705:
  - Propagation delay: 40 milliseconds
  - Number of entries in service order table: 2
  - Min. time between poll cycles: 0.5 sec.
  - Line turnaround time: 8.5 milliseconds
  - Input data per SDLC response: 1
  - Output data per SDLC response: 1
  - NCP buffer size: 240 bytes

BSC Operation:

NCP Parameters:
- Dynamic Reconfiguration
- All available RAS options
- 3863, 3864 or 3865 Modems used for LPDA
- ACF/NCP/VS R3

Line Parameters:
- Message size: 25 characters in, 256 characters out
- Half-duplex BSC operation
- Message rate: 0.782 msg/sec.
- 9600 bps line speed
- 2-3270 control units per line
- 8-logical units per line
- Parameters used in CF3705:
  - Propagation delay: 40 milliseconds
  - Number of entries in service order table: 2
  - Min. time between poll cycles: 0.0 sec.
  - Line turnaround time: 8.5 milliseconds
  - NCP buffer size: default 64 bytes

High-Speed Operation: A generalized predefinition of performance with a high-speed line (over 9600 bps) is difficult because a parameter change can cause a significant change in performance. Therefore, it is recommended that the HONE Configurator (CF3705) be used when using a high-speed attachment to predict performance of the 3705-80.

The following specific configuration will run:

SDLC with Address Substitution used. One 56K bps duplex line will run with ten 4800 bps half-duplex lines as defined above for SDLC. Other lines may run but CF3705 should be used to check this possibility.

- Message size: 2,000 characters in, 2,000 characters out.
- Messages per second: 0.875 in and out.
- Data throughput at 3,500 characters per second.
- 3705 to 3705 with virtual route pacing 1 for 6 PIUs (FID4).
- Parameters used in CF3705 as defined above except propagation delay of 20 milliseconds.

The Hone Configurator (CF3705) must be run for PEP configuration.

SPECIFY

- Voltage (AC, 3-phase, 4-wire, 60 Hz): 4.3 meter (14 feet) cable, or specify **#9986** for 1.8 meter (6 feet) cable. Specify **#9903** for 208V, **#9905** for 230V. **Field Installation:** Yes.
- Color: Specify **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunset yellow, **#9063** for classic blue, **#9064** for charcoal brown, **#9066** for pearl white. **Field Installation:** Not recommended.
- Prior to submitting an MES order, the FE Branch Manager should be consulted for any software or hardware compatibility requirements resulting from the order.
- Cables: The cables that are included in each line set are listed in the *IBM Input/Output Equipment Installation Manual - Physical Planning*, GC22-7064. These cables must be ordered separately from the 3705 machine order on a cable order.

  To obtain cables longer than 15 meters (50 feet) select the required cable below and order the cable assembly P/N and the required cable length in meters. These longer cables are ordered by P/N on an MES. The cable price includes installation charges. Maintenance charges are included in the associated Line Sets. Inquire into the QSLM file for prices.

3705-80 Communications Controller (cont'd)

To order a cable for a CCITT V.35 Interface Modem Attachment:

Duplex (Line Set 2 **#6712**)
Order cable assembly P/N **1648394**
(See Note 1)

Half-Duplex (Line Set 2 **#6712**)
Order cable assembly P/N **5997479**
(See Note 1)
To order a cable for a Autocall Originate (RS-366/CCITT V.25) Interface Attachment:

(Line Set 1E **#4715**)
Order cable assembly P/N **1753439**
(See Note 2)

Note 1: Maximum Length: 30 meters (100 feet).
Note 2: Maximum Length: 45 meters (150 feet).

To order a cable for a EIA RS-232-C/CCITT V.24 Interface Modem Attachment:

The 3705 Communications Controller can now support a cable length of up to 100 meters when connecting to a 3863, 3864, or 3865 modem or equivalent. Cable lengths up to 15 meters (50 feet) are supported when connected to any modem that complies with the EIA/CCITT Interface Specifications.

To connect a cable longer than 15 meters (50 feet) the following must be done:

1. Determine the suffix level (the two alpha characters on the date tag) of each 3863, 3864 or 3865 modem to be interconnected. If the suffix is"FG" or later, no further action is required.

2. If the suffix is"DG" or earlier:

   A 3863 or 3864 modem or a 3865 modem which does *not* have Data Multiplexer #3260 installed must have EC **344120** installed.

   A 3865 modem with Data Multiplexer #3260 installed must have EC **323406** installed.

3. Order a cable:

   Duplex or Half-Duplex Line Attachment, order cable assembly P/N 1736733.

   Maximum length is 100 meters (328 feet).

SPECIAL FEATURES

NON-COMMUNICATIONS FEATURES

Remote Program Loader (#6261): This optional feature provides the means of remotely loading the NCP. **Limitations**: One per 3705-80. Cannot exist with second #1544. **Field Installation**: Yes.

Two-Channel Switch (#8002): This optional feature will connect to two S/360, S/370, 303X or 4300 Processor channels, which may be on the same host, or on a different host. Selection of which channel is used is by a manual switch on the control panel which will enable one channel at a time. Additional channel cables must be ordered with this feature. **Limitations**: One. Cannot be installed if two CAs are installed. **Field Installation**: Yes.

COMMUNICATIONS FEATURES

Channel Adapter Type 1 (CA1) (#1551): Provides the interface between the 3705-80 and a S/370, 303X or 4300 Processor. The 3705-80 will also attach to S/360 mdls 40, 50, 65, 67 (in 65 mode), 75 or 195 in 2701/2702/2703 Emulation mode only. The CA1 communicates with the processor byte multiplexer channel with 1, 2, 3, or 4-byte transfers. **Maximum**: One. **Field Installation**: Yes.

Channel Adapter Type 4 (CA4) (#1544): Provides the interface between the 3705-80 and S/370, 303X or 4300 Processors. The 3705-80 will also attach to S/360 mdls 40, 50, 65, 67 (in 65 mode), 75 or 195 in 2701/2702/2703 in Emulation mode only. There are two modes of operation of a CA4:

1. The CA4 operates like a CA1 and transfers one, two, three, or four bytes of data on the byte multiplexer channel.

2. Cycle Steal Mode increases the throughput of the ACF/NCP/VS program product. Up to 248 bytes of data can be transferred across the block or selector channels.

Only one mode of operation can be used at any time. Maximum performance is obtained with the cycle steal mode of operation. The CA4 can connect to the byte multiplexer channel (like the CA1), the block multiplexer channel, or the selector channel. To run the emulator program, the CA4 must be attached to the byte multiplexer channel. Dual CA4s can connect to different channel types and each CA4 can operate in a different mode. **Limitations**: The first CA4 cannot exist with a #1551 and the second CA4 cannot exist with a #1551 or a #6262. **Field Installation**: Yes.

Line Set 8 (LS8) (#5657): [9600 bps CCITT X.21 Attachment] This LS provides for attachment of two duplex switched or nonswitched, or two half-duplex nonswitched synchronous lines at speeds of 2400 bps, 4800 bps or 9600 bps. For switched operation specify **#9775**; for nonswitched operation specify **#9777**. Each specify applies to the entire LS. A switched line must have a BMC at less than 1/24th of the operating line speed. Another BMC of 2400 bps (#1416) is required for testing. Cable Group **#1391** is required to attach each line. **Limitations**: One LS per machine. **Field Installation**: Yes. Use a Record Purpose-Only MES to change between switched and nonswitched operation after initial installation. **#9775** and **#9777** are not recommended for field installation; use only on initial machine order. See the beginning of this section for more detail. Switched operation requires ACF/NCP R3. LS8 cannot be installed with #6712, #6713, #6714, #6715 or #5658. Not available on mdl M83.

Line Set 9 (LS9) (#5658): [48K bps CCITT X.21 Attachment] This LS provides for attachment of one duplex switched or nonswitched, or one half-duplex nonswitched synchronous line at 48K bps. For switched operation specify **#9776**; for nonswitched operation specify **#9778**. Each specify applies to the entire LS. A switched line must have a BMC at less than 1/24th of the operating line speed. Another BMC of 2400 bps (#1416) is required for testing. Cable Group **#1391** is required to attach to each line. **Limitations**: One LS per machine. Must use Address Substitution. For a mode change, order a Record Purpose-Only MES with specify code **#9776** for a nonswitched to switched mode change or **#9778** for a switched to nonswitched mode change. The CE must be provided the MES number from the Record Purpose-Only MES, the specify code indicating the mode change being performed and to reference the VA000A installation instructions. Switched operation requires ACF/NCP R3. LS9 cannot be installed with #6712, #6713, #6714, #6715 or #5657. Not available on mdl M83. **Field Installation**: Yes.

Line Set 2 (LS2) (#6712): [56K bps CCITT V.35 Attachment] This LS provides for the attachment of one duplex, or two half-duplex synchronous lines, which have a CCITT V.35 type interface with lines speeds up to 56K bps (this includes line speeds of 19.2K bps and 48K bps). Half-duplex data transmission requires one even address in EP or NCP (adjacent odd addresses will be assigned); duplex data transmission requires two even addresses in NCP (adjacent odd addresses will be assigned). For duplex operation specify **#9713**; for half-duplex operation, specify **#9714**. Each specify applies to the entire line set. This LS in duplex mode is used with a LS 1Z in a 3705-II for direct attachment at 14.4K bps, or 57.6K bps; in half-duplex mode it connects to LS 1W. This LS also connects to #6715 in another 3705-80 in half-duplex mode. To attach this LS to an external modem requires one of the following cables: Attachment to a duplex line requires Cable Group Group **#1497** ... attachment to a half-duplex line requires Cable Group **#496** for each modem . **Limitations**: One line set per machine. Uses address Substitution. A Record Purpose-Only MES does not apply. LS2 cannot be installed with #6713, #6714, #6715, #5657, or #5658. Not available on mdl M83. **Field Installation**: Yes.

Line Set 3 (LS3) (#6713): [50K bps Digital Attachment] This LS provides for attachment of one duplex synchronous line, or two half-duplex synchronous lines which have a high-speed digital interface. This LS attaches to an external modem for speeds up to 50K bps on nonswitched, or switched wideband facilities (not program supported for switched facilities). For duplex operation, specify **#9715**; for half-duplex operation, specify **#9716**. Each specify applies to the entire LS. Half-duplex data transmission requires one even address in EP, or NCP (adjacent odd address will be assigned); duplex data transmission requires two even addresses in NCP (adjacent odd addresses will be assigned). To attach to the high-speed digital interface requires Cable Group **#489** for each modem attachment. **Limitations**: One LS per machine. Uses Address Substitution. A Record Purpose-Only MES does not apply. LS3 cannot be installed with #6712, #6714, #6715, #5657 or #5658. Not available on M83. **Field Installation**: Yes.

Line Set 4 (LS4) (#6714): [Auto Call Attachment] This LS supports four RS-366-A/CCITT V.25 interfaces for attachment of external automatic calling units. Each auto call unit works with an EIA RS-232-C/CCITT V.24 line attachment. Two Cable Groups #486 to connect to four External Auto Call Units are required. **Limitations**: One LS per machine. LS4 cannot be installed with #6712, #6713, #6715, #5657, or #5658. Not available on mdl M83. **Field Installation**: Yes.

Line Set 5 (LS5) (#6715): [57.6K bps Direct Attachment CCITT V.35] This LS provides for local attachment of two half-duplex synchronous devices which have a CCITT V.35 interface. Clocking is provided. Specify **#9832** for 57.6K bps or **#9830** for 14.4K bps. The attached device must be set for external clock control. The total cable length must not exceed 60 meters (200 feet) at 14.4K bps operation, and 30 meters (100 feet) at 57.6K bps operation. The total length includes the attached device cable length. Each specify applies to the entire LS. This LS can connect to a LS 2 in another 3705-80 in half-duplex mode. Cable Group **#1394** is required to attach each device. **Limitations**: One LS per machine. Uses Address Substitution. For a speed change, order a Record Purpose-Only MES with specify code **#9832** for a 14.4K bps to 57.6K bps, or **#9830** for a 57.6K bps to 14.4K bps. The CE must be provided the MES number from the Record Purpose-Only MES, the

3705-80 Communications Controller (cont'd)

specify code indicating the speed change and to reference the VA000A installation instructions. LS5 cannot be installed with #6712, #6713, #6714, #5657, or #5658. Not available with mdl M83. **Field Installation:** Yes.

CCITT X.21 Line Attachments: **#9775** and **#9777** are not recommended for field installation. To change the mode of operation between switched or nonswitched operation on CCITT X.21 lines, order a Record Purpose-Only MES: Specify **#9724** to change one or more line attachments from nonswitched to switched. Specify **#9725** to change one or more line attachments from switched to nonswitched. The CE must be provided the MES number from the Record Purpose-Only MES, the specify code(s), and the Line Interface Address(es) to be changed with each associated Specify Code, and reference the VA000A installation instructions.

MODEL CONVERSIONS

The following 3705-80 model conversions are field installable. Other model conversions are not recommended.

Models	Conversion Time
M81 to M82	5.9 hours
M82 to M83	3.4 hours
M81 to M83	7.9 hours

- **EIA RS-232-C/CCITT V.24:** All Line Attachments will be shipped in half-duplex mode on model conversions. Do not use specify codes **#9711** or **#9712**.
- **CCITT X.21:** Line Attachments will be shipped in switched mode on model conversions. Do not use specify codes **#9775** or **#9777**.

ACCESSORIES

Keys: The 3705-80 with Operator Panel Lock is shipped with two keys. Additional or replacement keys may be purchased only from IBM. A customer letter of authorization with key identification number (stamped on key) must accompany each order. Allow 6 to 7 weeks for shipment.

SUPPLIES (None)

3715 PRINTER

PURPOSE

The 3715 is a printer for all models of the 3741.

MODELS

Model 1 001 40 cps printing rate in both directions

Model 2 002 80 cps printing rate in both directions

Prerequisites: #8111 and #8120 or #8121 on the 3741.

HIGHLIGHTS

The 3715 prints serially in both left-to-right and right-to-left directions using the EBCDIC character set. The maximum print line is 132 print positions at 10 characters per inch spacing. Line spacing is six lines per inch.

Reformatting, editing, disk read, line feed, and printed line length are factors which affect printer throughput. For detail calculation of performance, refer to *3741 Reference Manual* (GA21-9183). In most cases, throughput can be summarized as follows: the 3715 mdl 1 is equal to or faster than the 3713 Printer, and the 3715 mdl 2 is approximately 50 percent faster than the 3715 mdl 1.

When using the 3741 mdls 3 or 4 ACL Translator (#1350), the 3715 mdl 2 is recommended in order to obtain equal or greater throughput than the 3713.

The unit has a pressure-feed platen that permits feeding of forms in a range of 3 to 14-7/8 inches overall width. Continuous forms fold-to-fold length may range from 3 to 14 inches. Edge-punched continuous forms are fed using the adjustable forms tractor, which is standard.

Matrix characters are formed by seven vertical wires printing dots in up to four of seven possible horizontal positions. Refer to *Form-Design Printers Reference Guide* (GA24-3488) for design considerations and limitations. Up to 6-part forms can be printed with a maximum thickness of .018 inches. 5- and 6-part forms should be tried for satisfactory feeding, print registration, and print quality. Card stock continuous forms are not recommended. For optimum handling of continuous forms, the Forms Stand (**#4450**) is recommended.

Publications: *IBM Data Station Operator Guide* (GA21-9131) and *IBM 3741 Data Station Reference Manual* (GA21-9183).

SPECIFY

- Power: Power is supplied to the 3715 by the attaching 3741, no specify required.
- Color: Specify **#9041** for red, **#9042** for yellow, **#9043** for blue, or **#9045** for gray.

SPECIAL FEATURES (None)

MODEL CONVERSIONS

Model conversions are field installable.

ACCESSORIES

Forms Stand (#4450): Permits feeding of continuous forms from the carton and provides for forms stacking after printing. This accessory is a one-shelf forms stand.

SUPPLIES

Ribbons: A black ribbon, P/N 1136653 or equivalent, is required.

3717 PRINTER

PURPOSE

The 3717 is a printer for all models of the 3741.

MODELS

Model 1 001

Field Installation: Not recommended.

Prerequisites: #8122 on 3741 mdls 1 and 3, #8123 on 3741 mdls 2 and 4.

HIGHLIGHTS

The 3717 is a line printer with speeds of up to 155 lines per minute with a 48-character set or up to 120 lines per minute with an optional 64-character set. The maximum print line is 132 print positions at 10 characters per inch spacing. Line spacing is six lines per inch.

The unit has left- and right-adjustable forms tractors which hold overall forms widths from 3-1/2 to 14-7/8 inches. Continuous forms fold-to-fold length may range from 3 to 14 inches.

Up to 6-part forms can be printed with a maximum thickness of .02 inches. Card stock continuous forms are not recommended. Refer to *Form-Design Printers Reference Guide* (GA24-3488) for forms design considerations and limitations.

Publications: *IBM 3741 Data Station Operator Guide* (GA21-9131), and *IBM 3741 Data Station Reference Manual* (GA21-9183).

SPECIFY

- Voltage (AC, 60 Hz, 1-phase): Specify **#9901** for 115V, **#9902** for 208V, or **#9904** for 230V. Voltage must be consistent with system voltage.
- Color: Specify **#9041** for red, **#9042** for yellow, **#9043** for blue, or **#9045** for gray.
- Print Belt: Specify one: **#9496** for 64-character EBCDIC or **#9497** for 48-character EBCDIC. **Note:** **#9496** should be specified if printing of application control language source listings is required.

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES

Forms Stand (#4450): Permits feeding of continuous forms from the carton and provides for forms stacking after printing. This accessory is a one-shelf forms stand, and is recommended for optimum handling of continuous forms.

Print Belt, Add'l: Permits the customer to obtain more than one character set print belt for various applications. Order **#5910** for 64-character EBCDIC and **#5911** for 48-character EBCDIC. **Field Installation:** Yes.

SUPPLIES

Ribbons: A black ribbon, P/N 1136634 or equivalent, is required.

3725 COMMUNICATION CONTROLLER MDL 1

PURPOSE

The 3725 Model 1 controls data communications between modem-attached or directly-attached (without a modem) terminal devices and one or more directly- or remotely-connected S/370 (except mdls 115 and 125), 303X, 308X, 43XX host processors, or between two host processors. Remote connection may be via common carrier-provided or customer-owned communication facilities. The 3725 mdl 1 is the base machine. An optional 3726 provides additional line and channel attachment capability. A 3727 console is required for installation, operation, and maintenance.

The following is a brief summary of the 3725 Communication Controllers:

Communic. Controller	Max Lines*	Max Storage	Host Program	Comm Control Program
3725 Model 1	256	2M	VTAM/TCAM	ACF/NCP-PEP
	256	1M	BTAM	EP
3725 Model 2	24	512K	VTAM/TCAM	ACF/NCP-PEP
	24	512K	BTAM	EP

* Maximum lines that can physically attach, CF3725 is required to predict actual line attachment capabilities

See individual pages for each Communication Controller for information on additional features.

MODELS

Model 1 001

Prerequisites: If channel-attached, the 3725 requires a control unit position on a system channel. See processor pages for details. When attaching to a a 4321 or 4331 in EP mode, restrictions are imposed on the number of available subchannels which may be used by the 3725.

HIGHLIGHTS

The 3725 is a modular, programmable communication controller, which runs under the control of:

- Either ACF/NCP Version 2 for the 3725 or EP/3725 R1 or both in PEP mode.
- Or ACF/NCP Version 3 or EP/3725 R2 or both in PEP mode. (See Program Products and SCP sections for details.)

Its programmability allows a high degree of flexibility in tailoring a data communications system to the customer's requirements. In addition, it plays an active role in Communications Network Management (CNM) by providing data to the Network Communications Control Facility (NCCF) and the Network Problem Determination Application (NPDA).

The machine structure is simplified by having a small number of features: Five types of line interfaces, one storage feature, one type of communication scanner and one type of channel adapter. This allows easy additions and changes to the machine configuration.

Characteristics of the 3725 include:

- LSI technology for better RAS characteristics, lower power consumption, and less floor space than previous communication controllers.
- Increased internal performance (compared to the 3705-II) for high-speed lines and large networks.
- Attachment of high-speed lines which use the modulo 128 function of ACF/NCP for INN links.
- 512K bytes up to 2M bytes of main storage, by 256K byte increments, to accommodate larger networks and higher speed lines.
- Maintenance and Operator Subsystem (MOSS) a functionally separate processor facilitates maintenance and problem determination by providing:
  - box error logging
  - alert mechanisms
  - display of machine status
  - diagnostics for the Central Control Unit (CCU), channel adapters, scanners and line interfaces
  - utilities to:
    - collect microcode dumps and send them to the host for printing
    - provide actual configuration data, help the customer to plan for MES, and store this information on the MOSS diskette via the Graphic Configuration File for further console display or update. This information can be transferred to the host where the machine diagram can be printed by ACF/SSP
    - allow the operator to keep a current Line Description File, providing the physical address, symbolic name, speed, and protocol of each connected line. This file, stored on the MOSS diskette, may be transferred to the host and printed by ACF/SSP.
- Improved RAS Characteristics:
  - Reliability and availability of the 3725 are enhanced by the following elements:
    - Extensive error detection, including storage protection against inadvertent overlays.
    - Functional building block design (most adapter errors are contained within a single building block and thus will not take the system down)
    - Error correcting code for the main storage and scanner storage
    - Error by-pass facilities: Microcode re-IPLs, system re-IPLs and dynamic reconfiguration of SNA resources
    - Automatic first-level problem determination with alert messages, which report hardware errors to the network operator and recommend actions
    - Enhanced problem determination aids
    - Automatic power-on when power returns after loss
    - Port Swapping which allows the operator to logically swap a line from a failing port to a spare port without involvement of of the host processor.
  - Serviceability of the 3725 is improved by:
    - Many host-independent functions for installation and maintenance
    - Error information logging/retrieval
    - Diagnostics and trouble shooting facilities
    - Concurrent maintenance for MOSS diskette drive and console.
- Network Management and Problem Determination: Considerable function has been designed into this communication controller to provide maximum availability to the customer. The 3725 MOSS provides problem determination and recovery procedures that are designed to be easily understood and used by the operator e.g.:
  - Stand Alone Link Test facility to test an SDLC Communication link attaching another 3725 or 3705, without involvement of a host or a control program.
  - Line Interface Display to monitor at the console the status of most of the control leads on a line interface.

  The 3725 supports IBM's CNM (Communications Network Management) direction by sending error related information to the Network Problem Determination Application (NPDA) running in a host processor under the support of the Network Communications Control Facility (NCCF). This enhanced CNM support provides better problem determination in SNA networks. The basic NCP problem determination functions (alerts) are also offered in the non-NPDA environment, but they are not available in EP mode.
- Attachment of up to 96 lines to the 3725: Addition of the 3726 to the 3725 expands this capability to 256 lines, either duplex or half-duplex. Actual capacity of the system in operation may be less than the maximum physical line attachment capability.
- One or two channel adapters in the 3725 to connect to the byte multiplexer, block multiplexer or selector channels of host processors. Four more channel adapters can be installed in the 3726.
- Configuration Aids: The HONE Configurator CF3725 and the *Configuration Guide*, SA33-0012, are available to IBM representatives to assist in configuring a 3725 to specific network requirements. The CF3725 configurator provides configurations with feature and specify codes, cable lists as well as storage and performance estimates. In CF3725 a number of sample configurations are also available for guidance.

Machine Organization: The 3725 mdl 1 contains:

Central Control Unit: Executes instructions to control communication scanners and channel adapters. The CCU runs under the control of ACF/NCP for the 3725, EP/3725 or both in PEP mode.

Main Storage: Houses a 3725 network control program (NCP, EP, PEP) and other program products loaded from the host processor and provides buffers for the data exchanged with the channel adapters and the lines. The base machine includes 512K bytes of storage as standard.

Maintenance and Operator Subsystem (MOSS): Provides IPL and utility procedures for the 3725 mdl 1 operator. It includes an independent processor with its microcode, a diskette drive and an attachment for the operator console.

Two Line Attachment Bases: They are called CLABs. Each CLAB has one communication scanner and can attach up to 32 duplex or half-duplex communication lines via optional Line Interface Couplers (LICs).

Transmission Subsystem (TSS): Provides the physical connection to communication facilities. It consists of Line Attachment Bases (LABs) with microprocessor based scanners, Line Interface Couplers (LICs) and optional Internal Clock Controls (ICCs). Integrated DCEs (modems) are not available for the 3725 and 3726.

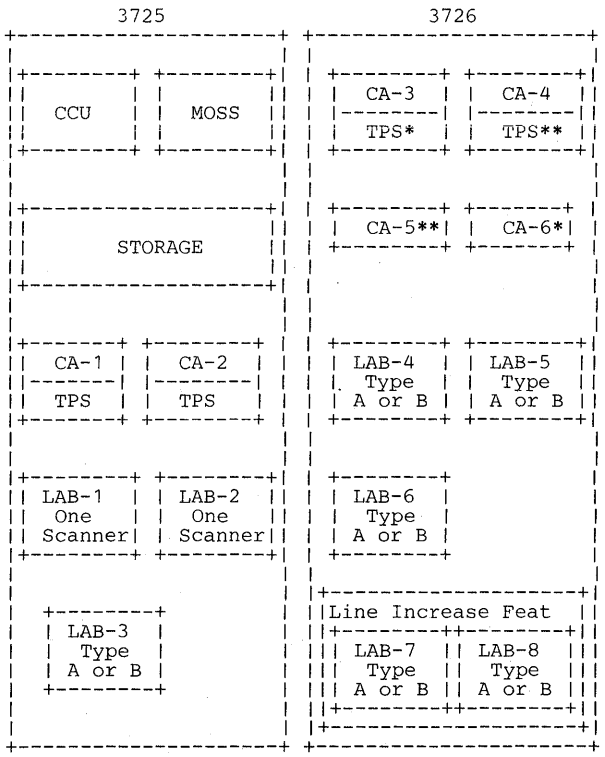
3725 Communication Controller Mdl 1 (cont'd)

The 3725 mdl 1 may also contain:

Channel Adapters (CAs): Provide physical connection to host channels. An optional two processor switch allows a channel adapter to be attached to two processor channels, with non-simultaneous communication. The base machine provides a physical base for two Channel Adapters and two Two-Processor Switches.

Expansion: One 3726 Communication Controller Expansion may be connected to the 3725 mdl 1. The 3726 allows attachment of up to 160 additional lines and/or up to four additional single channel adapters or two additional channel adapters equipped with Two-Processor Switches. See M3726 pages for additional information.

Console: The 3725 mdl 1 requires a primary 3727 Operator Console for installation, operation and maintenance; see M3727 pages for details. A second 3727 Operator Console may be used as an alternate operator console. The operator consoles are directly attached, i.e., no DCEs (modems) are required. Only one operator console is active at a given time. The active console is selected by a switch on the 3725 mdl 1 control panel. See "Service Requirements" for additional information.



Note: The numeric suffixes indicate positions, e.g. LAB-3 means LAB in position 3. LAB-1 and LAB-2 are standard in the base 3725.

* exclusive
** exclusive

Position Numbering: Channel Adapter and LAB positions are numbered sequentially through both the 3725 and the 3726. Thus Channel Adapter positions 1 and 2 are in the 3725 and Channel Adapter positions 3 through 6 are in the 3726. Similarly LAB positions 1,2 and 3 are in the 3725 and LAB positions 4 through 8 are in the 3726. See figure above.

Customer Responsibilities: See M2700 pages. Also see EP and NCP Programming pages for attachment capability.

Communications Facilities: The 3725 operates over common carrier-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

Remote Communication Controller: The 3725 can be used without channel connection to a host processor. Such a 3725 is termed "link-attached" and is connected via one or more communication links to channel-attached 3705s and/or 3725s. A link-attached controller has the same networking capabilities as a channel-attached one. Link attachment is a standard capability of the 3725; no special feature is needed.

For more information on the functions of a link-attached Communication Controller, see the Advanced Communications Functions for NCP (ACF/NCP) in the Program Products section.

Service Requirements: The 3725 requires a local (primary) 3727 Operator Console as the console for operation, as well as for installation and maintenance. Maximum distance is 7.5 meters (25 feet).

The 7427 Console Switching Unit (Special Product provided by RPQ 8J5008) offers the capability to allow up to four 3725 machines to share a single primary operator console.

Service limitations are: A primary console is required for maintenance and must be available whenever service is to be performed. There must be no obstructing wall or door between the primary console and any attached 3725. The primary console must be available for maintenance personnel when called for servicing a 3725 or 3726.

Data Communication Equipment:

Modems: The following modems or units may be used with the 3725:

3863 mdl 1/2	2400 bps	
3864 mdl 1/2	4800 bps	
3865 mdl 1/2	9600 bps	
3867	2400 to 9600 bps	Link Diag Unit
3868 mdl 1	2400 bps	
3868 mdl 2	4800 bps	
3868 mdl 3/4	9600 bps	
3872	2400 bps	
3874	4800 bps	

Public Data Networks: Public Data Networks are attached as listed in the charts of the M2700 pages.

Non-IBM DCEs: Non-IBM DCEs complying with EIA RS-232-C, CCITT Recommendations V.24/V.28, V.35 or X.21 may be attached under the provisions of the IBM Multiple Supplier Systems Bulletin.

Automatic Calling Equipment: Automatic calling equipment which comply with EIA RS-366 or CCITT Recommendation V.25 may be attached under the provisions of the IBM Multiple Supplier Systems Policy.

Data Encryption Equipment: The following devices may be attached to the 3725: 3845 Data Encryption Device ... 3846 Data Encryption Device

Configuring and Ordering Procedures:

- For a new machine:

  A new machine must be configured with the aid of the HONE Configurator CF3725, or the *Manual Configuration Guide,* SA33-0012. Either procedure yields a list of feature codes and specify codes, which is used to order the machine, and a pictorial diagram showing the positions of the LABs, LICs and ICCs. A copy of this diagram should be given to the customer, as it will be needed when the NCP or EP is generated. At order confirmation time, the machine configuration must be verified by the configurator CF3725. A copy of the CF3725 output must be given to CE, as it will be needed to order and install the DCE and other communication cables.

  Approximately 30 days before the machine is to be shipped, the plant will send a similar pictorial diagram to the branch office. It will include two more copies of this diagram with the machine documentation. One of these should be given to the customer, the other to CE.

  A similar pictorial diagram, called the Graphic Configuration File, is stored on the MOSS diskette. Most of this file is generated by the 3725, but the customer is responsible for adding the LIC weights (see Transmission Subsystem for description of LIC weights) and for keeping them up to date when line protocols or speeds are changed. This information is required for subsequent MES orders.

  A 3727 console must be ordered for each 3725, unless the 3725 is to share a console via the 7427 Console Switching Unit (RPQ 8J5008).

- For an MES:

  From the Graphic Configuration file stored on the MOSS diskette, a diagram of the actual machine configuration is obtained on the host printer. The HONE Configurator or the *Configurator Guide* and this diagram of the machine may be used to configure the MES. This procedure yields a list of feature codes and specify codes (including LIC weights), which is used to order the MES, and an updated pictorial diagram of the LABs, LICs and ICCs. A copy of the updated configuration on the Graphic Configuration printout marked with the MES order number must be sent by the marketing representative to the servicing branch office for use by the CE detailing plugging information for installation planning purposes. This updated configuration is required by the CE as it provides the only source of internal machine feature location and plugging information for the LICs and ICCs.

  To assist the customer and CE the MES number for the ordered LICs and ICCs as well as the LIC types and weights should be entered in the Graphic Configuration File when the MES is ordered.

3725 Communication Controller Mdl 1 (cont'd)

After installation of the MES, the CE verifies that the LICs and their weights in the Graphic Configuration File are consistent with the installation.

- For cables:

  External cables, except the cable for the primary console, are ordered via AAS . Cables for the 3726 Communication Controller Expansion must be ordered with the 3726.(Canada, Latin America, Taiwan) IBM supplies LIC cables and alternate console cable at standard length, 13.5 meter (45 feet) long, except for direct attached DTEs on LIC4A, LIC4B where the standard length is 30 meter (100 feet): order the corresponding cable group as defined in the IMPP. For shorter cables, or for the alternate operator console cable up to 20 meter (64 feet) long or for channel cables, order the corresponding cable group at the specified length as defined in the IMPP. For longer cables, order cables by P/N at the specified length on an MES. These cables include installation charges. Maintenance charges are included in the associated Line Sets. Inquire into the QSLM file for prices.

The primary operator console is installed with a attachment cable of 7.5 meters (25 feet) maximum, which is included in the shipping group of the 3725. For the Alternate Operator Console, IBM supplies a cable of up to 20 meters (65 feet) . This cable is obtained by ordering cable group **#0099**. Additional length up to 150 meters (490 feet) may be ordered by RPQ.

Channel Adapters: The 3725/3726 Channel Adapter attaches to a host channel to provide communications with S/370 (except mdls 115 and 125), 303X, 308X, 43XX Processors.

A Two-Processor Switch allows a Channel Adapter to be connected to two processor channels instead of one. The channels may belong to the same or different processors. Data transfers occur on only one channel interface at a time. Manual switches on the 3725 control panel allow the user to enable both channel interfaces, one interface or the other, or neither interface. In the case where both interfaces are enabled, the processors are responsible for resolving any contention, since only one interface can transfer data at a time. In this mode the TPS provides functions comparable to the 3705 CA Type 3.

The Channel Adapters must occupy contiguous positions beginning with position 1. This means that two Channel Adapters must be installed in the 3725 before any may be installed in the 3726. A Two-Processor Switch will always be installed in the first available position.

Transmission Subsystem (TSS): The Transmission Subsystem consists of Line Attachment Bases (LAB), Line Interface Couplers and Internal Clock Controls. Three types of LABs are available: LABs Type A, LABs Type B and CLABs. LABs Type A and CLABs provide one communication scanner and LABs Type B provide two communication scanners. Two CLABs are included in the base machine. They are not provided as optional features. Optionally an additional LAB of either type A or B may be installed in the 3725.

The microprocessor based communication scanner serializes and de-serializes the data, supports various line protocols and provides character buffering and cycle steal transfer into the 3725 main storage. The scanner supports BSC (EBCDIC, ASCII) and SDLC in normal mode or block mode, i.e., in a mode of operation similar to the one of Scanner Type 3 of the 3705. Asynchronous protocols with 5 to 8 data bits and 1 or 2 stop bits are supported in "character mode" with EP/3725 R1 and ACF/NCP V2, i.e. in a mode of operation similar to the one of Scanner Type 2 of the 3705. They are also supported in "enhanced mode" with EP/3725 R2 and ACF/NCP V3. BSC tributary operation (EP or PEP) is supported in "character mode" at speeds up to 1200 bps with EP/3725 R1. It is also supported in normal mode at speeds up to 64k bps with EP/3725 R2. In addition, the scanner supports procedures for automatic calling units and X.21 native, X.21bis and X.20bis. It handles a variable number of lines depending on the protocol and the transmission speed.

Line Interface Couplers (LIC) provide the functions necessary to attach the external communications facilities and Data Terminal Equipment (DTEs). DTEs are attached to the 3725 either directly or via DCEs. The type of LIC to use depends on the physical interface presented by the DCE, not on the protocol transmitted through the port. For example, provided that the corresponding software is available in the 3725, X.25 packet switching may be supported through LIC Type 1, LIC Type 3, LIC Type 4A or LIC Type 4B, whichever is matching the physical interface presented by the X.25 network. According to its type a LIC attaches one or up to four duplex or half-duplex lines. Up to 8 LICs can be installed on a Line Attachment Base (LAB), for a maximum of 32 lines per LAB.

Each LIC is assigned a scanner "weight", which is the percentage of scanner capacity consumed by the lines attached to that LIC. This weight depends upon the speeds and protocols of the lines. The specific values for each case are given in Tables 1 through 4B. The total load put on a scanner must not exceed 100 percent. To build the machine correctly, the plant must know the weights of the ordered LICs. These weights are conveyed to the plant by including the corresponding specify codes in the order.

Refer to the *3725 Configuration Guide,* SA33-0012, for detailed explanations of the configuration rules used on the TSS.

Internal Clock Control features are required to attach devices which are not clocked by a DCE, such as asynchronous terminals and directly attached synchronous terminals.

Performance: The maximum number of lines capable of concurrent operation is a function of line speed, line protocols, the 3725 control program installed and the application work load. The number of lines which can be physically installed may exceed the operational capability. Analysis should be performed to determine the operational limits in the customer's situation. The HONE Configurator CF3725 should be used to perform such an analysis.

Direct Attachment: The 3725 allows direct, i.e. modemless, attachment of Data Terminal Equipment (DTE) using LIC-1, LIC-3, LIC-4A or LIC-4B and the corresponding direct attachment cable. LIC-1 attaches devices using asynchronous (start/stop) protocols at speeds up to 1200 bps (9600 bps if they use external clocking) or devices using synchronous protocols (BSC or SDLC) at speeds up to 19.2K bps. LIC-3 attaches devices using BSC and SDLC protocols at speeds up to 56K bps. LIC-4A attaches devices using SDLC protocols at speeds up to 9600 bps. LIC-4B attaches devices using SDLC protocols at speeds up to 56K bps.

Directly-attached DTEs require the ICC feature in the 3725. At speeds of up to 1200 bps, the speed is set at the time of control program generation and must match that of the DTE's internal clock. At speeds above 1200 bps, the DTE must use external clocking (provided by the 3725) and the speed is set by hardware in the 3725. At the plant the speed will be set to 9600 bps. At installation time, it may be changed by the CE on a per-LIC basis to 2400, 4800, 19.2K or 56K bps.

For information on the available direct attachment cable types and lengths, refer to the *Installation and Physical Planning Manual,* GC22-7064.

Bibliography: GC20-0001

SPECIFY

The voltage and color specify codes are not recommended for field installation. Specify codes may not be necessary to order a 3725, if the default options specified below are satisfactory.

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Voltage default option is 208V. Specify **#9914** for 240V. If the 4.3 meter (14 foot) power cable is not desired, specify **#9986** for a 1.8 meter (6 foot) power cable.
- Color: The standard color is pearl white .
  For other colors, specify **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue , **#9064** for charcoal brown, **#9065** for pebble gray .

SPECIAL FEATURES

NON-COMMUNICATIONS FEATURES

Storage Increment 256K (#7100): Provides main storage increments of 256K bytes to allow up to two megabytes of memory. **Maximum:** Six per 3725. **Field Installation:** Yes.

Two-Processor Switch (#8320): Provides a second channel interface to attach CA #1561 to a Multiprocessor System (MP) or to two channels of the same or different processors. One or both channel interfaces are enabled by a manual switch on the 3725 control panel. The enabled channel interface is operational when selected by the host channel. Data transfer cannot occur concurrently on both channel interfaces. Order channel cable groups #3920 and #1178 with this feature. **Maximum:** Two per 3725. **Prerequisites:** #1561 in the corresponding position. **Field Installation:** Yes.

COMMUNICATIONS FEATURES

Channel Adapter (#1561): Provides the logical and physical interface between a 3725 and a S/370 (except mdls 115 and 125), 303X, 308X, 43XX processor. It attaches to a byte multiplexer, block multiplexer or selector channel. Each one may be equipped with a Two-Processor Switch (TPS). With this feature order channel cable groups #3920 and, if required, #1178. **Maximum:** Two per 3725. The possible combinations of CAs and TPSs are:

Number of CA	CA Position	TPS Position
0	–	–
1	1	1
2	1,2	1,2

Prerequisites: None. **Field Installation:** Yes.

Internal Clock Control (#4666): Provides bit clocking when the attached external DCE does not provide this clocking, or when direct attachment of the DTE is required. It provides clocking for eight LICs (up to 32 lines) at 50, 110, 134.5, 200, 300, 600 and 1200 bps for operation with or without a DCE and at speeds of 2400, 4800, 9600, 19K and 56K bps for operation without a DCE (direct attachment). At

3725 Communication Controller Mdl 1 (cont'd)

speeds up to 1200 bps, the speed is set at the time of control program generation and must match that of the internal clock of the attached DTE. At speeds above 1200 bps, the DTE must use external clocking (provided by the 3725) and the speed is set by hardware in the 3725. At the plant the speed will be set to 9600 bps. At installation time, it may be changed by the CE on a per LIC basis to 2400, 4800, 19K or 56K bps. **Maximum:** Two per base machine plus one per LAB Type A or Type B. **Field Installation:** Yes.

Line Attachment Base Type A (#4771): Provides a communication scanner and a physical base for up to eight LICs Type 1 (#4911) or Type 4A (#4941). **Limitations:** The sum of LIC weights must not exceed 100. Except by MES, only LICs with weight 12 or 18 may be installed on the LAB Type A. Exclusive with LAB Type B (#4772). **Maximum:** One per 3725. **Prerequisites:** Specify **#9671** only to order a LAB Type A without any associated LIC. **Field Installation:** Yes.

Line Attachment Base Type B (#4772): Provides two communication scanners and a physical base for up to eight LICs Type 1 (#4911), Type 2 (#4921), Type 3 (#4931), Type 4A (#4941) or Type 4B (#4942). Each scanner controls up to four LICs. **Limitations:** The sum of the four LIC weights attached to one communication scanner must not exceed 100. Exclusive with LAB Type A (#4771). **Maximum:** One per 3725. **Prerequisites:** Specify **#9672** only to order a LAB Type B without any associated LIC. **Field Installation:** Yes.

Line Interface Coupler Type 1 (#4911): Provides four EIA RS-232-C/CCITT V.24 interfaces for communication lines operating at transmission speeds up to 19.2K bps. The lines may be used either for duplex or half-duplex data transmission. LIC Type 1 provides direct (modemless) attachment of synchronous DTEs at 2400, 4800, 9600 or 19.2K bps and of externally clocked start stop DTE's at 2400, 4800 and 9600 bps, if it is associated with an ICC. The DTEs attached directly to a given LIC must operate at the same speed. In addition, direct attachment of asynchronous devices is provided at speeds up to 1200 bps.

LIC 1 provides modem attachment of asynchronous devices (not clocked by the DCE) at speeds up to 1200 bps, if it is associated with an ICC. The asynchronous DTE's using DCE clocking can also be attached at speeds above 1200 bps and up to 9600 bps, without associated ICC.

Depending on the options chosen at the generation of the control program, each port of LIC Type 1 can support one of the following interfaces:

Duplex or half-duplex EIA RS 232/CCITT V.24 at speeds up to 19.2K bps
EIA RS-366/CCITT V.25 Autocall Equipment
X.21bis
X.20bis

Cables: For each LIC type 1, four cables for DCE, autocall equipment and/or direct attachment must be ordered. Order cable group **#1404** for DCE attachment, cable group **#0082** for attachment to automatic calling units cable group **#0085** for direct attachment of 3101 and TTY 33/35, or cable group **#1400** for direct attachment of other DTEs.

EIA RS-232-C/CCITT V.24 Interface Modem Attachment:

The LIC Type 1 (#4911) can support a cable length of up to 100 meters when connecting to a 3863, 3864 or 3865 modem or equivalent. Cable lengths up to 35 meters (115 feet) are supported when connected to any modem that complies with the EIA/CCITT Interface Specifications. To connect a cable longer than 35 meters (115 feet) the following must be done:

1. Determine the suffix level (the two alpha characters on the date tag) of each 3863, 3864 or 3865 modem to be interconnected. If the suffix is "FG" or later, no further action is required.
2. If the suffix is "DG" or earlier: A 3863 or 3864 or 3865 modem which does *not* have Data Multiplexer #3260 installed must have EC **344120** installed ... a 3865 modem with Data Multiplexer #3260 installed must have EC **323406** installed.
3. Order the cable: See "Ordering Procedures".

Limitations: If the transmission speed of any of the lines connected to a communication scanner exceeds 9600 bps, the maximum number of LICs for that scanner is 4. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** 16 per basic 3725, plus eight additional per LAB Type A (#4771) or Type B (#4772). **Prerequisites:** LAB Type A (#4771) or Type B (#4772) in LAB position 3. An ICC on the same LAB, if direct attachment is required or if DCE does not provide clocking. **Specify:** LIC weights in accordance with Table 1. **Field Installation:** Yes.

Table 1: LIC Type 1 Weight Specify Codes

Line Control		Transmission Speed (bps) LT/EQ	LIC Weight	...Specify Code... no ICC req'd	ICC req'd
- ACF/NCP 3725 or EP/3725, except EP/3725 R1 for BSC tributary operation					
AUTOCALL		N/A	12	**#9101**	N/A

	EBCDIC ASCII	19200 19200	50	**#9103**	**#9123**
SDLC	HDX DX	9600 4800	12	**#9101**	**#9121**
	DX	9600	25	**#9102**	**#9122**
	DX HDX	19200 19200	50	**#9103**	**#9123**
- EP/3725 R1, for BSC tributary operation					
	Ch Mode	1200	42	N/A	**#9113**
- ACF/NCP 3725 and EP/3725, except ACF/NCP V2 and EP/3725 R1.(Speeds above 1200 bps are supported only for externally clocked DTEs.)					
S/S(*)		1200(1)	12	N/A	**#9121**
		2400(1)	25	**#9102**	**#9122**
		4800(1)	50	**#9103**	**#9123**
		9600(1)	100	**#9104**	**#9124**
- ACF/NCP V2 and EP/3725 R1					
S/S		300	12	N/A	**#9121**
Ch Mode		600	18	N/A	**#9111**
		1200	37	N/A	**#9112**

* Weights and specify codes apply to most commonly used DTE's, i.e. those DTE's using transmission codes with at least 10 bits per character (start, data/parity, stop(s)) like ASCII. DTE's using transmission codes with less than 10 bits per character (start, data/parity, stop(s)), are also supported at speeds up to 600 bps.

Line Interface Coupler Type 2 (#4921): Provides attachment for one communication line at speeds up to 230.4K bps. LIC Type 2 supports either duplex or half-duplex data transmission. It has a digital interface for attachment to a nonswitched "wideband" Type 8751, 8801 or 8803 Service. **Cables:** For each LIC type 2 order one cable group **#0086**. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths. **Limitations:** When an LIC Type 2 is installed on a communication scanner, the maximum number of LICs for that scanner is 4. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Eight per basic 3725, plus eight additional per LAB Type B (#4772). **Prerequisites:** LAB Type B (#4772) for LICs in LAB position 3. **Specify:** LIC weights in accordance with Table 2. **Field Installation:** Yes.

Table 2: LIC Type 2 Weight Specify Codes

Line Control		Transmission Speed (bps) LT/EQ	LIC Weight	Specify Code
BSC (See Note)	EBCDIC	64000	25	**#9201**
	ASCII	32000		
	ASCII	64000	42	**#9202**
SDLC	HDX DX	64000 32000	25	**#9201**
	DX	64000	42	**#9202**
	HDX DX	230400 230400	100	**#9203**

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC 1, "BSC Char. Mode").

Line Interface Coupler Type 3 (#4931): Provides attachment for one nonswitched high-speed communication line via the CCITT V.35 interface at speeds up to 256K bps. The line may be used for duplex or half-duplex data transmission. LIC Type 3 provides direct (modemless) attachment at up to 56K bps, if it is associated with an ICC. **Cables:** For each LIC Type 3, order one cable group **#0087** for DCE attachment or cable group **#0088** for direct attachment. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths and types. **Limitations:** When an LIC Type 3 is installed on a communication scanner, the maximum number of LICs for that scanner is 4. Due to the sum of LIC weights, the number of LICs

3725 Communication Controller Mdl 1 (cont'd)

may have to be further reduced. **Maximum:** Eight per basic 3725, plus eight additional per LAB Type B (#4772). **Prerequisites:** LAB Type B (#4772) for LICs in LAB position 3. An ICC on the same LAB, if direct attachment is required. **Specify:** LIC weights in accordance with Table 3. **Field Installation:** Yes.

Table 3: LIC Type 3 Weight Specify Codes

Line Control	Transmission Speed (bps) LT/EQ	LIC Weight	...Specify Code... no ICC req'd	ICC req'd
BSC EBCDIC (See Note)	64000	25	#9301	#9321
ASCII	32000			
ASCII	64000	42	#9302	#9322
SDLC HDX	64000	25	#9301	#9321
DX	32000			
DX	64000	42	#9302	#9322
HDX	256000	100	#9303	N/A
DX	256000			

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC 1, BSC "Char. Mode").

Line Interface Coupler Type 4A (#4941): Provides four CCITT X.21 interfaces as defined in GA27-3287 for communication lines operating at speeds up to 9600 bps. Both switched and nonswitched operation are supported. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4A provides direct (modemless) attachment at 2400, 4800 or 9600 bps, if it is associated with an ICC. The DTEs directly attached to the same LIC must operate at the same speed. Clock speed is set to 9600 bps at the plant and may be changed to 2400 or 4800 bps in the field. **Cables:** For each LIC Type 4A, four cables for DCE and/or direct attachment must be ordered. Order cable group **#0089** for DCE attachment or cable group **#0091** for direct attachment. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths and types. **Limitations:** Supports only the SDLC line protocol. If any of the lines connected to a communication scanner exceeds 9600 bps, the maximum number of LICs for that scanner is 4. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** 16 per basic 3725, plus eight additional per LAB Type A (#4771) or Type B (#4772). **Prerequisites:** LAB Type A (#4771) or Type B (#4772) for LICs in LAB position 3. An ICC on the same LAB, if direct attachment is required. **Specify:** LIC weights in accordance with Table 4A. **Field Installation:** Yes.

Table 4A: LIC Type 4A Weight Specify Codes

Line Control	Transmission Speed (bps) LT/EQ	LIC Weight	...Specify Code... no ICC req'd	ICC req'd
SDLC HDX	9600	12	#9401	#9421
DX	4800			
DX	9600	25	#9402	#9422

Line Interface Coupler Type 4B (#4942): Provides one CCITT X.21 interface as defined in GA27-3287 for a communication line operating at speeds up to 64K bps. Switched operation is supported up to 48K bps. Nonswitched operation is supported at up to 64K bps. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4B provides direct (modemless) attachment at up to 56K bps, if it is associated with an ICC. **Cables:** For each LIC Type 4B, order one cable group **#0089** for DCE attachment or one cable group **#0091** for direct attachment. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths and types. **Limitations:** Supports only the SDLC line protocol. When an LIC Type 4B is installed on a communication scanner, the maximum number of LICs for that scanner is 4. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Eight per basic 3725, plus eight additional per LAB Type B (#4772). **Prerequisites:** LAB Type B (#4772) for LICs in LAB position 3. An ICC on the same LAB, if direct attachment is required. **Specify:** LIC weights in accordance with Table 4B. **Field Installation:** Yes.

Table 4B: LIC Type 4B Weight Specify Codes

DX	64000	42	#9404	#9424

Configurating and Ordering Procedures of Specified Configurations:

- General:
  - It is possible to configure a 3725 without following all the rules described in the *IBM 3725 Communication Controller Configuration Guide,* (Chapter "Graphic Configuration Procedure").
  - This configuring procedure allows flexibility in placing Line Interface Couplers (LICs) and Internal Clock Control (ICCs) in the 3725 and should only apply to match to match very specific configuration requirements.
  - Such configurations are called: "Specified Configurations" and should be ordered with Specify Code **#6000.**
  - Use of Specified Configurations results in bypassing some of the standard configuring rules. Therefore, use of the CF3725 HONE Configurator is required at order entry, order alteration or MES entry time to validate all specified configurations and any subsequent modifications to ensure they meet the mandatory mandatory configuring rules.
  - For configuring information, refer to the *IBM 3725 Communication Controller Configuration Guide,* appendix "Configuring and ordering specified configurations", and to the HONE Configurator CF3725.
- Ordering Procedure:
  - Use CF3725 to configure the 3725 to the customer's requirement.
  - Enter the order directly into AAS or via HONE-AAS link. Specify Code **#6000** is required.
  - Rerun CF3725 to validate the actual configuration 12 weeks before the scheduled ship date.
  - Make a copy of the configuration section of CF3725 output showing LAB diagrams. On each page, print or type: date, machine type, Plant Order number, scheduled shipment date, customer name, and customer number. Mail to manufacturing plant, "Order Department"Dept 447, Research Triangle Park, Raleigh, N.C..
  - Rerun CF3725 each time an order alteration is made and mail the configuration section of the CF3725 output to the manufacturing plant as described above.

ACCESSORIES (None)

SUPPLIES (None)

3725 COMMUNICATION CONTROLLER MDL 2

PURPOSE

The 3725 model 2 controls data communications between modem-attached or directly-attached (without a modem) terminal devices and one or more directly- or remotely-connected S/370 (except models 115 and 125), 303X, 308X, 43XX host processors, or between two host processors. Remote connection may be via common carrier-provided or customer-owned communication facilities. A 3727 console is required for installation, operation and maintenance.

The following is a brief summary of the 3725 Communication Controllers.

Communic. Controller	Max Lines*	Max Storage	Host Program	Comm Control Program
3725 Model 1	256	2M	VTAM/TCAM	ACF/NCP-PEP
	256	1M	BTAM	EP
3725 Model 2	24	512K	VTAM/TCAM	ACF/NCP-PEP
	24	512K	BTAM	EP

* Maximum lines that can physically attach, CF3725 is required to predict actual line attachment capabilities

See individual pages for each Communication Controller for information on additional features.

MODELS

Model 2 002

Prerequisites: If channel-attached, the 3725 mdl 2 requires a control unit position on a system channel. See processor pages for details.

When attaching to a 4321 or 4331 in EP mode, restrictions are imposed on the number of available subchannels which may be used by the 3725 mdl 2.

HIGHLIGHTS

The 3725 mdl 2 is a modular, programmable communication controller, which runs under the control of:

- Either ACF/NCP Version 2 for the 3725 or EP/3725 R1 or both in PEP mode.
- Or ACF/NCP Version 3 or EP/3725 R2 or both in PEP mode. (SEe Program Products and SCP sections for details.)

Its programmability allows a high degree of flexibility in tailoring a data communications system to the customer's requirements. In addition, it plays an active role in Communications Network Management (CNM) by providing data to the Network Communications Control Facility (NCCF) and the Network Problem Determination Application (NPDA).

The machine structure is simplified by having a small number of features: Five types of line interfaces and one type of channel adapter. This allows easy additions and changes to the machine configuration.

The 3725 mdl 2 is field upgradable to 3725 mdl 1.

Characteristics of the 3725 mdl 2 include:

- LSI technology for good RAS characteristics and low power consumption.
- The same internal performance as the 3725 mdl 1.
- Attachment of high-speed lines which use the modulo 128 function of ACF/NCP for INN links.
- 512K bytes of main storage
- Internal Clock Control included in the base machine.
- Maintenance and Operator Subsystem (MOSS), a functionally separate processor, facilitates maintenance and problem determination by providing:
  - Box error logging
  - Alert mechanisms
  - Display of machine status
  - Diagnostics for the Central Control Unit (CCU), channel adapters, scanners and line interfaces
  - Utilities to:
    - collect microcode dumps and send them to the host for printing
    - provide actual configuration data, help the customer to plan for MES, and store this information on the MOSS diskette via the Graphic Configuration File for further console display or update. This information can be transferred to the host where the machine diagram can be printed by ACF/SSP
    - allow the operator to keep a current Line Description File, providing the physical address, symbolic name, speed, and protocol of each connected line. This file, stored on the MOSS diskette, may be transferred to the host and printed by ACF/SSP.
- Same RAS Characteristics as the 3725 mdl 1:
  - Reliability and availability of the 3725 are enhanced by the following elements:
    - Extensive error detection, including storage protection against inadvertent overlays.
    - Functional building block design (most adapter errors are contained within a single building block and thus will not take the system down)
    - Error correcting code for the main storage and scanner storage
    - Error by-pass facilities: Microcode re-IPLs, system re-IPLs and dynamic reconfiguration of SNA resources
    - Automatic first-level problem determination with alert messages, which report hardware errors to the network operator and recommend actions
    - Enhanced problem determination aids
    - Automatic power-on when power returns after loss
    - Port Swapping which allows the operator to logically swap a line from a failing port to a spare port without involvement of the host processor.
  - Same serviceability as the 3725 mdl 1, including:
    - Many host-independent functions for installation and maintenance
    - Error information logging/retrieval
    - Diagnostics and trouble shooting facilities
    - Concurrent maintenance for MOSS diskette drive and console.
- Same Network Management and Problem Determination as the 3725 mdl 1: Considerable function has been designed into this communication controller to provide maximum availability to the customer. The 3725 MOSS provides problem determination and recovery procedures that are designed to be easily understood and used by the operator e.g.:
  - Stand Alone Link Test facility to test an SDLC Communication link attaching another 3725 or 3705, without involvement of a host or a control program.
  - Line Interface Display to monitor at the console the status of most of the control leads on a line interface.

  The 3725 supports IBM's CNM (Communications Network Management) direction by sending error related information to the Network Problem Determination Application (NPDA) running in a host processor under the support of the Network Communications Control Facility (NCCF). This enhanced CNM support provides better problem determination in SNA networks. The basic NCP problem determination functions (alerts) are also offered in the non-NPDA environment, but they are not available in EP mode.
- Attachment of up to 24 duplex or half-duplex lines to the 3725 mdl 2. Actual capacity of the system in operation may be less than the maximum physical line attachment capability.
- One or two channel adapters in the 3725 mdl 2 to connect to the byte multiplexer, block multiplexer or selector channels of host processors.
- Configuration Aids: The HONE Configurator CF3725 and the *Configuration Guide,* SA33-0022, are available to IBM representatives to assist in configuring a 3725 mdl 2 to specific network requirements. The CF3725 configurator provides configurations with feature and specify codes, cable lists as well as storage and performance estimates. In CF3725 and in these pages a number of sample configurations are also available for guidance.

Sample Configurations

To ease the task of configuring and ordering a 3725 mdl 2, several sample configurations representing popular combinations of lines have been defined here and in CF3725 response files.

If one of the sample configurations matches the customer's requirements, it may be ordered directly without running CF3725. If none of the sample configurations matches the customer's requirements, then CF3725 or the *Configurator Guide,* SA33-0012, should be used to configure the 3725 mdl 2.

Presentation of the sample configurations C1 to C7:

The first column of each table describes the different categories of lines by groups of protocols. Then, each configuration CONF1 to CONF7 provides a combination of those lines and the related feature/specify codes to be ordered.

(1) Excluding character mode (See Table 1: LIC Type 1).

(2) Not supported with control program level prior to ACF/NCP V3 and EP/3725 R2 (See Table 1: LIC Type 1).

Note: For each of these sample configurations you must also order:

- The 3725 mdl 2 base machine (select voltage, and color from "Specify").
- As many #1561s (channel adapters) as are needed (maximum 2).
- One 3727 Operator Console (separate order).

Machine Organization

The 3725 mdl 2 contains:

Central Control Unit: Executes instructions to control the communication scanner and the channel adapters. The CCU runs under the control of ACF/NCP V2, EP/3725 or both in PEP mode.

Main Storage: Houses a control program (NCP, EP, PEP) and other program products loaded from the host processor and provides buffers for the data exchanged with the channel adapters and the lines. The base machine includes 512K bytes of storage.

Maintenance and Operator Subsystem (MOSS): Provides IPL and utility procedures for the 3725 mdl 2 operator. It includes an independent processor with its microcode, a diskette drive and an attachment for the operator console.

Transmission Subsystem (TSS): Provides the physical connection to communication facilities. It consists of one Line Attachment Base (LAB) with a microprocessor based scanner and Internal Clock Control (ICC).

The 3725 mdl 2 may also contain:

Channel Adapters (CAs): Provide physical connection to host channels. The base machine provides a physical base for two Channel Adapters.

Line Interface Couplers (LICs): Provide interfaces to communication lines. The base machine provides a physical base for up to six LICs.

The 3725 mdl 2 does not attach the 3726.

Console: The 3725 mdl 2 requires a primary 3727 Operator Console for installation, operation and maintenance; see M3727 pages for details. A second 3727 Operator Console may be used as an alternate operator console. The operator consoles are directly attached, i.e., no DCEs (modems) are required. Only one operator console is active at a given time. The active console is selected by a switch on the 3725 mdl 2 control panel. See "Service Requirements" for additional information.

Customer Responsibilities: See M2700 pages. Also see EP and NCP Programming pages for attachment capability.

Communications Facilities: The 3725 mdl 2 operates over common carrier-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

Remote Communication Controller: The 3725 mdl 2 can be used without channel connection to a host processor. Such a 3725 mdl 2 is termed 'link-attached' and is connected via one or more communication links to channel-attached 3705s, 3725 mdl 1s and/or 3725 mdl 2s. A link-attached controller has the same networking capabilities as a channel-attached one. Link attachment is a standard capability of the 3725 mdl 2; no special feature is needed. For more information on the functions of a link-attached Communication Controller, see the Advanced Communications Functions for NCP (ACF/NCP) in the Program Products section.

Service Requirements: The 3725 mdl 2 requires a local (primary) 3727 Operator Console as the console for operation, as well as for installation and maintenance. Maximum distance is 7.5 meters (25 feet). The 7427 Console Switching Unit (Special Product provided by RPQ 8J5008) offers the capability to allow up to four 3725 mdl 2 and/or 3725 mdl 1 machines to share a single primary operator console.

Service limitations are: A primary console is required for maintenance and must be available whenever service is to be performed. There must be no obstructing wall or door between the primary console and any attached 3725 mdl 2. The primary console must be available for maintenance personnel when called for servicing a 3725 mdl 2.

Data Communication Equipment:

Modems: The following modems or units may be used with the 3725 mdl 2:

3863 mdl 1/2	2400 bps
3864 mdl 1/2	4800 bps
3865 mdl 1/2	9600 bps
3867	2400 to 9600 bps Link Diag Unit
3868 mdl 1	2400 bps
3868 mdl 2	4800 bps
3868 mdl 3/4	9600 bps
3872	2400 bps
3874	4800 bps

Public Data Networks: Public Data Networks are attached as listed in the charts of the M2700 pages.

Non-IBM DCEs: Non-IBM DCEs complying with EIA RS-232-C, CCITT Recommendations V.24/V.28, V.35 or X.21 may be attached under the provisions of the IBM Multiple Supplier Systems Bulletin.

Automatic Calling Equipment: Automatic calling equipment which comply with EIA RS-366 or CCITT Recommendation V.25 may be attached under the provisions of the IBM Multiple Supplier Systems Policy.

Data Encryption Equipment: The following devices may be attached to the 3725 mdl 2: 3845 Data Encryption Device ... 3846 Data Encryption Device.

3725 Communication Controller Mdl 2 (cont'd)

Configuring and Ordering Procedures:

- For a new machine:

  A new machine must be configured with the aid of the HONE Configurator CF3725 or the *Configuration Guide,* SA33-0022, unless one of the sample configurations is ordered. Either procedure yields a list of feature codes and specify codes, which is used to order the machine, and a pictorial diagram showing the positions of the LICs. A copy of this diagram should be given to the customer, as it will be needed when the NCP or EP is generated. At order confirmation time, the machine configuration must be verified by the configurator CF3725. A copy of the CF3725 output must be given to CE, as it will be needed to order and install the DCE and other communication cables. Approximately 30 days before the machine is to be shipped, the plant will send a similar pictorial diagram to the branch office. It will include two more copies of this diagram with the machine documentation. One of these should be given to the customer, the other to CE.

  A similar pictorial diagram, called the Graphic Configuration File, is stored on the MOSS diskette. Most of this file is generated by the 3725 mdl 2, but the customer is responsible for adding the LIC weights (see "Transmission Subsystem" for description of LIC weights) and for keeping them up to date when line protocols or speeds are changed. This information is required for subsequent MES orders.

  A 3727 console must be ordered for each 3725 mdl 2, unless the 3725 mdl 2 is to share a console via the 7427 Console Switching Unit (RPQ 8J5008).

- For an MES:

  From the Graphic Configuration file stored on the MOSS diskette, a diagram of the actual machine configuration is obtained on the host printer. The HONE Configurator CF3725 or the **Configuration Guide** and this diagram of the machine may be used to configure the MES. This procedure yields a list of feature codes and specify codes (including LIC weights), which is used to order the MES, and an updated pictorial diagram of the LICs. A copy of the updated configuration on the Graphic Configuration printout marked with the MES order number must be sent by the marketing representative to the servicing branch office for use by the CE detailing plugging information for installation planning purposes. This updated configuration is required by the CE as it provides the only source of internal machine feature location and plugging information for the LICs.

  To assist the customer and CE, the MES number for the ordered LICs, as well as the LIC types and weights, should be entered in the Graphic Configuration File when the MES is ordered. After installation of the MES, the CE verifies that the LICs and their weights in the Graphic Configuration File are consistent with the installation.

- For cables:

  External cables, except the cable for the primary console, are ordered via AAS. . Cables for the 3726 Communication Controller Expansion must be ordered with the 3726.(Canada, Latin America, Taiwan) IBM supplies LIC cables and alternate console cable at standard length, 13.5 meter (45 feet) lone, except for direct attached DTEs on LIC4A, LIC4B where the standard length is 30 meter (100 feet): order the corresponding cable group as defined in the IMPP. For shorter cables, or for the alternate operator console cable up to 20 meter (64 feet) long or for channel cables, order the corresponding cable group at the specified length as defined in the IMPP. For longer cables, order cables by P/N at the specified length on an MES. These cables include installation charges. Maintenance charges are included in the associated Line Sets. Inquire into the QSLM file for prices.

The primary operator console is installed with an attachment cable of 7.5 meters (25 feet) maximum, which is included in the shipping group of the 3725 mdl 2. For the Alternate Operator Console, IBM supplies a cable of up to 20 meters (65 feet). This cable is obtained by ordering cable group **#0099.** Additional length up to 150 meters (490 feet) may be ordered by RPQ.

Channel Adapters: The 3725 mdl 2 Channel Adapter attaches to a host channel to provide communications with S/370 (except mdls 115 and 125), 303X, 308X, 43XX Processors.

Transmission Sub-System (TSS): The Transmission Subsystem consists of a Line Attachment Base (LAB), Line Interface Couplers, an Internal Clock Control and a communication scanner. Only Line Interface Couplers are available as optional features.

The microprocessor based communication scanner serializes and de-serializes the data, supports various line protocols and provides character buffering and cycle steal transfer into the 3725 mdl 2 main storage. The scanner supports BSC (EBCDIC, ASCII) and SDLC in normal mode or block mode, i.e., in a mode of operation similar to the one of Scanner Type 3 of the 3705. Asynchronous protocols with 5 to 8 data bits and 1 or 2 stop bits are supported in "character mode" with EP/3725 R1 and ACF/NCP V2, i.e. in a mode of operation similar to the one of the Scanner Type 2 of the 3705. They are also supported in "enhanced mode" with EP/3725 R2 and ACF/NCP V3. BSC tributary operation (EP or PEP) is supported in "character mode" at speeds up to 1200 bps with EP/3725 R1. It is also supported in normal mode at speeds up to 64K bps with EP/3725 R2. for tributary addressing under EP or PEP. In addition the scanner supports procedures for automatic calling units and X.21 native, X.21bis and X.20bis. It handles a variable number of lines depending on the protocol and the transmission speed.

Line Interface Couplers (LIC) provide the functions necessary to attach the external communications facilities and Data Terminal Equipment (DTEs). DTEs are attached to the 3725 mdl 2 either directly or via DCEs. The type of LIC to use depends on the physical interface presented by the DCE, not on the protocol transmitted through the port. For example, provided that the corresponding software is available in the 3725, X.25 packet switching may be supported through LIC Type 1, LIC Type 3, LIC Type 4A or LIC Type 4B, whichever is matching the physical interface presented by the X.25 network. According to its type a LIC attaches one or up to four duplex or half-duplex lines. Up to six LICs can be installed on the Line Attachment Base (LAB), for a maximum of 24 lines.

Each LIC is assigned a scanner 'weight', which is the percentage of scanner capacity consumed by the lines attached to that LIC. This weight depends upon the speeds and protocols of the lines. The specific values for each case are given in Tables 1 through 4B. The total load put on the scanner must not exceed 100 percent. To build the machine correctly, the plant must know the weights of the ordered LICs. These weights are conveyed to the plant by including the corresponding specify codes in the order.

Refer to the *Configuration Guide,* SA33-0022, available to IBM representatives, for detailed explanations of the configuration rules used for the TSS.

Internal Clock Control (ICC) is used to attach devices which are not clocked by a DCE, such as asynchronous terminals and directly attached synchronous terminals. This ICC is part of the base 3725 mdl 2.

Performance: The maximum number of lines capable of concurrent operation is a function of line speed, line protocols, the 3725 mdl 2 control program installed and the application work load. The number of lines which can be physically installed may exceed the operational capability. Analysis should be performed to determine the operational limits in the customer's situation. The HONE Configurator CF3725 should be used to perform such an analysis.

Direct Attachment: The 3725 mdl 2 allows direct, i.e., modemless, attachment of Data Terminal Equipment (DTE) using LIC-1, LIC-3, LIC-4A or LIC-4B and the corresponding direct attachment cable. LIC-1 attaches devices using asynchronous (start/stop) protocols at speeds up to 1200 bps (9600 bps if they use external clocking) or devices using synchronous protocols (BSC or SDLC) at speeds up to 19.2K bps. LIC-3 attaches devices using BSC and SDLC protocols at speeds up to 56K bps. LIC-4A attaches devices using SDLC protocols at speeds up to 9600 bps. LIC-4B attaches devices using SDLC protocols at speeds up to 56K bps.

Directly attached DTEs use the ICC in the 3725 mdl 2. At speeds of up to 1200 bps the speed is set at the time of control program generation and must match that of the DTE's internal clock. At speeds above 1200 bps, the DTE must use external clocking (provided by the 3725 mdl 2) and the speed is set by hardware in the 3725 mdl 2. At the plant the speed will be set to 9600 bps. At installation time, it may be changed by the CE on a per-LIC basis to 2400, 4800, 19.2K or 56K bps.

For information on the available direct attachment cable types and lengths, refer to the *Installation and Physical Planning Manual,* GC22-7064.

Bibliography: GC20-0001

SPECIFY

The voltage and color specify codes are not recommended for field installation. Specify codes may not be necessary to order a 3725 mdl 2, if the default options specified below are satisfactory.

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Voltage default option is 208V. Specify **#9914** for 240V. If the 4.3 meter (14 foot) power cable is not desired, specify **#9986** for a 1.8 meter (6 foot) power cable.
- Color: The standard color is pearl white .
  For other colors, specify **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue , **#9064** for charcoal brown, **#9065** for pebble gray .

SPECIAL FEATURES

NON-COMMUNICATIONS FEATURES (None)

COMMUNICATIONS FEATURES

Channel Adapter (#1561): Provides the logical and physical interface between a 3725 mdl 2 and a S/370 (except mdls 115 and 125), 303X,

3725 Communication Controller Mdl 2 (cont'd)

308X, 4300 processor. It attaches to a byte multiplexer, block multiplexer or selector channel. With this feature, order channel cable group **#3920** and, if required, **#1178**. **Maximum:** Two per 3725 mdl 2. **Prerequisites:** None. **Field Installation:** Yes.

Line Interface Coupler Type 1 (#4911): Provides four EIA RS-232-C/CCITT V.24 interfaces for communication lines operating at transmission speeds up to 19.2K bps. The lines may be used either for duplex or half-duplex data transmission. LIC Type 1 provides direct (modemless) attachment of synchronous DTEs at 2400, 4800, 9600 or 19.2K bps and of externally clocked start stop DTE's at 2400, 4800 and 9600 bps, if it is associated with an ICC. The DTEs attached directly to a given LIC must operate at the same speed. In addition, direct attachment of of asynchronous devices is provided at speeds up to 1200 bps. Depending on the options chosen at the generation of the control program each port of LIC Type 1 can support one of the following interfaces:

- Duplex or half-duplex EIA RS-232/CCITT V.24 at speeds up to 19.2K bps
- EIA RS-366/CCITT V.25 Autocall Equipment
- X.21bis switched or nonswitched
- X.20bis switched or nonswitched

LIC 1 provides modem attachment of asynchronous DTE's at speeds up to 1200 bps. At speeds above 1200 bps and up to 9600 bps, the start stop DTE's can be attached, provided they use modem clocking.

Cables: For each LIC type 1, four cables for DCE, autocall equipment and/or direct attachment must be ordered. Order cable group **#1404** for DCE attachment, cable group **#0082** for attachment to automatic calling units cable group **#0085** for direct attachment of 3101 and TTY 33/35, or cable group **#1400** for direct attachment of other DTEs.

EIA RS-232-C/CCITT V.24 Interface Modem Attachment:

The LIC Type 1 (#4911) can support a cable length of up to 100 meters when connecting to a 3863, 3864 or 3865 modem or equivalent. Cable lengths up to 35 meters (115 feet) are supported when connected to any modem that complies with the EIA/CCITT Interface Specifications. To connect a cable longer than 35 meters (115 feet) the following must be done:

1. Determine the suffix level (the two alpha characters on the date tag) of each 3863, 3864 or 3865 modem to be interconnected. If the suffix is "FG" or later, no further action is required.
2. If the suffix is "DG" or earlier: A 3863 or 3864 or 3865 modem which does *not* have Data Multiplexer #3260 installed must have EC **344120** installed. ... a 3865 modem with Data Multiplexer #3260 installed must have EC **323406** installed.
3. Order the cable: See "Ordering Procedure".

Limitations: If the transmission speed of any of the lines connected to the communication scanner exceeds 9600 bps, the maximum number of LICs is four. Due to the sum of LIC weights the number of LICs may have to be further reduced. **Maximum:** Six per basic 3725 mdl 2. **Specify:** LIC weights in accordance with Table 1. **Field Installation:** Yes.

Table 1: LIC Type 1 Weight Specify Codes

Line Control	Transmission Speed up to	LIC Weight	Specify Code
-ACF/NCP 3725 or EP/3725, except EP/3725 R1 for BSC tributary operation

* Weights and specify codes apply to the most commonly used DTE's, i.e. those DTE's using transmission codes with at least 10 bits per character (start, data/parity, stop(s)), like ASCII. DTE's using transmission codes with less than 10 bits per character (start, data/parity, stop(s)), are also supported at speeds up to 600 bps.

Line Interface Coupler Type 2 (#4921): Provides attachment for one communication line at speeds up to 230.4K bps. LIC Type 2 supports either duplex or half-duplex data transmission. It has a digital interface for attachment to a nonswitched "wideband" Type 8751, 8801 or 8803 Service. **Cables:** For each LIC type 2, order one cable group **#0086**. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths. **Limitations:** When an LIC Type 2 is installed on a communication scanner, the maximum number of LICs is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Four per basic 3725 mdl 2. **Specify:** LIC weights in accordance with Table 2. **Field Installation:** Yes.

Table 2: LIC Type 2 Weight Specify Codes

DX	64000	42	**#9202**
HDX	230400	100	**#9203**
DX	230400		

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC 1, "BSC Char. Mode").

Line Interface Coupler Type 3 (#4931): Provides attachment for one nonswitched high-speed communication line via the CCITT V.35 interface at speeds up to 256K bps. The line may be used for duplex or half-duplex data transmission. LIC Type 3 provides direct (modemless) attachment at up to 56K bps. **Cables:** For each LIC Type 3, order one cable group **#0087** for DCE attachment or cable group **#0088** for direct attachment. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths and types. **Limitations:** When an LIC Type 3 is installed on a communication scanner, the maximum number of LICs is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Four per basic 3725 mdl 2. **Specify:** LIC weights in accordance with Table 3. **Field Installation:** Yes.

3725 Communication Controller Mdl 2 (cont'd)

Table 3: LIC Type 3 Weight Specify Codes

SDLC HDX	64000	25	**#9301**
DX	32000		
DX	64000	42	**#9302**
HDX	256000	100	**#9303**
DX	256000		

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC Type 1 BSC "Char. Mode", in Table 1).

Line Interface Coupler Type 4A (#4941): Provides four CCITT X.21 interfaces as defined in GA27-3287 for communication lines operating at speeds up to 9600 bps. Both switched and nonswitched operations are supported. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4A provides direct (modemless) attachment at 2400, 4800 or 9600 bps. The DTEs directly attached to the same LIC must operate at the same speed. Clock speed is set to 9600 bps at the plant and may be changed to 2400 or 4800 bps in the field. **Cables:** For each LIC Type 4A, four cables for DCE and/or direct attachment must be ordered. Order cable group **#0089** for DCE attachment or cable group **#0091** for direct attachment. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths and types. **Limitations:** Supports only the SDLC line protocol. If any of the lines connected to a communication scanner exceeds 9600 bps, the maximum number of LICs is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Six per basic 3725 mdl 2. **Specify:** LIC weights in accordance with Table 4A. **Field Installation:** Yes.

Table 4A: LIC Type 4A Weight Specify Codes

SDLC HDX	9600	12	**#9401**
DX	4800		
DX	9600	25	**#9402**

Line Interface Coupler Type 4B (#4942): Provides one CCITT X.21 interface as defined in GA27-3287 for a communication line operating at speeds up to 64K bps. Switched operation is supported up to 48K bps. Nonswitched operation is supported at up to 64K bps. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4B provides direct (modemless) attachment at up to 56K bps, if it is associated with an ICC. **Cables:** For each LIC Type 4B, order one cable group **#0089** for DCE attachment or one cable group **#0091** for direct attachment. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths and types. **Limitations:** Supports only the SDLC line protocol. When an LIC Type 4B is installed on a communication scanner, the maximum number of LICs is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Four per basic 3725 mdl 2. **Specify:** LIC weights in accordance with Table 4B. **Field Installation:** Yes.

Configurating and Ordering Procedures of Specified Configurations:

- General:
  - It is possible to configure a 3725 without following all the rules described in the *IBM 3725 Communication Controller Configuration Guide,* (Chapter "Graphic Configuration Procedure").
  - This configuring procedure allows flexibility in placing Line Interface Couplers (LICs) and Internal Clock Control (ICCs) in the 3725 and should only apply to match to match very specific configuration requirements.
  - Such configurations are called: "Specified Configurations" and should be ordered with Specify Code **#6000.**
  - Use of Specified Configurations results in bypassing some of the standard configuring rules. Therefore, use of the CF3725 HONE Configurator is required at order entry, order alteration or MES entry time to validate all specified configurations and any subsequent modifications to ensure they meet the mandatory mandatory configuring rules.
  - For configuring information, refer to the *IBM 3725 Communication Controller Configuration Guide,* appendix "Configuring and ordering specified configurations", and to the HONE Configurator CF3725.
- Ordering Procedure:
  - Use CF3725 to configure the 3725 to the customer's requirement.
  - Enter the order directly into AAS or via HONE-AAS link. Specify Code **#6000** is required.
  - Rerun CF3725 to validate the actual configuration 12 weeks before the scheduled ship date.
  - Make a copy of the configuration section of CF3725 output showing LAB diagrams. On each page, print or type: date, machine type, Plant Order number, scheduled shipment date, customer name, and customer number. Mail to manufacturing plant, "Order Department"Dept 447, Research Triangle Park, Raleigh, N.C..
  - Rerun CF3725 each time an order alteration is made and mail the configuration section of the CF3725 output to the manufacturing plant as described above.

MODEL CONVERSIONS

The following model conversion is field installable: 3725 model 2 to 3725 model 1. Conversion time is 12 hours.

ACCESSORIES (None)

SUPPLIES (None)

3726 COMMUNICATION CONTROLLER EXPANSION

PURPOSE

Provides additional line and/or channel attachment capability to the 3725 Communication Controller.

MODELS

Model 1 001

Prerequisites: If channel-attached, the 3726 requires a control unit position on a system channel. See processor pages.

HIGHLIGHTS

One 3726 Communication Controller Expansion only attaches to a 3725 Communication Controller, which is required for its operation and maintenance. It expands the capability of the 3725 by providing physical attachment for up to four Channel Adapters without Two-Processor Switches or two Channel Adapters with Two-Processor Switches and up to five Line Attachment Bases supporting up to 160 lines.

The HONE Configurator CF3725 or the *Configuration Guide,* SA33-0012, must be used to configure a 3726.

Communications Facilities: The 3726 operates over common carrier-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see the M2700 pages.

Data Communication Equipment: The 3726 attaches the same DCEs as the 3725.

Ordering Procedures: See the M3725 pages.

Transmission Subsystem (TSS): The Transmission Subsystem consists of Line Attachment Bases (LAB), Line Interface Couplers and Internal Clock Control. Two types of LABs are available: LABs Type A and LABs Type B. LABs Type A provide one communication scanner and LABs Type B provide two communication scanners.

The microprocessor based communication scanner serializes and de-serializes the data, supports various line protocols and provides character buffering and cycle steal transfer into the 3725 main storage. The scanner supports BSC (EBCDIC, ASCII) and SDLC in normal mode or block mode, i.e., in a mode of operation similar to the one of Scanner Type 3 of the 3705. Asynchronous protocols with 5 to 8 data bits and 1 or 2 stop bits are supported in "character mode" with EP/3725 R1 and ACF/NPC V2, in a mode of operation similar to the one of Scanner Type 2 of the 3705. They are also supported in "enhanced mode" with EP/3725 R2 and ACF/NCP V3. BSC tributary operation (EP or PEP) is supported in "character mode" at speeds up to 1200 bps with EP/3725 R1. It is also supported in normal mode at speeds up to 64K bps with EP/3725 R2. In addition, the scanner supports procedures for automatic calling units and X.21 native, X.21bis and X.20bis. It handles a variable number of lines depending on the protocol and the transmission speed.

Line Interface Couplers (LIC) provide the functions necessary to attach the external communications facilities and Data Terminal Equipment (DTEs). DTEs are attached to the 3726 either directly or via DCEs. The type of LIC to use depends on the physical interface presented by the DCE, not on the protocol transmitted through the port. For example, provided that the corresponding software is available in the 3725, X.25 packet switching may be supported through LIC Type 1, LIC Type 3, LIC Type 4A or LIC Type 4B, whichever is matching the physical interface presented by the X.25 network. According to its type a LIC attaches one or up to four duplex or half-duplex lines. Up to 8 LICs can be installed on a Line Attachment Base (LAB), for a maximum of 32 lines per LAB.

Each LIC is assigned a scanner "weight", which is the percentage of scanner capacity consumed by the lines attached to that LIC. This weight depends upon the speeds and protocols of the lines. The specific values for each case are given in Tables 1 through 4B. The total load put on a scanner must not exceed 100 percent. To build the machine correctly, the plant must know the weights of the ordered LICs. These weights are conveyed to the plant by including the corresponding specify codes in the order.

Refer to the *Configuration Guide,* SA33-0012, available to IBM representatives, for detailed explanations of the configuration rules used for the TSS.

Internal Clock Control features are required to attach devices which are not clocked by a DCE, such as asynchronous terminals and directly-attached synchronous terminals.

Performance: The maximum number of lines capable of concurrent operation is a function of line speed, line protocols, the 3725 control program installed and the application work load. The number of lines which can be physically installed may exceed the operational capability. Analysis should be performed to determine the operational limits in the customer's situation. The HONE Configurator CF3725 should be used to perform such an analysis.

Direct Attachment: The 3726 allows direct (i.e., modemless) attachment of Data Terminal Equipment (DTE) using LIC-1, LIC-3, LIC-4A or LIC-4B and the corresponding direct attachment cable. LIC-1 attaches devices using asynchronous (start/stop) protocols at speeds up to 1200 bps or devices using synchronous protocols (BSC or SDLC) at speeds up to 19.2K bps. LIC-3 attaches devices using BSC and SDLC protocols at speeds up to 56K bps. LIC-4A attaches devices using SDLC protocols at speeds up to 9600 bps. LIC-4B attaches devices using SDLC protocols at speeds up to 56K bps.

Directly attached DTEs require the ICC feature in the 3726. At speeds of up to 1200 bps the speed is set at the time of control program generation and must match that of the DTE's internal clock. At speeds above 1200 bps, the DTE must use external clocking (provided by the 3726) and the speed is set by hardware in the 3726. At the plant the speed will be set to 9600 bps. At installation time it may be changed by the CE on a per-LIC basis to 2400, 4800, 19,200 or 56,000 bps.

For information on the available direct attachment cable types and lengths, refer to the *Installation and Physical Planning Manual,* GC22-7064.

SPECIFY

The voltage and color specify codes are not recommended for field installation. Specify codes may not be necessary to order a 3726, if the default options specified below are satisfactory.

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Voltage default option is 208V. Specify **#9914** for 240V. If the 4.3 meter (14 foot) power cable is not desired, specify **#9986** for a 1.8 meter (6 foot) power cable.
- Color: The standard color is pearl white .
  For other colors, specify **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue , **#9064** for charcoal brown, **#9065** for pebble gray .

SPECIAL FEATURES

NON-COMMUNICATIONS FEATURES

Line Increase Feature (#3602): Allows the installation of more than three LABs Type A (#4771) or Type B (#4772) in the 3726. It is required for LABs in positions 7 and 8 of the 3726. **Maximum:** One per 3726. **Field Installation:** Yes.

Two-Processor Switch (TPS) (#8320): Provides a second channel interface to attach CA #1561 to a Multiprocessor System (MP) or to two channels of the same or different processors. One or both channel interfaces are enabled by a manual switch on the 3725 control panel. The enabled channel interface is operational when selected by the host channel. Data transfer cannot occur concurrently on both channel interfaces. Order channel cable groups #3920 and #1178 with this feature. Each #8320 installed in the 3726 reduces the number of installable Channel Adapters in the 3726 by one. **Maximum:** Two per 3726. **Prerequisites:** #1561 in the corresponding position. Two TPSs must be installed in the attached 3725 before any TPS can be installed in the 3726. **Field Installation:** Yes.

COMMUNICATIONS FEATURES

Channel Adapter (CA) (#1561): Provides the logical and physical interface between a 3726 and a S/370 (except mdls 115 and 125), 303X, 308X, 43XX processor. It attaches to a byte multiplexer, block multiplexer or selector channel. Order channel cable groups #3920 and #1178 with this feature. **Limitations:** Each TPS installed in the 3726 reduces the number of installable CAs by one. **Maximum:** Four per 3726. The possible combinations of CAs and TPSs Switches are:

Number of CA	CA Position	TPS Position
0	–	–
1	3	3
2	3,4	3,4
3	3,4,5	3
4	3,4,5,6	–

Prerequisites: Two #1561s must be installed in the attached 3725 before any #1561 can be installed in the 3726. **Field Installation:** Yes.

Internal Clock Control (#4666): Provides bit clocking when the attached external DCE does not provide this clocking, or when direct attachment of the DTE is required. It provides clocking for eight LICs (up to 32 lines) at 50, 110, 134.5, 200, 300, 600 and 1200 bps for operation with or without a DCE and at speeds of 2400, 4800, 9600, 19,200 and 56,000 bps for operation without a DCE (direct attachment). At speeds up to 1200 bps the speed is set at the time of control program generation and must match that of the internal clock of the attached DTE. At speeds above 1200 bps, the DTE must use external clocking (provided by the 3726) and the speed is set by hardware in the 3726. At the plant the speed will be set to 9600 bps. At installation time it may be changed by the CE on a per LIC basis to 2400, 4800, 19,200 or 56,000 bps. **Maximum:** One per LAB Type A or Type B. **Field Installation:** Yes.

Line Attachment Base Type A (#4771): Provides a communication scanner and a physical base for up to eight LICs Type 1 (#4911) or Type 4A (#4941). **Limitations:** The sum of LIC weights must not exceed

3726 Communication Controller Expansion (cont'd)

100. Except by MES, only LICs with weight 12 or 18 may be installed on the LAB Type A. **Maximum:** Five per 3726, including LABs Type B (#4772). **Prerequisites:** #3602 for #4771 in position 7 of the 3726. A LAB Type A or B must be installed in position 3 of the attached 3725 before any LAB can be installed in the 3726. Specify **#9671** only to order a Line Attachment Base Type A without any associated LIC. **Field Installation:** Yes.

Line Attachment Base Type B (#4772): Provides two communication scanners and a physical base for up to eight LICs Type 1 (#4911), Type 2 (#4921), Type 3 (#4931), Type 4A (#4941) or Type 4B (#4942). Each scanner controls up to four LICs. **Limitations:** The sum of the four LIC weights attached to one communication scanner must not exceed 100. Exclusive with LAB Type A (#4771). **Maximum:** Five per 3726, including LAB Type A (#4771). **Prerequisites:** #3602 for #4772 in position 7 of the 3726. A LAB Type A or B must be installed in position 3 of the attached 3725 before any LAB can be installed in the 3726. Specify **#9672** only to attach a Line Attachment Base Type B without any associated LIC. **Field Installation:** Yes.

Line Interface Coupler Type 1 (#4911): Provides four EIA RS-232-C/CCITT V.24 interfaces for communication lines operating at transmission speeds up to 19.2K bps. The lines may be used either for duplex or half-duplex data transmission. LIC Type 1 provides direct (modemless) attachment of synchronous DTEs at 2400, 4800, 9600 or 19,200 bps, if it is associated with an ICC. The synchronous DTEs attached directly to a given LIC must operate at the same speed. Lines connected via DCEs to this LIC may operate at a different speed. Clock speed is set to 9600 bps at the plant and may be changed to 2400, 4800 or 19,200 bps in the field. Direct attachment of asynchronous devices is provided at speeds up to 1200 bps. Depending on the options chosen at the generation of the control program, each port of LIC Type 1 can support one of the following interfaces:

- Duplex or half-duplex EIA RS 232/CCITT V.24 at speeds up to 19.2K bps
- EIA RS-366/CCITT V.25 Autocall Equipment
- X.21bis
- X.20bis

Cables: For each LIC type 1, four cables for DCE, autocall equipment and/or direct attachment must be ordered. Order cable group **#1404** for DCE attachment, cable group **#0082** for attachment to automatic calling units cable group **#0085** for direct attachment of 3101 and TTY 33/35, or cable group **#1400** for direct attachment of other DTEs.

EIA RS-232-C/CCITT V.24 Interface Modem Attachment:

The LIC Type 1 (#4911) can support a cable length of up to 100 meters when connecting to a 3863, 3864 or 3865 modem or equivalent. Cable lengths up to 35 meters (115 feet) are supported when connected to any modem that complies with the EIA/CCITT Interface Specifications. To connect a cable longer than 35 meters (115 feet) the following must be done:

1. Determine the suffix level (the two alpha characters on the date tag) of each 3863, 3864 or 3865 modem to be interconnected. If the suffix is "FG" or later, no further action is required.
2. If the suffix is "DG" or earlier: A 3863 or 3864 or 3865 modem which does *not* have Data Multiplexer #3260 installed must have EC **344120** installed ... a 3865 modem with Data Multiplexer #3260 installed must have EC **323406** installed.
3. Order the cable: See "Ordering Procedure".

Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths and types. **Limitations:** If the transmission speed of any of the lines connected to a communication scanner exceeds 9600 bps, the maximum number of LICs for that scanner is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Eight per LAB Type A (#4771) or Type B (#4772). **Prerequisites:** LAB Type A (#4771) or Type B (#4772). An ICC on the same LAB, if direct attachment is required or if DCE does not provide clocking. **Specify:** LIC weights in accordance with Table 1. **Field Installation:** Yes.

Table 1: LIC Type 1 Weight Specify Codes

* Weights and specify codes apply to most commonly used DTEs, i.e. those DTEs using transmission codes with at least 10 bits per character (start, data/parity, stop(s)) like ASCII. DTEs using transmission codes with less then 10 bits per character (start, data/parity, stop(s)), are also supported at speeds up to 600 bps.

Line Interface Coupler Type 2 (#4921): Provides attachment for one communication line at speeds up to 230.4K bps. LIC Type 2 supports either duplex or half-duplex data transmission. It has a digital interface for attachment to a nonswitched "wideband" Type 8751, 8801 or 8803 Service. **Cables:** For each LIC type 2 order one cable group **#0086**. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths. **Limitations:** When an LIC Type 2 is installed on a communication scanner, the maximum number of LICs for that scanner is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Eight per LAB Type B (#4772). **Prerequisites:** #4772. **Specify:** LIC weights in accordance with Table 2. **Field Installation:** Yes.

Table 2: LIC Type 2 Weight Specify Codes

HDX DX	230400 230400	100	**#9203**

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC1, "BSC Char. Mode").

Line Interface Coupler Type 3 (#4931): Provides attachment for one nonswitched high-speed communication line via the CCITT V.35 interface at speeds up to 256K bps. The line may be used for duplex or half-duplex data transmission. LIC Type 3 provides direct (modemless) attachment at up to 56K bps, if it is associated with an ICC. **Cables:** For each LIC Type 3, order one cable group **#0087** for DCE attachment or cable group **#0088** for direct attachment. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths and types. **Limitations:** When an LIC Type 3 is installed on a communication scanner, the maximum number of LICs for that scanner is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Eight per LAB Type B (#4772). **Prerequisites:** LAB Type B (#4772). An ICC on the same

3726 Communication Controller Expansion (cont'd)

LAB, if direct attachment is required. **Specify:** LIC weights in accordance with Table 3. **Field Installation:** Yes.

DX	64000	42	**#9302**	**#9322**

Note: Speed/LIC weight not supported with EP/3725 R1 for tributary operation (see LIC 1, BSC "Char. Mode").

Line Interface Coupler Type 4A (#4941): Provides four CCITT X.21 interfaces as defined in GA27-3287 for communication lines operating at speeds up to 9600 bps. Both switched and nonswitched operation are supported. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4A provides direct (modemless) attachment at 2400, 4800 or 9600 bps, if it is associated with an ICC. The DTEs directly attached to the same LIC must operate at the same speed. Clock speed is set to 9600 bps at the plant and may be changed to 2400 or 4800 bps in the field. **Cables:** For each LIC Type 4A, four cables for DCE and/or direct attachment must be ordered. Order cable group **#0089** for DCE attachment or cable group **#0091** for direct attachment. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths and types. **Limitations:** Supports only the SDLC line protocol. If any of the lines connected to a communication scanner exceeds 9600 bps, the maximum number of LICs for that scanner is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Eight per LAB Type A (#4771) or Type B (#4772). **Prerequisites:** LAB Type A (#4771) or Type B (#4772). An ICC on the same LAB, if direct attachment is required. **Specify:** LIC weights in accordance with Table 4A. **Field Installation:** Yes.

Table 4A: LIC Type 4A Weight Specify Codes

Line Control	Transmission Speed (bps) LT/EQ	LIC Weight	...Specify Code... no ICC req'd	ICC req'd
SDLC HDX	9600	12	**#9401**	**#9421**
DX	4800			
DX	9600	25	**#9402**	**#9422**

Line Interface Coupler Type 4B (#4942): Provides one CCITT X.21 interface as defined in GA27-3287 for a communication line operating at speeds up to 64K bps. Switched operation is supported up to 48K bps. Nonswitched operation is supported at up to 64K bps. The physical interface follows the CCITT V.11 Recommendation. LIC Type 4B provides direct (modemless) attachment at up to 56K bps, if it is associated with an ICC. **Cables:** For each LIC Type 4B, order one cable group **#0089** for DCE attachment or one cable group **#0091** for direct attachment. Refer to the *Installation and Physical Planning Manual,* GC22-7064, for information on available cable lengths and types. **Limitations:** Supports only the SDLC line protocol. When an LIC Type 4B is installed on a communication scanner, the maximum number of LICs for that scanner is four. Due to the sum of LIC weights, the number of LICs may have to be further reduced. **Maximum:** Eight per LAB Type B (#4772). **Prerequisites:** LAB Type B (#4772). An ICC on the same LAB, if direct attachment is required. **Specify:** LIC weights in accordance with Table 4B. **Field Installation:** Yes.

Table 4B: LIC Type 4B Weight Specify Codes

Line Control	Transmission Speed (bps) LT/EQ	LIC Weight	...Specify Code... no ICC req'd	ICC req'd
SDLC HDX	64000	25	**#9403**	**#9423**
DX	64000	42	**#9404**	**#9424**

Configurating and Ordering Procedures of Specified Configurations:

- General:
  - It is possible to configure a 3725 without following all the rules described in the *IBM 3725 Communication Controller Configuration Guide,* (Chapter "Graphic Configuration Procedure").
  - This configuring procedure allows flexibility in placing Line Interface Couplers (LICs) and Internal Clock Control (ICCs) in the 3725 and should only apply to match to match very specific configuration requirements.
  - Such configurations are called: "Specified Configurations" and should be ordered with Specify Code **#6000**.
  - Use of Specified Configurations results in bypassing some of the standard configuring rules. Therefore, use of the CF3725 HONE Configurator is required at order entry, order alteration or MES entry time to validate all specified configurations and any subsequent modifications to ensure they meet the mandatory mandatory configuring rules.
  - For configuring information, refer to the *IBM 3725 Communication Controller Configuration Guide,* appendix "Configuring and ordering specified configurations", and to the HONE Configurator CF3725.
- Ordering Procedure:
  - Use CF3725 to configure the 3725 to the customer's requirement.
  - Enter the order directly into AAS or via HONE-AAS link. Specify Code **#6000** is required.
  - Rerun CF3725 to validate the actual configuration 12 weeks before the scheduled ship date.
  - Make a copy of the configuration section of CF3725 output showing LAB diagrams. On each page, print or type: date, machine type, Plant Order number, scheduled shipment date, customer name, and customer number. Mail to manufacturing plant, "Order Department"Dept 447, Research Triangle Park, Raleigh, N.C..
  - Rerun CF3725 each time an order alteration is made and mail the configuration section of the CF3725 output to the manufacturing plant as described above.

ACCESSORIES (None)

SUPPLIES (None)

3727 OPERATOR CONSOLE

PURPOSE

An 3727 operator console when attached to the 3725 Communication Controller provides an operator interface to the Maintenance and Operator Subsystem (MOSS) of the 3725. One primary operator console is required for installation, operation and maintenance of the 3725. An optional alternate operator console may be located at up to 150 meters (492 feet) from the 3725.

MODELS

Model 70 070 Operator Console 3727

Note: One order of a 3727 mdl 70 Operator Console automatically provides one logic unit, one keyboard feature, and one display feature, unless otherwise requested.

Note: Language - English US only, Keyboard - English US only.

Prerequisites: One 3725 Communications Controller.

HIGHLIGHTS

- Operator console consisting of three elements: The logic unit, the display feature and the keyboard feature.
- Display of 1,920 characters in 24 rows of 80 characters with operator status on a 25th line.
- Buffered transmission of data as well as field manipulation of data by use of attribute characters.
- English US Keyboard: 59 keys for alphameric and special characters, 12 keys for numeric keypad, 8 keys for cursor control, editing and MOSS interrupt, 5 keys for program functions, and 3 dedicated keys for direct display of MOSS messages, Central Control Unit (CCU) functions and cursor positioning for function selection.

Operator Factors: The operator console has a contrast enhancement filter. The screen is organized by functional areas: 3725 current machine status on the first three lines, pre-prepared menus and operation options in the central part, alarms, messages, and operator information on the last two lines. An audible alarm is provided to alert the operator who may adjust its volume. The display element can be tilted and swivelled to change the screen angle for the operator. The cable-connected keyboard can be moved and has separators to help prevent accidental striking of control keys.

Input Editing Capability: Eight keys control the cursor without affecting any information on the screen: New line, tab, back tab, move-cursor, and backspace keys. In addition three editing keys are provided: Insert character, delete character, and erase keys. All alphameric special characters, and move-cursor keys have typamatic capability.

Maintenance: On-site maintenance will be provided for the 3727.

Cables: The 3727 Operator Console requires an attachment cable to communicate with the 3725 Communication Controller. The primary 3727 operator console is installed with a cable of 7.5 meters (25 feet), which is included in the shipping group of the 3725 Communication Controller.

The alternate operator console is supplied with a cable of 13.5 meters (45 feet). This cable is obtained by ordering cable group #0099 of the 3725. Shorter or longer cable up to 150 meters (490 feet) may be ordered . For details, see "Configuring and Ordering Procedures of Specified Configurations" in the M3725 pages.

SPECIFY

Power and Power Cable:

- Power (120V, AC, 1 phase, 3-wire, 50/60 Hz):

  Power cable: 1.8 meters (6 feet), non-locking plug

SPECIAL FEATURES

Display (#3255): Provides display screen for the 3727. Displays up to 1,920 characters in 24 rows of 80 characters each. Each character is represented in a maximum 7x14 dot matrix in the 9x16 contiguous box matrix. Displays 70 graphic characters: 26 upper case alphabetics, 10 numerics and 33 special characters plus a space.

Keyboard (#4655): Provides movable keyboard for the 3727. All alphamerics, special characters, and move cursor keys have typamatic capability. A 12 key numeric keypad, five program function keys and three special keys are also provided.

4300 Processors Console Table (#1550).

3081 Processors Console Table (#1560).

SUPPLIES (None)

3732 TEXT DISPLAY STATION

PURPOSE

Provides a text entry and editing keyboard and display for the 3730 Distributed Office Communication System and the 8100 Information System.

MODELS

Model 1: 001

Prerequisites: Either 3791 Controller, mdl 11C, 12A, or 12B, with **#9171** installed (refer to M3791 pages for details) or an 8100 Information System with #1501 or #1502 (refer to M8100 pages for details).

HIGHLIGHTS

The 3732 consists of a display and keyboard (special feature) that have been designed specifically to provide text entry and editing facilities for the 3730 Distributed Office Communication System and 8100 Information System. The 3732 displays all the text characters that can be entered at the keyboard. In addition, special graphic characters are displayed to denote certain text control functions. The 3732 must be installed with a keyboard.

Display: The display is a 15-inch (diagonal) cathode ray tube display providing 24 lines of 80 characters each, to give a total of 1920 characters. For text entry and editing, lines 1 and 24 are reserved for system use, leaving 22 lines for text entry (line 1 displays a scale to indicate character position, and is used to display formatting information such as margin settings and tab stops, and to track cursor position; line 24 is used to display status information). When, with user-programming, the 3732 is used for full-screen processing, the user has control over all 24 lines (except for minor restrictions on the use of lines 1 and 24). The display includes an anti-glare screen.

Keyboards: One of three keyboards may be ordered (as special features): a 77-Key Typewriter Keyboard (#4621), a 77-Key ASCII Typewriter Keyboard (#4622), or a 75-Key Typewriter Keyboard (#4623). The keyboards contain a central text entry section that is similar in layout to typewriter keyboards. Both upper and lower case characters may be entered. In addition, the keyboards contain 29 function and control keys concerned with document creation, editing, formatting, and printing.

Text Functions: The following text entry and editing functions are provided by the 3732:

Automatic new line and word spill (allowing an operator to enter text without being concerned about line endings)

Temporary left margin (providing automatic indentation)

Adjustable right margin

Adjust and no-adjust entry mode

Insert mode

Tabulation (providing normal, decimal, and centering tab stops)

Column tabulation (allowing an operator to enter tabular material column-by-column)

Required characters (new line, space, backspace, hyphen)

Special characters (such as superscripts, subscripts, temporary left margin)

Delete character, word

Backspace deletion

Underscore character, word, or group of words (separated by required spaces)

System Functions: The following system functions are invoked using function keys on the 3732 keyboard:

Block insert, copy, move, return, delete

Delete line, sentence

Screen advance, return

Page advance, return

Go to End, Go to Top of document

A HELP key to aid users who have problems when operating the 3732.

A PRINT key to send the currently displayed document to a preassigned print queue, for printing as soon as the assigned printer is available.

An ADJST key to adjust the line length of the currently displayed document and to divide the document into pages.

When attached to the 8100 Information System, the following system functions may be invoked using function keys on the 3732 keyboard: Screen Left ... Screen Right ... Column Edit.

Additional 3732 functions:

Cursor-positioning keys to move the display cursor to any position within the display area (up, down, left, right, and "home" - the first available text character position).

An audible alarm tone, similar to the bell on a typewriter, warns an operator that a line or a screen is nearly full (for example, in no-adjust mode the alarm tone sounds when a character is entered or moved into a position five characters from the right margin.

A DISP key to allow or inhibit the display of certain special characters (such as space, and tabs).

Attachment: The 3732 attaches to a 3791 Controller mdl 11C, 12A, 12B or to the 8100 Information System with the Display and Printer Attachment via a coaxial cable at a distance up to 609 meters (2,000 feet).

Security And Integrity Features: A Security Keylock (#6340) helps prevent unauthorized use of the 3732. Text cannot normally be displayed or modified unless the key is in the On position.

Problem Determination Procedures: To minimize machine downtime, users are encouraged to determine the cause of 3732 malfunctions using IBM-provided Problem Determination Procedures. Data obtained from these procedures is used to correct customer operating or programming errors, or is passed to a CE to aid in isolating a machine malfunction. The Problem Determination Procedures are presented in an easy-to-follow graphic form and are contained in the *3732 Problem Determination Guide* (GA33-3024 without **#9610** and GA33-3087 with **#9610**), which is stored in the Keyboard.

Publications: Refer to the latest level of *IBM System/370 Bibliography of Industry Systems and Application Programs* (GC20-0370), for details of 3730 system publications including 3732 on 3730. Refer to *8100 Information System Bibliography* (GC20-8100), for details of publications including 3732 on 8100.

SPECIFY

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): **#9890** for locking plug, or **#9891** for non-locking plug.
- Power Cable: If standard 2.8 meter (9 foot) power cable is not required, specify **#9511** for 1.8 meter (6 foot) cable, **#9512** for 3.7 meter (12 foot) cable, **#9513** for 4.5 meter (15 foot) cable.
- Character Set: Specify one of the following: **#9082** for EBCDIC character set (word processing) [Used with 77-Key Typewriter Keyboard (#4621)]. **#9084** for ASCII character set [Used with 77-Key ASCII Typewriter Keyboard (#4622)].
- Keyboard Layouts: Keyboard layouts are shown in *3730 Distributed Office Communication System: Introduction* (GA33-3021), for 3732 without the 8100 attachment **#9610** and in *IBM 3732 Text Display Station for the 8100 Information System Introduction and Configurator* (GA33-3084), for 3732 with **#9610**.
- 8100 Attachment: **#9610** for attachment to 8100 Information System. When thus specified, the 3732 cannot be attached to a 3791 Controller. **Field Installation:** Yes.
- Cables: See "Accessories" for cables... also for cable specifications, when the 3732 is attached to a 3730 System, see *3790 Communication System Installation Manual Physical Planning* (GA27-2769). For cable specifications when the 3732 is attached to an 8100 Information System see *IBM 3732 Text Display Station for IBM 8100 Information System Installation Manual Physical Planning* (GA33-3082).

SPECIAL FEATURES

77-Key Typewriter Keyboard (#4621): Movable typewriter-like layout, with 48 text entry keys and 29 function and control keys. EBCDIC Character Set (**#9082**). See "Specify". **Maximum:** One keyboard (#4621, #4622 or #4623). **Field Installation:** Yes. **Prerequisites: #9082.**

77-Key ASCII Typewriter Keyboard (#4622): Movable, ASCII typewriter-like layout, with 48 text entry keys and 29 function and control keys. See "Specify". **Maximum:** One keyboard (#4621, #4622 or #4623). **Field Installation:** Yes. **Prerequisites: #9084.**

75-Key Typewriter Keyboard (#4623): Movable typewriter-like layout, with 46 text entry keys and 29 function and control keys. See "Specify". **Maximum:** One keyboard (#4621, #4622 or #4623). **Field Installation:** Yes. **Prerequisites: #9082.**

Security Keylock (#6340): A lock and key that normally prevent modification or display of the data in the display when the key is in the Off position. For additional or replacement keys, see "Accessories". **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS (None)

3732 Text Display Station (cont'd)

ACCESSORIES

Keylock, Keys: The 3732 with Keylock (#6340) is shipped with two keys. Additional keys may be purchased only from IBM. (Vendor will supply additional keys *only* to original purchaser.) A letter of authorization with key identification number must accompany each order. Specify **P/N 2577741**. Allow three weeks for delivery.

Cables: The twinaxial cables and/or associated parts to interconnect the 3732 and attached systems may be purchased from IBM or from a customer-selected source. The customer is responsible for the installation and maintenance of these cables and their associated parts. When cabling is ordered from IBM, specify a shipping date at least four weeks in advance of receiving the machine. See "Cables" under "Specify".

Twinax® Connector Kit (**P/N 7362268**): Includes two connectors. Twinax Wire and one Twinax Connector Kit are required for each attachment cable. (Individual connectors **P/N 7362229** are available for replacement.)

Twinax Wire (**P/N 7362211**): Order must specify the desired length. Twinax Wire and one Twinax Connector Kit are required for each attachment cable. (This is an indoor/outdoor cable.)

Twinax Cable Assembly (**P/N 7362267**): Includes a connector kit (two connectors) attached to bulk wire. The required length of wire must be specified on the order. The cost of the wire must be added to the fixed assembly price to obtain the total price of the cable assembly.

Twinax Adapter (**P/N 3762230**): Permits two Twinax Cables Assemblies to be joined together. Allow a lead time of 120 days.

Twinax Station Protector Kit (**B/M 7361807**): Two protectors. One is required at each end of each Twinax Attachment Cable installed outdoors (either above or below ground level). Individual Twinax Station Protectors, **P/N 7362426**, are available for replacement purposes. Allow a lead time of 120 days.

Twinaxial Cable is available with Teflon® covering. Teflon-covered cable complies with the National Electrical Code requirements for low smoke-producing, plenum-installed cables.

Twinax® Connector Kit: Includes two connectors. Twinax wire and one connector kit are required for each attachment cable. Order **P/N 7362063** for Teflon-covered cable. Individual connectors **P/N 7362229** are available for replacement.

Twinax Wire: Order must specify the desired length. Twinax wire and one connector kit are required for each attachment cable. Order **P/N 7362061** for Teflon-covered cable.

Twinax Cable Assembly: Includes a connector kit (two connectors) attached to bulk wire. The required length of wire must be specified on the order. The cost of the wire must be added to the fixed assembly price to obtain the total price of the cable assembly. Order **P/N 7362062** for Teflon-covered cable assembly.

SUPPLIES (None)

3741 DATA STATION/ WORKSTATION

Effective February, 1984, all models of the 3741 will no longer be available. All RPQs, special features, and accessories will also be withdrawn and will not be available. Model conversions will continue to be available.

PURPOSE

Used to record keyed data onto a magnetic disk by manual operation of the keyboard. Also, to verify data that has been previously keyed. Also, to execute programs written in the Application Control Language. Disks can be used as a data storage medium, for batch transmissions via a binary synchronous adapter, or read into a 3747 Data Converter to convert captured data onto one-half inch computer tape for subsequent processing. Diskettes can also be read directly into a S/370 model 115, 125, 135, 145, 148, 155 II, 158, 165 II, or 168 via a 3540 Diskette I/O Unit. Diskettes can also be read directly into a System/32, System/34, or a System/3 with a 3741 Attachment Feature.

MODELS

Model 1 001 — A single data entry station with: variable record size, 1 to 128 characters, 10 program levels standard, auxiliary duplication, 240-character CRT display, and operator guidance.

Model 2 002 — Same functional characteristics as model 1. Also includes a binary synchronous communications adapter, switched or nonswitched, point-to-point, or non-switched multipoint, auto-answer, EBCDIC transparency standard (except when transmitting or receiving blocked data), can be used as a remote terminal at 1200, 2000, or 2400 bps over appropriate communications facilities. See "Communication Facilities" below.

Model 3 003 — Executes programs written in the Application Control Language. Optionally can create object programs from source programs. Can operate with same functional characteristics as a mdl 1 when not under ACL program control.

Model 4 004 — Same functional characteristics as model 3. Adds the binary synchronous communications capability of the model 2 and can operate with the same remote characteristics as the model 2 when not under ACL program control.

Prerequisites:

- S/360 communications: Mdl 22 through 75 (except mdl 44 or 67 in TSS mode) and 195, via a 2701 Data Adapter Unit, 2703 Transmission Control, or a 3704 or 3705 Communications Controller equipped with appropriate features. See M2701, 2703, 3704, 3705 pages.
- S/370 communications: Mdl 115 through 195, via an Integrated Communications Adapter (#4640), or 2701, 2703, 3704, or 3705.
- System/3 communications:

  Mdl 4, 6, 10 Disk, or mdl 15: Via the Binary Synchronous Communications Adapter (#2074) on the mdl 4, or 6, and (#2074 or #2084) on the mdl 10 Disk and mdl 15. The 3741 mdl 2 or 4 may also be attached directly, via its external modem cable, to the Local Communications Adapter (#4765) on the mdl 6, mdl 10 Disk, and mdl 15.

  Mdl 8 and 12: Via the Binary Synchronous Communications Adapter (#2074) or the Integrated Communications Adapter (#4645 and #6202), on mdl 8, and on mdl 12 via the Binary Synchronous Communications Adapter (#2074 and/or #2084) or the Integrated Communications Adapter (#4645 and #6202). The 3741 mdl 2 or 4 may also be attached directly, via its external modem cable to the Integrated Communications Adapter (#4645 and #4802) on the mdl 8 or 12.
- System/32 communications: Via the Binary Synchronous Communications Adapter (#2074) on the 5320 System Unit.
- System/34 communications: Via its Communications Adapter on the 5340 System Unit.
- System/38 communications: Via its appropriately configured BSC adapter and subfeatures.
- 5230 Data Collection System communications: Via the BSC Adapter (#2074) on the 5231 mdl 2. Transmission is batch mode only via single diskette transfer, point-to-point unidirectional transmission only.
- 5280 communications: Via the Communications Adapter (#2500) on the 5285 and 5288.

HIGHLIGHTS

Has a buffered storage area into which data is keyed prior to recording on disk, thus allowing for correction of detected errors before record is written. Ten program levels are standard. Programs control the automatic functions of skipping, duplicating, field definition, etc. Automatic program selection provided by program-chaining enables operator to key up to a 1,280-character logical record. Modes of operation (Enter, Update, Verify (#4002), or Search) are under keyboard control. Data record lengths can be variable from 1 to 128 characters. **Limitations:** All records within a single data set must be the same length, however, more than one data set can be written on the same disk.

Keyboard: Has a standard 64-character alphameric combination keyboard with "EL" character set for key entry and verifying. In addition to standard keys, the keyboard has: Record-Field-Character Backspace, Record-Field-Character Advance, and Repeat keys.

CRT Display: Up to 240 characters can be displayed in six rows with 40 characters per row. The first row displays machine status (mode of operation, column indicator and error codes). Rows 2, 3, 4 and the first eight positions of row 5 display either the data being keyed or the active program, at operator's option. Data is displayed progressively as it is keyed to build full records for visual verification. The last 30 characters of row 5 display, at operator's option, either field prompting information or current field format. Row 6 provides an isolated display of current field data, as it is being keyed.

Operator Guidance: Utilizes two display lines of the CRT display (row 5 and row 6) for the purpose of describing to the operator the type of information which is required to be keyed. Display lines are updated on a field-by-field basis. The first line displays a prompting message associated with the field being keyed. The second line displays the data as it is being keyed. The even-numbered program levels are used for guidance information storage.

Magnetic Disk: Diskette 1 storage capacity to record up to 1,898 data records (128-characters each). Maximum of 19 data sets per disk. Removable and interchangeable among 3741s. All data is recorded serially on disk as standard EBCDIC code. One Diskette for data recording is provided as standard. For additional diskettes, see "Supplies" below.

Search Address: Provides a means for direct access to a record that the operator specifies by it's track and sector address.

Search EOD: Provides a means to directly access the last record of a data set.

Search on Content: Allows user to retrieve and display data previously recorded on disk by comparing the contents of the desired data record to a search argument. Argument may be equal to all or portion of the data record. Blank characters in the search argument are treated as "don't care" characters. Search terminates when equal condition occurs between argument and data record or if a match cannot be found.

Search Sequential Content: Provides a search by content that is much faster than "Search Content". The records must be arranged in the data set in ascending alphameric order within the portion of the record that corresponds to the search argument.

Application Control Language (ACL): Allows the user to execute programs containing arithmetic, logical, branching, I/O, and control statements. These source statements are translated to executable code by the optional Application Control Language Translator, see "Special Features". Up to four disk data sets, the printer, the keyboard, and display can be controlled in one program. The Second Disk (#6677) can be written on as well as read when under ACL control. Includes 4K of "Read/Write Storage".

Printer Attachment: Matrix Printer Attachment (#8111) allows the attachment of the 40 characters per second 3713 Printer. Printer formatting can be controlled by programs in the program buffers or by printer control characters in the data stream. Reformatting within a record can be accomplished during printing. Records can also be printed with no format control with one record printed per line. A single record, a complete data set, or records that satisfy a mask record can be printed. The Matrix Printer Attachment also allows the attachment of the 40 cps 3715 Printer mdl 1 or the 80 cps 3715 mdl 2. In addition to the functions provided for the 3713 Printer described above, the functions provided for the 3715 Printer include:

Print edit flexibility.
Printing from second disk drive.
Print constant data stored in program levels.
Print program chaining.
Print disk address along with record.
Page numbering and page headings.
Re-expansion of compressed data streams.

3717 Expansion Feature: Allows the attachment of the 155 lines per minute 3717 Printer and/or the Second Disk Feature to the 3741 mdls 1 and 3, or 2 and 4 respectively. The 3717 Printer includes all of the functions described above for the Matrix Printer Attachment feature and also offers 48/64-character set print belt interchangeability by the operator.

I/O Adapter Feature: Allows the direct attachment of the 3741 mdl 1, 2, 3 or 4 to a System/3 equipped with the 3741 Attachment feature.

3741 Data Station/Workstation (cont'd)

The 3741 can be used as the System/3 Reader (for OCL) or Punch, and RPG II object programs can read records from, or write records to a diskette (RPG II Telecommunications feature is not required).

Communications: The binary synchronous communications adapter on the mdl 2 or 4 operates in half-duplex mode over: facilities C4, C5, D3, D4 or X1M.

Binary Synchronous Transmission allows for transmission rates of 1200, 2000, or 2400 bps. May communicate over point-to-point switched or nonswitched facilities to another 3741 mdl 2 or 4, or a 3747 Data Converter with the appropriate communications adapter.

The 3741 mdl 2 or 4 may communicate over dial or leased facilities to:

- System/3 mdl 4, 6, or 8, mdl 10 Disk, mdl 12 and 15
- 5280 (switched or nonswitched, point-to-point only)
- System/32 (switched or nonswitched point-to-point only)
- System/34 (switched or nonswitched point-to-point only)
- 5231 mdl 2 (switched or nonswitched point-to-point unidirectional only)
- S/360 mdls 22 through 75 and 195 (except mdl 44 or mdl 67 in TSS mode)
- S/370 mdls 115 through 195

See "Programming" section for core size limitations. Code is EBCDIC.

When the 3741 mdl 2 or 4 without Expanded Communications (#1680), is connected to a 3863 mdl 2 modem, the modem configuration switch S1-2 must be set in the down (V.26-bits) position if the 3741 will be the first device to transmit after a line connection is established.

Customer Responsibilities: See M2700 pages.

Publications: *IBM 3741 Data Station Reference Manual* (GA21-9183), and *IBM 3741 Data Station Operator Guide* (GA21-9131).

SPECIFY

- Voltage (AC, 1-phase, 60 Hz): Standard non-locking plug uses customer standard type receptacle. Specify **#9881** for 115V, **#9885** for 208V, or **#9887** for 230V. A locking plug requires customer locking type receptacle. Specify **#9880** for 115V, **#9884** for 208V or **#9886** for 230V. Voltage changes cannot be made in the field.
- Color: **#9041** red, **#9042** yellow, **#9043** blue, **#9045** gray. **Note:** Color accent is provided on front and back panels only. Top and sides will always be white. Color changes cannot be made in the field.
- Data Set Attachment: [Mdls 2, 4] The 3863 and 3872 modems are recommended for 2,400 bps operation on C5 or D4 facilities. One of the following, depending on facility, must be specified:

  #9120 for C5M/D4M (2000 bps)
  #9121 for C5/D4 or X1M (2400 bps)
  #9122 for D3M (1200 bps)
  #9123 for C4M (1200 bps).

  For attachment to the Local Communications Adapter (#4675) or ICA (#4645 and #4802) on the System/3, specify **#9121. Prerequisites: #9122** or **#9123** requires #7705. See "Special Features".
- Data Set Cable: [Mdls 2, 4] A 6m (20 foot) modem cable is provided as standard. If a 12m (40 foot) cable is desired, specify **#9021.** On field upgrades from mdl 1 to 2 or 4, or mdl 3 to 4, the 12m (40 foot) cable may be specified.

SPECIAL FEATURES

ACL (#1350): [Mdls 3, 4] The Application Control Language Translator provides the capability of translating programs written in the Application Control Language into executable code. A program listing is prepared optionally, and diagnostic messages are printed. **Field Installation:** Yes. **Note:** Purchase customers who may elect to later upgrade to 8K storage should consider the purchase of #4975 initially, because the field upgrade requires replacement of the original 4K storage. **Prerequisites:** #6677.

Expanded Communications (#1680): [Mdls 2, 4] Consists of the following:

Expanded Communications Buffer: Expands the size of the communications buffer from 128 bytes to 512 bytes providing an increase in transmit and receive throughput. Multiple records can be transmitted or received per block (up to 512 bytes), each record being separated by IRS characters. Transparent mode cannot be used when sending or receiving blocked data.

Transmit Selected Fields: Provides the capability of transmitting selected field from data records, thus increasing communications line efficiency. Fields are selected under a special program level loaded prior to initiating the teleprocessing function (cannot be used in conjunction with "Transmit Selected Records" function).

Transmit Selected Records: Provides the capability of transmitting selected records from a data file, thus increasing communication line efficiency. Records are selected under a special program level loaded prior to initiating the teleprocessing function. All records matching a search argument are transmitted (cannot be used in conjunction with "Transmit Selected Fields" function).

Receive Data and Insert Constants: Provides the capability of receiving data on a communication line and inserting constant information prior to writing records onto the diskette. The constant information and location is controlled by a special program level loaded prior to initiating the teleprocessing function.

Unattended Print Mode: Allows the printer attached to the 3741 mdl 2 to print the first data set received at the completion of the teleprocessing function without operator intervention. It is accomplished by proper loading of printer program levels and specific operator set-up procedures. **Maximum:** One.

Expanded Comm./MDLC (#1685): [Mdls 2, 4] The Expanded Communications/Multipoint Data Link Control provides all of the capabilities listed under Expanded Communications (#1680) plus Inquiry. Inquiry provides the capability of keying an inquiry message, logging it on the diskette, and transmitting it to a host CPU. The response will be written onto the diskette. A number of records can be received for a long response; after the last record is received, the diskette read/write head will be positioned at the first record received, and it will be displayed on the CRT. The operator can then "record advance" to look at subsequent records in the response. Also allows multiple 3741 mdl 2s to reside on a dedicated network as tributary stations along with other BSC devices. 3741 mdl 2 can be polled or selected when acting as a tributary station in a multipoint system. All 3741 mdl 2s installed on the same line facility require this feature, and they must all use the same type of modem. See "Modems" and M2700 pages. **Limitations:** Cannot be installed with Terminal Identification (#7850). **Maximum:** One.

Data Recorder Attachment (#3200): To attach either a 129 Card Data Recorder mdl 2 equipped with 3741/5320 Attachment (#8201), or a 5496 Data Recorder mdl 1 equipped with a 2772/3741/5320 Attachment (#7850). **Limitations:** Cannot be installed with I/O Adapter (#3265/3266). **Maximum:** One.

I/O Adapter (#3265/#3266): To attach any mdl of the 3741 to a System/3. #3265 for 3741 mdls 1 and 2. #3266 for 3741 mdls 3 and 4. A cable with a maximum length of 12m (40 feet) is provided with an I/O Adapter (#3265/3266). Specify **#9018** indicating length as a quantity of 6m (20 feet) or 12m (40 feet). **Limitations:** Cannot be installed with Data Recorder Attachment (#3200). See limitations for the 3741 Attachment (#8220) on System/3. **Maximum:** One. **Prerequisites:** #8220 on the 5406, 5408, 5410, 5412 or 5415.

3713 Expansion (#3891, #3892): Provides additional capacity to permit installation of Second Disk (#6677) and/or Matrix Printer Attachment (#8111). #3891 for 3741 mdl 1 or 3. #3892 for 3741 mdl 2 or 4. **Limitations:** Cannot be installed with 3715 Expansion (#8120 or #8121) or 3717 Expansion (#8122 or #8123). **Maximum:** One. **Field Installation:** Yes.

Feature Group A (#4002): Consists of the following:

Verify: Provides the capability to check the accuracy of pre-recorded records. If any recorded data is changed as a result of verification, the disk record will be updated upon completion of record. Fields that do not require verification may be bypassed by program control.

Production Statistics: Provides machine statistics for customer use in measurement of workload or production, analysis of errors, and job accounting. Counts automatically under machine control (no programming) data and functional keystrokes, verify correction keystrokes, and records processed. Displaying and/or recording of totals on disk is under operator keyboard control.

Field Totals: Provides the ability to create a hash total for a group of records or a batch of work, or to crossfoot and write totals in the same record or in a following record under program control. Feature consists of three 19-position individual accumulators that add any manually keyed or duplicated numeric fields into any accumulator, under program control. The maximum size of the input field is 14 decimal positions. If overflow beyond 19 digits occurs in an accumulator, it will not be indicated. In addition to the numbers 0-9, a field-total field may include any of the 256 EBCDIC characters. All characters with the low order 4 bits of the character being 0-9 will accumulate with numeric values 0-9 respectively. All other characters will accumulate with the value zero. Arithmetic sign control will be determined by the zone portion of the data keyed into the units position of the field. Responsibility for input size limitation and accumulator overflow is left to the user. Maximum output field size is 19 positions. Accumulators carry true totals in Enter mode. In Update or Verify mode, accumulators contain the net difference between the data read from the disk and the modified data in the accumulate fields. Thus, the net difference totals provide an auto-balance capability. Accumulators can be displayed on the CRT display at operator's option. In addition to keying, totals can be accumulated on an offline basis. Function provides for automatic processing of: each pre-recorded disk record as it is read, adds designated field contents to appropriate counters, reads out/resets and records

3741 Data Station/Workstation (cont'd)

data from counters, and automatic program level selection based on type of record being processed.

Self-Checking Number (Modulus 10 and 11): Feature assures that all digits of a number, such as account or item field, have been correctly keyed. The self-checking number consists of two parts, the basic identifying number, and its check digit. A detected error locks the keyboard. Operates in Enter, Verify and Update mode. **Note:** Self-checking numbers of modulus 10 are not compatible with those of modulus 11. Left-base numbers are not accommodated. Self-checking numbers and left-zero insertion are mutually exclusive within the same field. Self-check number-generating ability is not available.

Disk Initialization: Disks sold by IBM will be initialized at time of manufacture. Disks which develop bad tracks in use can be re-initialized with this feature, so that bad tracks are automatically bypassed.

Keylock (#4655): [Mdls 2, 4] A key-operated switch. When the switch is in the "locked" position, entry into the communications mode of operation is prevented. The 3741 may be used for communications provided it was set up to do so prior to the keylock being set to the "locked" position. **Note:** For additional and/or replacement keys, see "Accessories".

Storage Addition 4K (#4975): Expands storage to 8K for use by an ACL program. **Limitations:** Programs using the 4K additional storage must be translated on a machine with this feature. **Field Installation:** Yes.

Operator Identification Card Reader (#5450): [Mdls 2, 4] Provides the capability of reading a small, 2-1/8 inch by 3-3/8 inch (credit card size), plastic card with a magnetic stripe on the back. This card can be encoded with up to 40 numeric characters, including control characters. This feature provides the ability to read an operator identification card to allow identification of the station operator, thus enhancing system data security capability. Available with 115V (**#9880** or **#9881**) only. For complete information on the availability of operator identification cards, contact IBM. **Maximum:** One.

Integrated Modem, Nonswitched (#5500): [Mdls 2, 4] A modem for nonswitched, 1200 bps, 2- or 4-wire operation over voice grade channel, Type 3002. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #7705. The terminal device with which the 3741 mdl 2 or 4 is communicating must also be equipped with an 1200 bps Integrated Modem.

1200 bps Integrated Modem (#5501): Switched With Auto-Answer. [Mdls 2, 4] A modem with auto-answer for switched operation at 1200 bps over a telecommunications network via FCC registered protective circuitry of the CBS Type (or equivalent) provided by the user. **Maximum:** One. **Prerequisites:** #7705. The terminal device with which the 3741 mdl 2 or 4 is communicating must also be equipped with a 1200 bps Integrated Modem.

Proof Keyboard (#5901): Modifies the standard alphameric keyboard to provide an alphameric keyboard with a numeric key arrangement similar to the adding machine. **Field Installation:** Yes. **Note:** Customers who elect to purchase a 3741 with #5901 only and later add Feature Group A (#4002) and/or Record Insert (#6123) should consider initially purchasing the additional features because this field upgrade requires replacement and re-installation of #5901 along with Feature Group A and/or Record Insert.

Record Insert (#6123): Provides capability to add records within an existing data file. Sequential files can be updated or corrected by inserting records in their proper location within the sequence. **Maximum:** One.

Second Disk (#6677): Provides a second disk drive that allows the user to accomplish the following functions:

- Merge: Records can be merged *from* the second disk and the keyboard onto the first disk.
- Copy: A data file from the second disk can be copied onto the first disk.
- Pooling: Data can be copied from more than one disk onto a single disk. The disks that are to be copied are mounted on the second disk drive and the data is written onto the disk mounted on the standard disk drive.
- BSCA: The second disk may be used to expand the data storage capacity when transmitting or receiving. All second disk functions are read-only functions except when used in conjunction with BSCA feature or on the 3741 mdls 3 and 4 when under ACL program control. **Prerequisites:** #3891 or #3892, or #8120 or #8121, or #8122 or #8123. **Note:** Customers wanting Second Disk *only* (no printer) should order Expansion Feature #3891 or #3892. However, customers who may elect to purchase a 3741 with Second Disk only and later add either a 3715 Printer or a 3717 Printer should consider purchase of Expansion Feature #8120, #8121, #8122, or #8123.

Synchronous Clock (#7705): [Mdls 2, 4] Provides business machine clocking of the data onto and off of the transmission line. To be used only when the attached modem does not provide such clocking. The terminal device with which the 3741 mdl 2 or 4 is communicating must also be equipped with business machine provided clocking. **Field Installation:** Yes. **Prerequisites: #9122** or **#9123.** See "Specify".

Terminal Identification (#7850): [Mdls 2, 4] Provides an expanded identification function when operating on a switched (dial-up) facility. Station transmits a four-character identification sequence when initiating or responding to a line bid. Station can check far-end device identification sequence. Four character identification sequence consists of a one-character terminal type code (this code is the same for all 3741 mdl 2s or 4s), followed by a three-character sequence that specifically identifies that station from any other 3741. The specific terminal identification is a plant-installed sequence assigned by IBM from a randomly generated master list. Also, with this feature, a 3741 can identify if a legitimate station within the user's network is initiating the line bid. This is accomplished by comparing an operator-keyed sequence of characters to a terminal identification sequence received after a connection has been established. Transmission or reception of data can commence only after the received terminal identification sequence matches character-for-character with the operator-keyed sequence. **Limitation:** Cannot be installed with Expanded Communications/Multipoint Data Link Control (#1685).

Matrix Printer Attachment (#8111): Provides the capability to attach a 3713 Printer (40 cps), a 3715 Printer mdl 1 (40 cps bidirectional), or mdl 2 (80 cps bidirectional). **Limitations:** Cannot be installed with 3717 Expansion Feature (#8122 or #8123). **Maximum:** One. **Prerequisites:** #3891, #3892, #8120, or #8121.

3715 Expansion Feature (#8120, #8121): Provides additional capacity to permit installation of Second Disk (#6677) and/or Matrix Printer Attachment (#8111). #8120 for 3741 mdls 1 and 3 or #8121 for 3741 mdls 2 and 4. **Limitations:** Cannot be installed with 3713 Expansion Feature (#3891 or #3892) or 3717 Expansion Feature (#8122 or #8123). **Maximum:** One. **Field Installation:** Yes.

3717 Expansion Feature (#8122, #8123): Provides the capability to attach a 3717 Printer (155 lpm) and/or the Second Disk (#6677) to the 3741. #8122 for 3741 mdls 1 and 3 or #8123 for 3741 mdls 2 and 4. **Limitations:** Cannot be installed with Matrix Printer Attachment (#8111) or 3713 Expansion Feature (#3891 or #3892) or 3715 Expansion Feature (#8120 or #8121). **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS

Model conversions are field installable. **Note:** Purchase customers who wish to upgrade to a model 2 or 4 with Expansion Feature from a model 1 or 3, with or without Expansion Feature (#3891), must purchase Expansion Feature (#3892) at time of upgrade.

ACCESSORIES

Locks and Keys: [Mdl 2, 4] The 3741 with Keylock (#4655) special feature is shipped with two keys. Additional keys may be purchased only from IBM. (Vendor will supply additional keys only to original purchaser.) Order via MES from Rochester, Minnesota. A letter of authorization must accompany each order. Allow six to eight weeks for delivery.

SUPPLIES

Diskettes: For magnetic Diskettes, contact IBM.

Operator Identification Cards: For complete information on availability of operator identification cards, contact IBM.

3742 DUAL DATA STATION

PURPOSE

The 3742 is used to record keyed data onto a magnetic disk by manual operation of the keyboard, and also to verify data that has been previously keyed. Disks are read into a 3747 Data Converter to convert captured data onto one-half inch computer tape for subsequent processing. Diskettes can also be read into an S/370 models 115, 125, 135, 145, 155-II, 158, 165-II, and 168 via the 3540 Diskette Input/Output Unit. Diskettes can be read directly into System/32 or System/34.

MODELS

Model 1 001

HIGHLIGHTS

- Two independently operating stations housed in a single physical unit.
- 80-character fixed record size.
- Verify, production statistics, auxiliary duplicating, and six program levels standard per station.
- 120-character CRT display.

The optional 128-Character feature replaces the 80-character record with a record length that is variable from 1 to 128 characters.

The 3742 has buffered storage area into which data is keyed prior to recording on disk, thus allowing for correction of detected errors before record is written. Six program levels are standard. Programs control the automatic functions of skipping, duplicating, field definition, etc. Automatic program selection provided by program chaining enables operator to key up to a 480-character logical record. Modes of operation (ENTER, VERIFY, UPDATE, or SEARCH) are under keyboard control.

Keyboard: Has a standard 64-character alphameric combination keyboard with "EL" character set for key entry and verifying. In addition to standard keys, the keyboard has Record-Field-Character Backspace, Record-Field-Character Advance, and Repeat keys.

CRT Display: Up to 120 characters can be displayed to each operator, three rows of 40 characters per row. The first row displays machine status (mode of operation, column indicator, and error codes). Rows 2 and 3 display either the data being keyed or the active program, at the operator's option. Data is displayed progressively as it is keyed to build full records for visual verification.

Magnetic Disk: Diskette 1 storage capacity to record up to 1,898 80- or 128-character records, with a maximum of 19 data sets per disk. It is removable and interchangeable among data stations. All data is recorded serially on the disk as standard EBCDIC code. One diskette per station for data recording is provided as standard. For additional diskettes, see "Supplies".

Verify: Provides the capability to check the accuracy of pre-recorded records. If any recorded data is changed as a result of verification, the disk record will be updated upon completion of the record. Fields that do not require verification may be bypassed by program control.

Production Statistics: Provides machine statistics for customer use in measurement of workload or production, analysis of errors, and job accounting. Counts automatically under machine control (no programming), data and functional keystrokes, verify correction keystrokes, and records processed. Displaying and/or recording of totals on disk is under operator keyboard control.

Search Address: Provides a means for direct access to a record that the operator specifies by its track and sector address.

Search EOD: Provides a means to directly access the last record of a data set.

Publications: *IBM 3742 Dual Data Station Reference Manual* (GA21-9184) and *IBM 3742 Dual Data Station Operator Guide* (GA21-9136).

SPECIFY

- Voltage (AC, 1-phase, 60 Hz): For locking plug, specify **#9880** for 115V, **#9884** for 208V, or **#9886** for 230V. For nonlocking plug, specify **#9881** for 115V, **#9885** for 208V, or **#9887** for 230V. Voltage changes cannot be made in the field.
- Color: Specify **#9041** for red, **#9042** for yellow, **#9043** for blue, or **#9045** for gray. **Note:** Color accent is provided on the workspace divider and the front and back panels only; top and sides will always be white. Color changes cannot be made in the field.

SPECIAL FEATURES

Feature Group A (#4003, #4004): #4003 for 80-character machine, #4004 for 128-character machine. **Field Installation:** Yes. **Prerequisites:** #4004 requires #5455. Consists of the following:

Disk Copy: Reads disk records from disk two (secondary station) and writes those records onto disk one (primary station). Initiating the disk copy can occur only from the primary operator station; control must be relinquished by the secondary operator station before operation can begin. This feature allows the user to accomplish the following functions: Merge - records can be merged from the secondary station disk and the primary station keyboard onto the primary station disk; Copy - a data file from the secondary station disk can be copied onto the primary station disk; Pooling - data can be copied from more than one disk onto a single disk. The disks that are to be copied are mounted on the secondary station disk drive, and the data is written onto the disk mounted on the primary station disk drive. **Note:** All secondary disk operations associated with this feature are "read-only" functions.

Disk Initialization: Diskettes sold by IBM will be initialized at time of manufacture. Disks which develop bad tracks in use can be re-initialized with this feature, so that the bad tracks are automatically bypassed. **Note:** Initialization can only be performed at the primary operator station. During the disk initialization process, the secondary operator station is inoperative.

Offline Field Totals: Provides the ability to create a hash total for a group of records or a batch of work, or to crossfoot and write totals in the same record or in a following record under program control.

This feature consists of three 19-position individual accumulators. Data can be summed in accumulators from a specified field or fields in specific or all records of a batch of work. The summation is under program control. Function provides for automatic processing of each pre-recorded disk record as it is read, adds designated field contents to appropriate counters, reads out and records data from counters, reads out/resets and records data from counters, and provides automatic program level selection based on type of record being processed.

Maximum size of input field(s) is 14 decimal positions. Overflow beyond 19 digits in the accumulator will not be indicated. In addition to the digits 0-9, a field total field may include any of the 256 EBCDIC characters. All characters with the low order four bits of the character being 0-9 will accumulate with numeric values of 0-9 respectively. All other characters will accumulate with the value of zero. Arithmetic sign control will be determined by the zone portion of the data keyed in the units position of the fields being processed. Responsibility for input size limitation and accumulator overflow is left to the user. Maximum output field size is 19 positions. **Note:** Offline field total operations can be initiated at either the primary or secondary operator station; however, the non-initiating station is inoperative until completion of run.

Search on Content: Allows user to retrieve and display data on disk by comparing the contents of the desired data record to a search argument. Argument may be equal to all or any portion of the data record. Blank characters in argument are treated as "don't care" characters. Search terminates when equal condition occurs between argument and data record or if a match cannot be found.

Search Sequential Content: Provides a search by content that is much faster than Search on Content. The records must be arranged in the data set in ascending alphameric order within the portion of the record that corresponds to the search argument.

Self-Checking Number (Modulus 10 and 11): This feature assures that all digits of a number, such as an account of item field, have been correctly keyed. The self-checking number consists of two parts, the basic identifying number and its check digit. A detected error locks out the keyboard. Operates in ENTER, VERIFY, and UPDATE mode. **Note:** Self-checking numbers of Modulus 10 are not compatible with those of Modulus 11. Left-base numbers are not accommodated. Self-checking numbers and left-zero insertion are mutually exclusive within the same field. Self-check number generating ability is not available.

128-Character (#5455): Provides record length that is variable from 1 to 128 characters and four additional program levels for a total of 10. Automatic program selection provided by program chaining enables operator to key up to a 1,280-character logical record. Automatic scrolling of the CRT data display permits viewing of the entire 128-character record. A maximum of 80 data characters is visible at any one time. Two added keys provide manual scrolling. **Note:** If field installing 128-Character and Feature Group A (#4003) has been previously installed, Feature Group A (#4003) must be removed and Feature Group A (#4004) installed. In addition, if Record Insert (#6125) has been previously installed, Record Insert (#6125) must be removed and Record Insert (#6126) installed. **Field Installation:** Yes.

Proof Keyboard (#5902): Modifies the standard alphameric keyboard to provide both key stations of the 3742 with alphameric keyboards having numeric key arrangements similar to an adding machine. **Note:** Customers who may elect to purchase a 3742 with #5902 only and later add Feature Group A (#4003 or #4004) should consider purchase of the additional feature initially because this field upgrade requires replacement of #5902 and the re-installation of #5902 along with Feature Group A. **Maximum:** One. **Field Installation:** Yes.

Reading Board Extension (#6065): The extension can be attached to the front edge of the standard reading board to provide an additional 4x40 inch working area to the left of the keyboard. Feature provides

3742 Dual Data Station (cont'd)

extension board for each station. **Maximum:** One. **Field Installation:** Yes.

Record Insert (#6125, #6126): Provides capability to add records within an existing data file. Sequential files can be updated or corrected by inserting records in their proper location within the sequence. #6125 is for 80-character machines, #6126 for 128-character machines. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS

There are no model conversions. Customers who may elect to purchase an 80-character 3742 with Feature Group A and/or Record Insert and later upgrade to a 128-character 3742 should consider purchase of the 128-character machine initially rather than the 80-character machine.

ACCESSORIES (None)

SUPPLIES

Diskettes: For magnetic diskettes, contact IBM.

3747 DATA CONVERTER

Effective February, 1984, the 3747 will no longer be available. RPQs, special features, and accessories will also be no longer available. Model conversions will continue to be available.

PURPOSE

The 3747 is a stand-alone buffered machine used primarily to convert batched data from diskette to one-half inch magnetic tape. Special features provide conversion from tape to disk, tape blocking and deblocking, record reformatting, and basic processing of IBM magnetic tape labels. The communications special feature allows point-to-point BSC communications with other BSC devices. This feature also allows the 3747 to be used as a tape transmission device.

MODELS

Model 1 001

HIGHLIGHTS

The basic 3747 consists of a control unit, control panel, disk drive and autoloader, and magnetic tape drive. The basic function of this machine is to convert data from disk to tape as a stand-alone offline unit. It provides a fast input medium to the CPU via the tape, relieving the computer operator from handling unit records. Errors in data transmission or tape and disk writing are detected and corrected with minimal operator involvement. Job statistics are available via a control panel display.

Special features provide the ability to transcribe data from tape to disk. Basic tape label processing is also possible as a special feature. Another feature permits reformatting of records as well as blocking and deblocking of records. With the Communications Adapter, the 3747 can be used as a binary synchronous terminal for point-to-point communications with various BSC devices.

Communications: The 3747 may communicate over point-to-point switched or nonswitched facilities (C4, C5, D3, D4, or X1M) with another 3747 or 3741 mdl 2 or 4 with the appropriate communications adapters. For further information concerning these facilities, see the M2700 pages.

Communications are also possible with a 5280 via its Communications Adapter; a System/32 via Binary Synchronous Communications; a System/34 via its Communications Adapter; an S/360 mdls 22-75 (except mdls 44 and 67 in TSS mode) and mdl 195; an S/370 mdls 115, 125, 135, 135-3, and 138 via Integrated Communications Adapters; and an S/370 mdls 115-195 via a 2701 Data Adapter Unit, a 2703 Transmission Control, or a 3704 or 3705 Communications Controller equipped with appropriate BSC adapters and features.

See programming pages for storage size requirements for teleprocessing support. Code is EBCDIC.

Magnetic Tape: The following tapes and reels can be used: IBM Series 500, IBM Heavy Duty, IBM Dynexcel, or equivalent formulations which meet the tape and reel criteria in *Tape Specifications* (GA32-0006).

Publications: *3747 Data Converter Reference Manual and Operator Guide* (GA21-9170).

SPECIFY

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Specify **#9880** for 115V, locking plug. For nonlocking plug, specify **#9881** for 115V, **#9885** for 208V, or **#9887** for 230V. For raised floor applications, specify **#9902** for 208V or **#9904** for 230V. Voltage changes cannot be made in the field.
- Color: Specify **#9041** for red, **#9042** for yellow, **#9043** for blue, or **#9045** for gray. **Note:** Color accent is provided on the top covers only. The front, side, and back panels will always be white. Color changes cannot be made in the field.
- Modem Attachment: The 3863 or 3872 modem is recommended for 2400 bps operation on C5 or D4 facilities. One of the following must be specified, depending upon the line facilities to be used, if the Communications Adapter (#1660) is selected: **#9120** for C5M/D4M (2000 bps), **#9121** for C5/D4/X1M (2400 bps), **#9122** for D3M (1200 bps), or **#9123** for C4M (1200 bps). **Prerequisites: #9122** or **#9123** requires #7705. See "Special Features".
- Modem Cable: A 20 foot modem cable is provided as standard. If more than 20 feet of cable are required, specify **#9021** for a 40 foot length and indicate 40 as the quantity.
- Tape Control: A tape control (#7880, #7885, #7890, or #7895) must be specified. See "Special Features".

SPECIAL FEATURES

Selection of a tape control feature determines whether any other special feature can be added. One of the tape control features must be selected.

Blocking/Reformatting (#1480): Provides capability to block or deblock records on tape or to BSCA up to limits of available storage. Also provides ability to reformat records by rearrangement of fields, deletion of fields, insertion of constants, and splitting and joining of records. Reformatting may be done in conjunction with blocking or deblocking. With an appropriate Storage feature (#7690, #7691, or #7692) and Communications Adapter (#1660), provides the ability to send or receive long records (up to limits of available storage) to a similarly configured 3747, or under programming support. See programming section for information on programming support. Although transmission blocks up to 8,000 bytes may be sent or received by an appropriately featured 3747, it is recommended that transmission blocks be limited to 512 bytes when communicating with supported systems. Use of larger blocks may be limited by host system buffer size, multiplexer buffer size, line quality, or effects on total system throughput. **Limitations:** Not available with Tape Control, Write-Only (#7880). **Field Installation:** Yes. **Prerequisites:** #3888; #7690, #7691, or #7692; and #7885, #7890, or #7895.

Communications Adapter (#1660): Provides the 3747 with a serializer/deserializer, associated registers, and line control logic for binary synchronous operation. The necessary interface is included for point-to-point half-duplex mode operations on a switched or nonswitched network. Transmission is provided at rates of 1200, 2000, or 2400 bps. Included as standard with this feature are user options for Auto-Answer, EBCDIC Transparency, Terminal Identification, and Far-End Device (also called CPU) Identification. **Note:** For increased transmission rates up to 9600 bps, order RPQ S40093. See "Modem Attachment" under "Specify" for facilities. **Field Installation:** Yes. **Prerequisites:** #7885, #7890, or #7895.

Expanded Function (#3888): Provides additional capacity to permit installation of Storage (#7690, #7691, or #7692) and Blocking/Reformatting (#1480). Also provides capability to position tape to add records to a file, add a file to a tape, or replace a file on tape. Provides checking of diskette label names during disk to tape operations and also for writing and checking of a diskette conversion mark. With Communications Adapter (#1660), provides the ability to select from files recorded on one tape to send each to a different location, and to restart communications without retransmission of data correctly received. **Limitations:** Not available with Tape Control, Write-Only (#7880). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #7885, #7890, or #7895.

Int. Modem, Nonswitched (#5500): An integrated modem for nonswitched operation at 1200 bps, 2- or 4-wire voice grade channel, Type 3002. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1660; #7705; and #7885, #7890, or #7895. The terminal device with which the 3747 is communicating must also be equipped with a 1200 bps integrated modem.

Modem, Switched with Auto-Answer (#5501): An integrated modem with auto-answer for operation at 1200 bps over a switched telecommunications network via FCC-registered protective circuitry of the CBS Type (or equivalent) provided by the user. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1660; #7705; #7885, #7890, or #7895. The terminal device with which the 3747 is communicating must also be equipped with a 1200 bps integrated modem.

Storage (#7690, #7691, #7692): Storage for use with Blocking/Reformatting (#1480). #7690 provides 2K bytes of storage, #7691 provides 4K bytes of storage, and #7692 provides 8K bytes of storage. **Limitations:** Not available with Tape Control, Write-Only (#7880). **Maximum:** One per 3747. **Field Installation:** Yes. **Prerequisites:** #1480; #3888; and #7885, #7890, or #7895.

Synchronous Clock (#7705): Provides business machine clocking of the data onto and off of the transmission line. To be used only when the attached modem does not provide such clocking. **Field Installation:** Yes. **Prerequisites:** #1660 and #7885, #7890, or #7895. The terminal device with which the 3747 is communicating must also be equipped with business machine provided clocking. See also "Modem Attachment" under "Specify".

Tape Control, Write-Only (#7880): Provides a 9-track, 1600 bpi, PE write-only tape control. This tape cannot be read. No other special features can be installed on a machine with this control. **Field Installation:** Yes.

Tape Control, Read/Write (#7885): Provides a 9-track, 1600 bpi, PE read or write tape control. The tape can be read as well as written, thus providing a tape-to-disk capability. Other special features may be installed on a machine with this control. **Note:** Customers who may elect a write-only machine and later upgrade to the read/write 1600 bpi should consider the 1600 bpi Tape Control, Read/Write (#7885) initially, rather than Tape Control, Write-Only (#7880). **Field Installation:** Yes.

Tape Control, Read/Write (#7890): Provides a 9-track, 800 bpi, NRZI read or write tape control. The tape can be read as well as written, thus providing a tape-to-disk capability. Other special features may be attached to a machine with this control. **Field Installation:** Yes, only to replace #7895. Not recommended to replace a Phase Encoded tape control (#7880 or #7885).

Tape Control, Read/Write (#7895): Provides a 7-track, NRZI read or write tape control. User-selectable options at job time are density

3747 Data Converter (cont'd)

(800/556 bpi) and parity (even/odd). Translate on and convert off are standard fixed modes. The tape can be read as well as written, thus providing a tape-to-disk capability. Other special features may be attached to a machine with this control. **Field Installation:** Yes, only to replace #7890. Not recommended for field installation to replace a Phase Encoded tape control (#7880 or #7885).

Tape Label (#7900): Provides the logic to check and build IBM magnetic tape labels. Also provides accessibility to secured tapes via a Keylock/Cipher Lock and an Erase-to-Tape Indicate facility. This assists the user in providing protection for sensitive data. **Note:** For additional or replacement keys, see "Accessories". **Field Installation:** Yes. **Prerequisites:** #7885, #7890, or #7895.

MODEL CONVERSIONS (None)

ACCESSORIES

Locks and Keys: The 3747 Tape Label (#7900) is shipped with a lock and two keys. Additional keys may be purchased only from IBM. Key identification number must accompany each order. Allow six to eight weeks for delivery. A new keylock with two keys must be ordered by MES if the key identification number cannot be supplied.

SUPPLIES (None)

3760 DUAL KEY ENTRY STATION

PURPOSE

Used to key data on to the 3791 Controller disk. The disk in the 3791 is used as a data storage medium prior to transmission of batched data by channel or SDLC communications facilities to any virtual storage S/370 or 4300 processors. Data extraction can be done by diskettes.

MODELS

Model 1: 001 A Dual Key Entry Station ... Display Panel ... attaches to the 3791 with Device Attachment Type I (#7900) or Device Attachment Type I Add'l (#7922).

Model 2: 002 Same external appearance as model 1. First model 2 is attached to model 1 via 3760 model 2 Attachment (#7920). Second model 2 is attached to model 1 via a second model 2 Attachment (#7920).

Model 3: 003 A Single Key Entry Station ... Display Panel. Has same functional characteristics as model 1. Attaches to the 3791 with Device Attachment Type I (#7900) or Device Attachment Type I, Add'l (#7922). Can be optionally attached to up to four 3791 3791 Controllers simultaneously with the capability to switch between them. 3760 model 2s cannot be attached.

Prerequisites: For 3760 mdl 1 and mdl 3 ... **#9175** or **#9195**, #7900 or #7922, a #3220 , #3221 or #1590 and one or more #1602s or #1612s. For 3760 mdl 2 ... 3760 mdl 1 and #7920. For details, see M3791 pages.

HIGHLIGHTS

Mdl 1 and mdl 2 ... each physical station provides two keyboard operator positions each with keyboard and display panel area. Mdl 3 provides one operator position with keyboard and display panel area.

Has buffered storage area into which data is keyed prior to recording on the 3791 disk storage thus allowing for correction of detected errors before record is stored. Formats control the automatic functions of skipping, duplicating, editing, etc. Modes of operation are under keyboard control.

Keyboard: Has a standard 66-character alphameric combination keyboard with "EL" character set for key entry and verifying. In addition to standard keys, the keyboard has: Record-Field-Character Backspace, Field-Character Advance, Auto Skip/Dup and Auto Entry Key Switch, Display Record, Next Format, Record Position, Insert and Delete, Cursor Up and Down, Cursor Placement at Command Line, Mark Record and Scan Next Record keys . Command Keys (**#9079**) are provided as a specify feature. Optionally available are ASCII Keyboard and proof arrangements of both the EBCDIC and the ASCII keyboard.

Display Panel: Up to 236 characters can be displayed to each operator, six rows of 40 positions each. First row is the command line on which messages, commands, error types, and mode of operation are displayed, row two through six display keyed data as it is entered. A fill-in-the-blanks format may be displayed and as data is entered the cursor will automatically skip over the indicative format data. Status Indicators on the left and right side of the panel. Left side indicators are: Operator Attention, Auto Skip/Dup, Display Record, Auto Enter, Verify Mismatch . Right side indicators are: Operator Attention, Station Available, Enter, Verify, Insert Mode and Dup Not Allowed.

Publications: GC20-0370

SPECIFY

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Locking Plug -- **#9980** for 115V, **#9884** for 208V, **#9886** for 230V. Non-locking Plug -- **#9881** for 115V, **#9885** for 208V, **#9887** for 230V. **Note:** Mdl 1 and the two attached mdl 2s require the same power specifies.
- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray.

  Note: Color accent is provided on the knee panel only and may be any of the above colors. Top and side panels will always be white.
- Cables: See "Accessories". For cable specifications see *3790 Information Manual - Physical Planning* (GA27-2769).
- Command Keys **#9079**: Provides, through the command key at the left side of the space bar, the ability to issue commands: HELP, COPY, FLAG, ACCEPT, RETURN, CONTINUE SEARCH, SAVE and FORMAT DISPLAY by pressing the command key first and then the appropriate top row key of the keyboard. A label on the keyboard cover, just above the top row, identifies the command functions of the keys. **Maximum:** Two per 3760 mdls 1 and 2 ... one per mdl 3. **Field Installation:** Yes. **Prerequisites:** #7115.
- Conditional Display **#9220**: This option may be specified to prevent Keyboard overrun in some situations. For details see IBM. **Maximum:** One per mdl 1. This function works on all operator positions attached to the mdl 1 with this feature. **Field Installation:** Yes. **Prerequisites:** #7115 (mdl 1 only) and **#9175** or **#9195** on 3791.
- Keyboard Arrangements: EBCDIC is standard. If required, specify **#9393** for ASCII. Proof versions have the alphameric keyboard with a numeric key arrangement similar to that of an adding machine. All 3760 mdl 2s will have the same arrangement as the attached 3760 mdl 1. If required, specify: **#9425** for proof keyboard, ASCII; **#9426** for proof keyboard, EBCDIC. **Field Installation:** Yes ... specify **#9391** for field installation of standard EBCDIC keyboard. **Prerequisites:** #7115 [mdl 1] and **#9175** or **#9195** on the 3791.

SPECIAL FEATURES

Security Keylock (#6350): [Mdl 1, 3] A key operated switch. When the switch is in the "locked" position, entry of data into the 3760 mdl 1s, mdl 3s and all attached mdl 2s is prevented. **Note:** For additional and/or replacement keys, see "Accessories". **Field Installation:** Yes.

Selector Switch (#6660): [Mdl 3] Provides a 4-position rotary switch, allowing a 3760 mdl 3 to be switched between up to four 3791 Controllers. **Maximum:** One per 3760 mdl 3. **Field Installation:** No. **Prerequisites:** #6350.

Storage Extension (#7115): Provides additional storage in 3760 mdl 1, permitting installation of Command Keys (#9079), Proof Keyboard **#9425** or **#9426** on 3760 mdl 1 and 2 and Conditional Display (**#9220**) on 3760 mdl 1. **Maximum:** One per 3760 mdl 1. **Field Installation:** Yes.

3760 Mdl 2 Attachment (#7920): To attach one 3760 Dual Key Entry Station mdl 2 to a 3760 mdl 1. **Maximum:** Two per 3760 mdl 1. **Field Installation:** Yes.

MODEL CONVERSIONS (None)

ACCESSORIES

Keys: The 3760 with Security Keylock (#6350) is shipped with two keys. Additional keys may be purchased only from IBM. Order via MSORDER (Category = Supplies/Accessories; Group Code = DP Supply Order) on AAS. A letter of authorization must accompany order and serial number of lock must be included.

SUPPLIES (None)

3762 PAYMENT TRANSACTION PROCESSOR

PURPOSE

To process payment transactions by scanning OCR-A encoded data from turn-around documents (stubs), validating keyed-in payment amounts and storing selected payment information onto the disk in the 3791 Controller, to which the 3762 attaches. One-step processing is achieved with the appropriate special features, producing proper batches of inscribed and endorsed checks for deposit in the bank with user-specified audit trail information, complete with deposit ticket and journal tape listing. A storage extension feature allows handling of agent transactions, user-programmable subroutines, OCR-B, 1428 and 0.095 inch standard 1403 fonts.

MODELS

Model 1: 001

Prerequisites: In 3791 ... #7900 and #7922 depending upon the number of units attached ... #3221, #1590, and #1603, #1613 as required. For details, see M3791 pages. Configuration guidelines are given in GA33-4572.

HIGHLIGHTS

A 3762 provides two operator positions, each equipped with a keyboard, a 240-character display, a document transport and a scanner to read one line of up to 60 machine-printed numeric digits in either OCR-A, OCR-B, 0.095 inch standard 1403 or 1428 font. OCR-A is standard, other fonts require Storage Extension (#7500). The appropriate recognition logic is loaded into the 3762 automatically. Different OCR fonts can be used by different 3762s in one 3790 communication system/data entry configuration simultaneously, but the two operator positions on one 3762 must use the same font. Documents are entered by hand into the document entry slot in front of the operator. They are transported under machine control past the OCR read station which incorporates a solid state scanning device to collect character images. These images are analyzed and recognized within the 3762 recognition and control processor.

The table of "Acceptable Characters and Printing Devices" below shows the characters which are acceptable from typewriters, high-speed printers and offset printing using the designated font. Non-recognized OCR data as well as the payment amount can be entered by the operator via the keyboard. After (user-specified) editing and checking of the data entered, the amount paid is checked for acceptability (according to user-specified criteria). The output record is subsequently prepared and transferred to the attached 3791 Controller for intermediate storage on the 3791 disk. Special features include audit trail printing on stubs, checks and deposit tickets, E13B inscribing of checks and deposit tickets, endorsing of checks, and journal tape printing of the amounts processed. Printing is under program control.

Acceptable Characters and Printing Devices

	OCR-A	OCR-B (6)	0.095 inch Standard 1403 (1,6)	1428 (6)
Digits	0 - 9	0 - 9	0 - 9	0 - 9
Delimiters	Hook Fork Chair LVM (2) Double Blank (3) Single Blank (4) Margins (5)	< + > LVM (2) Double Blank (3) Single Blank (4) Margins (5)	– LVM (2) Double Blank (3) Single Blank (4) Margins (5)	LVM (2) Double Blank (3) Single Blank (4) Margins (5)
Printers	Selectric® 1403 3203 3211 3800 Offset	Selectric® 1403 3203 3211 3800 Offset	1403 3203 3211 Offset	1403 3203 3211 Offset

Notes:

(1) Also called 407-I font. Train arrangements must have suffix 2, e.g., HN2.

(2) The LVM is a pre-printed vertical line, 3.70mm (0.145 inches) minimum height, centered in the print band, having the normal character stroke width and occupying a full character space.

(3) A Double Blank is a blank space of at least 4.3mm (0.170 inch). Single and double blanks may not be specified intermixed in one codeline.

(4) A Single Blank is a blank space of at least 2.3mm (0.090 inch) and less than 4.3mm (0.170 inch).

(5) The Right and Left Margins are each 6.35mm (0.250 inch) wide.

(6) The OCR-B, 0.095 inch standard 1403 and 1428 fonts can only be recognized when the Storage Extension feature is installed.

The 3762 can process single-stub, multi-stub and agent transactions. Agent transactions require Storage Extension (#7500). A transaction may contain one or more checks. All data entry operating modes available for the 3760 Dual Key Entry stations are also available on the 3762. For details, see M3760 pages. Moreover, 3760 operations such as updating of a customer's address can be performed intermixed with payment transaction processing. See *IBM 3790 Communication System - 3762 Payment Transaction Introduction* (GA33-4570), and *IBM 3790 Communication System - 3762 Payment Transaction Functional Description* (GA33-4571).

Keyboard: Has a standard 66-character alphameric combination keyboard with EL character set for key entry and verifying in 3760 mode. In addition to standard keys, the keyboard has: Record-, Field-, and Character-Backspace ... Field-Character-Advance ... Auto Skip/Dup and Auto Enter Key Switch ... Display Record ... Next Format ... Record Position ... Insert and Delete ... Cursor Up and Down ... Command Line and Command ... Mark Record ... Hex/Alternate ... Scan Next Record ... and PF keys. Use of the top row of keys as command keys for the following 12 commands is standard: Help, Copy, Flag, Accept, Return, Continue Search, Save, Format Display, Total, Check,Purge, and Notice (only active with Agent Processing).

Optionally available are ASCII keyboard, and proof arrangements of the EBCDIC and the ASCII keyboards. The proof keyboard modifies the standard keyboard to provide a numeric key arrangement similiar to that of an adding machine. See "Specify" below for details.

Display Panel: Up to 236 characters can be displayed to each operator on six rows of 40 positions each ... first row is the command line on which entered commands, messages, error types, and mode of operation are displayed ... data entered may be displayed on rows two through six ... a fill-in-the-blanks format may be displayed and the cursor will automatically skip over the prompting information as data is entered ... status indicators on the left and right side of the panel ... left side indicators are: Operator Attention, Auto Skip/Dup, Display Record, Auto Enter, and Verify Mismatch ... right side indicators are: Operator Attention, Station Available, Enter, Verify, Insert Mode and Dup Not Allowed ... as on the 3760. A special format screen is displayed for payment transaction processing.

Transport: Contains an entry slot, a document transport mechanism, a pocket selector and two pockets ... documents are hand-fed. Documents move from the entry slot past the scanner to the pockets. The transport accepts stubs ranging from 76.2 to 152.4mm (3.0 to 6.0 inches) high and 69.85 to 222.25mm (2.75 to 8.75 inches) long, provided the height/length ratio is 1.4:1 or less, and checks with standard ABA check sizes. Allowable weight ranges from 16 to 32 lbs and card stock. For details, see *3762 Paper and Printing Requirements* (GA33-4576).

Scanner: Consists of four lamps, a lens, and a linear array of 64 photodiodes and is located in the transport. Its vertical position is operator-settable to the appropriate position of the codeline of printing to be scanned on the document. For details on permissible codeline locations, see *3762 Paper and Printing Requirements* (GA33-4576).

Pockets: Provided are two document pockets with a depth of 44.4mm (1.75 inches) each. Stubs and checks are automatically selected to the two pockets.

Documents and Printing: The input documents and printing must conform to the specifications described in *3762 Paper and Printing Requirements* (GA33-4576). Ribbons and background inks meeting the outlined criteria will give good performance. See "Accessories" and "Supplies".

Document Tray: Two document trays are provided with every 3762, one for each operator position. The document tray can be used by an operator to hold the stack of stubs and checks to be entered. For additional or replacement document trays, see "Accessories".

Publications: GC20-0370

SPECIFY

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Locking plug -- **#9880** for 115v, **#9884** for 208V, **#9886** for 230V. Non-locking plug -- **#9881** for 115V, **#9885** for 208V, **#9887** for 230V.
- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray. **Note:** Color accent is provided on the knee panel only and may be any one of the above colors ... top and side panels will always be white.

3762 Payment Transaction Processor (cont'd)

- Cables: For cable specifications, see *IBM 3790 Information Manual - Physical Planning* (GA27-2769).
- Keyboard/Language Arrangements: Proof versions have the alphameric keyboard with a numeric key arrangement similiar to that of an adding machine.

  #9420 for ASCII
  #9421 for EBCDIC
  #9423 for Proof Keyboard (ASCII)
  #9424 for Proof Keyboard (EBCDIC)

  Note: All 3762 stations attached to the same 3791 Controller must have the same keyboard/language arrangement. The proof version may be intermixed with the non-proof version in a 3790 system but not in the 3762 unit.

SPECIAL FEATURES

Audit Trail Printers (#1310): This feature consists of two matrix-print devices, one in each transport. It prints 7x7 dot characters with a pitch of 8.5 characters per inch ... a maximum of 40 print positions on one line. Printing is on the back of the documents starting at 3.0mm (0.12 inches) from the leading edge, on stubs, checks and deposit tickets, centered 66.5mm (2.62 inches) from the bottom edge. Fields to be printed on stubs and checks are selected by the user during format definition (not for Deposit Tickets). The character set consists of ten digits, 26 letters, seven symbols and blank. See "Supplies" for cartridge ribbon. **Field Installation**: No.

Endorsers (#3805): This feature consists of two endorsing stations, one in each transport. It prints a user-designed endorsement legend on the reverse side of the checks. The maximum size of the legend is 28 x 33mm (1.1 x 1.3 inches). The user can specify the horizontal endorsement position close to the leading or the trailing edge during format definition. See "Accessories" for endorser plates. **Field Installation**: No. **Specify**: Endorser Ink Roll -- **#9145** for black, **#9147** for purple, **#9148** for red.

Journal Tape Printers (#4660): This feature consists of two journal tape print devices, one for each operator. It lists the check amounts processed within a deposit and the deposit total as well as the appropriate deposit identification. When processing agent transactions, the individual stub amounts are printed. With the individual amounts, a 3-digit item identification number is printed in italics in the three leftmost character positions. The two rightmost positions are reserved for a code that identifies the printed line. In total, 15 character positions are avaialble. The printed tape is within reach of the operator for tear-off at completion of the deposit. See "Supplies" for Ink Ribbons and Journal Tape. **Field Installation**: No.

MICR Inscribers (#5100): This feature consists of two MICR (E13B) inscribing units, one in each transport. It encodes the amount on checks of acceptable transactions. At the user's option it encodes in the same pass, amount, process control, account number and transit routing fields on deposit tickets. All fields are encoded in accordance with the Bank Check Specifications for MICR, ANSI X3.3-1970. See "Supplies". **Field Installation**: No.

Security Keylock (#6350): A key-operated switch ... one per 3762. When the key is in the "locked" position, entry of data via a scanner or a keyboard is prevented. Automatic Re-IMI occurs when unlocking. Note: For additional and/or replacement keys, see "Accessories". **Field Installation**: Yes.

Storage Extension (#7500): This feature provides an 8K byte storage extension in the 3762. It must be installed when processing agent transactions ... applying user-programmable subroutines ... 1428, OCR-B 0.095 inch standard or 1403 numeric font recognition is required. Only one type font can be recognized in the 3762 at any one time, but different 3762s may recognize different fonts. **Maximum**: One. **Field Installation**: Yes.

ACCESSORIES

Document Gauge: The 3762 Document Gauge can be ordered as GX33-8505.

Document Trays: The 3762 is shipped with two document trays. Additional or replacement trays may be purchased. Order on MES from Raleigh. Document Tray, P/N 2716872.

Endorser Plates: For ordering, see SSD sales manual and use SSD form Z170-1479.

Locks and Keys: The 3762 with Security Keylock (#6350) is shipped with two keys. Additional keys may be purchased only from IBM. A letter of authorization must accompany order and serial number of lock must be indicated.

SUPPLIES

Ribbons for Printing Input Documents:

Film Ribbon Selectric - P/N 1136310 or 1136391
Fabric Ribbon Selectric - P/N 1136138
1403 (mdl 2 and N1) - P/N 1136430, 414486 and 424325
3211 Ribbon - P/N 1136626 or 1136627
3203 (mdls 1, 2 and 3) - P/N 1136430.

Ribbons not having similiar characteristics may result in reduced recognition performance.

Audit Trail Printer (#1310):

Cartridge Ribbon ... P/N 1136970 or equivalent.

Journal Tape Printers (#4660):

Ink Ribbon ... recommended material Nylon or Vinylon fiber (FF40). Spool diameter ... 35.1mm (1.38 inches). Spool type ... standard only, ribbon width 12.7mm (0.5 inch), length 6,096mm (240 inches), P/N 1299087 (black) or equivalent.

Journal Tape ... single- or two-ply width 57.2mm (2.25 inches), roll diameter 81.0mm (3-3/16 inches) maximum.

Single-ply ... recommended paper weight 16 lbs at 5% (approx. 60 gr/sq.m), tape has to be colored through the last 1.8m (6 feet) approx., P/N 457297 or equivalent.

Two-ply ... recommended paper weight 16 lbs at 5% (approx. 60 gr/sq.m) per ply, tape has to be colored through the last 1.8m (6 feet) approx., P/N 457298 or equivalent.

MICR Inscriber (#5100):

MICR ribbon P/N 431555 or equivalent.

A MICR gauge is available for checking inscriber output registration.

3767 COMMUNICATION TERMINAL

PURPOSE

A keyboard printer terminal for transmission of data or text to or from any virtual storage S/370, 4300 processor via a 3704, 3705, or 3725 Communications Controller, to a 4321, 4331 or 4361 via its Communications Adapter, or to the 8100 Information System via the 8130, 8140 and/or 8101. The 3767 uses Synchronous Data Link Control (SDLC) line discipline.

Also attaches to System/3 or System/7 via RPQ. See Start/Stop feature description.

MODELS

Model 1	001	40 cps average bidirectional printer.
Model 2	002	80 cps maximum bidirectional printer; includes dual 256-byte line buffers and full buffer editing capability.
Model 3	003	120 cps maximum bidirectional printer; includes dual 256-byte line buffer and full buffer edit capability.

Note: Throughput on all models is dependent upon output format, line control, buffering and transmission speed.

Customer Set-Up (CSU): The 3767 is designated as a customer set-up device thereby offering the customer early availability and relocation flexibility. The IBM Marketing Representative must advise customers of their responsibilities before receipt of the machine.

The CSU Allowance is one day.

HIGHLIGHTS

The 3767 consists of control functions, printer keyboard, control keys and indicator lights in one integrally designed desk-top unit. This configuration allows an operator/machine relationship that is most favorable for both interactive and batch operations. Special features available permit tailoring of the terminal to the user's requirements.

Control Functions: Provides the control for all online and offline operations; facilitates communication at speeds up to 2400 bps in SDLC line discipline and controls single line data editing on the base mdl 1. It also controls, on both mdls, basic functions such as Automatic Terminal Identification, Station Control, Internal Communication Clocking, Transmit and Receive Interrupt, End of Line Alarm, Buffer Full Alarm and Auto (EOB/EOM) switch.

Printer: [Mdl 2] Maximum printer throughput is obtained with bidirectional serial matrix printing and indexing without unnecessary print head movement. Electronic tabbing over the full 132 printable positions is provided. The printer dot matrix is 4 or 7 wide by 8 high giving high legibility with character spacing at 10 to the inch. Line spacing is 6 lines to the inch. Forms of up to six parts (total thickness 0.018 inches) may be used. For any multipart or pre-printed continuous forms, the Variable-Width Forms Tractor (#8700) is recommended. Five- and six-part continuous forms should be tried on an individual basis for acceptable feeding, registration, and print quality. Single part continuous or up to four part cut forms can be used with the standard friction feed platen. The Paper Roll Holder and Forms Guide with Paper Bail **#9180** is available for use with roll paper and is recommended for use with single part fan-fold paper when the Variable-Width Forms Tractor (#8700) is not used. Maximum overall forms width is 15 inches. Card stock forms are not recommended. See GA24-3488 for form specifications and limitations.

Printer: [Mdl 3] Same as described above for mdls 1 and 2 with the exception that Forms Tractor is required for all continuous forms.

Keyboard: Provides several keyboard arrangements and includes typamatic on hyphen, underscore, backspace and space keys. In addition to the standard 44 alphanumeric data keys, are function keys, indicator lights, operating mode switches, and a 3-position numeric "print position indicator" display to aid the operator.

Security Enhancement Features: Print Suppress (standard) allows selected data fields to be entered without being printed. The Security Keylock (optional) with the power switch "On" allows the 3767 to be operational.

The Magnetic Stripe Reader (optional) is provided to allow operator identification to be transmitted.

Communication Facilities: The 3767 operates in half-duplex mode over the public switched telephone network, a nonswitched voice grade line or the Dataphone® Digital Service. For details, see M2700 pages.

® Registered Trademark of AT&T

Synchronous Data Link Control: Allows for transmission rates of 600, 1200 or 2400 bps.

The 3767 can communicate on a switched or nonswitched point-to-point facility, or as a secondary station on a multipoint or duplex multipoint facility to any virtual storage S/370 or 4300 processor, or nonswitched point-to-point or multipoint on the 8100 Information System.

Modems: One integrated Modem or External Modem can be used. See "Special Features" for options. Synchronous clock is a standard feature.

Problem Determination Procedures: Significant function has been designed into the 3767 to provide greater availability to the customer. This has been done through the use of problem determination and recovery routines and procedures that are easily understood and used by the operator. See *IBM 3767 Operator's Guide,* GA18-2000.

Customer Responsibilities: The customer is responsible for:
- –unpacking, placement, set-up and checkout of the 3767 at time of delivery, or when relocating the 3767.
- –removal and packing of the 3767 at time of discontinuance.
- –relocation of the 3767 (if required) to allow IBM service access.
- –using and following the Problem Determination Procedures and filling out the Trouble Report prior to calling IBM for service.

See M2700 pages for additional responsibilities.

Publications: See KWIC Index G320-1621 or specific system bibliography

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, **#9881** for non-locking plug.
- Keyboard Arrangement: **#9381** for Correspondence or **#9391** for EBCDIC.
- SDLC transmission speed selection:

  #9533 (2400 bps)
  #9532 (1200 bps)
  #9531 (600 bps)

  See "Special Features" for modems and modem attachments.
- SDLC transmission speed selection:
- SDLC transmission speed selection:

  See "Special Features" for modems and modem attachments.
- Integrated/External Modem Cable: A 20-foot cable is provided as standard. If a longer cable is required, specify **#9021**, indicating length in feet as a quantity of 25, 30, 35 or 40.
- 6-foot Power Cord: Specify **#9986**; otherwise a 10-foot power cord will be provided.
- Variable-Width Forms Tractor Covers: Specify **#9850** for cover change if the Variable-Width Forms Tractor (#8700) accessory is ordered.
- Paper Roll Holder and Forms Guide (**#9180**): [Mdls 1, 2] with Paper Bail **#9180** must be ordered on all machines without Variable-Width Forms Tractor Covers (#9850). A customer using the Variable Width Forms Tractor has the option of ordering specify feature **#9180** at no additional charge, once per machine, for friction feeding of single part continuous roll and fan fold paper. Specify feature **#9180** is used interchangeably with the Variable-Width Forms Tractor and is attached and removed by the customer.
- Paper Roll Holder and Forms Guide (**#9180**): Provides a paper holder for roll paper supply. Also provides a guide for single part, fan-fold when Variable Width Forms Tractor (#8700) is not used. Accepts roll sizes -- up to 14-7/8 inch width, up to 5-1/2 inch diameter.
- SNA Terminal Address: **#9857** must be specified on all orders ... supplemental specs available for giving one EBCDIC byte address. Any two "Hex" characters, excluding "00" and "FF" may be used.
- Blower (**#9030**): [Mdls 1, 2] Must be specified for 3767 expected to operate in an environment above 90 degrees F ambient temperature (specification limit is up to 105 degrees F).
- Paper Tear Bar (**#9422**): [Mdls 1, 2] A device for tearing continuous forms. **Prerequisites:** #9180.

SPECIAL FEATURES

Note: Customers who elect to purchase one of the features* listed in Group #1 or Group #2 and later order additional features within that group should consider purchase of all features initially because these field upgrades require replacement of the initial feature and installation of the new combination.

* Except when Vertical Forms Control (#8731) has previously been installed and the Magnetic Stripe Reader (#4930) is the additional feature being ordered.

Group #1: Vertical Forms Control (#8731), Magnetic Stripe Reader (#4930), Calculate-Scientific (#1572).

3767 Communication Terminal (cont'd)

Group #2: Start/Stop Feature -- 2740-1 (#7111), -- 2740-2 (#7112) -- 2741 (#7113), Alternate Character Set (#1291), Buffer with Edit -- 512 (#1481), Buffer with Edit - 1024 (#1482).

Acoustic Coupler - 600 bps (#1110): Provides an acoustic coupler for communications through a telephone handset at speeds up to 600 bps. Requires a 1200 bps Integrated Modem on host end of communication facility. **Maximum:** One. **Field Installation:** Yes. Customer will set up at time of 3767 delivery -- FE will install if ordered via MES. **Prerequisites:** 1200 bps Integrated Modem (#5502 or #5506), 600 bps (**#9531**), in addition, if Start/Stop Feature (#7111 or #7113) is ordered, 300 bps (**#9540**). **Note:** Due to the nature of the public switched network environment, line conditions may cause a 3767 to be inoperable with an acoustic coupler. For limitations on public switched network, consult M2700.1.

ASCII Feature (#1201): Provides ASCII Keyboards (48-Key) and graphics in lieu of those normally provided by Keyboard Specify Codes. **Maximum:** One. **Field Installation:** Not recommended. **Limitations:** Cannot be installed with Start/Stop Features (#7111, #7112, #7113), Alternate Character Set (#1291), or Keyboard Arrangement **#9381** (Correspondence) or **#9391** (EBCDIC).

Alternate Character Set (#1291): Provides a switch control for alternate printed graphics, to those selected by the keyboard specification. Compatible with Start/Stop Feature #7113 (2741) and #7111 (2740-1). Only specify codes #9394 and #9395 (EBCDIC-Mono) are compatible with #7112 (2740-2). Keytop engraving remains the same. Key front decals will be provided for easy operator reference in using this feature. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Cannot be installed with ASCII (#1201).

CHART A

		SDLC					Start/Stop							
		Graphics				Data Code	Graphics			Line Code				
Keybd	Alt Char Set	CORRES	EBCDIC	APL	MONO(2)	EBCDIC	CORRES	EBCD(2)	APL	MONO(2)	CORRES	PTTC/EBCD	Keybd Prereq Specify Code	Select Only One (1)
Corres		X				X	X				X		#9381	
	EBCDIC		X			X		X				X		#9382
	APL			X		X			X		X			#9383
EBCDIC			X			X		X				X	#9391	
	Corres	X				X	X					X		#9392
	APL			X		X			X			X		#9393
	Mono(3)				X	X				X		X		#9394
	Mono(4)				X	X				X		X		#9395

(1) Alternate Character Set (#1291) is a prerequisite.

(2) Subset of EBCDIC.

(3) Upper case alpha printed from keyboard - upper/lower case may be printed from the communications line.

(4) Upper case alpha printed from keyboard or the communications line regardless of key shift or line code shift.

Buffer Edit (#1481, #1482): #1481 (mdl 1 only) provides two 256-byte buffers for receiving data. #1482 (mdls 1, 2 or 3) provides two additional 256-byte buffers for receiving data. On key entry these two features provide full buffer (up to 512- or 1024-bytes) edit capability under key control. With the Edit switch "off", a single data line may be transmitted. When used with 2740 mdl 2 Start/Stop(#7112), single buffer 120-, 248-, 440-byte operation is provided. The Buffer Full Alarm warns the operator 10 positions before full capacity. **Maximum:** One of each. **Field Installation:** Yes. **Limitations:** This feature is not active if Start/Stop feature (#7111 or #7113) is active. A 512-byte buffer (equivalent to #1481) is standard on 3767 mdl 2 or 3. **Prerequisites:** #1482 requires #1481 on mdl 1 only.

Calculate - Scientific (#1572): In offline mode, this feature, under switch control, using the same keyboard (with supplied keyfront label) allows the following type calculations to take place: addition; subtraction; multiplication; division; inverse calculation; square root; statistical value (mean and standard deviation) logarithm; natural logarithm; exponential constant; circular constant and trigonometrical functions (sin, cos, tan, arcsin, arccos, arctan). Two memories are provided for temporary storage of totals. Sixteen digit input/output is allowed. **Maximum:** One. **Field Installation :** Yes.

EIA/CCITT Interface - No Clock (#3718): Provides one EIA/CCITT interface for the attachment of an 3863, 3872 or other external modem, with modem clocking (3767 clock disabled). **Maximum:** One. **Field Installation:** Yes. **Specify:**

- **#2834** (line speed select) provides a switch, if 3872 Modem is not attached, to allow speed changes as follows (SDLC only):
  600/1200 bps switch when **#9532** is specified.
  1200/2400 bps switch when **#9533** is specified.
- **#9707** for attaching 3863 Modem or
  3872 Modem (line speed select included in this feature)
- **#9619** for switched facilities

Limitations: Cannot be installed with 1200 bps Integrated Modem (#5500, #5502 or #5505), Start/Stop (#7111, #7112 and #7113) or EIA/CCITT Interface with Clock (#3719).

EIA/CCITT Interface - With Clock (#3719): Provides one EIA/CCITT interface for the attachment of an external modem with business machine (3767) clocking.
Note: This feature may be used for local attachment to 3704 or 3705 equipped with Line Set Type 1F for operation at 600 or 1200 bps. See "specify" below.

Maximum: One. **Field Installation:** Yes. **Specify:**

- **#2834** (line speed select) provides a switch to allow the following speed changes (SDLC only):
  600/1200 bps switched when **#9532** is specified.
- **#9619** for switched facilities.
- **#9404**, if this feature is to be used with Line Set Type 1F.

Limitations: Cannot be installed with 1200 bps Integrated modem (#5500, #5502 or #5505) or EIA/CCITT Interface - No Clock (#3718). **Prerequisites:** One of the following must be specified; **#9532** (1200 bps) or **#9531** (600 bps) for C2 and D3 Facility. If Start/Stop feature is installed, also specify that feature line speed prerequisite.

Note: One IBM modem can be attached.

Modem	Speed	Line
3872	1200/2400 bps	Nonswitched
3976-1	200 bps	Nonswitched
3976-2	200/300 bps	Switched
3976-3	600/1200 bps	Nonswitched or switched

Magnetic Stripe Reader (#4930): A small self-enclosed device for reading information from a magnetically-striped and encoded identification card and a magnetic credit card (2-1/8 inches x 3-3/8 inches). Reads up to 40 ABA standard numeric characters,including control characters. See IBM for information on cards. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Not functional when operating in Start/Stop (#7111, #7112, #7113) mode.

1200 bps Integrated Modem, Nonswitched (#5500): A modem for operation at 300, 600 or 1200 bps over 2- or 4-wire nonswitched voice-grade channels. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Cannot be installed with EIA/CCITT Interface (#3718 or #3719) or 1200 bps Integrated Modem (#5502 or #5505). **Prerequisites:** For SDLC operation, specify either **#9532** (1200 bps) or **#9531** (600 bps). If Start/Stop feature is installed, also specify **#2717** (200 bps), **#9540** (300 bps), or **#9541** (600 bps).

1200 bps Integrated Modem (#5502): Switched. A manual answer modem for operation at 300, 600 or 1200 bps over Public Switched Telephone Networks. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Cannot be installed with EIA Interface (#3718 or #3719) or 1200 bps integrated Modem (#5500, #5505 or #5506). **Prerequisites:** **#9532** (1200 bps) or **#9531** (600 bps) facilities. If Start/Stop Feature is installed, that feature's line speed specify. **Note:** This feature requires either Acoustic Coupler - 600 bps (#1110) or FCC registered protective circuitry of the CDT type (or equivalent) provided by the user.

1200 bps Integrated Modem/Interrupt, Nonswitched (#5505): [Mdls 1, 2] modem for operation at 300 bps (Start/Stop), 600 or 1200 bps (SDLC) over 2-wire nonswitched voice-grade channels. This modem includes a bidirectional reverse channel capability. This interrupt signal is transmitted when the ATTN key on the 3767 keyboard is depressed. **Note:** This featured modem is required to transmit or receive an interrupt only with 2741 Start/Stop (#7113) operating at 300 bps in Start/Stop mode on a 2-wire (**#9402**) nonswitched voice-grade channel and the EIA/CCITT Interface is not used. Line Set Type 8C on 3704 or Line Set Type 12A on 3705 is required to support the feature. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Cannot be installed with EIA/CCITT Interface (#3718 or #3719) or 1200 bps Integrated Modem (#5500 or #5502). **Prerequisites:** Specify either **#9532** (1200 bps) or **#9531** (600 bps) or **#9540** (300 bps).

1200 bps Integrated Modem/Interrupt (#5506): [Mdls 1, 2] Switched. A manual answer modem for operation at 300 bps (Start/Stop), 600 bps or 1200 bps (SDLC) over Public Switched

3767 Communication Terminal (cont'd)

Telephone Networks. This modem includes a bidirectional reverse channel capability. This interrupt signal is transmitted when the ATTN key on the 3767 keyboard is depressed. **Note:** This featured modem is required to transmit or receive an interrupt only with Start/Stop 2741 (#7113) operating at 300 bps in Start/Stop mode on a half-duplex switched channel and EIA Interface #3719) is not used. Line Set Type 8D on the 3704 or Line Set Type 12B on the 3705 is required to support this feature. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Cannot be installed with EIA Interface (#3718 or #3719) or 1200 bps Integrated Modem (#5500, #5502, or #5505). **Prerequisites: #9532** (1200 bps) or **#9531** (600 bps) or **#9540** (300 bps) facilities. **Note:** This feature requires either Acoustic Coupler - 600 bps (#1110) or FCC registered protective circuitry of the CDT type (or equivalent) provided by the user.

Security Keylock (#6660): Provides a key-operated switch. When in the "locked" position, the machine operations cannot be performed. Two keys are supplied. For additional or replacement keys, see "Locks and Keys" in "Accessories". **Maximum:** One. **Field Installation:** Yes.

Start/Stop Feature (#7111, #7112, #7113): These features provide a Type 1 Start/Stop line control migration aid on the 3767 to allow operation with existing program support (see Programming pages). This feature allows data transmission to or from a Virtual Storage S/370 mdl 115 through 168MP or a 3031 Processor via a 3704 or 3705 at 300 bps (2740-1 or 2741 Line Control) or at 600 or 1200 bps (2740-2 Line Control) or via a 2701 at 600 bps (2740-2 Line Control). It also allows transmission, via communications facility to or from a 3115 ICA, 3125 ICA, 3135 ICA, 3135-3 ICA or 3138 ICA at 300 bps (2740-1 or 2741 Line Control) or at 600 bps (2740-2 Line Control), 1200 bps (2740-2 Line Control) also supported by 3115 ICA and 3125 ICA. It allows communications via a 3704/3705 Communications Controller attached to a channel of a S/360 mdls 30, 40, 50, 65, 67 (in 65 mode), 75 and 195 at 300 bps (2740-1 or 2741 Line Control) or at 600 bps or 1200 bps (2740-2 Line Control); via a 2701 attached to a channel of a S/360 mdls 22, 25, 30, 40, 44, 50, 65, 67 (in 65 mode), 75 and 195; or a S/370 mdl 155, 165 and 195 at 600 bps (2740-2 Line Control); or via an Integrated Communications Attachment on S/360 mdl 25 at 600 bps (2740-2 Line Control). An SDLC/Start-Stop switch is provided to allow operation in either mode. Communications facility must be specified for this feature. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Cannot be installed with ASCII Feature (#1201).

Select One:

#7111 -- 2740-1 Line Control [Mdls 1, 2] **Specify: #9540** (300 bps). **Note:** For multipoint -- specify **#9560** (Station Control) and see "Terminal and Group Addresses" (below) for additional information to be specified. **Note:** On a given nonswitched line, one terminal within each group and one terminal for the entire line (All Call) must provide the necessary checking and addressing responses for that group and/or for the entire line. Specify **#9197** for a group responding and/or **#9035** for an All Call responding terminal. **Limitations:** Group or All Call addressing requires duplex communications facilities. Nonswitched facility required for SDLC if Station Control (**#9560**) is specified. Cannot be installed with 2400 bps (**#9533**) or EIA Interface - No Clock (#3718).

#7112 -- 2740-2 Line Control [Mdls 1, 2, 3] Buffer Receive mode is standard operation. **Limitations:** Group or All Call addressing requires duplex communications facilities. If multi-dropped on the same communication line with 2740-2s the 3767 must not be designated as the Group or All Call Responding terminal. Nonswitched facility required for SDLC with this feature installed. Cannot be installed with Correspondence Keyboard (#9381). **Specify:** See "Terminal and Group Addresses" (below) for additional information to be specified. **Note:** On a given nonswitched line, one terminal within each group and one terminal for the entire line (All Call) must provide the necessary checking and addressing responses for that group and/or for the entire line. Specify **#9197** for a group responding and/or **#9035** for an All Call responding terminal. Specify Line Speed -- **#9541** (600 bps) or **#9542** (1200 bps). Buffer Positions **#9015** for 120, **#9016** for 248, or **#9017** for 440. **Note:** This specified feature has no effect on buffer size under SDLC line discipline. **Prerequisites:** On mdl 1, Buffer with Edit (#1481 or #1482).

#7113 -- 2741 Line Control [Mdls 1, 2] **Specify: #9540** (300 bps). **Limitations:** Cannot be installed with 2400 bps (#9533) or EIA Interface - No Clock (#3718). **Note:** See "Terminal Identification" (below) for additional information to be specified.

The 2741 Transmit & Receive Interrupt Function on the 3767 with #7113 (2741 Line Control) is supported via the following:

	1200 bps Intg'd Modem			External Modem		
	Sw'd	Nonswitched		Switched	Nonswitched	
	2-wire	2-wire	4-wire	2-wire (1)	2-wire (1)	4-wire
3115 ICA	--- ---	--- ---	#1231 #4781	#1231	#1231	#1231
3125 ICA	--- ---	--- ---	#1231 #4781	#1231	#1231 or #1232	#1231 or #1232
3135 ICA	--- ---	--- ---	--- ---	9593-9600 9721-9728 9737-9744 9745-9752 9625-9632	9593-9600 9721-9728 9737-9744 9745-9752	9593-9600 9721-9728 9737-9744 9745-9752
3704	#4786	#4785	#4781	#4711 or #4714	#4711 or #4714	#4711 or #4714
3705	#4786	#4785	#4781	#4711 or #4714	#4711 or #4714	#4711 or #4714
3767	#5506	#5505	#5500	#3719	#3719	#3719
8130	---	---	#5500	#3701	#3701	#3701
8140	---	---	#5500	#3701	#3701	#3701
8101	---	---	#5500	#3701	#3701	#3701

(1) Modem must be full duplex.

Terminal and Group Addresses

Terminal and group addresses must be selected when one of the following Start/Stop Features is ordered:

#7111 for 2740 mdl 1 Line Control with Station Control **#9560** specified.

#7112 for 2740 mdl 2 Line Control.

For Terminal Address and Group Address, a 2-character code must be selected as described below. The first character must be the Terminal Address, and the second character must be the Group Address. (The same character may be ordered for both addresses. However, in this case, the terminal will be wired at the factory as a Group Responding **#9197** terminal.)

Depending on the Keyboard Arrangement specified for the base machine, the following characters may be selected for Terminal and Group Addresses:

With EBCDIC Keyboard Arrangement **#9391**, select characters from:

A through Z, 0 through 9, and special characters @ (at sign) ... $ (dollar sign) ... & (ampersand) ... - (hyphen) ... . (period).

† With Correspondence Keyboard Arrangement **#9381**, select characters from:

A through Z (except B and X), 0 through 8, and special characters = (equal) ... / (slash) ... ; (semi-colon) ... , (comma) ... . (period) ... ' (apostrophe) ... - (hyphen).

† Not available with #7112.

If Alternate Character Set (#1291) is installed on the terminal, the Terminal and Group Address line code bit configuration remains the same for either switch setting.

Specify: #9644 (Terminal and Group Addresses) .

Terminal Identification

If Terminal Identification is used in the customers application (provided by RPQ E46148 Auto Address Answer-back on the 2741), a 4-character Terminal Identification must be selected when Start/Stop Feature - 2741 Line Control (#7113) and one of the following are ordered: #5502, #5506, or #3719 with **#9619** (switched line operation) specified.

Depending on the Keyboard Arrangement specified on the base machine, the following characters may be selected for the Terminal Identification code.

With EBCDIC Keyboard Arrangement (**#9391**), select characters from:

A through Z, 0 through 9, and special characters # (number sign) ... / (slash) ... $ (dollar sign) ... & (ampersand) ... @ (at sign) ... , (comma) ... . (period) ... - (hyphen) ... C/R (carriage return) ... (space).

3767 Communication Terminal (cont'd)

With Correspondence Keyboard Arrangement (**#9381**), select characters from:

A through Z, 0 through 9, and special characters = (equal) ... / (slash) ... ' (apostrophe) ... - (hyphen) ... ; (semi-colon) ... . (period) ... , (comma) ... C/R (carriage return) ... (space).

The same character may be selected for all four positions except C/R may only be used in the fourth position.

If Alternate Character Set (#1291) is installed on the terminal, the Terminal ID line code bit configuration remains the same for either switch setting.

Specify: Note: For "space" character, enter %. For C/R character, enter * (available in fourth position only).

Variable-Width Forms Tractor (#8700): A forms-feeding device for continuous edge-punched forms. Forms with overall widths of from 3 to 15 inches can be fed. **Prerequisites: #9850**

Vertical Forms Control (#8731): Allows vertical forms skipping to a pre-set page header location or pre-set vertical tab position. Page size, header location and vertical tab stops are entered from the keyboard or received from the host under SDLC line control. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Variable-width forms tractor covers (**#9850**) and Variable-Width Forms Tractor (#8700). **Limitations:** This feature is non-functional in Start/Stop (#7111, #7112, #7113) mode.

MODEL CONVERSIONS

Field conversion is possible for models 1 to 2, 1 to 3, and 2 to 3.

ACCESSORIES

Available on a purchase-only basis. For shipment with machine, order feature number indicated below.

Forms Stand (#4450): A two-shelf forms stand that permits placement of continuous forms on a stand above floor and provides for stacking after printing. . Order via MSORDER (Category = Supplies/ Accessories; Group Code = 31) on AAS.

Locks and Keys: The 3767 with Keylock special feature is shipped with two keys. Additional or replacement keys may be obtained only from IBM (purchase only). Order via MSORDER (Category = Supplies/Accessories; Group Code = Supply Order) on AAS. A customer letter of authorization with key identification number (stamped on key) must accompany each order. Allow 10 to 12 weeks for shipment. A new Keylock (#6660) special feature must be ordered if the key identification number cannot be supplied.

SUPPLIES

Ribbons: P/N 1136653, or equivalent, is required.

3771 COMMUNICATION TERMINAL

PURPOSE

This desk-style console-keyboard-printer is a member of the 3770 Data Communication System. Communication features permit operation over switched or nonswitched facilities at speeds up to 4800 bps, using SDLC or BSC transmission techniques. Special features permit the attachment of one card reader or card punch operating at 50 cpm. The card punch can optionally be equipped with a special feature for Card Read to permit single-path card reading or card punching.

MODELS

Model 1	001	40 cps average print rate, bidirectional
Model 2	002	80 cps maximum, bidirectional
Model 3	003	120 cps maximum, bidirectional

Limitations: The input/output capabilities outlined under "Highlights" are dependent upon appropriate configurations of the terminal. Keyboard and console printer are standard. For other configurations, refer to special features below.

Prerequisites:

For SDLC Communications with S/370 or 4300 Processors: A 3704, 3705, or 3725 Communications Controller operating under Network Control Program (NCP/VS) attached to any virtual storage S/370 or 4300 processor operating under DOS/VS, OS/VS1 or OS/VS2; or these operating systems running under VM/370. SDLC Communication is also available via the Communications Adapter on 4331 -- see "Programming" for software support available.

For BSC Communications with S/360, S/370 or 4300 Processors: A virtual storage S/370 operating under BTAM or VTAM and DOS/VS, or under BTAM, TCAM or VTAM and OS/VS1 or OS/VS2; or these operating systems running under VM/370. The 3770 Communication Terminals use 2770 BSC programming support when operating in BSC mode. Operation with S/360, S/370 and 4300 Processors using 2770 BSC programming is also permitted. The customer may have to modify existing 2770 application programs for operation with 3770. See GA27-3097 for BSC compatibility considerations. BSC attachment can be made via a 3704, 3705, or 3725 Communications Controller or a 2701 Data Adapter Unit attached to a channel of any S/370 or 4300 processor; or via an Integrated Communications Adapter on S/370 mdls 115, 125 135, 135-3, 138 or via the Communications Adapter feature on 4331. BSC attachment can be made via a 3704, 3705, or 3725 Communications Controller attached to a channel of a S/360 mdl 30, 40, 50, 65, 67 (in mdl 65 mode), 75, and 195; via a 2701 attached to a channel of a S/360 mdl 22, 25, 30, 40, 44, 50, 65, 67 (in mdl 65 mode), 75, and 195; or via an Integrated Communications Attachment on S/360 mdl 25.

HIGHLIGHTS

Keyboard: EBCDIC arrangement with 44 data keys (produces 88 characters). Associated with the keyboard are: indicator lights, function keys, operating mode switches, and a 3-position numeric display.

Printer: Prints serially by character, while the wire-matrix print head is moving in either direction: bidirectional printing. Print span is 132 positions at 10 characters per inch. Line spacing is six lines per inch. Single-part continuous forms or cut forms of up to three parts can be handled with the standard friction-feed platen. A variable-width forms tractor, available as a special feature, is required for feeding multipart or preprinted continuous forms of up to six parts maximum (total thickness not greater than 0.018 in.). Five- and six-part continuous forms should be tried on an individual basis for acceptable feeding, registration and print quality. Overall form widths of from 3.0 to 15.0 in. can be accommodated. To facilitate handling of continuous forms, the Forms Stand (a special feature) is recommended. Card stock continuous forms are not recommended. Refer to GA24-3488 for forms design considerations. A 94-character set is standard.

Dual 256-byte Buffers: Transfer data between the input and output devices. The buffers alternate in providing input and output service to permit overlapped operation.

Buffer Edit: Allows corrections to be made on the contents of a buffer during key entry jobs. Corrections can be made by character, by line or by entire buffer (up to 256 bytes).

Extended Buffer: Combines the dual 256-byte buffers into a single 512-byte buffer under operator control for keyboard-to-line jobs. Buffer edit capability applies to the full 512 bytes. Buffer transfers to line are in 256-byte increments and cannot be overlapped.

Printer Format Controls: Facilitate the formatting of printed data. Vertical and horizontal control characters in data initiate vertical or horizontal tabbing. Format controls can be entered from keyboard, or from an attached card reader, or can be system-defined.

Compression/Expansion: Provides a means for improving the efficiency of data transmission. For BSC, the compression option can be invoked at the terminal for a job that reads non-transparent data from cards. A 2-byte sequence is substituted for each occurrence of three or more consecutive blank card columns (63 consecutive blanks is the upper limit). A second 2-byte sequence is appended if more than 63 consecutive blank columns are read. The terminal monitors the non-transparent data received which is destined for printer or attached card punch and automatically expands this 2-byte sequence to the correct number of blanks. A similar capability is provided when using SDLC procedures.

Input/Output Selection: Is under control of keyboard set-up with an option for entering one set of printer format controls from keyboard or the card reader. A fully-configured 3771 will allow the following:

	INPUT	OUTPUT
Offline Jobs	Keyboard Card Reader Keyboard*	Printer Printer Card Punch
Online Batch Jobs	Card Reader Line Line	Line** Printer Card Punch**
Online Interactive Jobs	Keyboard* Line	Line Printer

* Output to printer is automatic.
** Monitor Print is an output option in addition to line or card punch.

Problem Determination Procedures: Significant function has been designed into this unit to provide greater availability to the customer. This has been done through the use of problem identification and recovery routines and procedures that are easily understood and used by the operator. See *IBM 3771/3773 Operating Procedures Guide,* GA27-3100.

Communications: See "Special Features". Transmission speeds of up to 4800 bps over switched or nonswitched facilities are allowed by selecting the appropriate modem and communication facility. Refer to M2700 pages for information on communication facilities and other attachment information; also to M3863, 3864, 3872, and 3976 pages.

Customer Responsibilities: It will be the customer's responsibility to use and follow the Problem Determination Procedures and to fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Bibliography: GC20-0001

SPECIFY

- Voltage (115 V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug.
- Color: **#9041** - Red, **#9042** - Yellow, **#9043** - Blue, **#9045** - Gray
  Note: Available at time of manufacture only.
- Cabling: Fixed-length cables are supplied as standard. Refer to *Installation Manual-Physical Planning,* GA27-3006.

SPECIAL FEATURES

For Communication Capability: Select one Communication feature (#1460, #1461, or #1470), one Communication Driver (#1481 or #1482), and one Integrated Modem (#5500, 5501 or 5502) or EIA Interface (#3701). #1462 is required in addition to #1460 or #1461 for multipoint operation using BSC.

ASCII Feature (#1201): A 48 data keyboard (produces 94 ACSII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with BSC features #1460, #1461 or #1462, or with SDLC features #1460 or #1470. **Maximum:** One. **Field Installation:** Not recommended.

Audible Alarm (#1390): Sounds an alarm to alert the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One. **Field Installation:** Yes.

SDLC/BSC, Switched Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. **Limitations:** Not with #1461 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum:** One. **Field Installation:** Yes.

BSC, Point-To-Point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. **Limitations:** Not with #1460 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum:** One. **Field Installation:** Yes.

BSC Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. **Limitations:** See GA27-3097 for BSC compatibility considerations. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1461 or #1460.

3771 Communication Terminal (cont'd)

SDLC (#1470): Provides for switched and nonswitched SDLC procedures. **Limitations:** Not with #1460 or #1461. **Maximum:** One. **Field Installation:** Yes. **Specify:** Specify one of the following: **#9977** for DOS/VS VTAM, **#9988** for OS/VS1 VTAM, **#9989** for OS/VS2 VTAM, or **#9993** for all other combinations of operating systems and access methods.

Without Business Machine Clocking (#1481): Provides communication driver without clocking. **Limitations:** Not with #1482. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1460, #1461, #1470.

With 1200 bps Business Machine Clocking (#1482): Provides communication driver with 1200-bps clocking. **Limitations:** Not with #1481. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1460, #1461, or #1470.

EIA Interface (#3701): Provides a cable and interface meeting RS-232C characteristics for attachment of an IBM Modem or non-IBM modem. Speeds up to 4800 bps for switched or nonswitched operation are permitted. This feature in combination with #1481 can be used to attach to Modem Fan-out (#3901) on an adjacent terminal, or on an IBM 3863, 3864 or 3872 Modem. This feature in combination with #1482 can be used for direct attachment to a 3704 or 3705 equipped with Local Attachment (#4716) for operation at 1200 bps synchronous. **Limitations:** Cannot be installed with any Integrated Modem feature. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1481 or #1482.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with this feature. Refer to "Accessories" for information on additional or replacement keys. **Maximum:** One. **Field Installation:** Yes.

Operator Identification Card Reader (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8 in. x 2-1/8 in. ranging from 0.007 to 0.045 in. thick may be read. With BSC, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic stripe card cannot be printed. **Limitations:** (1) The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. (2) BSC programming for 2770 does not support this feature. **Maximum:** One. **Field Installation:** Yes.

1200 bps Integrated Modem, Nonswitched (#5500): Provides for point-to-point or multipoint operation over nonswitched communication facilities. **Limitations:** Not with #3701 or with another integrated modem. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1482.

1200 bps Integrated Modem, Switched, Auto Answer (#5501): Provides for point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. **Limitations:** Cannot be installed with #3701, or with another Integrated Modem. **Maximum:** One. **Field Installation:** Yes. Attachment to the Switched Network is via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. **Prerequisites:** #1482.

1200 bps Integrated Modem, Switched, Manual Answer (#5502): Provides for point-to-point operation over switched networks using manual originate/manual answer for establishing connection. **Limitations:** Cannot be installed with #3701, or another Integrated Modem. **Maximum:** One. **Field Installation:** Yes. Attachment to the Switched Network is via FCC registered protective circuitry of the CDT type (or equivalent) provided by the user. **Prerequisites:** #1482.

3501 Card Reader Attachment (#8050): Provides for attachment of the 3501 Card Reader. **Limitations:** Not with #8150. **Maximum:** One. **Field Installation:** Yes.

3782/3521 Card Punch Attachment (#8150): Provides for attachment of the 3782 Card attachment unit mdl 1 and the 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print. **Limitations:** Not with #8050. **Maximum:** One. **Field Installation:** Yes.

Variable Width Forms Tractor (#8700): Provides a forms feeding device for continuous edge-punched forms. Overall forms width from 3.0 in. to 15.0 in. can be fed. Refer to *Forms Design Reference Guide for Printers,* GA24-3488. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS

The following model changes are field installable:

Model 1 to Model 2
Model 1 to Model 3
Model 2 to Model 3

ACCESSORIES

The following items are available on a purchase only basis. For shipment with machine, order the feature number indicated below.

Forms Stand (#4450): A two-shelf forms stand that permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after printing.

Locks and Keys: Keylock (#4650) is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM. A customer letter of authorization must accompany each order. Allow six to seven weeks for shipment.

SUPPLIES

Ribbons: A black ribbon, P/N **1136653**, or equivalent, is required.

3773 COMMUNICATION TERMINAL

[NO LONGER AVAILABLE]

PURPOSE

This desk-style console-keyboard-printer includes as standard a diskette storage device with removable, reusable diskette. It is a member of the 3770 Data Communication System. Communication features permit operation over switched or nonswitched facilities at speeds up to 4800 bps. It uses the SDLC or BSC transmission technique.

MODELS

Model 1, P1	001, P01	40 cps average print rate, bidirectional
Model 2, P2	002, P01	80 cps maximum, bidirectional
Model 3, P3	003, P03	120 cps maximum, bidirectional

The prefix "P" on the model number designates user-programmable.

HIGHLIGHTS

Not applicable for a withdrawn machine.

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug.
- Color Group: **#9041** - Red, **#9042** - Yellow, **#9043** - Blue, **#9045** - Gray. Note: Available at time of manufacture only.
- Remote Power Off: **#9501** ... specify this feature for capability to "power down" terminal from the host CPU using a controlled data sequence over communication facilities.
- Cabling: Fixed-length cables are supplied as standard. Refer to *Installation Manual-Physical Planning*, GA27-3006.

SPECIAL FEATURES

Special features are on an "As Available" basis for field installation, except #1201 and #4660 which cannot be field installed.

For communication capability: Select one Communication feature (#1460, #1461, or #1470); one Communication Driver (#1481 or #1482); and one Integrated Modem (#5500, 5501, 5502 or EIA Interface (#3701). #1462 is required in addition to #1460 or #1461 for multipoint operation using BSC.

Communication Features

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. **Limitations:** Not with #1461 or #1470. See SRL GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC, Point-to-point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. **Limitations:** Not with #1460 or #1470. See SRL GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. **Limitations:** See SRL GA27-3097 for BSC compatibility considerations. **Maximum:** One. **Prerequisites:** #1460 or #1461.

SDLC (#1470): Provides for switched and nonswitched SDLC procedures. **Limitations:** Not with #1460 or #1461. **Maximum:** One.

Communication Driver Without Business Machine Clocking (#1481): Provides a communication driver without clocking. **Limitations:** Not with #1482. **Maximum:** One. **Prerequisites:** #1460, #1461, or #1470.

Communication Driver With 1200 bps Business Machine Clocking (#1482): Provides communication driver with 1200-bps clocking. **Limitations:** Not with #1481. **Maximum:** One. **Prerequisites:** #1460, #1461, or #1470.

EIA Interface (#3701): Provides a cable and interface meeting RS-232-C characteristics for attachment of an IBM Modem or non-IBM modem. Speeds up to 4800 bps for switched or nonswitched operation are permitted. This feature in combination with #1481 can be used to attach to Modem Fan-out (#3901) on an adjacent terminal, or on a 3863, 3864, 3872 or 3874 Modem. This feature in combination with #1482 can be used for direct attachment to a 3704 or 3705 equipped with Local Attachment (#4716) for operation at 1200 bps synchronous. **Limitations:** Cannot be installed with any Integrated Modem feature. **Maximum:** One. **Prerequisites:** #1481 or #1482.

1200 bps Integrated Modem, Nonswitched (#5500): Provides for point-to-point or multipoint operation over nonswitched communication facilities. **Limitations:** Not with #3701 or with another integrated modem. **Maximum:** One. **Prerequisites:** #1482.

1200 bps Integrated Modem, Switched, Auto Answer (#5501): Provides for point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. **Limitations:** Cannot be installed with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1482. Attachment to the Switched Network is via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user.

1200 bps Integrated Modem, Switched, Manual Answer (#5502): Provides for point-to-point operation over switched network facilities using manual originate/manual answer for establishing connection. **Limitations:** Cannot be installed with #3701, or another Integrated Modem. **Maximum:** One. **Prerequsites:** #1482. Attachment to the Switched Network is via FCC registered protective circuitry of the CDT type (or equivalent) provided by the user.

Non-Communication Features

ASCII Feature (#1201): A 48-key data keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage and BSC features #1460, #1461 or #1462, or with SDLC features #1460 or #1470. **Maximum:** One. **Field Installation:** Not recommended.

Audible Alarm (#1390): Sounds an alarm to alert the operator to conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. **Limitations:** The keys provided with this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. **Maximum:** One.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with this feature. Refer to "Accessories" for information on additional or replacement keys. **Maximum:** One.

Keypad, Numeric (#4660): Provides a keypad in adding machine arrangement to facilitate rapid entry of numeric only data. **Limitations:** Not available for mdls 1, 2 or 3. **Maximum:** One. **Field Installation:** Not recommended. **Prerequisites:** Mdl P1, P2 or P3.

Operator Identification Card Reader (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8 in. x 2-1/8 in. ranging from 0.007 in. to 0.045 in. thick may be read. With a BSC non-programmable terminal, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic stripe card cannot be printed. For programmable terminal the Operator ID Reader (#5450) is under control of the 3770 application program. **Limitations:** (1) The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. (2) BSC programming for 2770 does not support this feature. **Maximum:** One.

Storage Increment 4K (#6800): Provides an additional 4,096 bytes of programmable storage. **Limitations:** Not available for mdls 1, 2 or 3. Not with #6800. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Mdl P1, P2 or P3.

Storage Increment 8K (#6801): Provides an additional 8,192 bytes of programmable storage. **Limitations:** Not available for mdls 1, 2 or 3. Not with #6800. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Mdl P1, P2 or P3.

Variable Width Forms Tractor (#8700): Provides a forms feeding device for continous edge-punched forms. Overall forms width from 3.0 to 15.0 in. can be accommodated. Refer to *Forms Design Reference Guide for Printers*, GA24-3488. **Maximum:** One.

MODEL CONVERSIONS (None)

ACCESSORIES

The following items are available on a purchase only basis.

Forms Stand (#4450): A two-shelf forms stand that permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after printing.

Locks and Keys: Keylock (#4650) is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM. A customer letter of authorization must accompany each order. Allow seven weeks for shipment.

SUPPLIES (None)

3774 COMMUNICATION TERMINAL

[3774 MODELS 1 AND 2 ARE NO LONGER AVAILABLE]

PURPOSE

This desk-style console-keyboard-printer is a member of the 3770 Data Communication System. The basic printer operates at a maximum speed of 80 or 120 characters per second and prints bidirectionally, serially by character, using a wire-matrix print head. Special features permit one or two diskette storage devices and provide for the attachment of an additional printer, the 3784 Line Printer, and one card reader and one card punch. One of three card readers can be selected for operation at speeds of 50, 150, or 300 cards per minute. The card punch operates at 50 cards per minute.

Communication features allow for operation over switched or non-switched facilities at speeds of up to 4800 bps using SDLC or BSC transmission techniques and an appropriate modem.

MODELS

Mdl 1, P1	001, P01	80 cps maximum, bidirectional printer
Mdl 2, P2	002, P02	120 cps maximum, bidirectional printer

The prefix "P" in the model number designates user-programmable.

HIGHLIGHTS (All Models)

Keyboard: EBCDIC arrangement with 44 data keys (produces 88 characters). Underscore/Hyphen, Backspace, Space and "Print Character" ("Character" on programmable models) keys have typamatic operation. Associated with the keyboard are: indicator lights, function keys, operating mode switches, and a 3-position numeric display.

Printer: Prints serially by character at a maximum rate of 80 or 120 characters per second while the wire-matrix print head is moving in either direction: bidirectional printing. Print span is 132 positions at 10 characters per inch. Line spacing is 6 lines per inch. The 3774 mdls P1 and P2 (without Emulator) provide for line spacing of 6 or 8 lines per inch. Single-part continuous forms or cut forms of up to three parts can be handled with the standard friction feed platen. A variable-width forms tractor, available as a special feature, is required for feeding multipart or preprinted continuous forms of up to six parts maximum (total thickness not greater than 0.018 in.). Five- and six-part continuous forms should be tried on an individual basis for acceptable feeding, registration, and print quality. Overall form widths of from 3.0 in. to 15.0 in. can be accommodated. To facilitate handling of continuous forms, the Forms Stand (an accessory) is recommended. Card stock continuous forms are not recommended. Refer to GA24-3488 for forms design considerations. A 94-character set is standard.

Performance Considerations: Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, etc., must all be considered in determining actual throughput. See *IBM 3770 Data Communication System,* GA27-3097, for additional information.

Problem Determination Procedures: Significant function has been designed into this unit to provide greater availability to the customer. This has been done through the use of problem identification and recovery routines and procedures that are easily understood and used by the operator. See *IBM 3774/3775 Operating Procedures Guide,* GA27-3094 or *IBM 3773, 3774, and 3775 Programmable Communication Terminals Operator's Guide,* GA27-3114.

Communications: See "Special Features". Transmission over switched or nonswitched facilities at speeds of up to 4800 bps are allowed by selecting the appropriate modem and communication facility. Refer to M2700 pages for information on Customer Responsibilities, Communication Facilities, and other attachment information, and to M3872 pages.

The 2400 bps Integrated Modem and IBM 3872 Modem, when appropriately configured, can be intermixed on the same communication facility.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Prerequisites:

For SDLC Communications with S/370 or 4300 Processor: A 3704, 3705, or 3725 Communications Controller operating under Network Control Program/Virtual Storage (NCP/VS) attached to any virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1, or OS/VS2; or these operating systems running under VM/370.

For BSC Communications with S/360, S/370 or 4300 Processors: A virtual storage S/370 or 4300 processor operating under DOS/VS, OS/VS1 or OS/VS2, or under RSCS (non-programmable terminals only) and VM/370, or any of these operating systems running under VM/370. The 3770 Communication Terminals use 2770 BSC programming support when operating in BSC mode. Operation with S/360, S/370, or 4300 processors using 2770 BSC programming is also permitted. The customer may have to modify existing 2770 application programs for operation with non-programmable models of the 3774. The customer will have to modify existing application programs for operation with programmable mdls of the 3774. See GA27-3097 for BSC compatibility considerations. BSC attachment can be made via a 3704, 3705, or 3725 Communications Controller or a 2701 Data Adapter Unit attached to a channel of any virtual storage S/370 or 4300 processor or via an Integrated Communications Adapter on S/370; or via a Communications Adapter feature on the 4331 or 4361 processor. BSC attachment can be made via a 3704/3705 Communications Controller attached to a channel of a S/360 mdl 30, 40, 50, 65, 67 (in 65 mode), 75, and 195; via a 2701 attached to a channel of a S/360 mdl 22, 25, 30, 40, 44, 50, 65, 67 (in 65 mode), 75, and 195; or via an Integrated Communications Attachment on S/360 mdl 25. Note: The 3725 is not connectable to S/360.

HIGHLIGHTS (Mdls 1, 2 and P1, P2 With Emulator)

Dual 256-Byte Buffers: Transfer data between the input and output devices. The buffers alternate in providing input and output service to permit overlapped operation.

Buffer Edit: Allows corrections to be made on the contents of a buffer during key entry jobs. A 256-byte diskette record, if the diskette feature is present, can also be retrieved into the buffer using Update Mode and be corrected using buffer edit functions. Corrections can be made by character, by line, or by entire buffer (up to 256 bytes).

Extend Buffer: Combines the dual 256-byte buffers into a single 512-byte buffer under operator control for keyboard-to-line or keyboard-to-diskette jobs. Buffer edit capability applies to the full 512 bytes. Buffer transfers to line or diskette are in 256-byte increments and cannot be overlapped.

Printer Format Controls: Facilitate the formatting of printed data. Vertical and horizontal control characters in data initiate vertical or horizontal tabbing. Format controls for up to five jobs can be entered from keyboard, or from diskette or card if either one of these devices is attached.

Compression/Expansion: Provides a means for improving the efficiency of data transmission. For BSC, the compression option can be invoked at the terminal for a job that reads non-transparent data from cards. A 2-byte sequence is substituted for each occurrence of three or more consecutive blank card columns (63 consecutive blanks is the upper limit). A second 2-byte sequence is appended if more than 64 consecutive blank columns are read. The terminal monitors the non-transparent data received that is destined for printer or attached card punch and automatically expands this 2-byte sequence to the correct number of blanks. A similar capability is provided when using SDLC procedures.

Auto Interrupt: Allows the terminal to automatically interrupt an offline job for an online job initiated by the host processor. The terminal stops the offline job, executes the online job for receiving line data, and automatically restarts the offline job without operator intervention. A manual switch on the keyboard enables/disables this mode of operation. See "Operating Characteristics-Automatic Interrupt" in *3770 System Components Manual,* GA27-3097.

Input/Output Job Definitions: Can be operator- or terminal-defined. Up to five operator-defined jobs can be read from diskette or card reader to facilitate rapid job set-up when the terminal is equipped with either of the special features; otherwise they can be entered from keyboard under control of a prompting sequence and executed from temporary storage. Printer format controls can be part of the job definition. An appropriately configured 3774 will permit input/output job designations as follows:

3774 Communication Terminal (cont'd)

Input	Output
Offline Jobs	
Keyboard[1]	Console Printer, Diskette, Card Punch, or Printer Second
Diskette[2]	Console Printer, Diskette, Card Punch, or Printer Second
Card Reader[2]	Console Printer, Diskette, Card Punch, or Printer Second
Keyboard & Diskette[3]	Console Printer & either Diskette or Card Punch
Keyboard and Card Reader[3]	Console Printer & either Diskette or Card Punch
Online Batch Jobs	
Diskette or Card Reader[2]	Line
Line[2]	Console Printer, Diskette, Card Punch, or Printer Second
Online Interactive Jobs	
Keyboard[1]	Line
Line	Console Printer

Notes:
[1] One input and one output device per job. Output-to-console printer is automatic when input is keyboard.
[2] One input device and one output device per job. Monitor print is an additional output option when Diskette, Card Punch, or Line is the output device.
[3] Record Format feature (#6010) is required in addition to I/O devices to allow multiple input and output devices for a job.

Limitations: The input/output capabilities outlined under "Highlights" are dependent upon appropriate configurations of the terminal. Keyboard and console printer are standard. For other configurations, refer to "Special Features" below.

HIGHLIGHTS
(Mdls P1 and P2 Without Emulator)

Offline Operations: Are controlled by a user-written program. The 3774 interprets the user-written program after it is loaded into program storage from diskette storage. The 3774 has 6K bytes of program storage as standard. Additional 4K-, 8K-, 12K- and 16K-byte increments of program storage are available by special feature to a maximum of 16K additional bytes of program storage. A program can be selected and invoked by the operator, by a prior program call, or by an auto execute command from the host processor. Valid data sources for offline operations are the Operator Identification Card Reader, keyboard, diskette storage, and card reader. Valid data output devices are the console printer, diskette storage, card punch, 3784 Printer, and display.

3774P system utilities provide additional capabilities for the following operations:

- Card reader to console printer, diskette, card punch, or 3784 Printer
- Card print (Read Interpret)
- Keyboard-to-Card Punch
- Create, copy, list diskette
- Data set support for bypass, create, delete, erase, rename, and write protect data set
- Data set update for create, read, write, and dump data set
- Copy data set
- Program library support
- Print error log
- Set date
- Set configuration.

Storage Considerations: Storage is used for executing a 3770 application program that is loaded from diskette storage for Communications Mode, for data buffers, and for execution of device-related functions that are specified by the opening statement in the application program. Storage may also be allocated for devices and functions at power-on time through options available in the Terminal Configuration Utility. The amount of storage required for devices specified in the opening statement is:

Device or Function	Bytes
Supervisor Control Code Resident	3.0K
Programmable Communications - BSC	2.0K
Programmable Communications - SDLC	7.0K
Communications Mode	
Basic (Diskette and Console Printer I/O)	6.0K
Additional Storage for Card I/O and 3784 Printer	
Using BSC Communications	4.0K
Using SDLC Communications	5.75K
Additional Storage Using SDLC	
Multiple SYS.INTR Function	0.75K
Format Image Buffer (Power on Allocation Only)	256
3501 Card Reader	1.75K
2502 Card Reader	2.5K
Display Feature	2.5K
3521 Card Punch	3.0K
Read-Next Buffers (optional for diskette operation)	0.25K for each data set to a maximum of five

The amount of storage required is also dependent on the following variables:

Size of 3770 application program	xK bytes
Working storage for tables, storage-to-storage operations, buffers, etc., including 0.75K bytes for basic 3 buffers	xK bytes

Online Communications Operation: Terminals equipped with the appropriate I/O and Communications Features can operate as follows:

Transmission is controlled by the Communications Mode function or by a user-written program using the Programmable Communications function. *Communicate Mode* provides for selection of diskette datasets, card reader, or keyboard (Logon) for input data. Output data can be directed to a diskette data set, card punch, console printer, or 3784 Printer. Support is provided for printer horizontal or vertical format control. The *Programmable Communications* capability allows for transmission of data with any I/O device under control of a user-written program.

Diskette Storage Device: There are 99,840 bytes of storage available as standard on a non-removable diskette. Characteristics of the non-removable diskette are one read/write surface, 30 data tracks, 26 sectors per track and 128 bytes per sector. Up to 390 256-byte records or up to 780 128-byte records can be stored on the non-removable diskette. Programmable communication (SDLC) reduces the amount of storage for user data from 30 to 28 tracks.

Two additional Diskette Storage Devices providing 242,944 bytes of storage - each on removable reusable diskettes - are provided by special feature.

The diskettes can be used for storage of 3770 application programs and for application data. The maximum number of user-written data sets that can reside on the non-removable diskette and each removable diskette is 18. A maximum of seven data sets can be opened for any one program. A program library data set can contain a maximum of 99 user-written programs. Program identification can be numbered from 01 to 99.

Processor Interrupt: Can automatically occur during offline programs in order to receive an unsolicited processor message. The message is stored on diskette storage (or, under certain conditions, printed on the console printer) and the offline program is automatically resumed. A manual switch on the keyboard enables/disables this mode of operation.

Address Stop Function: Is provided to facilitate debugging of 3770 application programs at the terminal site. The status of program resources at the stop-address can be outputted to the printer or display.

Publications: GC20-0001

SPECIFY

- Voltage: (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug.
- Color: One must be specified. **#9041** for Red, **#9042** for Yellow, **#9043** for Blue, **#9045** for Gray. **Note:** Available at time of manufacture only.
- Remote Power Off (**#9501**): Specify this feature for capability to "power down" terminal from the host processor using a controlled data sequence sent over communication facilities.
- Cabling: Fixed-length cables are supplied as standard. Refer to *Installation Manual-Physical Planning,* GA27-3006.
- Emulator (**#9141**): Specify this feature to equip the terminal with the non-programmable function in lieu of the standard programmable

3774 Communication Terminal (cont'd)

function. This feature supplies non-programmable notation on the keyboard and operator panel. This feature is not recommended for field installation. It can be field removed to change the terminal from non-programmable to programmable function.

SPECIAL FEATURES

All special features can be field-installed except ASCII feature (#1201) or Keypad feature (#4660) for which field installation is not recommended. Special features for 3774 mdls 1 and 2 are on an "As Available" basis for field installation.

Communications Features

For Communication Capability Select one from each group:

- One Communication Feature (#1460, #1461 or #1470)*
- One Communication Driver (#1481 or #1482)
- EIA Interface (#3701) or One Integrated Modem (#5500, #5501, #5502, #5600, #5602, or #5610).

*#1462 is required in addition to #1460 or #1461 for multipoint operation using BSC.

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. **Limitations:** Not with #1461 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC, Point-To-Point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. **Limitations:** Not with #1460 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC, Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. **Limitations:** See GA27-3097 for BSC compatibility considerations. **Maximum:** One. **Prerequisites:** BSC point-to-point (#1461) or SDLC/BSC (#1460).

SDLC (#1470): Provides for switched and nonswitched SDLC procedures. **Maximum:** One. **Limitations:** Not with #1460 or #1461.

Without Business Machine Clocking (#1481): Provides communication driver without clocking. **Limitations:** Not with #1482. **Maximum:** One. **Prerequisites:** Communication Feature (#1460, #1461, or #1470).

With 1200 bps Business Machine Clocking (#1482): Provides communication driver with 1200 bps clocking. **Limitations:** Not with #1481. **Maximum:** One. **Prerequisites:** Communication Feature (#1460, #1461, or #1470).

EIA Interface (#3701): Provides a cable and interface meeting RS-232-C characteristics for attachment of an IBM Modem or non-IBM modem. Speeds up to 4800 bps for switched or nonswitched operation are permitted. This feature, in combination with #1481, can be used to attach to Modem Fan-Out (#3901) on an adjacent terminal, or on an IBM 3863, 3864, 3872 or 3874 Modem. This feature, in combination with #1482, can be used for direct attachment to a 3704 or 3705 equipped with Local Attachment (#4716) for operation at 1200 bps synchronous. **Limitations:** Not with Integrated Modem features. **Maximum:** One. **Prerequisites:** Communication Driver (#1481 or #1482).

1200 bps Integrated Modem, Nonswitched (#5500): Provides for point-to-point or multipoint operation over nonswitched communication facilities. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** Communication Driver (#1482).

1200 bps Integrated Modem, Switched, Auto Answer (#5501): Provides for point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. Attachment to the Switched Network is via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** Communication Driver (#1482).

1200 bps Integrated Modem, Switched Manual Answer (#5502): Provides for point-to-point operation over switched network facilities using manual originate/manual answer for establishing connection. Attachment to the Switched Network is via FCC registered protective circuitry of the CDT type (or equivalent) provided by the user. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** Communication Driver (#1482).

2400 bps Integrated Modem, Nonswitched Point-To-Point (#5600): This self-clocked modem provides for point-to-point operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting receive equalization. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** Communication Driver (#1481).

2400 bps Integrated Modem, Nonswitched Multipoint (#5602): This self-clocked modem provides for multipoint operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting transmit and receive equalization. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** Communication Driver (#1481).

This self-clocked modem provides for point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. Operator controls provide for half-speed operation. Attachment to the Switched Network is via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** Communication Driver (#1481).

Modem Fan-Out (#3901): [2400 bps Integrated Modem] Equips the 2400 bps Integrated Modem, Nonswitched Multipoint (#5602) with the capability to be shared by up to two other terminals in addition to the host. **Limitations:** This feature can be used at a tributary station in a centralized multipoint network. In this configuration, BSC multipoint programming discipline or SDLC nonswitched programming discipline will provide the selection/control of the terminal without any additional user involvement. **Maximum:** One. **Prerequisites:** #5602.

Switched Network Backup (#7951): [2400 bps Integrated Modem] Provides the capability of attaching 2400 bps Integrated Modem (#5600 or #5602) to the switched network facility as a backup to the primary nonswitched facility. Operation over the switched network is in manual originate/manual answer mode to establish the connection. It can communicate at 2400/1200 bps with an 3872 Modem equipped for operation over the public switched network (#7941, #7951, or #7952) attached to a 3704, 3705, or ICA of 3115 or 3125. **Note:** To use this feature operator intervention at the terminal is required. Operator intervention, program modification, or both, may be required on the using system. This feature can be used with BTAM programs for DOS/VS, OS/VS1, and OS/VS2 in certain configurations. Additional customer program routines will be required in existing BTAM programming to fully utilize the capabilities of this feature. **Limitations:** Not with #3701. **Maximum:** One. **Prerequisites:** 2400-bps Integrated Modem, Nonswitched (#5600 or #5602). Attachment to the Switched Network is via FCC registered protective circuitry of the CDT type (or equivalent) provided by the user.

Non-Communications Features

ASCII Feature (#1201): Provides a 48 data key keyboard (produces 94 ASCII graphics) in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features and 3784 Printer Attachment feature, and with BSC features #1460, #1461, or #1462 or with SDLC features #1460 or #1470. **Limitations (Mdls P1, P2 only):** The GETKB programming statement cannot be used in programs that are to be run on an ASCII machine. **Maximum:** One. **Field Installation:** Not recommended.

Audible Alarm (#1390): Sounds an alarm to alert the operator to conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One.

Display (#3250): [Mdls P1, P2] Provides a 480-character (12 lines of 40 characters each) information display under the control of the 3770 application program. **Limitations:** Cannot be installed with Emulator (#9141). **Maximum:** One.

Door Keylock (#3401): [Single use charge] Provides one keylock and two keys for the desk-console door. **Limitations:** The keys provided with this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. **Maximum:** One.

Door Keylocks, Dual (#3402): [Single use charge] Provides two keylocks and four identical keys for both desk-console cabinet doors. **Limitations:** The keys provided with this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. **Maximum:** One. **Prerequisites:** #4902.

Keylock (#4650): [Single use charge] Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with this feature. See "Accessories" for information on additional or replacement keys. **Maximum:** One.

Keypad, Numeric (#4660): [Mdls P1, P2] Provides a keypad in adding machine arrangement to facilitate rapid entry of numeric-only data. **Limitations:** Cannot be installed with Emulator #9141. **Maximum:** One. **Field Installation:** Not recommended.

Diskette Storage, First (#4901): One device with a customer-removable diskette is placed in the left cabinet. Additional diskettes are available. Characteristics of the diskette storage device are: one movable read/write head, one read/write surface, 73 data tracks, 26 sectors per track, and 128 bytes per sector. Up to 949 256-byte records can be stored on the diskette (one 256-byte data record is reserved for job identification information in 3774 mdl 1 and 2.). Each 256-byte record is stored in two consecutive numbered sectors in interchange mode, or in two non-consecutive sectors in 3770 mode. Diskette data is code-insensitive in SDLC mode, non-transparent only in BSC mode (3774 mdl 1 and 2). An Update Switch on the 3774 mdl 1

3774 Communication Terminal (cont'd)

and 2 provides the operator with the capability of reading a 256-byte diskette record into the terminal buffer where it can be printed, edited, or deleted. **Maximum:** One.

Diskette Storage, Second (#4902): Provides a second diskette storage device with the same characteristics as the first (#4901). It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for:
Copy: Data can be copied from diskette 1 to diskette 2 (single data set or all active data sets.) **Concatenate (pool):** The ability to concatenate on a data set basis. **Continue (3774 mdls 1, 2):** Allows a read or write operation to automatically continue to diskette 2 if it has been placed in a ready condition. Continue is not allowed while keying data. **Record Update (3774 mdls 1, 2):** Allows a record to be read into the buffer from diskette 1, updated from keyboard, and written to the other diskette. Record Format feature (#6010) is a prerequisite for this update capability. **Maximum:** One. **Field Installation:** Yes. Color will be the same as that specified for the base machine. **Prerequisites:** #4901.

Operator Identification Card Reader (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8 in. x 2-1/8 in. ranging from 0.007 to 0.045 in. thick may be read. With a BSC non-programmable terminal, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic stripe card cannot be printed. For a programmable terminal, the Operator Identification Card Reader is under control of the 3770 application program. **Limitations:** (1) The operator must position and slide the card through the reader-slot at a steady rate between 5.0 in. and 40.0 in. per second for a read operation. (2) BSC programming for 2770 does not support this feature. **Maximum:** One.

Record Format (#6010): Provides an offline capability for constructing records using more than one input and output device. Input can be keyboard, and either diskette or an attached card reader. Output can be console printer, and either diskette or an attached card punch. A record format specification record stored on diskette can be defined and changed by the user to permit selection, by field, for merging or creating, in any sequence within a transaction cycle. It also permits selecting output by field. There may be multiple fields within a transaction and multiple transaction cycles within a job. Provision is also made with this feature for self-checking, decimal insertion, right justify and fill, and numeric checking. A record format specification record can be loaded to diskette from the line, keyboard, or card reader. This feature increases the size of "extend buffer" from 512 to 2,048 bytes. **Limitations:** Extend buffer and update operation is not permitted for a record format job. A record format job cannot be interrupted by the processor automatically; operator intervention is required. This feature is not compatible with terminal programming and will be removed from 3774 mdls P1 and P2 whenever Emulator (#9141) is removed. **Maximum:** One. **Prerequisites:** For mdl 1 or 2: #4901. For mdl P1 or P2: #4901 and #9141.

Storage Increment, 4K (#6800): [Mdls P1, P2] Provides an additional 4,096 bytes of programmable storage **Limitations:** Not available with other storage increments (#6801, #6802, or #6803). Cannot be installed with Emulator (#9141). **Maximum:** One.

Storage Increment, 8K (#6801): [Mdls P1, P2] Provides an additional 8,192 bytes of programmable storage. **Limitations:** Not available with other storage increments (6800, 6802, or 6803). Cannot be installed with Emulator (#9141). **Maximum:** One.

Storage Increment, 12K (#6802): [Mdls P1, P2] Provides an additional 12,288 bytes of programmable storage. **Limitations:** Not available with other storage increments (#6800, #6801, or #6803). Cannot be installed with Emulator (#9141). **Maximum:** One.

Storage Increment, 16K (#6803): [Mdls P1, P2] Provides an additional 16,384 bytes of programmable storage. **Limitations:** Not available with other storage increments (#6800, #6801, or #6802). Cannot be installed with Emulator (#9141). **Maximum:** One.

3501 Card Reader Attachment (#8050): Provides for attachment of the 3501 Card Reader. **Limitations:** Not with 3782/2502 Card Reader Attachment (#8149). **Maximum:** One.

3782/2502 Card Reader Attachment (#8149): Provides for the attachment of the 3782 Card Attachment Unit mdl 2 and 2502 Card Reader mdl A1 or A2. The 2502 can be equipped with special features for 51/80 or 66/80 column cards and/or Optical Mark Read. A companion Optical Mark Read special feature is required on the 3782 mdl 2. **Limitations:** Not with 3501 Card Reader Attachment (8050). **Maximum:** One.

3782/3521 Card Punch Attachment (#8150): Provides for attachment of the 3782 Card Attachment Unit mdl 1 and the 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print . **Limitations (3774 mdl 1 or 2 only):** If a 2502 or 3501 Card Reader is also attached (#8149 or #8050), the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. **Maximum:** One.

3784 Printer Attachment (#8155): Provides for the attachment of the 3784 Line Printer as a second printer. **Maximum:** One.

Variable-Width Forms Tractor (#8700): Provides a forms feeding device for continuous edge-punched forms. Overall forms width from 3.0 in. to 15.0 in. can be fed. Refer to *Forms Design Reference Guide for Printers,* GA24-3488. **Maximum:** One.

MODEL CONVERSIONS

Are field installable. For 3774 mdl 1 and 2 are on an "As Available" basis. **Limitations:** Model downgrades from programmable models to non-programmable models are not permitted.

ACCESSORIES

Forms Stand (#4450): A 2-shelf forms stand that permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after printing. For shipment with the machine, order by feature number.

Locks and Keys: The Keylock **#4650** special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM (purchase only). A customer letter of authorization with key identification number must accompany each order. Allow seven weeks for shipment. **SUPPLIES**

Ribbons: A black ribbon, P/N 2236653 , or equivalent, is required. Contact IBM.

3775 COMMUNICATION TERMINAL

PURPOSE

This desk-style console-keyboard-printer is a member of the 3770 Data Communication System. The basic printer operates at a maximum speed of 120 lines per minute using a 64-character set or 80 lines per minute using a 94-character set . An engraved character font print belt can be interchanged by the operator. Special features permit one or two diskette storage devices and provide for the attachment of one card reader and one card punch. One of three card readers may be selected for operation at a speed of 50, 150, or 300 cards per minute. The card punch operates at 50 cards per minute.

Communication features allow for operation over switched or non-switched facilities at speeds of up to 4800 bps using SDLC or BSC transmission techniques and an appropriate modem.

MODELS

Model 1 001 [NO LONGER AVAILABLE] (Non-programmable): 80/120 lpm printer

Model P1 P01 (User-programmable): 80/120 lpm printer

The prefix "P" on the model number designates user-programmable.

HIGHLIGHTS (All Models)

Keyboard: EBCDIC arrangement with 44 data keys (produces 88 characters). Underscore/Hyphen, Backspace, Space and "Print Character" ("Character" on programmable mdls) keys have typamatic operation. Associated with the keyboard are: indicator lights, function keys, operating mode switches, and a 3-position numeric display.

Printer: During a key entry job, the print platen lowers to provide print line visibility. Printing is from characters engraved on a revolving print belt. Included as standard is one interchangeable print belt (either 64or 94-character set) . Also included are a variable-width forms tractor for feeding continuous forms up to 15 inches overall width, paper jam detection, and 132 print positions. Character spacing is 10 per inch; line spacing is 6 or 8 per inch. Maximum print speed is 120 lines per minute with the 64-character set, 80 lines per minute with the 94-character set, . Continuous card stock forms are not recommended. Refer to GA24-3488 for forms design considerations.

Performance Considerations: Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, etc., must all be considered in determining actual throughput. See *IBM 3770 Data Communication System,* GA27-3097, for additional information.

Problem Determination Procedures: Significant function has been designed into this unit to provide greater availability to the customer. This has been done through the use of problem identification and recovery routines and procedures that are easily understood and used by the operator. See *IBM 3775/3775 Operating Procedures Guide* GA27-3094 or *IBM 3773, 3774, and 3775 Programmable Communications Terminals Operator's Guide,* GA27-3114.

Communications: See "Special Features".

Transmission over switched or nonswitched facilities at speeds of up to 4800 bps are allowed by selecting the appropriate modem and communication facility. Refer to M2700 pages for information on Customer Responsibilities, Communication Facilities, and other attachment information, and to M3872 and 3874 pages.

The 2400 bps Integrated Modem and 3872 Modem, when appropriately configured, can be intermixed on the same communication facility.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Prerequisites:

For SDLC Communications with S/370 or 4300 Processor: A 3704, 3705, or 3725 Communications Controller operating under Network Control Program/Virtual Storage (NCP/VS) attached to any virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1, or OS/VS2; or these operating systems running under VM/370.

For BSC Communications with S/360, S/370 or 4300 Processors: A virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1 or OS/VS2, or under RSCS (non-programmable terminals only) and VM/370, or any of these operating systems running under VM/370. The 3770 Communication Terminals use 2770 BSC programming support when operating in BSC mode. Operation with S/360, S/370 or 4300 Processors using 2770 BSC programming is also permitted. The customer **may** have to modify existing 2770 application programs for operation with **non-programmable** mdls of the 3775. The customer **will** have to modify existing application programs for operation with **programmable** mdls of the 3775. See GA27-3097 for BSC compatibility considerations. BSC attachment can be made via a 3704, 3705, or 3725 Communications Controller or a 2701 Data Adapter Unit attached to a channel of any virtual storage S/370 or 4300 Processor; or via an Integrated Communications Adapter on S/370 processor; or via a Communications Adapter feature on a 4331 or 4361 processor. BSC attachment can be made via a 3704/3705 Communications Controller attached to a channel of a S/360 mdl 30, 40, 50, 65, 67 (in mdl 65 mode), 75, and 195; via a 2701 attached to a channel of a S/360 mdl 22, 25, 30, 40, 44, 50, 65, 67 (in mdl 65 mode), 75, and 195; or via an Integrated Communications Attachment on S/360 mdl 25. **Note:** The 3725 is not connectable to S/360.

HIGHLIGHTS (Mdls 1 and P1 With Emulator)

Dual 256-Byte Buffers: Transfer data between the input and output devices. The buffers alternate in providing input and output service to permit overlapped operation.

Buffer Edit: Allows corrections to be made on the contents of a buffer during key entry jobs. A 256-byte diskette record, if the diskette feature is present, can also be retrieved into the buffer using Update Mode and be corrected using buffer edit functions. Corrections can be made by character, by line, or by entire buffer (up to 256 bytes).

Extend Buffer: Combines the dual 256-byte buffers into a single 512-byte buffer under operator control for keyboard-to-line or keyboard-to-diskette jobs. Buffer edit capability applies to the full 512 bytes. Buffer transfers to line or diskette are in 256-byte increments and cannot be overlapped.

Printer Format Controls: Facilitate the formatting of printed data. Vertical and horizontal control characters in data initiate vertical or horizontal tabbing. Format controls for up to five jobs can be entered from keyboard, or from diskette or card if either one of these devices is attached.

Compression/Expansion: Provides a means for improving the efficiency of data transmission. For BSC, the compression option can be invoked at the terminal for a job that reads non-transparent data from cards. A 2-byte sequence is substituted for each occurrence of three or more consecutive blank card columns (63 consecutive blanks is the upper limit). A second 2-byte sequence is appended if more than 64 consecutive blank columns are read. The terminal monitors the non-transparent data received that is destined for printer or attached card punch and automatically expands this 2-byte sequence to the correct number of blanks. A similar capability is provided when using SDLC procedures.

Auto Interrupt: Allows the terminal to automatically interrupt an offline job for an online job initiated by the host processor. The terminal stops the offline job, executes the online job for receiving line data, and automatically restarts the offline job without operator intervention. A manual switch on the keyboard enables/disables this mode of operation. See *Operating Characteristics-Automatic Interrupt in 3770 System Components Manual,* GA27-3097.

Input/Output Job Definitions: Can be operator-or terminal-defined. Up to five operator-defined jobs can be read from diskette or card reader to facilitate rapid job setup when the terminal is equipped with either of the special features; otherwise they can be entered from keyboard under control of a prompting sequence and executed from temporary storage. Printer format controls can be part of the job definition. An appropriately configured 3775 will permit input/output job designations as follows:

Input	Output
Offline Jobs	
Keyboard [1]	Console Printer, Diskette, or Card Punch
Diskette [2]	Console Printer, Diskette, or Card Punch
Card Reader [2]	Console Printer, Diskette, or Card Punch
Keyboard and Diskette [3]	Console Printer and either Diskette or Card Punch
Keyboard and Card Reader [3]	Console Printer and either Diskette or Card Punch

3775 Communication Terminal (cont'd)

Online Batch Jobs

Diskette or Card Reader[2]	Line
Line[2]	Console Printer, Diskette, or Card Punch

Online Interactive Jobs

Keyboard[1]	Line
Line	Console Printer

Notes:
1. One input and one output device per job. Output-to-console printer is automatic when input is keyboard.
2. One input device and one output device per job. Monitor print is an additional output option when Diskette, Card Punch, or Line is the output device.
3. Record Format (#6010) is required in addition to I/O devices to allow multiple input and output devices for a job.

Limitations: The input/output capabilities outlined under "Highlights" are dependent upon appropriate configurations of the terminal. Keyboard and console printer are standard. For other configurations, refer to "Special Features" below.

HIGHLIGHTS
(Mdl P1 Without Emulator)

Offline Operations: Are controlled by a user-written program. The 3775 interprets the user-written program after it is loaded into program storage from diskette storage. The 3775 has 6K bytes of program storage as standard. Additional 4K-, 8K-, 12K- and 16K-byte increments of program storage are available by special feature to a maximum of 16K additional bytes of program storage.

A program can be selected and invoked by the operator, by a prior program call, or by an auto execute command from the host processor. Valid data sources for offline operations are the Operator Identification Card Reader, keyboard, diskette storage, and card reader. Valid data output devices are the console printer, diskette storage, card punch, and display.

3775P system utilities provide additional capabilities for the following operations:

- Card reader to console printer, diskette, or card punch
- Card print (Read Interpret)
- Keyboard to Card Punch
- Create, copy, list diskette
- Data set support for bypass, create, delete, erase, rename, and write protect data set
- Data set update for create, read, write, and dump data set
- Copy data set
- Program library support
- Set date
- Set configuration.

Storage Considerations: Storage is used for executing a 3770 application program that is loaded from diskette storage for Communications Mode for data buffers, and for execution of device-related functions that are specified by the application program. Storage may also be allocated for devices and functions at power-on time through options available in the Terminal Configuration Utility. The amount of storage required for devices specified in the opening statement is:

Device or Function	Bytes
Supervisor Control Code Resident	3.0K
Programmable Communications - BSC	2.0K
Programmable Communications - SDLC	7.0K
Communications Mode	
Basic (Diskette and Console Printer I/O)	6.0K
Additional Storage for Card I/O	
Using BSC Communications	4.0K
Using SDLC Communications	5.75K
Additional Storage Using SDLC	
Multiple SYS.INTR Function	0.75K
Format Image Buffer (Power on	
Allocation Only)	256
3501 Card Reader	1.75K
2502 Card Reader	2.5K
Display Feature	2.5K
3521 Card Punch	3.0K
Read-Next Buffers (optional for diskette operation)	0.25K for each date set to a maximum of five

- The amount of storage required is also dependent on the following variables:

Size of 3770 application program	xK bytes
Working storage for tables, storage-to-storage operations, buffers, etc., including 0.75K bytes for basic 3 buffers	xK bytes

Online Communications Operation: Terminals equipped with the appropriate I/O and Communications Features can operate as follows:

Transmission is controlled by the Communications Mode function or by a user-written program using the Programmable Communications function. *Communicate Mode* provides for selection of diskette datasets, card reader, or keyboard (Logon) for input data. Output data can be directed to a diskette data set, card punch, console printer, or 3784 Printer. Support is provided for printer horizontal or vertical format control. The *Programmable Communications* capability allows for transmission of data with any I/O device under control of a user-written program.

Diskette Storage Device: There are 99,840 bytes of storage available as standard on a non-removable diskette. Characteristics of the non-removable diskette are one read/write surface, 30 data tracks, 26 sectors per track and 128 bytes per sector. Up to 390 256-byte records or up to 780 128-byte records can be stored on the non-removable diskette. Programmable communication (SDLC) reduces the amount of storage for user data from 30 to 28 tracks.

Two additional diskette storage devices providing 242,944 bytes of storage - each on removable reusable diskettes - are provided by special feature.

The diskettes can be used for storage of 3770 application programs and for application data. The maximum number of user-written data sets that can reside on the non-removable diskette and each removable diskette is 18. A maximum of seven data sets can be opened for any one program. A program library data set can contain a maximum of 99 user-written programs. Program identification can be numbered from 01 to 99.

Processor Interrupt: Can automatically occur during offline programs in order to receive an unsolicited processor message. The message is stored on diskette storage (or, under certain conditions, printed on the console printer) and the offline program is automatically resumed. A manual switch on the keyboard enables/disables this mode of operation.

Address Stop Function: Is provided to facilitate debugging of 3770 application programs at the terminal site. The status of program resources at the stop-address can be outputted to the printer or display.

Bibliography: GC20-0001

SPECIFY

- Voltage: (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug.
- Color: One must be specified. **#9041** for Red, **#9042** for Yellow, **#9043** for Blue, **#9045** for Gray. Note: Available at time of manufacture only.
- Remote Power Off **(#9501):** Specify this feature for capability to "power down" terminal from the host processor using a controlled data sequence sent over communication facilities.
- Cabling: Fixed-length cables are supplied as standard. Refer to *Installation Manual-Physical Planning,* GA27-3006.
- Print Belt Character Set: One must be specified. Available at time of manufacture only. See Print Belt under "Accessories" for additional print belts. **#9491** for 64-Character Set EBCDIC, **#9492** for 94-Character Set EBCDIC, **#9494** for 64-character Set ASCII, **#9495** for 94-Character Set ASCII. **#9494** and **#9495** require ASCII Feature (#1201).
- Emulator (#9141): Specify this feature to equip the terminal with the non-programmable function in lieu of the standard programmable function. This feature supplies non-programmable notation on the keyboard and operator panel. This feature is not recommended for field installation. It can be field removed to change the terminal from non-programmable to programmable function.
- Alternate Address (#9011): [Mdl P1] Order this optional feature to specify that diskettes containing terminal control code engineering changes are to be mailed to an alternate address supplied by Field Engineering using a Teleprocessing Control number. The alternate address selected is usually the central site location. **Field Installation:** Yes. **Limitations:** Not with Emulator **#9141.** Each EC control diskette has been manufactured for use on the specific machine type/serial shown on the diskette label. EC diskettes for the 3775 terminal are unconfigured when they are mailed from IBM and have 23 tracks of storage available for user data. After the diskette is configured on the machine type/serial on which it is to be used, the amount of storage for user data is as follows:

  30 tracks - Configured to not use programmable communication SDLC

3775 Communication Terminal (cont'd)

28 tracks - Configured to use programmable communications SDLC.

For additional information see "Data Set Support" in the *Operator's Guide,* GA27-3114.

SPECIAL FEATURES

All special features can be field-installed except ASCII feature (#1201), Keypad feature (#4660) and Dual Independent Forms Feed (#3551) for which field installation is not recommended. Special features for 3775 mdl 1 are on an "as available" basis for field installation.

Communications Features

For communication capability, select one from each group:

- One Communication Feature (#1460, #1461 or #1470)*
- One Communication Driver (#1481 or #1482)
- EIA Interface (#3701) or One Integrated Modem (#5500, #5501, #5502, #5600, #5602, or #5610).

*#1462 is required in addition to #1460 or #1461 for multipoint operation using BSC.

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. **Limitations:** Not with #1461 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC, Point-To-Point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. **Limitations:** Not with #1460 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC, Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. **Limitations:** See GA27-3097 for BSC compatibility considerations. **Maximum:** One. **Prerequisites:** #1461 or #1460.

SDLC (#1470): Provides for switched and nonswitched SDLC procedures. **Maximum:** One. **Limitations:** Not with #1460 or #1461.

Without Business Machine Clocking (#1481): Provides communication driver without clocking. **Limitations:** Not with #1482. **Maximum:** One. **Prerequisites:** #1460, #1461, or #1470.

With 1200 bps Business Machine Clocking (#1482): Provides communication driver with 1200 bps clocking. **Limitations:** Not with #1481. **Maximum:** One. **Prerequisites:** Communication Feature #1460, #1461, or #1470.

EIA Interface (#3701): Provides a cable and interface meeting RS-232-C characteristics for attachment of an IBM Modem or non-IBM modem. Speeds up to 4800 bps for switched or nonswitched operation are permitted. This feature, in combination with #1481, can be used to attach to Modem Fan-Out (#3901) on an adjacent terminal, or on 3863, 3864, 3872 or 3874 Modem. This feature in combination with #1482 can be used for direct attachment to a 3704 or 3705 equipped with Local Attachment (#4716) for operation at 1200 bps synchronous. **Limitations:** Not with Integrated Modem features. **Maximum:** One. **Prerequisites:** #1481 or #1482.

Modem Fan-Out (#3901): Equips the 2400 bps Integrated Modem, Nonswitched Multipoint (#5602) with the capability to be shared by up to two other terminals in addition to the host. **Limitations:** This feature can be used at a tributary station in a centralized multipoint network. In this configuration, BSC multipoint programming discipline or SDLC nonswitched programming discipline will provide the selection/control of the terminal without any additional user involvement. **Maximum:** One. **Prerequisites:** #5602.

1200 bps Integrated Modem, Nonswitched (#5500): Provides for point-to-point or multipoint operation over nonswitched communication facilities. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1482.

1200 bps Integrated Modem, Switched, Auto Answer (#5501): Provides for point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. Attachment to the Switched Network is via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1482.

1200 bps Integrated Modem, Switched, Manual Answer (#5502): Provides for point-to-point operation over switched network facilities using manual originate/manual answer for establishing connection. Attachment to the Switched Network is via FCC registered protective circuitry of the CDT type (or equivalent) provided by the user. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1482.

2400 bps Integrated Modem, Nonswitched Point-To-Point (#5600): This self-clocked modem provides for point-to-point operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting receive equalization. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481.

2400 bps Integrated Modem, Nonswitched Multipoint (#5602): This self-clocked modem provides for multipoint operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting transmit and receive equalization. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisite:** #1481.

2400 bps Integrated Modem, Switched With Manual Answer (#5610): This self-clocked modem provides for point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. Operator controls provide for half-speed operation. Attachment to the Switched Network is via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. **Limitations:** Not with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481.

Switched Network Backup (#7951): Provides the capability of attaching 2400 bps Integrated Modem (#5600 or #5602) to the switched network facility as a backup to the primary nonswitched facility. Operation over the switched network is in manual originate/manual answer mode to establish the connection. It can communicate at 2400/1200 bps with an 3872 Modem equipped for operation over the public switched network **#7941, #7951, or #7952** attached to a 3704, 3705, or ICA of 3115 or 3125. **Note:** To use this feature operator intervention at the terminal is required. Operator intervention, program modification, or both, may be required on the using system. This feature can be used with BTAM programs for DOS/VS, OS/VS1, and OS/VS2 in certain configurations. Additional customer program routines will be required in existing BTAM programming to fully utilize the capabilities of this feature. **Limitations:** Not with #3701. **Maximum:** One. **Prerequisite:** 2400 bps Integrated Modem, Nonswitched (#5600 or #5602). Attachment to the Switched Network is via FCC registered protective circuitry of the CDT type (or equivalent) provided by the user.

Non-Communications Features

ASCII Feature (#1201): [Mdl P1] Provides a 48 data key keyboard (produces 94 ASCII graphics) in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features and 3784 Printer Attachment feature, and with BSC features #1460, #1461, or #1462 or with SDLC features #1460 or #1470. **Limitations:** The GETKB programming statement cannot be used in programs that are to be run on an ASCII machine. **Maximum:** One. **Field Installation:** Not recommended.

Audible Alarm (#1390): Sounds an alarm to alert the operator to conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One.

Display (#3250): [Mdl P1] Provides a 480-character (12 lines of 40 characters each) information display under the control of the 3770 application program. **Limitations:** Cannot be installed with Emulator **#9141. Maximum:** One.

Door Keylock (#3401): [SUC] Provides one keylock and two keys for the desk-console door. **Limitations:** The keys provided with this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. **Maximum:** One.

Door Keylocks, Dual (#3402): [SUC] Provides two keylocks and four identical keys for both desk-console cabinet doors. **Limitations:** The keys provided with this lock can be duplicated by local key makers. Additional or replacement keys are not available from IBM. **Maximum:** One. **Prerequisite: #4902.**

Keylock (#4650): [SUC] Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with this feature. See "Accessories" for information on additional or replacement keys. **Maximum:** One.

Keypad, Numeric (#4660): [Mdl P1] Provides a keypad in adding machine arrangement to facilitate rapid entry of numeric-only data. **Limitations:** Cannot be installed with Emulator **#9141. Maximum:** One. **Field Installation:** Not recommended.

Dual Independent Forms Feed (#3551): [Mdl P1] Provides two independently indexed pinfeed mechanisms on the console line printer with visibility platen. They operate under control of a 3775 application program. Different sizes of forms can be handled in each paper feed. Refer to GA24-3488 for forms design considerations. **Limitations:** Cannot be installed with Emulator **#9141. Maximum:** One. **Field Installation:** Not recommended.

Diskette Storage, First (#4901): One device with a customer-removable diskette is placed in the left cabinet. Additional diskettes are available ... contact IBM. Characteristics of the diskette storage device are: one movable read/write head, one read/write surface, 73 data tracks, 26 sectors per track, and 128 bytes per sector. Up to 949 256-byte records can be stored on the diskette (one 256-byte data record is reserved for job identification information in mdl 1.). Each

3775 Communication Terminal (cont'd)

256-byte record is stored in two consecutive numbered sectors in interchange mode, or in two non-consecutive sectors in 3770 mode. Diskette data is code-insensitive in SDLC mode, non-transparent only in BSC mode mdl 1. An Update Switch on the mdl 1 provides the operator with the capability of reading a 256-byte diskette record into the terminal buffer where it can be printed, edited, or deleted. **Maximum:** One.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the first (#4901). It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for:

Copy: Data can be copied from Diskette 1 to Diskette 2 (single data set or all active data sets.)

Concatenate (pool): The ability to concatenate on a data set basis.

Continue (mdl 1): Allows a read or write operation to automatically continue to Diskette 2 if it has been placed in a ready condition. Continue is not allowed while keying data.

Record Update (mdl 1): Allows a record to be read into the buffer from Diskette 1, updated from keyboard, and written to the other diskette. Record Format feature (#6010) is a prerequisite for this update capability.

Maximum: One. **Field Installation:** Yes. Color will be the same as that specified for the base machine. **Prerequisite:** #4901.

Operator Identification Card Reader (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8 inches x 2-1/8 inches ranging from 0.007 to 0.045 inches thick may be read. Contact IBM for magnetically striped and encoded identification cards. With a BSC non-programmable terminal, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic stripe card cannot be printed. For a programmable terminal, the Operator Identification Card Reader is under control of the 3770 application program. **Limitations:** (1) The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. (2) BSC programming for 2770 does not support this feature. **Maximum:** One.

Record Format (#6010): Provides an offline capability for constructing records using more than one input and output device. Input can be keyboard, and either diskette or an attached card reader. Output can be console printer, and either diskette or an attached card punch. A record format specification record stored on diskette can be defined and changed by the user to permit selection, by field, for merging or creating, in any sequence within a transaction cycle. It also permits selecting output by field. There may be multiple fields within a transaction and multiple transaction cycles within a job. Provision is also made with this feature for self-checking, decimal insertion, right justify and fill, and numeric checking. A record format specification record can be loaded to diskette from the line, keyboard, or card reader. This feature increases the size of "extend buffer" from 512 to 2,048 bytes. **Limitations:** Extend buffer and update operation is not permitted for a record format job. A record format job cannot be interrupted by the processor automatically; operator intervention is required. This feature is not compatible with terminal programming and must be removed from mdl P1 whenever Emulator **#9141** is removed. **Maximum:** One. **Prerequisite:** For mdl 1: #4901. For mdl P1: #4901 and #9141.

Storage Increment, 4K (#6800): [Mdl P1] Provides an additional 4,096 bytes of programmable storage. **Limitations:** Not available with other storage increments (#6801, #6802, or #6803). Cannot be installed with Emulator **#9141. Maximum:** One.

Storage Increment, 8K (#6801): [Mdl P1] Provides an additional 8,192 bytes of programmable storage. **Limitations:** Not available with other storage increments (#6800, #6802, or #6803). Cannot be installed with Emulator **#9141. Maximum:** One.

Storage Increment, 12K (#6802): [Mdl P1] Provides an additional 12,288 bytes of programmable storage. **Limitations:** Not available with other storage increments (#6800, #6801, or #6803). Cannot be installed with Emulator **#9141. Maximum:** One.

Storage Increment, 16K (#6803): [Mdl P1] Provides an additional 16,384 bytes of programmable storage. **Limitations:** Not available with other storage increments (#6800, #6801, or #6802). Cannot be installed with Emulator **#9141. Maximum:** One.

3501 Card Reader Attachment (#8050): Provides for attachment of the 3501 Card Reader. **Limitations:** Not with 3782/2502 Card Reader Attachment (#8149). **Maximum:** One.

3782/2502 Card Reader Attachment (#8149): Provides for the attachment of the 3782 Card Attachment Unit mdl 2 and 2502 Card Reader mdl A1 or A2. The 2502 can be equipped with special features for 51/80 or 66/80 column cards and/or is required on the #3782 mdl 2. **Limitations:** Not with 3501 Card Reader Attachment (#8050). **Maximum:** One.

3782/3521 Card Punch Attachment (#8150): Provides for attachment of the 3782 Card Attachment Unit mdl 1 and the 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print . **Limitations mdl 1:** If a 2502 or 3501 Card Reader is also attached (#8149 or #8050), the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. **Maximum:** One.

MODEL CONVERSIONS

Are field-installable. Model 1 to Model P1. For 3775 model 1, are on an "As Available" basis. **Limitations:** Model downgrade from model P1 to model 1 is not permitted.

ACCESSORIES

Accessories are available on a purchase-only basis. For shipment with machine, order feature numbers indicated below.

Forms Stand (#4450): A 2-shelf forms stand that permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after printing. For shipment with the machine, order by feature number. **Note:** For the 3775, it is recommended that forms be used out of carton.

Locks and Keys: The Keylock **#4650** special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM (purchase only). A customer letter of authorization with key identification number must accompany each order. Allow seven weeks for shipment.

@SS@

Print Belt, Add'l: Supplies a print belt in addition to the one that is provided as standard with the machine (see "Specify").

64-character	ASCII	**(#5812)***
94-character	ASCII	**(#5813)***
64-character	EBCDIC	**(#5822)**
94-character	EBCDIC	**(#5823)**

* ASCII Feature (#1201) is a prerequisite.

SUPPLIES

Ribbons: A black ribbon, P/N 1136634, or equivalent, is required. Contact IBM.

3776 COMMUNICATION TERMINAL MDL 1, 2

PURPOSE

The 3776 is a medium speed remote job entry terminal and is a member of the 3770 Data Communication System. The 3776 mdls 1 and 2 are SNA Single Logical Unit (SLU) and BSC terminals. A keyboard is used for terminal control and for operator communication with the host processor. The 3776 is not designed as an interactive terminal. The printer contains an engraved character font belt (48-, 64-, or 94character set) which can be interchanged by the operator. A special feature provides for paper insertion from either the front or rear of the machine. Special features permit one or two diskette storage devices, one card reader and one card punch. One of three card readers can be selected for operation at speeds of 50, 150 or 300 cards per minute. The card punch operates at 50 cpm.

Communication features permit operation over switched or non-switched facilities at speeds up to 4800 bps using SDLC or BSC transmission techniques and an appropriate modem.

MODELS

		Maximum Lines Per Minute	Character Set
Model 1	001	300	48
		230	64
		160	94
Model 2	002	400	48
		300	64
		230	94

Prerequisites:

For SDLC Communications with S/370, 4331 or 4341 processors: A 3704, 3705 or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1 or OS/VS2; or these operating systems running under VM/370 (OS/VS2 is not supported by the 4300 Processors).

For BSC Communications with S/360, S370 or 4300 Processor: A virtual storage S/370 or 4300 Processor operating under DOS/VS, OS/VS1 or OS/VS2; or under RSCS and VM/370; or any of these operating systems running under VM/370. The 3776 Communicafion Terminals use 2770/3780 BSC programming support when operating in BSC mode. Operation with S/360, S/370 or 4300 Processors using 2770/3780 BSC programming is also permitted. See GA27-3097 for BSC compatibility considerations. The customer may have to modify existing 2770/3780 application programs for operation with 3776. BSC attachment can be via a 3704, 3705, or 3725 Communications Controller, or a 2701 Data Adapter Unit attached to a channel of any S/370, 4331 or 4341 Processor; or via an Integrated Communications Adapter on S/370 mdl 115, 125, 135-3 or 138; or via a Communications Adapter feature on the 4331 Processor. BSC attachment can be made via a 3704/3705 attached to a channel of a S/360 mdl 30, 40, 50, 65, 67 (in 65 mode), 75 or 195; via a 2701 attached to a channel of a S/360 mdl 22, 25, 30, 40 44, 50, 65, 67 (in 65 mode), 75 or 195; or via an Integrated Communications Attachment on S/360 mdl 25. **Note:** The 3725 is not connectable to S/360.

For BSC Communications with System/38: All mdls of S/38 running under CPF (5714-SS1) featured with Communications Attachment (#1501 or #1502) and Communications Control, SDLC/BSC (#2001 or #2003). See *IBM System/38 Data Communications Programmer's Guide,* SC21-7825, for BSC function and compatibility considerations.

Limitations: The input/output capabilities outlined under "Highlights" are dependent on appropriate configurations of the terminal. Keyboard and printer are standard. For other configurations, refer to "Special Features" below.

HIGHLIGHTS

Keyboard -- EBCDIC arrangement with 44 data keys (produces 88 characters). Underscore/Hyphen, Backspace, Space, and Character Advance keys have typamatic operation. Associated with the keyboard are: indicator lights, function keys, operating mode switches, and a 3-position numeric display.

Printer -- line printing is from characters engraved on a revolving belt. Included as standard is one interchangeable print belt (either 48-, 64-, , or 94-character set) ... see "Specify" ... variable width forms tractor for feeding continuous forms up to 15 inches wide, paper jam detection, and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch. Maximum print lines are 127 lines per page. Refer to GA24-3488 for forms design considerations.

Buffers -- transfer data between the input and output devices and the communication line. Buffers also transfer data between input and output devices during offline operation. The buffers alternate in providing input and output service to permit overlapped operation. Dual 256-byte or dual 512-byte buffers are used to BSC or SDLC operation and are under operator control.

Printer Format Controls -- facilitate the formatting or printed data. Vertical and horizontal control characters in data initiate vertical and horizontal tabbing.

Compression/Expansion -- provides a means for improving the efficiency of data transmission. For BSC, the compression option can be invoked at the terminal for a job that reads non-transparent data from cards or diskette. A 2-byte sequence is substituted for each occurrence or three or more consecutive blanks (63 consecutive blanks is the upper limit). A second 2-byte sequence is appended if more than 63 consecutive blanks are read. The terminal monitors received non-transparent data that is destined for the printer or attached card punch and automatically expands this 2-byte sequence to the correct number of blanks.

SDLC implementation provides a compression option at the terminal for a job that reads data from cards or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. The terminal automatically expands the compression sequence to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received.

Transmission Reversal -- permits keyboard initiation of interrupt of host data transmission for terminal data transmission and for resumption of the host transmission upon completion of the terminal transmission. The function is dependent upon associated host programming.

Record Compress -- using two special feature diskette storage devices permits offline compression of Basic Exchange diskette records onto a single 3776 diskette for subsequent batch transmission. The compressed records are written on the 3776 diskette in 3770 mode. Record Compress using one diskette storage device permits the compression of Basic Exchange diskette records into blocks of 256 bytes of 512 bytes for transmission.

Dual Data Path -- provides for concurrent operation of a line-to-printer job and a card reader-to-diskette, or diskette-to-card punch, or diskette-to-diskette job. The line-to-printer job uses either the dual 256-byte or dual 512-byte alternating buffers to accept data from the line and transfer it to the printer. A single 256-byte or single 512-byte buffer is used for data buffering between card I/O and diskette or diskette and diskette. Throughput for both online and offline jobs is degraded when run concurrently using dual data path.

Automatic Card to Line Job -- when an online job is completed and the 3776 goes into Standby Status, a reader-to-line job is automatically started. The Start-Job procedure is not required provided the terminal has a 2502 Card Reader and it is in Ready Status.

Input/Output Form Definitions -- can be operator- or terminal-defined. Up to five operator-defined forms can be read from diskette or card reader to facilitate rapid job setup when the terminal is equipped with either of the special features; otherwise they can be entered from the keyboard. Printer format controls can be part of the job definition. An appropriately configured 3776 will permit input/output job designations as follows:

Input	Output
Offline Jobs	
Diskette[1]	Printer, Diskette or Card Punch
Card Reader[1]	Printer, Diskette or Card Punch
Online Batch Jobs	
Diskette or Card Reader[1]	Line
Line[1]	Printer, Diskette or Card Punch
Dual Data Path Jobs	
Line[2]	Printer
Card Reader[2]	Diskette
Diskette[2]	Card Punch
Diskette[2]	Diskette

[1] One input device and one output device per job.
[2] Line-to-printer occurs concurrently with card reader-to-diskette, or diskette-to-card punch, or diskette-to-diskette.

Performance Considerations: Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printer, forms skipping, application processing, etc., must all be considered in determining actual throughput. See *IBM 3770 Data Communication System.* GA27-3097, for additional information.

Problem Determination Procedures: Significant function has been designed into this unit to help provide greater availability to the customer. This has been done through the use of problem identification routines and procedures that are easily understood and used by the operator. See *IBM 3776 Operating Procedures Guide,* GA27-3107.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and to fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

3776-1 -2 (cont'd)

Communications: See "Special Features". Transmission speeds up to 4800 bps over switched or nonswitched facilities are allowed by selecting the appropriate modem and communication facility. Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information. Also refer to M3863 and 3872 pages. The 2400 bps Integrated Modem and 3872 Modem when appropriately configured can be intermixed on the same communication facility.

Bibliography: GC20-0001

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug.

- Color Group: One only must be specified.
  Available at time of manufacture only.
  #9041 for red, **#9042** for yellow, **#9043** for blue,
  #9045 for gray.

- Print Belt Character Set: Specify one. Available at time of manufacture only (specify for print belt to be shipped with machine. See "Print Belt" in "Accessories" for print belts available in addition to belt specified on order entry.

  #9489 -- 48-character set EBCDIC (HN Character Set)*
  #9490 -- 48-character set EBCDIC (Standard Character Set)*
  #9491 -- 64-character EBCDIC
  #9492 -- 94-character set EBCDIC
  #9493 -- 48-character set ASCII†
  #9494 -- 64-character set ASCII†
  #9495 -- 94-character set ASCII†

  † ASCII Feature (#1201) is required.

  * These belts are identical except for the special character differences:
    HN Character Set has) (±
    Standard Character Set has % # @

  Print Belts are interchangeable by the operator. The internal code structure adapts to the belt installed as follows:

	Data Stream Character	Printed Character
HN Character Set Specified		
HN Belt Installed	) (±	) (±
HN Belt Installed	% # @	) (±
Std Belt Installed	) (±	% # @
Std Belt Installed	% # @	% # @
Std Character Set Specified		
Std Belt Installed	% # @	% # @
Std Belt Installed	) (±	
HN Belt Installed	% # @	) (±
HN Belt Installed	) (±	

- Cabling: Fixed-length cables are supplied as standard. Refer to *Installation Manual - Physical Planning,* GA27-3006

- Remote Power Off (**#9501**): This specify feature can be used to conserve energy used by the terminal by providing the capability for the host processor application program to initiate power down at the terminal by sending a controlled data sequence over communication facilities. The terminal must also be equipped with the appropriate communication special features. This capability is in addition to the standard power down switch which can be manually operated.

MODEL CONVERSIONS

Changes from model 1 to model 2, 3 or 4 and from model 2 to model 4 are field installable. **Note:** Customer price quotations and customer order acknowledgment letters for purchase MESs must state: "Installation of this model change involves removal of parts which become the property of IBM".

SPECIAL FEATURES

All special features can be field installed , except #1201 for which field installation is not recommended.

For Communication Capability -- select one Communication Feature (#1460, #1461 or #1470); a Communication Driver (#1481); one Integrated Modem (#5600, #5602, #5610, #5700, #5702, #5710) or EIA Interface (#3701). #1462 is required in addition to #1460 or #1461 for multipoint operation using BSC.

ASCII Feature (#1201): A 48 data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette) and with BSC features #1460, #1461 or #1462 or with SDLC features #1460 or #1470. **Maximum:** One

Field Installation: Not recommended. **Specify:** Orders for #1201 must also specify one print belt, **#9493** for 48-character ASCII, **#9494** for 64-character ASCII, or **#9495** for 94-character ASCII.

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One.

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with #1462. **Limitations:** Cannot be installed with #1461 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC, Point To Point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. **Limitations:** Cannot be installed with #1460 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum:** One.

BSC Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. **Limitations:** See GA27-3097 for BSC compatibility considerations. **Maximum:** One. **Prerequisites:** #1460 or #1461.

SDLC (#1470): Provides for switched or nonswitched SDLC procedures. For record purposes, also identify the primary CPU/Program Environment code. Specify one of the following: **#9977** for DOS/VS VTAM, **#9988** for OS/VS1 VTAM, **#9989** for OS/VS2 VTAM, or **#9993** for all other combinations of operating systems and access methods. **Limitations:** Cannot be installed with #1460 or #1461. **Maximum:** One.

Communication Driver Without Business Machine Clocking (#1481): Provides communication driver without clocking. **Maximum:** One. **Prerequisites:** #1460, #1461 or #1470.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. **Limitations:** The keys provided for this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. **Maximum:** One.

Door Keylock, Dual (#3402): Provides two keylocks and four identical keys for both desk-console cabinet doors. **Limitations:** The keys provided with these locks can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. **Maximum:** One. **Prerequisites:** Diskette Storage, 2nd (#4902).

EIA Interface (#3701): Provides a cable and interface compatible with EIA RS-232C for attachment to a modem. Speeds up to 4800 bps for switched or nonswitched operation are permitted. This feature in combination with #1481 can be used to attach to Modem Fan-Out (#3902) on an adjacent terminal, or on an IBM 3863, 3864, 3872 or 3874 Modem. **Limitations:** Cannot be installed with any Integrated Modem Feature. **Maximum:** One. **Prerequisites:** #1481.

Modem Fan-Out (#3901): Equips the 2400 bps Integrated Modem, Nonswitched, Multipoint (#5602) with the capability to be shared by up to two other terminals in addition to the host. **Limitations:** This feature can be used at a tributary station in a centralized multipoint network. In this configuration, BSC multipoint programming discipline or SDLC nonswitched programming discipline will provide the selection/control of the terminal without any additional user involvement. **Maximum:** One. **Prerequisites:** #5602.

Modem Fan-Out (#3902): Equips the 4800 bps Integrated Modem, Nonswitched, Multipoint (#5702) with the capability to be shared by up to two other terminals in addition to the terminal containing the integrated modem. **Limitations:** This feature can be used at a tributary station in a centralized multipoint network. In this configuration, BSC multipoint programming discipline or SDLC nonswitched programming discipline will provide the selection/control of the terminal without any additional user involvement. **Maximum:** One. **Prerequisites:** #5702.

Forms Stand: Integrated into the machine covers for the 3776 mdl 1 and 2.

Front Feed (#3951): Enables the operator to insert paper forms in the front or rear of the machine. A forms entry chute is provided under the keyboard for front loading. The paper supply is placed on the floor either under the keyboard in the front of the machine for front loading, or underneath the forms enclosure for rear loading.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to input, output, or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. See "Accessories" for information on additional or replacement keys. **Maximum:** One.

Diskette Storage, 1st (#4901): Provides one device with a customer removable diskette placed in the left cabinet. Additional diskettes are available from IBM . Characteristics of the diskette storage device are: one movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 949 256-byte records or up to 474 512-byte records can be stored on the diskette (one 256-byte data record is reserved for forms control information). Each 256-byte record is stored in two consecutive numbered sectors in

3776-1 -2 (cont'd)

interchange mode, or in two non-consecutive sectors in 3770 mode. Each 512-byte record is stored in four consecutive sectors in interchange mode, or four non-consecutive sectors in 3770 mode. Diskette data is code insensitive in SDLC mode, non-transparent only in BSC mode. **Maximum:** One.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the 1st. It is placed in the right desk cabinet which is also supplied by this feature. *The second diskette allows additional capabilities for: *Copy* - data can be copied from Diskette 1 to Diskette 2 (single data set or all active data sets - 3770 mode only) ... *Concatenate* (pool) - the ability to concatenate on a data set basis ... *Continue* -- allows a read or write operation to automatically continue to Diskette 2 if it has been placed in a Ready condition. **Maximum:** One. **Prerequisites:** #4901. Orders for field installation must specify color -- **#9081** for red. **#9082** For yellow, **#9083** for blue, or **#9085** for gray. Color must be the same as that specified for the base machine.

Operator ID Feature (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8" ranging from 0.007" to 0.045" thick may be read. See SSD Sales Manual for magnetically striped and encoded identification cards. With BSC, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic stripe card cannot be printed. **Limitations:** The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. BSC programming for 2770 and 3780 does not support this feature. **Maximum:** One.

2400 bps Integrated Modem, Nonswitched, Point-To-Point (#5600): This self-clocked modem provides for point-to-point operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting receive equalization. **Limitations:** Cannot be installed with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481.

2400 bps Integrated Modem, Nonswitched, Multipoint (#5602): This self-clocked modem provides for multipoint operation over nonswitched communication facilities. Operator controls provide for half-speed operation and for adjusting transmit and receive equalization. **Limitations:** Cannot be installed with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481.

2400 bps Integrated Modem Switched, With Auto Answer (#5610): This self-clocked modem provides for point-to-point operation over switched network facilities using manual originate/auto answer for establishing connection. Operator controls provide for half-speed operation. **Limitations:** Cannot be installed with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481. Attachment to the Switched Network is via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user.

4800 bps Integrated Modem, Nonswitched, Point-To-Point (#5700): This self-clocked modem provides for point-to-point operation over 4-wire nonswitched communication facilities. This modem features automatic equalization and manual half-speed select. **Limitations:** Cannot be installed with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481.

4800 bps Integrated Modem, Nonswitched, Multipoint (#5702): This self-clocked modem provides for multipoint operation over 4-wire nonswitched communication facilities. This modem feature automatic equalization and manual half-speed select. **Limitations:** Cannot be installed with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481.

4800 bps Integrated Modem, Switched, With Auto Answer (#5710): This self-clocked modem provides for point-to-point operation over switched network facility using manual originate/auto answer for establishing connection. This modem features automatic equalization and manual half-speed select. **Limitations:** Cannot be installed with #3701, or with another Integrated Modem. **Maximum:** One. **Prerequisites:** #1481. Attachment to the Switched Network is via FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. **Note:** Attachment to the switched telephone network is via common carrier-provided data connector equipment type 1001A (CBS) or equivalent provided by the user.

Switched Network Backup (#7951): Provides the capability of attaching 2400 bps Integrated Modem (#5600 or #5602) to the switched network facility as a backup to the primary nonswitched facility. Operation over the switched network is in manual originate/manual answer mode to establish the connection. It can communicate at 2400/1200 bps with an IBM 3872 Modem equipped for operation over the public switched network (#7941, #7951 or #7952) attached to a 3704, 3705 or ICA of a 3115 or 3125. **Note:** To use this feature, operator intervention at the terminal is required. Operator intervention, program modification, or both, may be required at the using system. This feature can be used with BTAM programs for DOS/VS, OS/VS1 and OS/VS2 in certain configurations. Additional customer program routines will be required in existing BTAM programming to fully utilize the capabilities of this feature. **Limitations:** Cannot be installed with #3701. **Maximum:** One. **Prerequisites:** 2400 bps Integrated Modem (#5600 or #5602). Attachment to the Switched Network is via FCC registered protective circuitry of the CDT type (or equivalent) provided by the user. **Note:** Attachment to the switched telephone network is via common carrier-provided data connector equipment type 1001A (CBS) or equivalent provided by the user.

Switched Network Backup (#7952): Provides the capability of attaching 4800 bps Integrated Modem (#5700 or 5702) to the switched network facility as a backup to the primary nonswitched facility. Operation over the switched network is in manual originate/manual answer mode to establish the connection. It can communicate at 4800/2400 bps with an IBM 3874 Modem equipped for operation over the public switched network (#7941, #7951 or #7952) attached to a 3704, 3705 or ICA of a 3115 or 3125. **Note:** To use this feature, operator intervention at the terminal is required. Operator intervention, program modification, or both, may be required on the using system. Additional customer program routines will be required in existing programming to fully utilize the capabilities of this feature. **Limitations:** Cannot be installed with #3701. **Maximum:** One. **Prerequisites:** #5700 or #5702. Attachment to the Switched Network is via FCC registered protective circuitry of the CDT type (or equivalent) provided by the user. **Note:** Attachment to the switched telephone network is via common carrier-provided data connector equipment type 1001A (CBS) or equivalent provided by the user.

3501 Card Reader Attachment (#8050): To attach a 3501 Card Reader. **Limitations:** Cannot be installed with #8149. If a 3521 is also attached (#8150), the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. **Maximum:** One.

3782/2502 Card Reader Attachment(#8149): To attach a 3782 Card Attachment Unit mdl 2 and a 2502 Card Reader mdl A1 or A2. **Limitations:** Cannot be installed with #8050. If a 3521 is also attached via #8150, the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. **Maximum:** One.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit Mdl 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print . **Limitations:** If a 2502 or 3501 Card Reader is also attached (#8149 or 8050), the Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. **Maximum:** One.

ACCESSORIES

The following accessories are available on a purchase-only basis. For shipment with machine, order the feature or P/N indicated below.

Print Belt, Add'l: Supplies a print belt in addition to the one that is provided as standard with the machine (see "Specify").

48-character ASCII (**#5811**)*	48-character EBCDIC (**#5821**) [Standard Character Set]
64-character ASCII (**#5812**)*	64-character EBCDIC (**#5822**)
94-character ASCII (**#5813**)*	94-character EBCDIC (**#5823**)
48-character EBCDIC (**#5820**) [HN Character Set]	

* ASCII Feature (#1201) is a prerequisite @SS@

Locks and Keys: The Keylock (#4650) special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM. A customer letter of authorization with key identification number must accompany each order. Allow seven weeks for shipment.

Mercury Battery (P/N 1743456): Provides power to sustain the master key of the Encrypt/Decrypt feature (#3680) when normal power is not present. This accessory is a 4-volt non-rechargeable mercury battery. This battery has a shelf life of 1 year under normal conditions, and can be expected to provide 3.5 years of normal operation. Additional or replacement batteries can be ordered from IBM. **Note:** Discharged batteries should be returned to IBM for disposal. Return information is printed on the label of the battery.

SUPPLIES

Ribbons: A black ribbon, P/N 1136670, or equivalent, is required. Alternate P/N 1299160, or equivalent, incorporates a twist in the ribbon which may improve ribbon life if the major portion of printing is in the first 60 print positions. Contact IBM.

3776 COMMUNICATION TERMINAL MDLS 3, 4

PURPOSE

The 3776 is a medium speed remote job entry terminal and is a member of the 3770 Data Communication System. The 3776-3 and 3776-4 are SNA Multiple Logical Unit (MLU) terminals. A keyboard and a console display are used for terminal control and for operator communication with the host processor. Terminal operation may be controlled by the storage of operating procedures, terminal setups and local utility programs in terminal storage for use by the terminal operator. The 3776 is not designed as an interactive terminal. The printer contains an engraved character font belt (48-, 64-, or 94character set) which can be interchanged by the operator. A special feature provides for paper insertion from either the front or rear of the machine. Special features permit one or two diskette storage devices, one magnetic tape unit, one card reader and one card punch. One of three card readers can be selected for operation at speeds of 150, 300 or 400 cards per minute. The card punch operates at 50 cpm.

MODELS

		Maximum Lines Per Minute	Character Set
Model 3	003	300	48
		230	64
		160	94
Model 4	004	400	48
		300	64
		230	94

Limitations: The input/output capabilities outlined under "Highlights" are dependent on appropriate configurations of the terminal. Keyboard, console display, terminal storage and printer are standard. One communications feature (#3701, #4501, #5605 or #5651) is required. For other configurations, refer to "Special Features" below. The duplex data communications capability of the 3776-3, -4, 3777-3 is operational on nonswitched full-duplex communications facilities only.

Prerequisites for SDLC Communications with S/370 or 4300 Processor: A 3704, 3705 or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370, 4331 or 4341 Processor operating under VS1, MVS or DOS/VS using RES, JES2, JES3, POWER/VS or VTAM.

An appropriately featured 3705 operating under the appropriate level of Network Control Program (ACF/NCP/VS) is required for Duplex data stream operation.

HIGHLIGHTS

Communications -- Transmission speeds from 2400 bps to 9600 bps and at 19.2K bps are provided using the appropriate modems and communications facilities. Duplex -- simultaneous inbound/outbound -- data transmission is provided on nonswitched full duplex communication facilities only when communicating with an appropriately equipped 3705 or 3725 Communication Controller with the supporting ACF/NCP/VS level. May also be locally attached in either a duplex or half-duplex mode to a 3705 at 14.4K bps or a 3725 at 19.2K bps.

Keyboard -- EBCDIC arrangement with 44 data keys. The keyboard, in conjunction with a standard console display, indicator lights, function keys, operating mode switches and a 3-position numeric display, provides operator control. Host application commands, System Services Control Point (SSCP) commands and local functions are entered from the keyboard. Data entered on the keyboard is displayed. If a keying error is made, Character Backspace and Character Advance may be used for editing. Character Backspace and Advance are non-destructive. Character Advance is typamatic. Reset returns to the position from which the Character Backspace began.

Console Display -- contains 16 lines of 64 characters each for a total of 1024 characters. The 3776-3 and 3776-4 reserve the bottom three lines of the display for operator keying, display of system information and prompting for information required for the execution of functions. The remaining 13 lines of the display are used to display messages between the terminal and the host application or the SSCP and to display information regarding terminal operations such as host input. Lower case alphabetics are converted to upper case before displaying. When the cursor is beneath a character, any new data keystroke will cause the new character to replace the old. Overstrikes are not permitted.

Each message is displayed as it is received except as described below. Each message is also written in terminal storage. At power on time, the operator is prompted to specify date and time. As messages are received, they are time-stamped prior to display and storage. Messages longer than a display line will wrap around to the next line with an indent to aid readability. The display fills from top to bottom. Subsequent new message lines replace the oldest message lines. The most recent message received is identified by the Greater Than sign (>) in the first position. The following line is blanked to assist the operator with message identification.

Function keys on the keyboard allow the operator to control the display function. The display can be held while incoming messages are sent to terminal storage and not displayed. If messages arrive during the 'hold' state, a message alert light notifies the operator. The operator may subsequently display the desired message group. A terminal utility program is available for listing or copying the message contents of terminal storage for external message retention and reference.

Printer -- line printing is from characters engraved on a revolving belt. Included as standard is one interchangeable print belt (either 48-, 64-, or 94character set) ... see "Specify". Also standard are a variable width forms tractor for feeding continuous forms up to 15 inches wide, paper jam detection, and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch. Maximum print lines are 127 lines per page. Refer to GA24-3844 for forms design considerations.

Forms Stand -- is integrated into the machine covers for the 3776 mdl 3 and 4.

Terminal Storage -- is standard for message spooling, terminal control, utility programs and user-generated procedures.

Diskette Storage -- There are two diskette storage devices available as special features. While the devices are physically identical to those on the 3776-1 and 3776-2, additional operational facilities such as data set concatenation enhance the use of the special feature diskette storage devices. Also, each special feature diskette storage device may be assigned individually to an independent host SNA session or used locally for input or output. Diskette operation is concurrent with other terminal functions.

Magnetic Tape -- may be used as either an input or as an output device. One 3411-1 Magnetic Tape Unit and Control attachment is available as a special feature. The 3411-1 provides 9-track tape with recording densities of 1600 bpi Phase Encoded or 800 bpi NRZI. 7-track tape operation is not provided. The 3411-1 may be assigned to an independent host SNA session or used locally for input or output. Labeled and unlabeled tapes are supported. Records are fixed or variable length and may be unblocked or blocked to a maximum block size of 4000 bytes. Maximum record size is 255 bytes.
A block size of up to 2000 bytes automatically provides dual buffering. Magnetic tape operation is concurrent with other terminal functions. Refer to G232-0004 for detailed information on operation of the 3411-1. Refer to M3411 for ordering information. Feature #7003 is required on the 3411 mdl 1.

Buffers -- transfer data between the input and output devices and the communication line. SDLC communications uses a customer-defined Request/Response Unit (RU) of 256 or 512 byte buffer. The actual transmission is dependent on session pacing values, data length, buffer availability and data availability. Buffers also transfer data between input and output devices during local operation.

Printer Format Controls -- facilitate the formatting of printed data. Vertical control characters in data initiate vertical tabbing. Carriage control definition provides for specification of a variable number of line numbers per carriage stop with a maximum of 60 lines per carriage control definition. Carriage control definition may be defined at the terminal or may be sent dynamically by the host application. Extended Forms Definition is standard and utilizes terminal storage.

Compression/Expansion -- implementation provides a compression option at the terminal for a job that reads data from cards, magnetic tape, or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. Trailing blank truncation is standard. The terminal automatically expands the compression sequence to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received.

Decompaction -- provides the decompaction function associated with the receipt of a compacted data stream whereby a pair of consecutive alphameric characters is represented by a single transmission byte. Function depends upon transmission by the host of a decompaction table corresponding to the compaction table used by host programming in creating the compacted job data stream. Decompaction occurs for data directed to the printer, card punch, magnetic tape and diskette (except 3770 format). Compaction by the terminal of data inbound to the host is not provided.

Automatic Card Reading -- capability is under the control of the operator. The "hot reader" function may be enabled/disabled at any appropriate operational time.

Job Control -- initiated by the operator, pertains to online jobs with the host and local utility jobs run concurrently with the online jobs. Online job submission may be initiated at any time there is an SNA session available for data transmission. The terminal may have up to six concurrent sessions that are controlled by the operator. Online job input may consist of card, diskette or magnetic tape data. Data from different devices or data sets may be concatenated into a single input data stream as one job execution. Online job output may consist of printer, card, diskette or magnetic tape data.

Local utility jobs may be defined by the operator and stored in terminal storage to provide the following functions:

3776-3, -4 (cont'd)

Input	Output
Card	Printer, Magnetic Tape, Diskette, Card Punch
Magnetic Tape	Printer, Diskette, Card Punch
Diskette	Printer, Magnetic Tape, Diskette, Card Punch

Record Formats -- consist of card image, print image and 3770 format. Card image and print image, in addition to being applicable to card reader, card punch, printer and magnetic tape data sets, are also applicable to diskette as a function of Basic Exchange data sets (128 byte maximum).

Basic Exchange diskettes may be read by the terminal. Basic Exchange diskettes may also be written by the terminal, thereby creating a diskette for further Basic Exchange mode processing.

3770 format is applicable to diskette data recording which is to be subsequently printed or punched. 3770 format recording results in more efficient diskette utilization than does card or print image. Basic Exchange (card or print image) or 3770 format is a user specification in job control.

Input record size from both magnetic tape and diskette may be limited to 80 or 120 bytes, because of host programming considerations. In addition, the ability to concatenate multiple data sets, with different record lengths, into a single input job stream requires host programming support of a CDS-FM Header type 1 (Continue Destination Select).

Remote Power Off -- see **#9501** under "Specify" below.

Encrypt/Decrypt Feature -- available to provide secure data transmission in conjunction with ACF VTAM Encrypt/Decrypt Feature (Program Number 5735-RC2) (Feature Number 6010) and Programmed Cryptographic Facility Program Product (Program Number 5740-XY5).

Performance Considerations -- The line-to-printer performance of the 3776-3 is up to 300 lpm with a 48-character set print belt. The line-to-printer performance of the 3776-4 is up to 400 lpm with a 48-character set print belt.

The 3776-3 and 3776-4 MLU terminals will operate, however, with concurrent input-output processing in either a Duplex or Half Duplex data communications mode as a function of the base Multiple Logical Unit capability. The card reader, punch, diskette storage devices, magnetic tape unit and display console may have a degrading effect on printer performance during concurrent operations. The degree of degradation which may occur will tend to be greater when Half Duplex communications are employed as opposed to Duplex communications and system facilities in support of the concurrent inbound-outbound data stream capability of the terminal.

Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, SNA pacing, cryptographic processing, etc., must all be considered in determining actual throughput.

In general, Duplex data communications operation will tend to provide greater terminal throughput under concurrent input/output functions than a Half Duplex communications mode. The 3776-3 or 3776-4 operating Duplex at 19.2K bps on a terrestrial link may, however, present a variance of from greater to degrade overall terminal throughput when compared to comparable operation in a Half Duplex mode.

Problem Determination Procedures: Function has been designed into this unit to help provide availability to the customer. See *IBM 3770 Multiple Logical Unit Operator's Guide for 3776-3, 3776-4, 3777-3,* GA27-3125.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and to fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Communications: See "Special Features" ... Transmission speeds from 2400 bps to 9600 bps and at 19.2K bps. Point-to-point and multipoint transmission capability over switched or nonswitched facilities is allowed by selecting the appropriate modem and communication facility. Speeds above 4800 bps are on nonswitched facilities. Direct local attachment to 3705-II at 14.4K bps or a 3725 at 19.2K bps. EBCDIC is the standard transmission code. ASCII is available as a special feature. Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information.

For 19.2K bps, the 3776-3 and 3776-4 may use either the EIA Interface or the High-Speed Digital Interface to communicate through an appropriate modem and communication facility with a 3704, 3705, or 3725 Communications Controller Line Set Type 1G (#4717) at the central processor. This type of communication requires modems which are line compatible (suitable for inter-connection) and which provide optional EIA RS-232-C or High-Speed Digital Interface DTE interfaces. Also attaches via Communications Adapter feature on a 4321 or 4331 processor ... see M4321, 4331 pages for details.

IBM Modem	Speed	Switched	Nonswitched
3863 - I/II	2400	X	X
3864 - I/II	4800	X	X
3865 - I/II	9600		X

Communications Adapter without Business Machine Clocking: Standard -- integrated to provide SDLC communications over switched or nonswitched facilities.

Bibliography: GC20-0001

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug. See M3411 for Magnetic Tape Unit voltage requirements.
- Color Group: Blue is supplied as standard except for field model conversions where installed color groups will be matched (do not specify).
- Print Belt Character Set: Specify one. Available at time of manufacture only (specify for print belt to be shipped with machine). See "Print Belt" in "Accessories" for print belts available in addition to belt specified on order entry. Print belts are interchangeable by the operator.

  #9489 -- 48-character set EBCDIC (HN Character Set)*
  #9490 -- 48-character set EBCDIC (Standard Character Set)*
  #9491 -- 64-character EBCDIC
  #9492 -- 94-character set EBCDIC
  #9493 -- 48-character set ASCII†
  #9494 -- 64-character set ASCII†
  #9495 -- 94-character set ASCII†

  † ASCII Feature (#1201) is required.

  * These belts are identical except for the special character differences:
    HN Character Set has) (=
    Standard Character Set has % # @

  Print belts are interchangeable by the operator. The internal code structure adapts to the belt installed as follows:

	Data Stream Character	Printed Character
HN Character Set Specified		
HN Belt Installed	) (=	) (=
HN Belt Installed	% # @	) (=
Std Belt Installed	) (=	% # @
Std Belt Installed	% # @	% # @
Std Character Set Specified		
Std Belt Installed	% # @	% # @
Std Belt Installed	) (=	- - -
HN Belt Installed	% # @	) (=
HN Belt Installed	) (=	- - -

- Cabling: Fixed-length cables except for 3411 Magnetic Tape and Control are supplied as standard. Refer to *Installation Manual - Physical Planning,* GA27-3006. 3411 cables must be separately ordered.
- Remote Power Off (**#9501**): This specify feature can be used to conserve energy used by the terminal by providing the capability for the host processor application program to initiate power down at the terminal by sending a controlled data sequence over communication facilities. The terminal must also be equipped with the appropriate communication special features. This capability is in addition to the standard power down switch which can be manually operated.
- EIA RS-232C 19.2K bps Line Speed: **#9481** ... provides support of 19.2K bps.
- Alternate Address (#9011): Order this optional feature to specify that diskettes containing terminal control code updates are to be mailed to an alternate address supplied by Field

  Engineering using a Teleprocessing Control number (TPC). The alternate address selected is usually the central site location.

SPECIAL FEATURES

All special features can be field installed , except #1201 for which field installation is not recommended.

ASCII Feature (#1201): A 48-data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette). **Maximum:** One. **Field Installation:** Not recommended. **Specify:** Orders for #1201 must also specify one print belt, **#9493** for 48-character ASCII, **#9494** for 64-character ASCII, or **#9495** for 94-character ASCII.

3776-3, -4 (cont'd)

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. **Limitations:** The keys provided for this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. **Maximum:** One.

Door Keylock, Dual (#3402): Provides two keylocks and four identical keys for both desk-console cabinet doors. **Limitations:** The keys provided with these locks can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. **Maximum:** One. **Prerequisites:** #4902.

Encrypt/Decrypt (#3680): Provides cryptographic data transmission in conjunction with program support in the host. Includes a security keylock. Each machine will have its own unique key. Two identical keys are supplied with the feature. **Maximum:** One. **Prerequisites:** A mercury battery, IBM P/N 1743456 or equivalent is required. A battery is shipped with this feature. See "Accessories" for additional or replacement battery. Replacement of the discharged battery is the customer's responsibility.

EIA Interface (#3701): Provides a cable and interface compatible with EIA RS-232C for attachment to a modem. Speeds from 2400 bps to 9600 bps and at 19.2K bps are permitted. **Limitations:** Cannot be installed with DDS Adapter, Point-to-Point (#5650), DDS ADapter, Multipoint (#5651), High-Speed Digital Interface (#4501), or V35 Interface (#4720). **Maximum:** One. **Prerequisites:** For 19.2K bps operation, **#9481** is required ... see "Specify".

Front Feed (#3951): Enables the operator to insert paper forms in the front or rear of the machine. A forms entry chute is provided under the keyboard for front loading. The paper supply is placed on the floor either under the keyboard in the front of the machine for front loading, or underneath the forms enclosure for rear loading.

High-Speed Digital Interface (#4501): Provides a cable and interface for attachment to a modem which permits point-to-point and multipoint synchronous operation at 19.2K bps on a Type 5703 or 8803 wideband channel. **Limitations:** Cannot be installed with #3701 or #4720 or #5650 or #5651 . **Maximum:** One.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to keyboard control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. See "Accessories" for information on additional or replacement keys. **Maximum:** One.

V35 Interface (#4720): Required for direct High-Speed Local Attachment to 3705-II at 14.4K bps with a maximum cable distance of 170 feet or a 3725 at 19.2K bps with a maximum cable distance of 150.0m (491 ft). **Limitations:** Cannot be installed with #3701, #4501. **Field Installation:** Yes.

Diskette Storage, 1st (#4901): Provides one device with a customer removable diskette placed in the left desk cabinet. Additional diskettes are available from IBM. Contact IBM. Characteristics of the diskette storage device are: one movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 1898 128-byte records. Data may be stored in either a Basic Exchange data set or in a 3770 format data set. Diskette capabilities allow for: *Concatenate* (pool) - the ability to concatenate on a data set basis ... *Multivolume* - allows a read or write operation to automatically continue to diskette 2 if it has been placed in ready condition or it may continue on the current drive. **Maximum:** One.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the 1st. It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for: *Copy* - data can be copied from Diskette 1 to Diskette 2. **Maximum:** One. **Prerequisites:** #4901.

Operator ID Feature (#5450): Provides for reading magnetic stripe cards encoded in the ABA format to permit reading of 40 characters of which 37 are discretionary. Each character contains four bits plus odd parity. Card size 3-3/8" x 2-1/8" ranging from 0.007" to 0.045" thick may be read. Data read from the magnetic stripe card cannot be printed or displayed. **Limitations:** The operator must position and slide the card through the reader-slot at a steady rate between 5 and 40 inches per second for a read operation. **Maximum:** One.

DDS Adapter (DDSA) (#5650 -- For Point-to-Point Operation ... #5651 -- For Multipoint Operation): Provides adapter for SDLC data transmission at speeds of 2400, 4800, or 9600 bps over the AT&T nonswitched Dataphone® Digital Service network. The DDSA interfaces to a DDS channel service unit, the customer site termination of the DDS network. **Limitations:** Cannot be installed with #3701 or #4501 or #4720. **Maximum:** One. **Specify: #9822** for 2400 bps, **#9823** for 4800 bps, **#9825** for 9600 bps.

3411 Magnetic Tape Unit And Control Mdl 1 Attachment (#7801): To attach one 3411 Magnetic Tape Unit and Control mdl 1. **Maximum:** One. **Prerequisites:** #7003 on the 3411-1.

3782/2502 Card Reader Attachment (#8149): To attach a 3782 Card Attachment Unit Mdl 2 and a 2502 Card Reader Mdl A1, A2, or A3. **Limitations:** OMR is not supported. **Maximum:** One.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit Mdl 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print. **Limitations:** The Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. **Maximum:** One.

MODEL CONVERSIONS

Changes from model 3 to model 4 are field installable.

Note: Customer price quotations and customer order acknowledgement letters for purchase MESs must state: "Installation of this model change involves removal of parts which become the property of IBM."

ACCESSORIES

The following accessories are available on a purchase-only basis. For shipment with machine, order the feature or P/N indicated below.

Print Belt, Add'l: Supplies a print belt in addition to the one that is provided as standard with the machine (see "Specify").

48-character ASCII (**#5811**)*	48-character EBCDIC (**#5821**) [Standard Character Set]
64-character ASCII (**#5812**)*	64-character EBCDIC (**#5822**)
94-character ASCII (**#5813**)*	94-character EBCDIC (**#5823**)
48-character EBCDIC (**#5820**) [HN Character Set]	

* ASCII Feature (#1201) is a prerequisite @SS@

Locks and Keys: The Keylock (#4650) special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM. A customer letter of authorization with key identification number must accompany each order. Allow seven weeks for shipment.

Mercury Battery (P/N 1743456): Provides power to sustain the master key of the Encrypt/Decrypt feature (#3680) when normal power is not present. This accessory is a 4-volt non-rechargeable mercury battery. This battery has a shelf life of 1 year under normal conditions, and can be expected to provide 3.5 years of normal operation. Additional or replacement batteries can be ordered from IBM. **Note:** Discharged batteries should be returned to IBM for disposal. Return information is printed on the label of the battery.

SUPPLIES

Ribbons: A black ribbon, P/N 1136670, or equivalent, is required. Alternate P/N 1299160, or equivalent, incorporates a twist in the ribbon which may improve ribbon life if the major portion of printing is in the first 60 print positions. Contact IBM.

3777 COMMUNICATION TERMINAL MDL 1

PURPOSE

The 3777 mdl 1 is a high-speed remote job entry terminal and is a member of the 3770 Data Communication System. A keyboard is used for terminal control and may be used for operator communication with the host CPU. A printer is used for output. The 3777 mdl 1 is not designed as an interactive terminal. The printer is not integrated into the 3777 mdl 1 but is a stand-alone IBM 3203 mdl 3 printer which is cable-attached to the 3777 mdl 1. The 3203 mdl 3 uses the IBM 1416 Interchangeable Train Cartridge which can be interchanged by the operator. Special features permit one or two diskette storage devices, and provide for the attachment of one card reader. One of three card readers can be selected for operation at 150, 300 or 400 cards per minute. A minimum configuration includes a 3777 mdl 1 Communication Terminal and a 3203 Printer mdl 3.

Communication features permit operation at speeds of up to 9600 bps and at 19.2K bps using BSC or SDLC transmission techniques and an appropriate modem. Direct Local Attachment to 3705-II at 14.4K bps or to a 3725 at 19.2K bps via appropriate features.

Maximum Lines Per Minute		
Standard 3203-3	**Featured 3203-3**	**Character Set**
1000	1200	48 AN, HN
870	1020	60 PN

See Type Catalog for additional character sets and speeds. See M3203 pages for 1200 lpm Speed Enhancement feature information.

MODELS

Model 1 001

Limitations: The input/output capabilities are dependent upon appropriate configurations of the terminal. Keyboard is standard on the 3777 mdl 1, while the 3203 Printer mdl 3 is a stand-alone unit. A minimum configuration includes a 3777 mdl 1 Communication Terminal and a 3203 Printer mdl 3.

Prerequisites:

For SDLC Communications With S/370 or 4300 Processor: A 3704, 3705, or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370 or 4300 Processor operating under VTAM or TCAM through VTAM with OS/VS1 or OS/VS2, VTAM with DOS/VS; or these operating systems running under VM/370 (OS/VS2 is not supported by the 4300 Processors).

For BSC Communications With S/360, S/370 or 4300 Processors: A virtual storage S/370 or 4300 Processor operating under BTAM or VTAM and DOS/VS, or under BTAM, TCAM or VTAM and OS/VS1 or OS/VS2; or under RSCS and VM/370; or any of these operating systems running under VM/370 (OS/VS2 is not supported by the 4300 Processors). The 3777 mdl 1 Communication Terminals use 2770/3780 BSC programming support when operating in BSC mode. Operation with S/360 or 4300 processor using 2770/3780 BSC programming is also permitted. See GA27-3097 for BSC compatibility considerations. The customer may have to modify existing 2770/3780 application programs for operation with 3777 mdl 1. BSC attachment can be via a 3704, 3705, or 3725 Communications Controller, or a 2701 Data Adapter Unit attached to a channel of any S/370 processor; or via an Integrated Communications Adapter on S/370 mdls 115, 125, 135, 135-3 or 138; or via a Communications Adaptor feature on the 4331 Processor. BSC attachment can be made via a 3704/3705 attached to a channel of a S/360 mdl 30, 40, 50, 65, 67 (in 65 mode), 75 or 195; via a 2701 attached to a channel of a S/360 mdl 22, 25, 30, 40, 44, 50, 65, 67 (in 65 mode), 75 or 195; or via an Integrated Communications Attachment on S/360 mdl 25.

For BSC Communications With System/38: All mdls of S/38 running under CPF (5714-SS1) featured with Communications Attachment (#1501 or #1502) and Communications Control, SDLC/BSC (#2001 or #2003). See *IBM System/38 Data Communications Programmer's Guide*, SC21-7825, for BSC function and compatibility consideration.

HIGHLIGHTS

Keyboard: EBCDIC arrangement with 44 data keys (produces 88 characters). Underscore/Hyphen, Backspace, Space and Character Advance keys have typamatic action. Associated with the keyboard are indicator lights, function keys, operating mode switches, and a 3-position numeric display.

Printer: A stand-alone 3203 mdl 3 Printer cable-attached to the 3777. The 3203 mdl 3 uses the 1416 Interchangeable Train Cartridge. The 3777 mdl 1 supports fifteen Print Train Arrangements (AN, HN, OAA, ONA, ODA, OAB, GN, PCS-AN, PCS-HN, PN, QN, QNC, RN, SN, TN) as standard. When a substitute character is ordered to displace a character in one of the standard arrangements, the substitute character assumes the card and bit codes of the character it replaces. Refer to the Type Catalog. If the International Print Support specify feature **#9351** is installed, the 3777 mdl 1 will support Print Train Arrangements corresponding to the 48-, 64-, and 94-character EBCDIC sets available for print belts for the 3776 Communication Terminal. Support is also provided for the QN, HN, AN, PN, RN and PCS-HN arrangements. The 3203 mdl 3 accepts continuous forms of up to 20 inches wide and 132 print positions. Character spacing is 10 per inch; line spacing is 6 or 8 per inch under operator control. Maximum print lines are 127 per page when attached to the 3777 mdl 1. Refer to M3203 pages for further description of the 3203 mdl 3 Printer. Refer to Type Catalog for further description of the 1416 print train arrangements supported and for print speeds. Refer to GA24-3488 for forms design considerations.

Buffers: Transfer data between the input and output devices and the communication line. The buffers also transfer data between input and output devices during offline operation. Buffers alternate in providing input and output services to permit overlapped operation. Dual 256-byte or 512-byte buffers are used for BSC or SDLC operation and are under operator control.

Printer Format Controls: Facilitate the formatting of printed data. Vertical and horizontal control characters in data initiate vertical or horizontal tabbing.

Compression/Expansion: Provides a means for improving the efficiency of data transmission. For BSC, the compression option can be invoked at the terminal for a job that reads non-transparent data from card and diskette. A two-byte sequence is substituted for each occurrence of three of more consecutive blank bytes (63 consecutive blanks is the upper limit). A second two-byte sequence is appended if more than 63 consecutive blank bytes are read. Incoming non-transparent data (destined for the printer) is monitored by the terminal which automatically expands this two-byte sequence to the correct number of blanks.

SDLC implementation provides a compression option at the terminal for a job that reads data from cards or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. The terminal automatically expands the compression sequence to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received.

Decompaction: Provides the decompaction function associated with the receipt of a compacted data stream whereby a pair of consecutive alphameric characters is represented by a single transmission byte. Function is dependent upon transmission receipt, and subsequent 3777 mdl 1 storage, of a decompaction table corresponding to the compaction table used by host programming in creating the compacted job data stream. Decompaction function is available only under SDLC operation. Decompaction occurs only for data directed to the printer. Compaction by the 3777 mdl 1 of data inbound to the host is not provided.

Transmission Reversal: Data transmission from the host may be temporarily interrupted, via the keyboard, to permit data transmission from the terminal. When the terminal has completed its data transmission, the host automatically resumes its own transmission of data. This function is dependent upon associated host programming.

Record Compress: Using two special feature diskette storage devices permits offline compression of Basic Exchange diskette records onto a single 3777 mdl 1 diskette for subsequent batch transmission. The compressed records are written on the 3777 diskette in 3770 mode. Record Compress, using one diskette storage device, permits the compression of basic exchange diskette records into blocks of up to 256 or 512 bytes for transmission.

Dual Data Path: Provides for concurrent operation of a line-to-print primary job and a card reader-to-diskette or diskette-to-diskette secondary job. The line-to-printer job uses either the dual 256-byte or dual 512-byte alternating buffers to accept data from the line for printing. A single 256-byte or single 512-byte buffer is used for data buffering between card-and-diskette or diskette-and-diskette. The primary line-to-printer job will not normally be degraded during Dual Data Path operation. The secondary job will be degraded during periods of concurrent operation.

Automatic Card-to-Line Job: When an online job is completed and the 3777 goes into Standby Status, a reader-to-line job is automatically started. The Start-Job procedure is not required provided the terminal has a 2502 Card Reader and it is in Ready Status.

Remote Power Off: This feature can be used to conserve energy: The host CPU application program can initiate "power down" at the terminal by sending a controlled data sequence over communication special facilities. The terminal must also be equipped with the appropriate special communication features. This capability is in addition to the standard, manually operable "power down" switch.

Input/Output Form Definitions: Can be operator or terminal defined. Up to five operator defined forms settings can be read from diskette or card reader to facilitate rapid job set-up when the terminal is equipped with either of the special features, otherwise they can be entered from keyboard. Printer format controls can be part of the job definition. An appropriately configured 3777 mdl 1 will permit input/output job designation as follows:

3777 Communication Terminal Mdl 1 (cont'd)

	INPUT	OUTPUT
Offline Jobs	Diskette [1]	Printer or Diskette
	Card Reader [1]	Printer or Diskette
Online Batch Jobs	Diskette or Card Reader [1]	Line
	Line [1]	Printer or Diskette
Dual Data Path Jobs	Line [2]	Printer
	Card Reader [2]	Diskette
	Diskette [2]	Diskette

(1) One input device and one output device per job.
(2) Line-to-printer occurs concurrently with card reader-to-diskette or diskette-to-diskette.

Performance Considerations: Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, etc., must all be considered in determining actual throughput. See *IBM 3770 Data Communication System,* GA27-3097, for additional information.

Problem Determination Procedures

These are easily understood problem identification routines and procedures for use by the operator. See *IBM 3777-1 Operating Procedures Guide,* GA27-3124.

Customer Responsibilities

It will be a customer's responsibility to use and follow the Problem Determination Procedures and fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

Communications

See "Special Features". Transmission speeds of up to 9600 bps and at 19.2K bps are allowed by selecting the appropriate modem and communication facility. Direct Local Attachment to 3705-II at 14.4K bps or a 3725 at 19.2K bps. Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information.

For 19.2K bps the 3777 mdl 1 may use either the EIA or the High-Speed Digital Interface to communicate through an appropriate modem and communication facility with a 3704/3705 Communication Controller Line Set Type 1G (#4717) at the central processing unit. This type of communication requires modems which are line compatible (suitable for interconnection) and which provide optional EIA or RS-232-C or High-Speed Digital Interface DTE interfaces. Also attaches via a Communications Adapter feature on the 4331 Processor ... see M4331 pages for details.

IBM Modem	Speed
3863	2400
3864	4800
3865	9600

Note: 4-wire Switched Network Backup is available on 3863, 3864 and 3865. For communications capability, product utilization and features, see M3863, 3864 and 3865 pages.

Bibliography: GC20-0001

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug. See 3203 mdl 3 for 3-phase power requirements.
- Color Group: Blue is supplied as standard.
- International Print Support **(#9351)**: Provides support for modified AN, PN and SN Print Train Arrangements for the 1416 Interchangeable Train Cartridge corresponding to the 48-, 64-, and 94-character EBCDIC sets available for print belts for the 3776 Communication Terminal. Support is also provided for the QN, HN, AN, PN, RN, PCS-HN Print Train Arrangements. See "Type Catalog". **Note**: Not recommended for field installation. Replaces standard print support.
- Cabling: Fixed-length cables are supplied as standard. Refer to *Installation Manual-Physical Planning,* GA27-3006 and to Customer Site Preparation Planning Guide, GA27-3103.
- EIA RS-232-C 19.2K bps Line Speed: **#9481** ... provides support of 19.2K bps. Provides diagnostics

SPECIAL FEATURES

Communication Features

For Communication Capability, select one of the following Communication features (#1460, #1461 or #1470); a Communication Driver (#1481); and EIA Interface (#3701) or High-Speed Digital Interface (4501) BSC Multipoint (#1462) is required in addition to #1460 or #1461 for multipoint operation using BSC.

SDLC/BSC, Switch Control (#1460): Provides communication procedure using SDLC or BSC under operator switch control. SDLC allows point-to-point or multipoint operation. BSC operation is point-to-point without #1462, multipoint with 1462. **Limitations**: Cannot be installed with #1461 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum**: One. **Field Installation**: Yes.

BSC, Point-To-Point (#1461): Provides for point-to-point BSC operation over switched or nonswitched facilities. **Limitations**: Cannot be installed with #1460 or #1470. See GA27-3097 for BSC compatibility considerations. **Maximum**: One. **Field Installation**: Yes.

BSC Multipoint (#1462): Required for BSC multipoint operation over nonswitched facilities. **Limitations**: See GA27-3097 for BSC compatibility considerations. **Maximum**: One. **Field Installation**: Yes. **Prerequisites**: #1460 or #1461.

SDLC (#1470): Provides for switched and nonswitched SDLC procedures. Specify one of the following: **#9977** for DOS/VS VTAM, **#9988** for OS/VS1 VTAM, **#9989** for OS/VS2 VTAM, or **#9993** for all other combinations of operating systems and access methods. **Limitations**: Cannot be installed with #1460 or #1461. **Maximum**: One. **Field Installation**: Yes.

Communication Driver Without Business Machine Clocking (#1481): Provides communication driver without clocking. **Maximum**: One. **Field Installation**: Yes. **Prerequisites**: Communication Feature (#1460, #1461 or #1470).

EIA Interface (#3701): Provides an EIA RS-232-C compatible interface and a cable for attachment to a modem. Speeds from 2400 bps to 9600 bps and at 19.2K bps are permitted. **Limitations**: Cannot be installed with #4501 or #4720.**Maximum**: One. **Prerequisites**: For 19.2K bps operation, **#9481** is required ... see item under "Specify".

High-Speed Digital Interface (#4501): Provides an interface and a cable for attachment to a modem which permits point-to-point synchronous operation at 19.2K bps on a Type 5703 or 8803 wideband channel. **Limitations**: Cannot be installed with #3701 . **Maximum**: One. **Field Installation**: Yes. **Prerequisites**: #1481.

V35 Interface (#4720): Required for direct High-Speed Local Attachment to 3705-II at 14.4K bps with a maximum cable distance of 170 feet or to a 3725 at 19.2K bps with a maximum cable distance of 150m (491 ft). **Limitations**: Cannot be installed with a #3701, #4501. **Field Installation**: Yes. **Prerequisites**: #1481.

Non-Commmunication Features

ASCII Feature (#1201): A 48 data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette) and with BSC features #1460, #1461 or #1462 or with SDLC features #1460 or #1470. A #1416 interchangeable Train Cartridge containing an ASCII GN print train is required for the 3203 Printer mdl 3 if 1201 is ordered for the 3777. **Maximum**: One. **Field Installation**: Not recommended.

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum**: One. **Field Installation**: Yes.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. **Limitations**: The keys provided for this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. **Maximum**: One. **Field Installation**: Yes.

Door Keylock, Dual (#3402): Provides two keylocks and four identical keys for both desk-console cabinet doors. **Limitations**: The keys provided with this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. **Maximum**: One. **Field Installation**: Yes. **Prerequisites**: #4902.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to input, output or control of data at the terminal. Each machine will have its own unique key. Two identical key are supplied with the feature. See "Accessories" for information on additional or replacement keys. **Maximum**: One. **Field Installation**: Yes.

Diskette Storage, 1st (#4901): This storage device, with a customer-removable diskette, is placed in the left cabinet. Additional diskettes are available from IBM. Characteristics of the diskette storage device are: one movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 949 256-byte records, or 474 512-byte records can be stored on the diskette (one 256-byte data record is reserved for forms control information). Each 256-byte record is stored in two consecutive numbered sectors in exchange mode, or in two non-consecutive sectors in 3770 mode. Each 512-byte record is stored in four consecutive numbered sectors in exchange mode, or four non-

3777 Communication Terminal Mdl 1 (cont'd)

consecutive sectors in 3770 mode. Diskette data is code-insensitive in SDLC mode, non-transparent only in BSC mode. **Maximum:** One. **Field Installation:** Yes.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the first. It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for: **Copy** - Data can be copied from diskette 1 to diskette 2 (single data set or all active data sets - 3770 mode only). **Concatenate (Pool)** - The ability to concatenate on a data set basis. **Continue** - Allows a read or write operation to automatically continue onto diskette 2 if it has been placed in "ready" condition. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #4901.

Operator Identification Reader (#5450): Reads 40 characters (of which 37 are discretionary) from magnetic-stripe cards which are encoded in the ABA format. Each character contains four bits plus odd parity. Card size is 3-3/8 inches by 2-1/8 inches, and cards ranging in thicknesses of from 0.007 inches to 0.045 inches thick may be read. Contact IBM for magnetically striped and encoded identification cards. With BSC, a read operation can be initiated during a keyboard-to-line job only. Data read from the magnetic-stripe card cannot be printed. **Limitations:** (1) The operator must position and slide the card through the reader-slot at a steady rate of between 5 and 40 inches per second for a read operation. (2) BSC programming for 2770 and 3780 does not support this feature. **Maximum:** One. **Field Installation:** Yes.

Print Speed Enhancement (#5595): Provides support for 3203 Printer mdl 3 operating with 1200 lpm Speed Enhancement feature (#6360). **Maximum:** One. **Field Installation:** Yes.

2502 Card Reader Attachment (#8002): Provides for attachment of a 2502 Card Reader mdl A1, A2 or A3. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS

The following model upgrades are field installable: Model 1 to model 2 and model 2 to model 3. **Note:** Customer price quotations and customer order acknowledgement letters for purchase MESs must state: "Installation of this model change involves removal of parts which become the property of IBM."

ACCESSORIES

Locks and Keys: The Keylock **#4650** special feature is shipped with two identical keys. Additional or replacement keys may be obtained only from IBM (purchase only). A customer letter of authorization with key identification number must accompany each order. Allow seven weeks for shipment.

SUPPLIES

Ribbons: For 3203 mdl 3 ribbons, Contact IBM.

3777 COMMUNICATION TERMINAL MDL 2

PURPOSE

The 3777 model 2 is a high speed remote job entry terminal which operates as a S/360-20 Submodel 5 BSC MULTI-LEAVING Workstation. A keyboard is used for terminal control and may be used for operator communication with the host CPU. A 3203 model 3 Printer is used for output. The 3203 model 3 uses the 1416 Interchangeable Train Cartridge which can be interchanged by the operator. Special features provide for the attachment of one 1024-character console display, one diskette storage device for logging of console display messages, one diskette Storage Device for reading of card image Basic Exchange datasets (processed as 80-column card images), one card reader and one card punch. One of three 2502 Card Reader models can be selected for operation at 150, 300 or 400 cards per minute. The 3521 card punch operates at 50 cpm. A minimum configuration includes a 3777 model 2 Communication Terminal, a 3203 Printer model 3 and a 2502 Card Reader or a Diskette Input Device (#3201). If a Diskette Input Device is attached and a 2502 Card Reader is not present, a Console Display (#1601) is required. A console display is also required if the keyboard is to be used for operator console communication with the host processor.

Communications features permit operation at speeds of up to 9600 bps and at 19.2K using BSC transmission techniques and an appropriate modem. Direct Local Attachment to 3705-II at 14.4K bps or a 3725 at 19.2K bps via appropriate features.

MODELS

	Maximum Lines Per Minute	
Standard 3203-3	Featured 3203-3	Character Set
1000	1200	48 AN, PN
870	1020	60 PN

See Type Catalog for additional character sets and speeds. See M3203 pages for 1200 lpm Speed Enhancement feature information.

Limitations: The input/output capabilities outlined under "Highlights" are dependent on appropriate configurations of the terminal. Keyboard is standard on the 3777 mdl 2 while the 3203 Printer is a stand-alone unit. A minimum configuration includes a 3777 Communication Terminal mdl 2, a 3203 Printer mdl 3 and a 2502 Card Reader or a Diskette Input Device (#3201). If a Diskette Input Device is attached and a 2502 Card Reader is not present, a Console Display (#1601) is required.

Prerequisites: For BSC Communications with S/360 or 4300 Processor: The 3777 mdl 2 will interface to current host MULTI-LEAVING programming systems as a S/360-20 Submodel 5. BSC attachment can be made via a 3704/3705 Communications Controller, a 2701 Data Adapter Unit or a 2703 Transmission Control attached to a channel of any S/360, or S/370, supporting BSC MULTI-LEAVING Workstations. Also attaches via a Communications Adapter feature on the 4331 Processor.

HIGHLIGHTS

Keyboard: EBCDIC arrangement with 44 data keys (produces 88 characters). Space and Character Advance keys have typamatic action. Associated with the keyboard are: indicator lights, function keys, operating mode switches, and a 3-position numeric display. The keyboard, in conjunction with the optional console display, provides a console function for the 3777 mdl 2.

Printer: A stand-alone 3203 Printer mdl 3 cable attached to the 3777 mdl 2. The 3203 mdl 3 uses the 1416 Interchangeable Train Cartridge. The 3777 mdl 2 supports 15 Print Train Arrangements (AN, HN, OAA, ODA, ONA, OAB, GN, PCS-AN, PCS-HN, PN, QNC, QN, RN, SN, TN) as standard.

When a substitute character is ordered to displace a character in one of the standard arrangements, the substitute character assumes the card and bit codes of the character it replaces.

If the International Print Support specify feature is installed, the 3777 mdl 2 will support Print Train Arrangements corresponding to the 48-, 64- and 94-character EBCDIC sets available for print belts for the 3776 Communication Terminal. Support is also provided for the QN, HN, AN, PN, RN, PSC-HN arrangements. The 3203 Printer mdl 3 permits feeding continuous forms up to 20 inches wide and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch under operator control. Maximum form length is 24 inches when attached to the 3777 mdl 2. Refer to the 3203 write up for further description of the 3203 mdl 3. Refer to Type Catalog for further description of the 1416 print train arrangements supported and for print speeds. Refer to GA24-3488 for forms design considerations.

Console Display: Contains up to 1024 characters of information formatted into 16 lines of 64 character positions each. Operator messages are displayed in the top 14 lines of the display. Operator originated keyboard data is displayed in the bottom two lines of the display and will be displayed as keyed.

Operator messages larger than 64 characters overflow to subsequent lines. Subsequent lines of the message are indented. The latest message displayed is identified with a special character. If the display becomes full, the oldest message is overlayed retaining the most recent messages on the display. The operator may defer subsequent messages in order to complete reference to a particular message.

Console Display Spooling: A diskette storage device may be attached to the 3777 mdl 2 by special feature to provide storage for operator console messages. Two options are available to the operator when the diskette becomes filled. First, automatic rewrite occurs. New messages are overlaid upon older messages commencing with the initial message written upon the diskette. Second, an end of diskette signal is provided to the operator and messages are suspended pending replacement of the used diskette by a new diskette. The diskette may also be used to IPL the 3777 in lieu of the 2502 once the workstation program has been written on the diskette from a card reader.

Operator access to the diskette is via the keyboard. The diskette may be paged backward a defined number of messages and displayed for reference. In addition, the diskette may be written to the printer.

Diskette Input Device: A diskette storage device may be attached to the 3777 mdl 2 by special feature for reading of card image Basic Exchange datasets. Basic Exchange datasets will be processed by the 3777 mdl 2 as 80-column card images. The datasets may be multivolume. Individual datasets or all active datasets may be read. Volume label and dataset labels may be printed. Initial Program Load of the workstation program may take place from the Diskette Input Device if the Console Spool Device is not present. Diskette IPL must take place from the Console Spool Device if both diskette devices are present. IPL is available from the 2502 Card Reader if that device is attached.

If the 3777 mdl 2 configuration includes both a 2502 Card Reader and the Diskette Input Device, diskette input may be alternated with cards; however, both devices will not operate simultaneously. If the 3777 mdl 2 configuration includes a Diskette Input Device instead of a 2502 Card Reader, and IPL is executed from the Diskette Input Device or the Console Spool Device, the IPL diskette containing the workstation program must have been written on a 3777 mdl 2 configuration containing a 2502 Card Reader and a diskette device.

Buffers: Transfer data between the input and output devices and the communication line. The buffers alternate in providing input and output services to permit overlapped operation. Storage is provided in the 3777 mdl 2 for dual buffers for each input and output device attached. The buffer size is variable, dependent upon the workstation program. The recommended buffer size is 512-bytes.

Communications Adapter: Integrated to provide and BSC point-to-point operation over switched or nonswitched facilities.

Printer Format Controls: Facilitate the formatting of printed data. Vertical forms definition provides forms set-up for the printer by means of the keyboard or card reader. The definition may be displayed on the console display, if present, or printed for verification.

Extended forms definition may be used in conjunction with the Diskette Input Device (#3201). Standard forms definition provide for the definition of five printer forms. Extended forms definition provides for greater than five printer forms. The Diskette Input Device (#3201) is a prerequisite to the use of extended forms definition.

Compression/Expansion: Provides a means for improving the efficiency of data transmission. Provides options of (dependent upon the workstation program) trailing blank truncation, blank or data compression/expansion.

Performance Considerations: The line-to-printer performance of the 3777 mdl 2 and attached 3203 Printer mdl 3 is up to 1,000 lpm (up to 1200 lpm with 3203 mdl 3 Speed Enhancement feature) with 48-character AN or HN set and up to 870 lpm (up to 1020 lpm with 3203 mdl 3 Speed Enhancement feature) with a 60 character PN set. The 3777 mdl 2 may operate, however, with concurrent input/output processing as a function of the MULTI-LEAVING capability. The card reader, punch and display console may have a degrading effect on printer performance while transferring data to and from the 3777 mdl 2 buffers and the host as communications line time is shared by all 3777 mdl 2 I/O units.

Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression charcteristics, characters read/printed, forms skipping, application processing, etc., must all be considered in determining actual throughput. See *3770 Data Communication System,* GA27-3097, for additional information.

Problem Determination Procedures: Significant function has been designed into this unit to help provide greater availability to the customer. This has been done through the use of problem identification routines and procedures that are easily understood and used by the operator. See *IBM 3777-2 Operating Procedures Guide,* GA27-3129.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and fill out the trouble report prior to calling IBM for service. Also refer to M2700 pages.

3777 Communication Terminal Mdl 2 (cont'd)

Communications: See "Special Features". Transmission speeds of up to 9600 bps and at 19.2K bps. Point-to-point transmission capability over switched or nonswitched facilities is allowed by selecting the appropriate modem and communication facility. Speeds above 4800 bps are on nonswitched facilities. Direct Local Attachment to 3705-II at 14.4K bps or a 3725 at 19.2K bps. EBCDIC is the only supported transmission code. Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information.

For 19.2K bps the 3777 mdl 2 may use either the EIA or the High Speed Digital Interface to communicate through an appropriate modem and communication facility with a 3704/3705 Communications Controller Line Set Type 1G (#4717) at the central processing unit. This type of communication requires modems which are line compatible (suitable for interconnection) and which provide optional EIA or RS-232-C or High Speed Digital Interface DTE interfaces. Also attaches via a Communications Adapter feature on the 4331 Processor ... see M4331 pages for details.

IBM Modems	Speed
3863	2400
3864	4800
3865	9600

Note: 4-Wire Switched Network Backup is available on 3863, 3864 and 3865. For communications capability, product utilization and features, see M3863, 3864, 3865 and 2700 pages.

Bibliography: GC20-0001

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug. See M3203 mdl 3 pages for 3-phase power requirements.
- Color Group: Blue is supplied as standard.
- International Print Support **(#9351)**: Provides support for modified AN, PN and SN Print Train Arrangements for the 1416 Interchangeable Train Cartridge corresponding to the 48-, 64-, and 94-character EBCDIC sets available for print belts for the 3776 Communication Terminal. Support is also provided for the QN, HN, AN, PN, RN, PCS-HN Print Train Arrangements. See "Type Catalog". Note: Not recommended for field installation. Replaces standard print support.

- EIA RS-232-C 19.2K bps Line Speed: **#9481** ... provides support of 19.2K bps. Provides diagnostics.

SPECIAL FEATURES

Communication Features

Communication Driver Without Business Machine Clocking (#1481): [Required] Provides communication driver without clocking. **Maximum:** One. **Field Installation:** Yes. bps is permitted. Required for direct High-Speed Local Attachment to 3705-II at 14.4K bps with maximum cable distance of 170 feet or a 3725 at 19.2K bps with a maximum cable distance of 150 meters (491 feet). **Limitations:** Cannot be installed with #3701, #4501. Contact IBM

EIA Interface (#3701): Provides an EIA RS-232-C compatible interface and a cable for attachment to a modem. Speeds from 2400 bps to 9600 bps and at 19.2K bps are permitted. **Limitations:** Cannot be installed with High Speed Digital Interface (#4501) , DDS Adapter, Point-to-Point (#5650), DDS Adapter, Multipoint (#5651) or V.35 Interface (#4720). **Maximum:** One. **Prerequisites:** For 19.2K bps operation, **#9481** is required ... see item under "Specify".

High-Speed Digital Interface (#4501): Provides an interface and a cable for attachment to a modem which permits point-to-point synchronous operation at 19.2K bps on a Type 5703 or 8803 wideband channel. **Limitations:** Cannot be installed with #3701 or #2911. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1481.

V.35 Interface (#4720): Required for direct High Speed Local Attachment to 3705-II at 14.4K bps with maximum cable distance of 170 feet. **Limitations:** Cannot be installed with a #3701, #4501. **Field Installation:** Yes. **Prerequisites:** Communication Driver (#1481).

Non-Communication Features

Audible Alarm(#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One. **Field Installation:** Yes.

Console Display (#1601): Provides a 1024-character (16 lines of 64 characters each) console information display. **Maximum:** One. **Field Installation:** Yes.

Console Display Spooling (#1602): Diskette storage device for spooling of console display messages. One device with a customer removable diskette placed in the left cabinet. Additional diskettes are available from IBM. Contact IBM. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1601.

Diskette Input Device (#3201): Diskette storage device for reading of card image Basic Exchange Datasets. One device with a customer removable diskette placed in the right cabinet. Additional diskettes are available from IBM. contact IBM.

3777 COMMUNICATION TERMINAL MDL 3

PURPOSE

The 3777 model 3 is a high-speed remote job entry terminal and is a member of the 3770 Data Communication System. The 3777 model 3 is an SNA Multiple Logical Unit (MLU) terminal. A keyboard and console display are used for terminal control and for operator communication with the host processor. Terminal operation may be controlled by the storage of operating procedures, terminal setups and local utility programs in terminal storage for use by the terminal operator. The 3777 is not designed as an interactive terminal. The printer is not integrated into the 3777 model 3 but is a stand-alone 3203 Printer model 3 which is cable-attached to the 3777 model 3. Special features permit one or two diskette storage devices, one magnetic tape unit, one card reader and one card punch. One of three card readers can be selected for operation at speeds of 150, 300 or 400 cards per minute. The card punch operates at 50 cpm. A minimum configuration includes a 3777 model 3 Communication Terminal and a 3203 model 3 Printer.

MODELS

Maximum Lines Per Minute		
Standard 3203-3	Featured 3203-3	Character Set
1000	1200	48 AN, PN
998	1195	52 RN
870	1020	60 PN

See "Type Catalog" for additional character sets and speeds. See M3203 for 1200 lpm Speed Enhancement feature information.

Limitations: The input/output capabilities outlined under "Highlights" are dependent upon appropriate configurations of the terminal. Keyboard, console display and terminal storage are standard. The 3203 and 3262 Printers are stand-alone units. A minimum configuration includes a 3777 mdl 3 Communication Terminal and a 3203 Printer mdl 3. For other configurations refer to "Special Features" below. The duplex data communications capability of the 3776-3, -4, 3777-3 is operational on nonswitched full duplex communications facilities only.

Prerequisites: For SDLC Communications with S/370, 4331 or 4341 Processor - A 3704, 3705 or 3725 Communications Controller operating under Network Control Program (NCP/VS) and attached to any virtual storage S/370 Processor or 4300 Processor operating under VS1, MVS or DOS/VS using RES, JES2, JES3, POWER/VS and VTAM.

Note: 4300 MVS and JES2-3 support is limited to 4341 Processors.

An appropriately featured 3705 operating under the appropriate level of Network Control Program (ACF/NCP/VS) is required for duplex data stream operation.

HIGHLIGHTS

Communications: Transmission speeds from 2400 bps to 9600 bps and at 19.2K bps are provided using the appropriate modems and communications facilities. Duplex-- simultaneous inbound/outbound -- data transmission is provided on nonswitched full duplex communication facilities only when communicating with an appropriately equipped 3705 or 3725 Communication Controller with the supporting ACF/NCP/VS level. May also be locally attached in either a Duplex or Half-Duplex mode to a 3705 at 14.4K bps or a 3725 at 19.2K bps.

Keyboard: EBCDIC arrangement with 44 data keys. The keyboard in conjunction with a standard console display, indicator lights, function keys, operating mode switches and a 3-position numeric display provides operator control. Host application commands, System Services Control Point (SSCP) commands and local functions are entered from the keyboard. Data entered on the keyboard is displayed. If a keying error is made, Character Backspace and Character Advance may be used for editing. Character Backspace and Advance are non-destructive. Character Advance is typamatic. Reset returns to the position from which the Character Backspace began.

Console Display: Contains 16 lines of 64 characters each for a total of 1,024 characters. The 3777 mdl 3 reserves the bottom three lines of the display for operator keying, display of system information and prompting for information required for the execution of functions. The remaining 13 lines of the display are used to display messages between the terminal and the host application or the SSCP and to display information regarding terminal operations such as host input.

Lower case alphabetics are converted to upper case before displaying. When the cursor is beneath a character any new data keystroke will cause the new character to replace the old. Overstrikes are not permitted.

Each message is displayed as it is received except as described below. Each message is also written in terminal storage. At power on time the operator is prompted to specify date and time. As messages are received they are time-stamped prior to display and storage. Messages longer than a display line will wrap around to the next line with an indent to aid readability. The display fills from top to bottom. Subsequent new message lines replace the oldest message lines. The most recent message received is identified by the (>) in the first position. The following line is blanked to assist the operator with message identification.

Function keys on the keyboard allow the operator to control the display function. The display can be held while incoming messages are sent to terminal storage and not displayed. If messages arrive during the 'hold' state a message alert light notifies the operator. The operator may subsequently display the desired message group. A terminal utility program is available for listing or copying the message contents of terminal storage for external message retention and reference.

Printer: A standalone 3203 Printer mdl 3 cable attached to the 3777 mdl 3. The 3203 mdl 3 uses the 1416 Interchangeable Train Cartridge. The 3777 mdl 3 supports 15 Print Train Arrangements (AN, HN, OAA, ODA, ONA, OAB, GN, PCS-AN, PCS-HN, PN, QNC, QN, RN, SN, RN) as standard. When a substitute character is ordered to displace a character in one of the standard arrangements, the substitute character assumes the card and bit codes of the character it replaces. See "Type Catalog" pages. International Print Support is provided supporting Print Train Arrangements corresponding to the 48-, 64-, and 94-character EBCDIC sets available for print belts for the 3776 Communication Terminal. Support is also provided for the QN, HN, AN, PN, RN, and PCS-HN arrangements. The 3203 mdl 3 permits feeding continuous forms up to 20 inches wide and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch under operator control. Maximum forms length is 24 inches when attached to the 3777 mdl 3. Refer to 3203 for further description of the 3203 mdl 3. Refer to "Type Catalog" for further description of the 1416 print train arrangements supported and for print speeds. Refer to GA24-3488 for forms design considerations.

Terminal Storage: Is standard for message spooling, terminal control, utility programs and user-generated procedures.

Diskette Storage: There are two diskette storage devices available as special features. While the devices are physically identical to those on the 3777 mdl 1, additional operational facilities such as data set concatenation enhance the use of the special feature diskette storage devices. Also, each special feature diskette storage device may be assigned individually to an independent host SNA session or used locally for input or output. Diskette operation is concurrent with other terminal functions.

Magnetic Tape: May be used as either an input or as an output device. One 3411 mdl 1 Magnetic Tape Unit and Control attachment is available as a special feature. The 3411 mdl 1 provides 9-track tape with recording densities of 1600 bpi Phase Encoded or 800 bpi NRZI. 7-Track tape operation is not provided. The 3411 mdl 1 may be assigned to an independent host SNA session or used locally for input or output. Labeled and unlabeled tapes are supported. Records are fixed- or variable-length and may be unblocked or blocked to a maximum block size of 4,000 bytes. Maximum record size is 255 bytes. A block size of up to 2,000 bytes automatically provides dual buffering. Magnetic tape operation is concurrent with other terminal functions. Refer to G232-0004 for detailed information on operation of the 3411 Magnetic Tape Unit and Control. Refer to M3411 pages for ordering information, #7003 is prerequisite for attachment.

Buffers: Transfer data between the input and output devices and the communication line. SDLC communications uses a customer defined Request/Response Unit (RU) of up to 512 bytes. The actual transmission is dependent on session pacing values, data length, buffer availability and data availability. The buffers also transfer data between input and output devices during local operation.

Printer Format Controls: Facilitate the formatting of printed data. Vertical and horizontal control characters in data initiate vertical or horizontal tabbing. Carriage control definition provides for specification of a variable number of line numbers per carriage stop with a maximum of 60 lines per carriage control definition. Carriage control definition may be defined at the terminal or may be sent dynamically by the host application. Extended Forms Definition is standard and utilizes terminal storage.

Compression/Expansion: Implementation provides a compression option at the terminal for a job that reads data from cards, magnetic tape, or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. Trailing blank truncation is standard. The terminal automatically expands the compression sequences to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received. The option, when exercised, is unique to the individual associated session and output device.

Decompaction: Provides the decompaction function associated with the receipt of a compacted data stream whereby a pair of consecutive alphameric characters is represented by a single transmission byte. Function is dependent upon transmission by the host of a decompaction table corresponding to the compaction table used by host programming in creating the compacted job data stream. Decompaction occurs for data directed to the printer, card punch, magnetic tape and diskette (except 3770 format). Compaction by the terminal of data inbound to the host is not provided. The function is an option exercised and performed by the 3777 terminal and may be unique to each associated session and output device.

3777 Communication Terminal Mdl 3 (cont'd)

Automatic Card Reading: Capability is under the control of the operator. The "hot reader" function may be enabled/disabled at any appropriate operational time.

Job Control: Initiated by the operator, pertains to online jobs with the host and local utility jobs run concurrently with the online jobs. Online job submission may be initiated at any time there is an SNA session available for data transmission. The terminal may have up to six concurrent sessions that are controlled by the operator. Online job input may consist of card, diskette or magnetic tape data. Data from different devices or data sets may be concatenated into a single input data stream as one job execution. Online job output may consist of printer, card, diskette or magnetic tape data.

Local utility jobs may be defined by the operator and stored in terminal storage to provide the following functions:

Input	Output
Card	Printer, Magnetic Tape, Diskette, Card Punch
Magnetic Tape	Printer, Diskette, Card Punch
Diskette	Printer, Magnetic Tape, Diskette, Card Punch

Record Formats: Consist of card image, print image and 3770 format. Card image and print image, in addition to being applicable to card reader, card punch, printer and magnetic tape data sets, are also applicable to diskette as a function of Basic Exchange data sets (128 byte maximum).

Basic Exchange diskettes may be read by the terminal. Basic exchange diskettes may also be written by the terminal, thereby creating a diskette for further Basic Exchange mode processing.

3770 format is applicable to diskette data recording which is to be subsequently printed or punched. 3770 format recording results in more efficient diskette utilization than does card or print image. Basic Exchange (card or print image) or 3770 format is a user specification in job control.

Input record size from both magnetic tape and diskette may be limited to 80 or 128 bytes, because of host programming considerations. In addition, the ability to concatenate multiple data sets, with different record lengths, into a single input job stream requires host programming support of a CDS-FM Header type 1 (Continue Destination Select).

Remote Power Off: This feature can be used to conserve energy used by the terminal by providing the capability for the host CPU application program to inititate power down at the terminal by sending a controlled data sequence over communication facilities. The terminal must also be equipped with the appropriate communication special features. This capability is in addition to the standard power down switch which can be manually operated. **Note:** The 3262 Line Printer requires manual powering down.

Encrypt/Decrypt Feature: Available to provide secure data transmission in conjunction with ACF VTAM Encrypt/Decrypt Feature 5735-RC2, feature #6010 and Programmed Cryptographic Facility Program Product 5740-XY5.

Performance Considerations: The line-to-printer performance of the 3777 mdl 3 and attached 3203 mdl 3 is up to 1,000 lpm (up to 1,200 lpm with 3203 mdl 3 Speed Enhancement feature #6360) on the 3203 mdl 3 and Print Speed Enhancement (#5595) on the 3777 mdl 3 with 48-character AN or HN set, and up to 870 lpm (up to 1,020 lpm with 3203 mdl 3 Speed Enhancement feature) with a 60-character PN set. For other speeds, see the *3770 Data Communication System,* GA27-3097.

The 3777 mdl 3 MLU terminal will operate, however, with concurrernt input-output processing in either a Duplex or Half-Duplex data communications mode as a function of the Multiple Logical Unit capability. The card reader, punch, diskette storage devices, magnetic tape unit and display console may have a degrading effect on printer performance during concurrent operations.

The degree of degradation which may occur will tend to be greater when Half-Duplex communications are employed as opposed to Duplex communications and System facilities in support of the concurrent inbound-outbound data stream capability of the terminal.

Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression characteristics, characters read/printed, forms skipping, application processing, SNA pacing, and cryptographic processing, must all be considered in determining actual throughput. See *3776 and 3777 Component Description Manual,* GA27-3145, for additional information.

In general, Duplex data communications operation will tend to provide greater terminal throughput under concurrent input/output functions than a Half-Duplex communications mode. The 3777 mdl 3 operating Duplex 19.2K bps on a terrestrial link may however present a variance of from greater to degraded overall terminal throughput when compared to comparable operation in Half-Duplex mode. Reference the *Component Description Manual for the IBM 3776/3777 Communication Terminals,* GA27-3145, for specific performance considerations.

Problem Determination Procedures: Function has been designed into this unit to help provide availability to the customer. This has been done through the use of problem identification routines and procedures that are easily understood and used by the operator. See *IBM 3770 Multiple Logical Unit Operator's Guide for the 3776-3, 3776-4, 3777-3,* GA27-3165.

Customer Responsibilities: It will be a customer's responsibility to use and follow the Problem Determination Procedures and fill out the trouble report prior to calling IBM for service. Also refer to M2700, 3203 and 3262 pages.

Communications: See "Special Features". Transmission speeds from 2400 bps to 9600 bps and at 19.2K bps. Point-to-point and multipoint transmission capability over switched or nonswitched facilities is allowed by selecting the appropriate modem and communication facility. Speeds above 4800 bps are nonswitched facilities. Direct Local Attachment to 3705-II at 14.4K bps or a 3725 at 19.2K bps. EBCDIC is the standard transmission code. ASCII is available as a special feature on the 3777 and by RPQ on the 3262. Refer to M2700 pages for information on customer responsibilities, communication facilities and other attachment information.

For 19.2K bps, the 3777 mdl 3 may use either the EIA Interface (#3701) or the High-Speed Digital Interface (#4501) to communicate through an appropriate modem and communication facility with a 3704/3705 Communication Controller Line Set Type 1G (#4717) at the central processing unit. This type of communication requires modems which are line compatible (suitable for interconnection and which provide optional EIA RS-232-C or High-Speed Digital Interface DTE interfaces. Also attaches via a Communications Adapter feature(#1601) on the 4331 Processor. The 4331 must be equipped with a Local Attachment Interface (#4801) and its prerequisites ... see "Special Features" in M4331 pages.

IBM Modems	Speed
3863	2400
3864	4800
3865	9600

Note: 4-Wire Switched Network Backup is available on 3863 mdl 1, 3864 mdl 1 or 3865 mdls 1 or 2. For communications capability, product utilization and features, see M3863, 3864 and 3865 pages.

Communications Adapter: An integrated communications adapter without business machine clocking is standard. It provides SDLC communications over switched or nonswitched facilities.

Bibliography: GC20-0001

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, or **#9881** for non-locking plug. See M3203, 3262 and 3411 for their power requirements.
- **Color Group:** Blue is supplied as standard (no specify required).
- Cables: Fixed-length cables except for the 3602 and the 3411 Magnetic Tape are supplied as standard. Refer to *Installation Manual-Physical Planning,* GA27-3006. 3411 cables must be separately ordered.
- EIA RS-232-C 19.2K bps Line Speed: **#9481** ... provides support of 19.2K bps. Provides diagnostics and used for record purposes.
- Alternate Address: **#9011** ... for record purposes only. Order this optional feature to specify that diskettes containing terminal control code updates are to be mailed to an alternate address supplied by CE using a Teleprocessing Control number (TPC). The alternate address selected is usually the central site location.

SPECIAL FEATURES

ASCII Feature (#1201): A 48-data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette). Orders for #1201 must also specify one print belt, **#9493** for 48-character ASCII, **#9494** for 64-character ASCII, or **#9495** for 94-character ASCII. **Maximum** One. **Field Installation:** Not recommended. **Note:** ASCII on the 3262 requires an RPQ ... see M3262 pages.

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One. **Field Installation:** Yes.

Door Keylock (#3401): Provides one keylock and two keys for the desk-console cabinet door. **Limitation:** The keys provided for this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. **Maximum:** One. **Field Installation:** Yes.

Door Keylock, Dual (#3402): Provides two keylocks and four identical keys for both desk-console cabinet doors. **Limitation:** The keys provided with this lock can be duplicated by local keymakers. Additional or replacement keys are not available from IBM. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #4902.

3777 Communication Terminal Mdl 3 (cont'd)

Encrypt/Decrypt (#3680): Provides cryptographic data transmission in conjunction with program support in the host. Includes a security keylock. Each machine will have its own unique key. Two identical keys are supplied with the feature. **Maximum:** One. **Field Installation:** Yes. Note: A mercury battery, P/N 1743456 or equivalent, is required. A battery is shipped with this feature. See M10000 pages for additional or replacement battery. Replacement of the discharged battery is the customer's responsibility.

EIA Interface (#3701): Provides an EIA RS-232-C compatible interface and a cable for attachment to a modem. Speeds from 2400 bps to 9600 bps and at 19.2K bps are permitted. **Limitations:** Cannot be installed with High Speed Digital Interface (#4501), DDS Adapter, Point-to-Point (#5650), DDS Adapter, Multipoint (#5651) or V.35 Interface (#4720). **Maximum:** One. **Prerequisites:** For 19.2K bps operation, **#9481** is required ... see item under "Specify". .

High-Speed Digital Interface (#4501): Provides a cable and interface for attachment to a modem which permits point-to-point and multipoint synchronous operation at 19.2K bps on a Type 5703 or 8803 wideband channel. **Limitation:** Cannot be installed with EIA Interface (#3701), V.35 Interface (#4720) or DDS Adapter (#5650, #5651). **Maximum:** One. **Field Installation:** Yes.

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operator activity related to keyboard or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. Refer to M10000 pages for information on additional or replacement keys. **Maximum:** One. **Field Installation:** Yes.

V.35 Interface (#4720): Required for direct High-Speed Local Attachment to 3705-II at 14.4K bps with maximum cable distance of 170 feet or a 3725 at 19.2K bps with a maximum cable distance of 150 meters (491 feet). **Limitations:** Cannot be installed with a #3701, #4501. **Field Installation:** Yes. **Prerequisites:** #1481.

Diskette Storage, 1st (#4901): This storage device, with a customer-removable diskette, is placed in the left cabinet. Additional diskettes are available from IBM. Contact IBM. Characteristics of the diskette storage device are: one movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 1898 128-byte records. Data may be stored in either a Basic Exchange data set or in a 3770 format dataset. Diskette capabilities allow for:

Concatenate (pool) - the ability to concatenate on a data set basis.

Multi-Volume - allows a read or write operation to automatically continue to diskette 2 if it has been placed in ready condition or it may continue on the current drive.

Maximum: One. **Field Installation:** Yes.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the first. It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for: **Copy** - Data can be copied from diskette 1 to diskette 2. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #4901.

Operator Identification Reader (#5450): Reads 40 characters (of which 37 are discretionary) from magnetic-stripe cards which are encoded in the ABA format. Each character contains four bits plus odd parity. Card size is 3-3/8 inches by 2-1/8 inches ranging from 0.007 inches to 0.045 inches thick may be read. Data read from the magnetic stripe card cannot be printed or displayed. **Limitation:** The operator must position and slide the card through the reader-slot at a steady rate of between 5 and 40 inches per second for a read operation. **Maximum:** One. **Field Installation:** Yes.

Print Speed Enhancement (#5595): Provides support for 3203 Printer mdl 3 operating with 1,200 lpm Speed Enhancement feature (#6360). **Maximum:** One. **Field Installation:** Yes.

DDS Adapter (DDSA) (#5650, #5651): Provides adapter for SDLC data transmission at speeds of 2400, 4800 or 9600 bps over the AT&T nonswitched Dataphone® Digital Service network. The DDSA interfaces to a DDS channel service unit, the customer site termination of the DDS network. Available at three speeds; 2400, 4800 or 9600 bps. **Limitations:** Cannot be installed with #3701, #4501 or #4720. **Maximum:** One. **Specify #9822** for 2400 bps, **#9823** for 4800 bps or **#9825** for 9600 bps. For point-to-point (#5650); for multipoint tributary (#5651). Note: Cable length is 55 feet. **Maximum:** One. **Specify:** Record purposes only. **#9822** for 2400 bps, **#9823** for 4800 bps, or **#9825** for 9600 bps.

3411-1 Magnetic Tape Unit And Control Attachment (#7801): To attach one 3411-1 Magnetic Tape Unit and Control. **Maximum:** One. **Prerequisites:** #7003 or 3411 mdl 1. **Field Installation:** Yes.

2502 Card Reader Attachment (#8002): Provides for attachment of a 2502 Card Reader mdl A1, A2 or A3. **Limitation:** OMR is not supported. **Maximum:** One. **Field Installation:** Yes.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit mdl 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print. **Limitation:** The Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. **Maximum:** One. **Field Installation:** Yes.

ACCESSORIES (None)

SUPPLIES

For 3203 mdl 3 ribbons, contact IBM.

3777 COMMUNICATION TERMINAL MDL 4

PURPOSE

The 3777 model 4 is a high-speed remote job entry terminal providing an SNA Multiple Logical Unit (MLU). A keyboard and console display are used for terminal control and for operator communication with the host processor. Terminal operation may be controlled by the storage of operating procedures, terminal setups and local utility programs in terminal storage for use by the terminal operator. The 3777 is not designed as an interactive terminal. The printer is not integrated into the 3777 model 4 but is a stand-alone IBM 3262 model 2 or 12 Printer which is cable attached to the 3777 model 4. Special features permit one or two diskette storage devices, one magnetic tape unit, one card reader, one card punch and an additional printer. One of three card readers can be selected for operation at speeds of 150, 300 or 400 cards per minute. The card punch operated at 50 cpm. A minimum configuration includes a 3777 model 4 Communication Terminal and a 3262 model 2 or 12 Printer.

MODELS

Model 1 001

3262 NOMINAL RATED SPEED (LINES PER MINUTE)

CHARACTER SET	MODEL 2	MODEL 12
48 Character (AN)	650	325
64 Character	467	230
96 Character	364	180
63 Optimized	625 (max)	310 (max)

Limitations: The input/output capabilites outlines under "Highlights" are dependent upon appropriate configurations of the terminal. Keyboard, console display and terminal storage are standard. The 3262 Printer is a standalone unit. A minimum configuration includes a 3777 mdl 4 Communication Terminal with the appropriate communications capabilities and a 3262 Printer. For other configurations refer to "Special Features" below. The duplex data communications capability of the 3777 mdl 4 is operational on nonswitched full duplex communications facilities only.

Prerequisites

For SDLC Communications With S/370 or a 4300 Processor: A 3704, 3705 or 3725 Communications Controller operating under Network Control Pr ogram (NCP/VS) and attached to any virtual storage S/370 Processor or 4300 Processor operating under VS1, MVS or DOS/VS using RES, JES2, JES3, Power/VS and VTAM.

Note: 4300 MVS and JES2-3 support is limited to 4341 Processors.

An appropriately featured 3705 operating under the appropriate level of Network Control Program (ACF/NCP/VS) is required for Duplex data stream operation.

HIGHLIGHTS

Communications: Transmission speeds from 2400 bps to 9600 bps and at 19.2K bps are provided via an integrated communications adapter using the appropriate modems and communications facilities. Duplex-simultaneous inbound/outbound -- data transmission is provided on nonswitched full duplex communication facilities only when communicating with an appropriately equipped 3705 or 3725 Communication Controller with the supporting ACF/NCP/VS level.

Keyboard: EBCDIC arrangement with 44 data keys. The keyboard in conjunction with a standard console display, indicator lights, function keys, operating mode switches and a 3-position numeric display provides operator control. Host application commands, System Services Control Point (SSCP) commands and local functions are entered from the keyboard. Data entered on the keyboard is displayed. If a keying error is made, Character Backspace and Character Advance may be used for editing. Character Backspace and Character Advance are non-destructive. Character Advance is typamatic. Reset returns to the position from which the Character Backspace began.

Console Display: Contains 16 lines of 64 characters each for a total of 1024 characters. The 3777 mdl 4 reserves the bottom three lines of the display for operator keying, display of system information and prompting for information required for the execution of functions. The remaining 13 lines of the display are used to display messages between the terminal and the host application or the SSCP and to display information regarding terminal operations such as host input.

Lower case alphabetics are converted to upper case before displaying. When the cursor is beneath a character, any new data keystroke will cuase the new character to replace the old. Overstrikes are not permitted.

Each message is displayed as it is received except as described below. Each message is also written in terminal storage. At power on time the operator is prompted to specify date and time. As messages are received they are time-stamped prior to display and storage. Messages longer than a display line will wrap around to the next line with an indent to aid readability. The display fills from top to bottom. Subsequent new message lines replace the oldest message lines. The most recent message received is identified by the Greater Than sign in the first position. The following line is blanked to assist the operator with message identification.

Function keys on the keyboard allow the operator to control the display function. The display can be held while incoming messages are sent to terminal storage and not displayed. If messages arrive during the 'hold' state a message alert light notifies the operator. The operator may subsequently display the desired message group. A terminal utility program is available for listing or copying the message contents of terminal storage for external message retention and reference.

Printer: The 3262 is a standalone unit providing 132 print positions. Horizontal spacing is 10 characters per inch (25.4 mm). Vertical spacing is limited to 6 or 8 lines per inch (25.4 mm). Forms skipping and spacing are program controlled within the 3262, and is optimized by the 3777 to provide the closest comparison possible with the other 3776/3777 MLU models and their associated programming interfaces.

There are character set variations forms control variations between the 3262 and the other printers associated with the IBM 3776/3777. The user should refer to the *3776/3777 Component Description Manual* (GA 27-3145) and the *Forms Design Reference Guide for Printers* (GA 24-3488) for the specific variations. Refer to M3262 for ordering information.

Second Printer Attachment: Adding a second printer to the 3777 mdl 4 will yield a higher output to the 3777. As an example:

	SECOND PRINTER		48 CHARACTER Nominal Rated
3262 Mdl 2	3262 Mdl 2	3262 Mdl 12	LPM
650			650
650		325	975
650	650		1300

Terminal Storage: Is standard for message spooling, terminal control, utility programs and user generated procedures.

Diskette Storage: There are two diskette storage devices available as special features. While the devices are physically identical to those on the 3777 mdl 1, additional operational facilities such as data set concatenation enhance the use of the special feature diskette storage devices. Also, each special feature diskette storage device may be assigned individually to an independent host SNA session or used logically for input or output. Diskette operation is concurrent with other terminal functions.

Magnetic Tape: May be used as either an input or as an output device. One 3411 Magnetic Tape Unit and Control attachment is available as a special feature. The 3411 mdl 1 provides 9-track tape with recording densities of 1600 bpi Phase Encoded or 800 bpi NRZI. Seven track tape operation is not provided. The 3411 mdl 1 may be assigned to an independent host SNA session or used locally for input or ouput. Labeled and unlabeled tapes are supported. Records are fixed or variable length and may be unblocked or blocked to a maximum block size of 4,000 bytes. Maximum record size is 255 bytes. A block size of up to 2,000 bytes automatically provides dual buffering. Magnetic tape operation is concurrent with other terminal functions. Refer to G232-0004 for detailed information on operation of the 3411 Magnetic Tape Unit and Control. Refer to M3411 for ordering information, #7003 is prerequisite on 3411 mdl 1 for attachment to 3777.

Buffers: Transfer data between the input and output devices and the communication line. SDLC communications uses a customer defined Request/ Response Unit (RU) of 256 or 512 byte buffers. The actual transmission is dependent on session pacing values, data length, buffer availability and data availability. The buffers are used for transferring data between input and output devices during local operation.

Printer Format Controls: Facilitate the formatting of printed data. Vertical control characters in data initiate vertical tabbing. Carriage control definition provides for specification of a vaiable number of line numbers per carriage stop with a maximum of 60 lines per carriage control definition. Carriage control definition may be defined at the terminal or may be sent dynamically by the host application. Extended Forms Definition is standard and utilizes terminal storage.

Compression/Expansion: Implemenation in the 3777 mdl 4 by providing a terminal option for a job that reads data from cards, magnetic tape, or diskette to the line. An identifying sequence is substituted for each occurrence of two or more consecutive duplicate characters. Trailing blank truncation is standard. The terminal automatically expands the compression sequences to the correct number of blanks or duplicate characters for compressed transparent or non-transparent data received. The option, when exercised, is unique to the individual associated session and output device.

Decompaction: Provides the decompaction function associated with the receipt of a compacted data stream whereby a pair of consecutive alphanumeric characters is represented by a single transmission byte. Function is dependent upon transmission by the host of a decompaction table corresponding to the compaction table used by host programming in creating the compacted job data stream. Decompaction occurs for data directed the printers, card punch, magnetic tape and diskette (except 3770 format). Compaction by the terminal of data

3777 Communication Terminal Model 4 (cont'd)

inbound to the host is not provided. The function is an option exercised and performed by the 3777 terminal and may be unique to each associated session and ouput device.

Automatic Card Reading: Capability is under the control of the operator. The "hot reader" function may be enabled/disabled at any appropriate operational time.

Job Control: Initiated by the operator, pertains to online jobs with the host and local utility jobs run concurrently with the online jobs. Online job submission may be initiated at any time there is an SNA session available for data transmission. The terminal may have up to six concurrent sessions that are controlled by the operator. Online job input may consist of card, diskette, or magnetic tape data. Data from different devices or data sets may be concatenated into a single input data stream as one job execution. Online job output may consist of printer, card, diskette or magnetic tape data.

Local Utility: Jobs may be defined by the operator and stored in terminal storage to provide the following functions:

Input	Output
Card	Printers, Magnetic Tape, Diskette, Card Punch
Magnetic Tape	Printers, Diskette, Card Punch
Diskette(s)	Printers, Magnetic Tape, Diskette, Card Punch

Record Formats: Consist of card image, print image and 3770 format. Card image and print image, in addition to being applicable to card reader, card punch, printer and magnetic tape datasets, are also applicable to diskette as a function of Basic Exchange datasets (128 byte maximum). Basic Exchange diskettes may be read by the terminal. Basic exchange diskettes may also be written by the terminal, thereby creating a diskette for further Basic Exchange mode processing.

3770 format is applicable to diskette data recording which is to be subsequently printed or punched. 3770 format recording results in more efficient diskette utilization than does card or print image. Basic Exchange (card or print image) or 3770 format is a user specification in job control.

Input record size from both magnetic tape and diskette may be limited to 80 or 128 bytes, because of host programming considerations. In addition, the ability to concatenate multiple data sets, with different record lengths, into a single input job stream requires host programming support of a CDS-FM Header type 1 (Continue Destination Select).

Remote Power Off: This function can be used to conserve energy via the capability of the user written host CPU application program to initiate power down at the terminal by sending a controlled data sequence over communication facilities. This capability is in addition to the standard power down switch which can be manually operated. Note: The 3262 Line Printer requires manual powering down.

Performance Considerations: The line to printer performance of the 3777 mdl 4 and attached 3262 mdl 2 is up to 650 lpm with 48 character set. For other speeds see M3262.

The 3777 mdl 4 MLU terminal will operate, however, with concurrent input-output processing in either a Duplex of Half Duplex data communications mode as a function of the Multiple Logical Unit capability. The card reader, punch, diskette storage devices, magnetic tape unit and display console may have a degrading effect on printer performance during concurrent operations.

The degree of degradation which may occur will tend to be greater when Half Duplex communications are employed as opposed to Duplex communications and System facilities in support of the concurrent inbound-outbound data stream capability of the terminal.

In general, Duplex data communications operation will tend to provide greater terminal throughput under concurrent input/output functions than a Half Duplex communications mode. The 3777 mdl 4 operating Duplex 19.2K bps on a terrestrial link may, however, present a variance of from greater to degraded overall terminal throughput when compared to comparable operation in Half Duplex mode. Reference the Component Description Manual for the IBM 3776/3777 Communication Terminals (GA 27-3145) for specific performance considerations.

Actual terminal device throughput is dependent upon operational and systems programming characteristics. Factors such as the communication facilities, transmission block lengths, compression/compaction characteristics, characters read/printed, forms skipping, application processing, and SNA pacing, must all be considered in determining actual throughput. See *IBM Component Description 3776 & 3777 Manual* GA 27-3145 for additional information.

cProblem Determination Procedures:c Significant function has been designed into this unit to help provide greater availability to the customer. This has benn done through the use of problem indentification routines and procedures that are easily understood and used by the operator. See IBM 3777 mdl 4, iCommunications Terminal Operator's Guidei, (GA27-3309).

Customer Responsibilities: It will be a customer's responsibilityto use and follow the Problem Determination Procedures and fill out the trouble report prior to calling IBM for service. Also refer to M2700 and M3262 pages. The 3262 is designated as Customer Setup Unit (C.S.U.).

Communications: See Special Features. Transmission speeds from 2400 bps to 9600 bps and at 19.2K Point-to-point and multipoint transmission capability over switched or nonswitched facilities is allowed by selecting the appropriate modem and communication facility. Speeds above 9600 bps are nonswitched facilities. Refer to M2700 pages for information on customer responsibilities, communication facilities, and other attachment information.

For 19.2K bps the 3777 mdl 4 uses the EIA Interface to communicate through an appropriate modem and communication facility with a 3704/3705 Communication Controller Line Set Type 1G (#4717) at the central processing unit. This type of communication requires modems which are line compatible (suitable for interconnection) and which provide optional EIA RS-232-C DTE interface Also attaches via a Communications Adapter feature pn the 4331 Processor. See M4331 for details.

IBM Modems	Speed
3863	2400
3864	4800
3865	9600

Note: 4 Wire Switched Network Backup is available on 3863, 3864 and 3865. For Communications capability, product utilization and features, see M3863, M3864 and M3865 pages.

Bibliography: GC 20-0001

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug or **#9881** for non-locking plug. See 3411-1 Magnetic Tape Unit voltage requirements. See M3262 power requirements.
- Color Group: Blue is supplied as standard (do not specify).
- Cabling: All cables are supplied with fixed lengths with 3777 shipment except the 3411 Magnetic Tape and the 3262 Printer. Refer to *Installation Manual-Physical Planning,* GA27-3006. 3411 cables must be separately ordered (see M3411). The 3262 provides a 1.8 meter (6 foot) standard or 4.3 meter (14 feet) optionally specified Signal Cable (#9405) which connects to the 3777 mdl 4. The 3262 Customer Set-Up (CSU) must be performed prior to installation of the 3777 mdl 4.
- EIA RS-232-C 19.2K bps Line Speed: **#9481** ... provides support of 19.2K bps.
- Alternate Address: (90ll ... For record purposes only. Order this optional feature to specify that diskettes containing terminal control code updates are to be mailed to an alternate address supplied by Field Engineering using a Teleprocessing Control number (TPC). The alternate address selected is usually the central site location.

SPECIAL FEATURES

ASCII Feature (#1201): A 48 data key keyboard (produces 94 ASCII graphics) is provided in place of the standard EBCDIC keyboard. This feature also provides for operation with diskette storage features (ASCII is written on the diskette). **Maximum:** One. **Field Installation:** Not Recommended.
NOTE: ASCII on 3262 requires an RPQ (see M3262).

Audible Alarm (#1390): Sounds an alarm that alerts the operator of conditions requiring manual intervention. The alarm can be enabled and reset from the keyboard. **Maximum:** One. **Field Installation:** Yes.

EIA Interface (#3701): Provides an EIA RS-232-C compatible interface and a cable for attachment to a modem. Speeds from 2400 bps to 9600 bps and at 19.2K bps are permitted. **Limitations:** Cannot be installed with DDS Adapter, Point-to-Point (#5650); DDS Adapter, Multipoint (#5651). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** For 19.2K bps operation, **#9481** is required ... see item under "Specify".

Keylock (#4650): Provides a mechanical keylock to activate controls that disable all operations related to keyboard or control of data at the terminal. Each machine will have its own unique key. Two identical keys are supplied with the feature. Refer to M10000 pages for information on additional or replacement keys. **Maximum:** One. **Field Installation:** Yes.

Diskette Storage, 1st (#4901): This storage device, with a customer-removable diskette, is placed in the left cabinet. Additional diskettes are available from IBM. Contact IBM. Characteristics of the diskette storage device are: one movable read/write head; one read/write surface; 73 data tracks; 26 sectors per track and 128 bytes per sector. Up to 1898 128-byte records. Data may be stored in either a Basic Exchange dataset or in a 3770 format dataset. Diskette capabilities allow for:

Concatenate - the ability to concatenate on a data set basis.

3777 Communication Terminal Model 4 (cont'd)

Multi-Volume - allows a read or write operation to automatically continue to diskette 2 if it has been placed in ready condition or it may continue on the current drive.

Maximum: One. **Field Installation:** Yes.

Diskette Storage, 2nd (#4902): Provides a second diskette storage device with the same characteristics as the first. It is placed in the right desk cabinet which is also supplied by this feature. The second diskette allows additional capabilities for: Data can be copied from diskette 1 to diskette 2 or vice-versa. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Diskette Storage, 1st (#4901).

DDS Adapter (DDSA) (#5650, #5651): Provides adapter for SDLC data transmission at speeds of 2400, 4800 or 9600 bps over the AT&T nonswitched Dataphone® Digital Service network. The DDSA interfaces to a DDS channel service unit, the customer site termination of the DDS network. Available at three speeds; 2400, 4800 or 9600 bps. **Limitations:** Cannot be installed with #3701. **Maximum:** One. **Field Installation:** Yes. **Specify #9822** for 2400 bps, **#9823** for 4800 bps or **#9825** for 9600 bps. For point-to-point (#5650); for multi-point tributary (#5651). **Note:** Cable length is 55 feet.

Second Printer Attachment (#6302): Supports the attachment of a second 3262 Printer. Either a Mdl 2 or a Mdl 12 may be attached. **Maximum:** One.

3411-1 Magnetic Tape Unit And Control Attachment (#7801): To attach one 3411-1 Magnetic Tape Unit and Control. **Maximum:** One. **Field Installation:** Yes.

2502 Card Reader Attachment (#8002): Provides for attachment of a 2502 Card Reader Model A1, A2 or A3. **Limitations:** OMR is not supported. **Maximum:** One. **Field Installation:** Yes.

3782/3521 Card Punch Attachment (#8150): To attach a 3782 Card Attachment Unit Model 1 and a 3521 Card Punch. The 3521 can be equipped with special features for Card Read/Punch Check and/or Card Print. **Limitations:** The Card Read/Punch Check special feature on the 3521 is limited to the punch checking function only. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS

Field conversion is possible from Model 3 to Model 4.

ACCESSORIES (None)

SUPPLIES

For 3262 Belts and Ribbons, see M3262. For 3203 mdl 3 ribbons: Contact IBM.

3780 DATA COMMUNICATIONS TERMINAL

[NO LONGER AVAILABLE]

PURPOSE

A data transmission terminal using the BSC technique. It can communicate over appropriate communications facilities to another 3780, a S/360 models 22 through 195, any S/370 processor, or a 2780 Data Transmission Terminal. May be locally attached to a 3704/3705 Communications Controller. Communication is also possible with the 4300 processors via channel attached 2701, 3704, 3705 or via a Communications Adapter on the 4331 or 4361. For requirements, see "Prerequisites".

MODELS

Model 1 001

Prerequisites:

S/360 mdl 25 ... communications can be via the Integrated Communications Attachment (#4580) with appropriate binary synchronous features on the 2025, or via a 2701 Data Adapter Unit or 2703 Transmission Control ... see below.

S/360 mdls 22 through 195 (except mdl 44 or 67 in TSS mode), or any S/370 processor ... communications can be via a 2701 Data Adapter Unit or 2703 Transmission Control equipped with appropriate binary synchronous features ... see M2701, 2703 pages. **Notes:** [1] To utilize OLT support, the host processor requires a minimum of 32K bytes of storage ... [2] The 3780 communicates only in EBCDIC or ASCII codes ... [3] Only EBCDIC Transparency (#3601) is available on the 3780. Therefore, a 2701 or 2703 must be configured with 3780 restrictions and limitations for compatibility ... [4] All 3780s on a multipoint line must have the same code, EBCDIC or ASCII.

S/360 (except mdls 22, 25, 44, 67 in TSS mode, or 85), or any S/370 processor ... communications can be via a 3704/3705 Communications Controller. **Note:** See the 3704 and 3705 Machines and Programming pages for attachment capability and refer to Host System Programming pages for possible restrictions to any of the above attachments.

S/370 mdls 115, 125, 135, 135-3, 138 ... communications can be via the Integrated Communications Adapter (#4640) and appropriate binary synchronous features on the 3115, 3125, 3135, 3135-3, 3138 as well as via a 2701, 2703 or 3704/3705. Communication is also possible with the 4300 processors via channel attached 2701, 3704 or 3705; or via a Communications Adapter on the 4331 and 4361 processor.

3704/3705 Medium Speed Local Attachment ... attachment without modem at speeds up to 2400 bps via IBM-provided cables. Requires #7705 ... see "Specify".

Another 3780 ... communications require (**#9711**) and the same (**#9761** or **#9762**) on both units ... see "Specify".

2780 Data Transmission Terminal ... [mdls 1, 2, 4] communications require that both terminals have **#9761** on 3780, **#9762** on 2780 and #3601 on 3780, #8030 on 2780. Communications can be in EBCDIC Transparency mode only. The 3780 may not have multiple records in Transparent mode.

HIGHLIGHTS

Provides medium-speed, batch-oriented, buffered card reading and printing via appropriate communications facilities ... see "Communications Facilities". Punched card output is provided via attachment of a 3781 Card Punch ... see M3781 pages.

Card Reader: Reads at a rated speed of 600 cards/minute. Provides hopper capacity of 1200 cards and stacker capacity of 1300 cards. Only 80-column cards can be read.

Printing: Prints at a rated speed of 350 lines/minute utilizing the basic 52-character set. Interchangeable type bars of 39- and 63-character sets are available with rated speeds of 425 lpm and 300 lpm, respectively. Only the 63-character set may be employed when using ASCII transmission code. The printer provides 120 print positions standard with feature expansion to 144 positions ... see "Special Features". Horizontal and vertical format control are provided as standard functions of the printer.

Buffers: Provides two 512-character buffers which service the transmission line and the I/O units alternately to provide overlap operation for efficiency.

Buffer Checking: All characters are checked on the data path when sent to or received from the buffer.

Variable Record Length: End-to-end characters are used to define the end of a record, allowing for complete variable length. Full buffer-blocks with variable-length records can be transmitted or received. On card transmission, blank positions are removed from the end of the card record to increase the transmission efficiency.

Space Compression/Expansion: Operable under switch control, this capability provides for the removal of consecutive spaces in transmitted data and their re-insertion in received data. A 2-character sequence is substituted for from two to 63 consecutive spaces. If more than 63 consecutive spaces are to be transmitted, a second 2-character sequence will be substituted for the number of consecutive spaces greater than 63. If only one space is to be transmitted, it will be transmitted as a normal space. This feature is inoperable when transmitting in transparency mode or operating in home mode.

Home Mode: Provides card reader-to-buffer-to-printer operation in an offline non-communications mode.

Integrated 2400/1200 bps Modem: Provides 2400 bps transmission with half-speed backup on leased facilities ... compatible with 3872 modem.

Conversation Mode: Allows a CPU to turn the communications line around after receiving text and return text without additional selection.

Audible Alarm: Alerts the operator when manual intervention is required in line mode ... unattended operation is not provided.

Speed Select Switch: A switch allowing the control of switched network operation at either 600 or 1200 bps.

Communications Facilities: The 3780 operates in half-duplex mode over the types of facilities listed below ... for information concerning these facilities, see M2700 pages.

- PTT Public Switched Telephone Networks
- PTT Nonswitched Voice Grade lines
- PTT Public Switched Data Networks
- Privately owned communication facilities

Notes: When operating at 2400 bps on PTT-supplied switched or nonswitched facilities, there may be additional restrictions and limitations to the facility and the operation. For details, see *Bisynchronous General Information Manual* (GA27-3004). When operating at speeds above 2400 bps to 7200 bps, the facility requirements may vary by data set (modem) type. The data set (modem) manufacturer should provide this information to the customer at his request.

Binary Synchronous Transmission: Allows for transmission rates of 1200, 2000, 2400, 4800, 7200/3600 bps ... see "Modems" below and "Data Set Attachment" under "Specify". Communications can be with another 3780, a 2780 mdl 1, 2 or 4, a S/360 mdls 22 through 195 (except mdl 44 or mdl 67 in TSS mode), or any S/370 Processor. Communication is also possible with the 4300 processors via channel attached 2701, 3704 or 3705; or via a Communications Adapter on the 4331. For requirements, see "Prerequisites". In addition, the 3780 may be multidropped on the same line facility with other BSC devices (1826, 2715, 2780, 3271, 3275, 3735) as tributary stations on a multipoint line with a S/360 mdls 22-195 (except mdl 44 or mdl 67 in TSS mode), any 4300 processor or any S/370 processor as the control station. In a switched control network, it may use the same termination (phone number) at the computer that is used for the other BSC devices.

Transmission Code: One of two codes can be selected ... see "Specify". For printable graphics, see "Type Catalog" pages.

EBCDIC Code:	256-character set, which is the basic code of S/360 and S/370.
ASCII Code:	Industry standard code with a 128-character set.

Transmission Checking: A redundancy check is performed on all data. EBCDIC uses a 16-bit cyclic check transmitted as two 8-bit bytes ... ASCII uses an odd-parity VRC on each character, including the LRC character and an LRC check transmitted as a single 8-bit odd parity byte. Format check plus an odd/even block check is provided on both code sets.

Modems: One Integrated 2400/1200 bps modem feature, 3863 (2400 bps) modem, 3864 (4800 bps) modem, bps), 3872 modem (2400/1200), can be attached to the 3780. For communications capabilities, product utilization, and special features, see M2700, 3863, 3864, 3872 pages and "Integrated Modem" under "Special Features" below.

Card Limitations: Generally, scored cards require careful handling and a favorable environment. Use of the following scores has been approved:

Internal Scores (before separation): M-4, M-5, OM-2, OM-3, S-1 and ID-3. Two sizes only, 2 x 3-1/4 inches or 2-3/16 x 3-3/4 inches. **Note:** When using OM-2 or OM-3, reading must be terminated prior to the scored column.

External Scores (after separation): M-3, M-4, M-5, M-6, M-7, M-11, OM-2, CF-4 and CF-11. OM-3 may be used if the score is on the column 1 end. **Note:** Upper left corner cut required when the M-11 or CF-11 is used on the column 1 end.

All other scores may result in unsatisfactory performance. For possible use of Port-A-Punch® or Micro-Processing cards, consult IBM. Aqua cards and C-4 corner cut cards cannot be used.

Customer Responsibilities: See M2700 pages. In addition, the customer must be advised that when non-IBM data sets or privately owned communications facilities are used, he is responsible for

3780 Data Communications Terminal (cont'd)

ensuring that signal levels and impedances are compatible with the IBM communications interface.

Publications: GA24-3089

SPECIFY

- Power (AC, 1-phase):

50 Hz	60 Hz
100V **#2804**	100V **#2730**
110V **#2805**	115V **#9901**
123.5V **#2811**	200V **#2732**
200V **#2806**	208V **#9902**
220V **#2813**	230V **#9904**
235V **#2814**	

- Transmission Code: **#9761** for EBCDIC, **#9762** for ASCII. **Field Installation:** Yes.
- Character Set: One of the available character sets and the type size must be specified (no charge) on the initial order ... see "Type Catalog" pages for specified characters in each set and price for additional sets.
- Printer Tape Punch: Order under P/N 120910 on MES

  ... one punch is furnished per installation at no charge.
- Identification: **#9350** provides an identification function by which a CPU under stored program control and operating on a switched public network, can identify a legitimate 3780. **Prerequisites:** #7651.
- Terminal Use (point-to-point): **#9711** for communications with another 3780 or 2780. Provides "Bell" key and light indicator to signal remote terminal that voice mode is desired. Receipt of "Bell" code sounds alarm. When communication is alternatively with a CPU and another 3780 or 2780, via switched network. **Field Installation:** Yes.
- 3704/3705 Medium Speed Local Attachment: Specify Modem or Data Set Attachment ... see below. Either **#2903** (2000 or 2400 bps) or **#2983** (1200 bps), only. Also Communications Facilities ... see below. **#9402** for half-duplex.
- Modem or Data Set Attachment: One of the following, depending upon facility to be used, must be specified:

  #2903: For attachment to the 3977 mdl 2 for operation at 2000 or 2400 bps. **Prerequisites:** #7705 and either **#2995** for 2000 bps or **#2996** for 2400 bps.

  #2981: Switched Network Attachment. Required for operation on PTT switched facilities. **Note:** See #7705 to determine if required. **Maximum:** One. The 3976 mdl 3 will operate on the switched network without **#2981**. **Prerequisites:** #7651 ... not required for Manual Answer.

  #2982: Required for the 3976 Modem mdl 3 on switched lines or PTT mandatory modems at 1200 bps on switched lines complying with CCITT Recommendations (1976) V.23, V.24, V.28 and ISO Standard 2110. Other non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Bulletin. Includes the function of **#2981**. **Prerequisites:** #7705.

  #2983: Required for the 3976 Modem mdl 3 on nonswitched lines or PTT mandatory modems at 1200 bps on nonswitched lines complying with CCITT Recommendations (1976) V.23, V.24, V.28 and ISO Standard 2110. Other non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Bulletin. **Prerequisites:** #7705.

  #9120: Required for PTT mandatory modems at 2400 bps on switched lines complying with CCITT Recommendations (1976) V.24, V.26bis, V.28 and ISO Standard 2110. Other non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Bulletin.

  #9121: Required for IBM 2400 bps Integrated Modem or the 3872 modem or PTT mandatory modems at 2400 bps on nonswitched lines complying with CCITT Recommendations (1976) V.24, V.26, V.28 and ISO Standard 2110 . Other non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Bulletin.

  #9124: Provides 4800 bps. Required for the 3874 Modem or PTT mandatory modems at 4800 bps on nonswitched lines complying with CCITT Recommendations (1976) V.24, V.28 and V.27 or V.27bis, and ISO Standard 2110 . Other non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Bulletin.

  #9126: For 3875 at 7200 bps with backup half-speed on leased facilities.
- Communications Facilities: Features specify 3780 control of the data set and do not necessarily correspond to the communications facility. **Field Installation:** Yes. Specify as indicated below:

  #9402:

  Switched Network Operation

  Leased Private Line (or equivalent privately owned).

  Multipoint ... (half-duplex), although the communications facility may be 2- or 4-wire.

  Point-to-point ... for 2-wire (half-duplex) communications facilities.

  If the 3780 Integrated Modem or the 3872, or 3875 Modem is used.

  #9404:

  For 4-wire (full-duplex) facilities.
- Extended Retry Transmission: **#9150** extends the maximum retry count from three (12 seconds) to a maximum of 15 (48 seconds) in an effort to recognize a valid response to the last block of data transmitted, prior to sending an EOT code and timing out with an error condition.
- Data Set Cable: A 20 foot data set cable is provided as standard. If a longer cable is required, specify **#9021**, indicating length as a quantity of 25, 30, 35 or 40 feet.
- WACK Response: **#9936** if initial WACK (Wait before transmit - positive ACKnowledge) is to be transmitted immediately. All subsequent WACK responses are transmitted after a 2-second delay.
- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, **#9046** for white.

SPECIAL FEATURES

Component Selection (#1601): Provides the capability of specific 3780 I/O device selection. In addition to component selection, it provides priority output selection and Multipoint Data Link Control selection capability. It is a prerequisite for attachment of a 3781 Card Punch. **Field Installation:** Yes.

Direct Line Attachment (#2939): Provides modem/line isolation required by PTTs. **Prerequisites:** #5600 or #5602.

EBCDIC Transparency (#3601): Allows the 3780 to receive and transmit all 256 EBCDIC bit combinations as data characters. Variable length records cannot be transmitted if card I/O or printer is selected. Either normal or transparent text can be *received* without the "transparency" switch being in the transparency position. The switch must be "On" for *transmitting* in transparency. If a terminal on a multipoint line requires this feature, all terminals on that line must also have this feature. **Field Installation:** Yes. **Prerequisites: #9761.**

Keylock (#4650): A key-operated Power-On switch for the 3780. The key must be inserted and turned to the "On" position before the control unit Power-On switch is operative. When the key is turned off, power is removed from the control unit. For additional or replacement keys, see "Accessories". **Field Installation:** Yes.

Multipoint Data Link Control (#5010): Allows multiple 3780s to be used on the same communications line with a CPU. Terminal can be polled or selected when operating as a tributary station on a multipoint system. All 3780s installed on the same line facility require this feature and must use the same transmission code and data set attachment. Other BSC devices (2780, S/360, S/370, 4300 processors) as tributary stations, can be on a multipoint line with a processor control station. **Limitations:** If Terminal Use (**#9711**) is installed, it must be removed prior to installation of this feature. **Field Installation:** Yes.

Integrated 2400/1200 bps Modem (#5600, #5602,): Provides an integrated 2400 bps modem with half-speed backup capability. Equivalent to and compatible with similarly featured 3872 modems. versions cover different communications requirements, as described in the separate feature descriptions. Operator controls are integrated with the 3780 operator panel. Built-in diagnostic functions are provided for local and remote testing. See M2700, 3872 pages and "Prerequisites" above for additional information on allowable machine/system combinations and required features. **Maximum:** One #5600 or #5602.

Leased Line Point-to-Point Modem (#5600): Provides point-to-point terminal-terminal and terminal-CPU communications with a similarly equipped 3780 or a 2780, 3780, S/360, S/370 or 4300 Processors equipped with appropriate features and an equivalent featured 3872 modem. Includes manual equalization control. **Field Installation:** Yes. **Prerequisites: #9121, #9402. #9711** may be required, depending upon application. **Specify: #9021** plus length, if non-standard cable length is required.

Leased Line Multipoint Tributary Modem (#5602): Operates on a multipoint network with a controlling CPU. Other 3780s on the same line facility must have either #5602 or a 3872 modem with Multipoint Tributary (#5101 or #5102); other BSC tributary devices on the same line facility must have a 3872 modem with #5101 or #5102. **Limitations: #9711** cannot be installed. **Field Installation:** Yes. **Prerequisites: #9121, #9402,** #5010. **Specify: #9021** plus length, if non-standard cable length is required.

3780 Data Communications Terminal (cont'd)

Print Positions, Add'l (#5701): Provides an additional 24 print positions for the 3780 printer. **Field Installation:** Yes.

Switched Network Control (#7651): To attach to a switched network, provides automatic answering of incoming calls initiated by another terminal or central computer over common carrier switched (dial-up) facilities. The line must be equipped with an appropriate data set with auto answer capability and the terminal must be in "ready" status. Provides automatic disconnect when disconnect sequence is received or when no data is transmitted/received for 20 seconds. Disconnect causes audible alarm to sound. **Field Installation:** Yes.

Synchronous Clock (#7705): A synchronous clock for use with modems which do not have an internal clock, or for use with 3704/3705 Medium Speed Local Attachment Line Set, Type 1F. Will operate at 600 bps, 1200 bps, 2000 bps, or 2400 bps. The device with which the 3780 will communicate must also have an internal clock operating at the same bps rate. **Specify: #2701** for 600 bps, **#2702** for 1200 bps, **#2703** for 2000 bps, **#2704** for 2400 bps. If speed is 1200 bps, alternative speed of 600 bps will be provided via speed selector switch. **Field Installation:** Yes.

MODEL CONVERSIONS (None)

ACCESSORIES

Locks and Keys: The 3780 with Keylock (#4650) is shipped with two keys. Additional or replacement keys must be ordered only from IBM. A letter of authorization with key identification number (stamped on key) must accompany the order. **Note:** Without key identification number, a new Keylock (#4650) special feature must be ordered. Allow seven weeks for delivery.

SUPPLIES (None)

3782 CARD ATTACHMENT UNIT

PURPOSE

Used to attach the 2502 Card Reader model A1 or A2 to a 3774, 3775, 3776 model 1 or 3776 model 2 Communication Terminal or 3289 Printer model 3 (2502 model A1 only) or to attach a 3521 Card Punch to a 3771, 3774, 3775, 3776, 3777 Communication Terminal (except model 1), or 3289 Printer model 3. Used to attach the 2502 Card Reader model A3 to a 3776 Communication Terminal model 3 or 4.

MODELS

Model 1 001 Attaches a 3521 Card Punch

Model 2 002 Attaches a 2502 Card Reader mdl A1, A2 or A3

Prerequisites:

Mdl 1: Requires 3782/3521 Card Punch Attachment (#8150) on the 3289 mdl 3, 3771, 3774, 3775, 3776 or 3777 mdl 2 or 3 and a 3521 Card Punch.

Mdl 2: Requires 3782/2502 Card Reader Attachment (#8149) on the 3289 mdl 3, 3774, 3775, 3776 mdl 1 or 2, and a 2502 Card Reader mdl A1 or A2. Requires 3782/2502 Card reader Attachment (#8149) on the 3776 mdl 3 or 4 and a 2502 Card Reader mdl A1, A2 or A3 and **#9046** for white color. The following specify feature is required on the 2502: **#9901** for 115V AC,

HIGHLIGHTS

The unit supplies power and attachment circuits and services as a stand for mounting the card machine.

Bibliography: GC20-0001

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug or **#9881** for nonlocking plug.
- Color: Blue **#9043**, Red **#9041**, Gray **#9045**, Yellow **#9042**.
- Cabling: Fixed length cables are supplied as standard. Refer to *Installation Manual - Physical Planning,* GA27-3006.

SPECIAL FEATURES

Optical Mark Read (#5455): [Mdl 2] Required when the attached 2502 is equipped with Optical Mark Read (#5450). **Maximum:** One. **Limitations:** Refer to M2502 pages for feature description and card limitations. Not permitted if 2502 is attached to 3776 mdl 3, 3776 mdl 4 or 3777. **Field Installation:** Yes.

MODEL CONVERSIONS (None)

ACCESSORIES (None)

SUPPLIES

Contact IBM.

3784 LINE PRINTER

PURPOSE

A line printer for attachment to a 3774 Communcation Terminal for use as a second printer or attachment to a 3651 model 50 Retail Store Controller or a 3651 model 75 Programmable Store Controller.

MODELS

Model 1: 001

Limitations: Refer to *Forms Design - Printers Reference Guide* (GA24-3488) for forms design considerations. Printed output is not supported for optical character reading.

Prerequisites: #8155 on the 3774 or #8154 on the 3651 mdl 50 or a 3651 mdl 75.

HIGHLIGHTS

Maximum print speed of 115 lpm with 48-character set, 120 lpm with 64-character set, or 80 lpm with 94-character set . Line printing is from characters engraved on a revolving metal print belt.

Included as standard is one interchangeable print belt (48-, 64- or 94-character set) ... see "Specify". A variable-width forms tractor for feeding continuous forms up to 15 inches overall width, paper jam detection, compress/expand, printer forms control, dual buffers, and 132 print positions. Character spacing is 10 per inch, line spacing is 6 or 8 per inch.

Publications: Biblioghaphy, GC20-0001

SPECIFY

- Voltage (115V AC, 1-phase, 3-wire, 60 Hz): **#9880** for locking plug, **#9881** for non-locking plug.
- Color: Blue **#9043**, Red **#9041** Gray **#9045**, Yellow **#9042**. Available at time of manufacture only.
- Remote Power-Off: **#9501** ... specify this feature for capability to power-down the 3774 and 3784 from the host CPU using a controlled data sequence sent over communications facilities. The 3774 must also be equipped with **#9501**. **Limitations:** Not available with 3651 mdl A50, B50, A75 or B75 attachment (**#9716**) or the 3651 mdl C75 or D75 attachment (**#9717**).
- Print Belt Character Set: Specify one. Available at time of manufacture only. See "Accessories" if more than one print belt is required.

  #9490 -- 48-Character Set, EBCDIC
  #9491 -- 64-Character Set, EBCDIC
  #9492 -- 94-Character Set, EBCDIC
  #9493 -- 48-Character Set, ASCII - #1201 req'd on 3774
  #9494 -- 64-Character Set, ASCII - #1201 req'd on 3774
  #9495 -- 94-Character Set, ASCII - #1201 req'd on 3774
- Cabling: Fixed length cables are supplied as standard. Refer to *Installation Manual - Physical Planning* (GA27-3006).
- 3651 Retail or Programmable Controller Attachment: Specify **#9716** for attachment of a 3784 mdl 1 to a 3651 mdl A50, B50, A75, or B75. Specify **#9717** for attachment of a 3784 mdl 1 to a 3651 mdl C75 or D75. **Prerequisites:** The 3651 mdl 50 or mdl 75 must be equipped with #8154 and have a minimum of 48K of storage. **Note:** Remote Power-Off (**#9501**) not available with attachment to 3651 mdl 50 or mdl 75.

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES

The following items are available on a purchase-only basis. For shipment with machine, order the Feature Number indicated below.

Forms Stand (#4450): Permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after printing. This accessory is a two-shelf forms stand .

Print Belt, Add'l (#5811, #5812, #5813, #5821, #5822, #5823): Permits the customer to obtain more than one character print belt for various applications.

48-char ASCII **#5811***	48-char EBCDIC **#5821**
64-char ASCII **#5812***	64-char EBCDIC **#5822**
94-char ASCII **#5813***	94-char EBCDIC **#5823**

* ASCII (#1201) on the 3774 is prerequisite. ASCII (**#9022**) is required on the 3791.

SUPPLIES

Ribbon: A black ribbon, P/N 1136634, or equivalent, is required ... see IBM.

3791 CONTROLLER MDLS 1, 2

PURPOSE

The 3791 Controller serves as an intelligent base for clusters of operator stations attached to the 3790 Communication System or the 3790 Communication System/Data Entry Configuration. The 3791 communicates with the Host System (any virtual storage S/370, 4331 or 4341 processor**) by local channel attachment using byte and/or block multiplexer channel or the 3704, 3705 or 3725 Communications Controller over switched or nonswitched lines using Synchronous Data Link Control (SDLC). Also attaches via a Communications Adapter feature on the 4341 or 4361 processor.

MODELS

Model 1A	A01	[NO LONGER AVAILABLE]
Model 1B	B01	[NO LONGER AVAILABLE]
Model 1C	C01	Provides 10 million bytes* of disk storage
Model 2A	A02	Provides 20 million bytes* of disk storage
Model 2B	B02	Provides 30 million bytes* of disk storage

Maximum: One 3791 per 3790 system.

Prerequisites: Direct attachment to a S/370 or 4300 Processor byte and/or block multiplexer channel with Local Channel Attachment (#1515) or remote attachment utilizing one SDLC Communication feature (#6301, #6302 or #6303) for host system communications. If Batch Data Exchange (**#9037**) or Magnetic Tape Attachment (#7840) is installed with Configuration Support (**#9431, #9165** or **#9169**), the Host Communication Features or Channel Feature are not required.

Communications with a 3704, 3705 or Communications Adapter on a 4331 Processor is via a 1200 bps Integrated Modem (#5500, #5501, #5502) or an external modem attached via the EIA Interface feature (#3701). See M2700 pages.

To operate a 3790 Communication System Configuration Support **#9431, #9165, #9169**, at least one 3793 Keyboard-Printer or 3277 Display Station with keyboard is necessary.

To operate a 3790 Communication System/Data Entry Configuration Support (**#9175** or **#9195**) at least one 3760 Key Entry Station mdl 1 is necessary.

For standalone systems, not host attached, the appropriate SDLC feature is required for service of the 3791.

HIGHLIGHTS

3790 Communication System (#9431, #9165, #9169): When used in the 3790 Communication System, the 3791 is a programmable controller providing users with remote processing capability, disk storage data files, and control of terminal clusters. Flexibility of the 3791 enables the user to efficiently configure his 3790 system for initial requirements with the ability to change system hardware and functions to meet future needs. This configuration flexibility is attained by the selection of "special feature" and "specify" codes.

Configuration Support (#9431): When used with Configuration Support (**#9431**), the 3791 provides for attachment of 3277 Display Stations mdls 1 and 2, and 3284/3286/3287 and/or 3288 mdl 2 Line Printers. The 3791 Controller will permit up to a maximum of thirty-one 3277 and/or 3284, 3286, 3287, 3288 devices to be attached in any combination. In addition, up to a maximum of four 3793 Keyboard Printers can be attached to the 3791 Control Unit giving a maximum possible total of 35 devices attached to the 3791 Controller. Up to three 3792 Auxiliary Control Units may also be attached. Higher speed print capability of up to 410 lpm is provided by the 3791 printer feature.

In addition to the Host Link attachment, the 3791 has the capability to operate independently of the host via the Batch Data Exchange feature (**#9037**). The 3791 Controller performs all the logic and arithmetic functions to support concurrent operation of 16 user tasks, one host communication task, and two system printers. Removable diskette storage and up to 26.9* million bytes of disk storage are provided.

All 3790 programs are compiled and can be tested at the host computer prior to use at the remote locations, minimizing program development costs and helping assure uniformity of operations through the system. User-oriented application programs allow byte-by-byte and field editing, host file update, file organization option, and operator sharing of 3791 programs and data sets.

Reliability, Availability and Serviceability (RAS) capabilities ensure efficient system option by minimizing the loss of system data.

The 3790 has several features that assist in preventing unauthorized use of the system. Optional security and power-on keylocks prevent units from being made operational unless a key switch is operated. Operator-identification codes and password checking help prevent unauthorized personnel from using the system.

Configuration Support (#9165): When used with this Configuration Support, the 3791 supports the functions and terminals offered by Configuration Support (**#9431**) and provides expanded 3790 system capabilities. The additional capabilities of this Configuration Support consist of 3270 compatibility, full screen processing, RJE function, host link line speeds of up to 9600 bps (subject to carrier availability),ASCII support up to 31 concurrent tasks, including the Systems Printer tasks, and expanded 3790 DB/DC and VTAM host support.

Configuration Support (#9169): The 3790 Communication System now provides a data link adapter feature which allows communications with geographically dispersed displays and printers. When used with **#9169**, the 3791 supports the functions and terminals offered by Configuration Support **#9431** and **#9165** and provides additional 3790 system capabilities. The additional capabilities of **#9169** include attachment to the 3791 Controller via the Data Link Adapter of the 3276 Display Station Control Unit, 3278 Display and 3287 Printers (see 3791 Data Link Adapter for mdl) and attachment of the 3411 Tape and Control Unit mdl 1 (#7840) and 3410 Tape Unit mdl 1. Additional storage is also provided.

3791 Test Site Designation (#9595) for all configurations. The purpose of **#9595** is to provide the 3790 customer with the ability to designate a test site location at which he wants to install a Mandatory Control Code Engineering Change. Receipt of changes at this location will occur before a new production unit can reach the customer network and before the change is distributed to other installed locations requiring the change.

3791 Alternate Mailing Address (#9596) for Control Code Engineering Changes: The purpose of **#9596** is to provide the 3790 customer with the option to have Mandatory Control Code Engineering Changes shipped to a single address, generally Central Site, for greater Network Management Control. The alternate address is controlled by Field Engineering through assignment of a Teleprocessing Control Number (TPC #) or Microcode Control Number (MC#). Redistribution of the control code EC is the responsibility of the customer.

Installation of the Mandatory Control Code Engineering Change should be coordinated between the Central Site FE Manager and the customer central site coordinator to ensure a smooth and non-disruptive upgrade.

3790 Communication System/Data Entry Configuration (#9175, #9195): When used in the 3790 Communication System/Data Entry Configuration, the 3791 will provide Data Entry users with editing and checking capability that results in improved data accuracy and productivity. Flexibility in configuration is attained by the selection of Configuration Support, special feature and specify feature codes.

Configuration Support (#9175): When used with Configuration Support **#9175**, the 3791 provides for attachment of 3760 Dual Key Entry Station mdl 1 and 2 and 3. The 3791 Controller will permit up to a maximum of eight 3760 mdl 1s and/or 3s to be attached in any combination. Up to two 3760 mdl 2s can be attached to a 3760 mdl 1. A maximum of twelve stations equal to a maximum of twenty-four operator positions is supported if not combined with 3760 mdl 3s. For each attached 3760 mdl 3, the maximum number of operator positions is reduced by one.. In addition, support for user-programmable subroutines (#9850) and the attachment of the 3411 Magnetic Tape Control Unit mdl 1 (#7840) is available. For combinations and limitations, refer to *Configuration Guidelines,* GA33-4562. Supports 3791 mdls 1B, 1C, 2A and 2B. Printing at the 3791 is provided by the Line Printer feature (#4710). Data extraction can be done by host communications, magnetic tape or diskette.

The Data Entry Batch Transfer Program (BTP) SCP is available to support the extraction and reverse extraction of data between the 3790 Communication System/Data Entry Configuration and a S/370, 303X or 4300 virtual storage system.

Configuration Support (#9195): With Configuration Support **#9195**, the 3791 supports 3762 Payment Transaction Processing in addition to the functions, stations and output facilities offered by Configuration Support **#9175** and the attachment of the 3411 Magnetic Tape and Control Unit mdl 1 (#7840). The 3791 Controller will permit up to a maximum of eight 3762 Payment Transaction Processors and/or 3760 mdl 1 or 3 stations to be attached in any combination. A maximum of sixteen operator positions is supported if only 3762s are attached. If 3762s are mixed with 3760s, a maximum of twenty-four operator positions may be supported. For combinations and limitations, see *Configuration Guidelines,* GA33-4572. Supports 3791 mdls 1B, 1C, 2A and 2B.

The maximum number of specific terminals attached to the 3791 is dependent upon the 3790 system. In addition, the number of attached terminals that may be operational will depend on the number of tasks and task mixes. The following manuals will provide additional details for system configuration:

* Disk storage available for user programs and data storage is configuration dependent. Minimum storage based on a maximum 3791 configuration is 3.9 to 26.5 million bytes for Configuration Support #9431. 3.4 to 26.0 million bytes for Configuration Support #9165, and #9431 with Expanded Index #9142. 2.4 to 25.1 million bytes for Configuration Support #9169 and Configuration Support #9165 with Configuration Conversion #9530, and #9431 with #9142 and #9350. 7.2 to 25.7 million bytes for Configuration Support #9175. 7.2 to 25.7 million bytes for Configuration Support (#9195).

** See CICS pages in Programming for restrictions.

3791 Controller Mdls 1, 2 (cont'd)

An Introduction to the IBM 3790 Communication System, GA27-2807,
IBM 3790 Communication System Configurator, GA27-2768,
IBM 3790 Communication System Installation Manual - Physical Planning, GA27-2769.

For Configuration Support #9175:

IBM 3790 Communication System Data Entry Configuration Introduction, GA33-4550,
IBM 3760 Key Entry Station Introduction, GA33-4560,
IBM 3760 Key Entry Station Configuration Guidelines, GA33-4562,
IBM 3760 Key Entry Station Functional Description, GA33-4561,
IBM 3790 Communication System Installation Manual - Physical Planning, GA27-2769,
IBM 3790 Communication System Data Entry Configuration User Programmability Planning Guide, GC33-5903.

For Configuration Support #9195:

IBM 3790 Communication System/Data Entry Configuration
IBM 3762 Payment Transaction Processor Introduction, GA33-4570,
Configuration Guidelines, GA33-4572,
Functional Description, GA33-4571,
IBM 3790 Communication System Installation Manual - Physical Planning, GA27-2769,
IBM 3762 Payment Transaction Processor Paper and Printing Requirements, GA33-4576,
Document Gauge, GX33-8505,
IBM 3790 Communication System/Data Entry Configuration User Programmability Planning Guide, GC33-5903.

Communication Facilities: Direct Attachment to a S/370 or 4300 processor byte and/or block multiplexer channel utilizing Local Channel Attachment (#1515).

Synchronous Data Link Control (SDLC) using switched point-to-point lines at speeds of up to 4800 bps, or nonswitched point-to-point, or nonswitched multipoint lines at speeds of up to 9600 bps subject to carrier availability via the 3704, 3705 or 3725. Also attaches via a Communications Adapter feature on the 4331 Processor. See M2700 pages.

For the 3791-to-3704,3705,3725,4331 Communications Adapter SDLC link, IBM offers a 1200 bps integrated modem or an EIA feature for the attachment of external modems.

For the 3792-to-2741 link, IBM offers a Leased Line Adapter for communication at 134.2 bps, or an EIA feature for the attachment of external modems.

Note: For communication capabilities and modem attachment data, see M2700, 3872, 3791, 3792, 3704, 3705, 3725, or 4331 pages for further information.

Host/3791 Communication

Byte and/or Block multiplexer channel
1200 bps Integrated Modem, Nonswitched
1200 bps Integrated Modem, Switched
3872 Modem, Nonswitched
3872 Modem, Switched

The Data Link Adapter provides the capability for the 3791 Controller to attach via nonswitched communication lines the 3276 Control Unit Display Station mdls 2, 3, 4, 12, 13 and 14, with the appropriate 3278 Display Station mdls 2, 3 or 4, 3287 Printer mdls 1 or 2, or 3289 Line Printers mdls 1 or 2. The 3791 Controller supports only SDLC communication and the 1920-character format on the Data Link Adapter. 3276 mdls 2, 3 and 4 attached to a 3791 require the SDLC/BSC switch (#6315) to be in the SDLC position. 3276 mdls 3, 4, 13 and 14 and 3278 mdls 3 and 4 require the character made to be 1920 characters. The 3791 Controller Communication Link is provided by selection of #3703 with the Data Link Adapter (#3210 or #3211) at speeds of up to 9600 bps or the Integrated Modem (#4781) with the Data Link Adapter (#3210) at speeds of 1200 bps. See M2700 pages for available communication facilities.

The maximum number of Data Link Adapter features (#3210 and/or #3211) attached to a 3791 Controller is five. The maximum number of 3276 Control Units that can be attached to each Data Link Adapter is five to a 3791 Controller. The 3790 will allow the attachment of a total of 80 units and devices in any combinations on the five Data Link Adapters.

IBM Terminal Communications

1200 bps Integrated Modem - Nonswitched*
3872 Modem**
3874 Modem**

* Half-speed or 600 bps is not attainable
** If Switched Network Backup, switching is done manually.

Control Storage Feature: The amount of control storage to be ordered is fixed for the 3790 Communication System/Data Entry Configuration (**#9175** or **#9195**). See *3790 Communication System/Data Entry Configurator,* GA33-4562 or GA33-4572.

Publications: GC20-0370

SPECIFY

For details pertaining to specify codes, refer to the following: For Configuration Support **#9431, #9165, #9169**): *3790 Communication System Configurator,* GA27-2768. For Configuration Support **#9175** or **#9195**: *3790 Communication System/Data Entry Configurator,* GA33-4562 (**#9175**) or GA33-4572 (**#9195**).

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Moisture proof plug -- **#9902** for 208V or **#9904** for 230V. Locking plug --- **#9880** for 115V (mdl 1A, 1B only), **#9884** for 208V, or **#9886** for 230V. Field conversion is possible between **#9880** and **#9884** or **#9880** and **#9886**. No other field conversions are possible.
- Color: [Available at time of manufacture only] Blue **#9043**, Red **#9041**, Gray **#9045**, Yellow **#9042**.
- Up-ending Kit (in the event the 3791 must be placed on end to enter installation area): **#9840**. Required for mdls 1C, 2A and 2B only.
- Cables: See "Accessories" for ordering instructions.
- Specify **#9022** for ASCII support: ASCII support is provided for the Host Link, Diskette, 3276, 3277, 3278, 3284, 3286, 3287, 3288, 3289, 3791 Line Printers (#4710, #4711 or #4715) and Magnetic Tape Attachment (#7840). Only ASCII support type B is provided for the 3276, 3287 and 3278 and 3279. Not available with Configuration Support **#9431**. ASCII support for **#9175, #9195** is limited to keyboard and displays.
- Print Belt Character Set: Specify for 3791 Line Printer (feature codes #4710, #4711 or #4715) one of the following. These specify codes are available at time of manufacture only.)

  If additional print belts are required, see Print Belts in "Accessories". The 48-character print belt can be used for ASCII or EBCDIC.

	#9431	#9165	#9169	#9175	#9195
#9071–48-char set, EBCDIC	X	X	X	X	X
#9072–64-char set, EBCDIC	X	X	X	X	X
#9073–96-char set, EBCDIC	X	X	X		
#9071–48-char set, ASCII		X	X		
#9074–64-char set, ASCII		X	X		
#9075–96-char set, ASCII		X	X		

- Configuration Support: The 3791 System Configuration Support must be determined before specifying the functions required and ordering special features. **Field Installation:** Yes. Specify one of the following:

  – **#9431** must be specified for up to 16 concurrent device operations. Must be ordered for all 3791s without **#9165, #9169, #9175**or **#9195. Limitations:** Not available with **#9165, #9169, #9175** or **#9195**.

  – **#9165** must be specified for up to 31 concurrent device operations and expanded 3791 System capabilities. **Limitations:** Not available with Configuration Support **#9431, #9169, #9175** or **#9195 Prerequisites:** #3220 or #3221 ... One #1590 ... Following Control Storage Increments: Three Type I-A (#1603) and One Type II-A (#1613).

  – **#9169** for support of Data Link Adapter, 3276 Display Control unit, 3278 Display station, 3287 and 3289 Printers Additional Storage and attachment of the 3411 Tape and Control Unit mdl 1 (#7840), 3410 Tape Unit mdl 1 (#7840). **Limitations:** Not available with Configuration Support **#9431, #9165, #9175**or **#9195**.

    Available only with machines at EC level 744565 shipped after July 1, 1976.

    Field Installation: Yes. **Prerequisites:** #3220 or #3221 ... one #1591 ... six #1603s ... one #1613.

  – **#9175** for 3790 Communication System/Data Entry Configuration and the attachment of the 3411 Magnetic Tape and Control Unit mdl 1. **Limitations:** Not available with 3791 mdl 1A and with Configuration Support **#9431, #9165, #9169. Prerequisites:** #7900 ... #3221 for mdls 1B, 2A and 2B ... one #1590 ... and the following Control Increments: One #1603 ... three #1613s.

  – **#9195** for 3790 Communication System/Data Entry Configuration using the 3762 Payment Transaction Processor and the attachment of the 3411 Magnetic Tape and Control Unit mdl 1 (#7840). **Limitations:** Not available with 3791 mdl 1A and with Configuration Support **#9431, #9165, #9169, #9175. Prerequisites:** Device Attachment Type 1 (#7900) ... Add'l Disk Heads (#3221 for mdls 1B, 1C, 2A and 2B) ... Control

3791 Controller Mdls 1, 2 (cont'd)

Storage Expansion (#1590) and the following Control Storage Increments: One Type IA (#1603) and three Type II-As (#1613). Add'l Card Read Support (**#9852**) for attachment of one or more RPQs MH7024 (3762 mdl 21).

- Configuration: For each 3790 System Configuration Support **#9431, #9165, #9169, #9175**or **#9195**), the 3791 must be conditioned to support the function being provided and the terminals attached. Future modifications to a 3790 system must be specified by changes to the configuration features for the 3791.

3790 Communication System (#9165, #9169,#9431): The selection of the following function and attachment specify codes are required to complete the 3791 configuration order. **Limitations:** Not available with Configuration Support (**#9175**or **#9195**). Purchase customers must submit an RPQ for field conversion from **#9431** or **#9165** to **#9169**. **Field Installation:** Yes.

Device/Facility

On 3791 Controller:

3792 Attachment	**#9110**	First 3792
	#9120	Second 3792
	#9130	Third 3792
		Prerequisites: #9431, #9165, #9169.
3793 Attachment	**#9011**	Specify total number of 3793s attached by ordering quantity. **Maximum:** Four with **#9431** ... three with **#9165, #9169.** **Prerequisites: #9431, #9165, #9169.**
3277, 3284, 3286, 3287,	**#9200**	Specify total number of devices attached by ordering quantity.
3288 Attachment		**Maximum:** 31. **Prerequisites: #9431, #9165** or **#9169.**
	#9250	Specify for any mdl 2 device. **Maximum:** One. **Prerequisites: #9431, #9165.**
On 3792 Auxiliary Control Unit:		**Prerequisites: #9431, #9165** or **#9169.**

Terminals (and maximum per 3792)

	2741 (Two)	3793 (Four)	Line Printer (One)
First 3792	**#9115**	**#9111**	**#9119**
Second 3792	**#9125**	**#9121**	**#9129**
Third 3792	**#9135**	**#9131**	**#9139**

Specify the above codes by ordering quantity. Order once for each unit attached. **Note:** Only one 3792 line printer feature may be attached to a 3790 system. The one printer can be attached to any one of the 3792 Auxiliary Controllers. See "Limitations" in M3792 pages for details.

Configuration Support **#9165** provides all the functions of Configuration Support **#9431**. Some of the functions may not require ordering for Configuration Support **#9165**. Prerequisites will determine ordering requirements for **#9431** or **#9165**.

Support Functions #9431 and #9165:

Functions	Specify	Comment
Line Printer Support	**#9561**	132 print positions **Prerequisites: #9431**, or **#9165.**
	#9562	96-character print belt support. **Prerequisites: #9431.**
Print Data Set Specify one:	**#9421**	1,024 Records
	#9422	2,048 Records
	#9423	4,096 Records
	#9424	8,192 Records **Prerequisites: #9431, #9165.**
Transaction Data Set Specify One:	**#9771**	1,024 Records
	#9772	2,048 Records
	#9773	4,096 Records
	#9774	8,192 Records **Prerequisites: #9431, #9165.**
Control Storage Configuration	**#9531**	Control Storage Configuration 1
	#9532	Control Storage Configuration 2
	#9533	Control Storage Configuration 3 **Prerequisites: #9431.**
Operational Changes to the 3791	**#9431**	Installed on all 3791s shipped after May,1976. Prerequisite for any MES ordered after May,1976.
Additional 3790 Functions	**#9430**	Optional; order only if required. **Prerequisites: #9431.**
Expanded Program Index	**#9142**	Optional, order only if required. **Prerequisites: #9431** and **#9430.** See Note 1.
Batch Data Exchange via Diskette	**#9037**	Optional, order only if required. **Prerequisites:** One **#9431** or **#9165** and #6301, #6302, #6303,#1515.
Configuration: Conversion	**#9350**	Optional, order only if required. **Prerequisites: #9431** and **#9142, #9430, #9424** and **#9774** or **#9165** and **#9424** and **#9774.** See Note 2.

Note 1: Machines shipped prior to July 1, 1976 and not at EC level 744209 or higher cannot take advantage of the installation assist function of **#9142**. Configuration Support **#9165** can be field installed on these machines but requires reinstallation of the data base. See "Field Installation" of #3220 and #3221.

Note 2: Machines shipped prior to July 1, 1976 and not at Factory EC level 744565 or higher cannot install **#9350** on Configuration Support **#9169**. Mdls 2A and 2B with serial numbers 20113 through 20196, excluding numbers 20165, 20190 and 20194, must have Field EC 746445 installed with Configuration Conversion **#9350** on second and third position disk storage files to avoid reinstall later for feature #3221 on these files.

User Data Set	**#9501**	For first additional 16 user data sets. **Maximum:** One. **Prerequisites: #9431, #9165.**
	#9502	For second additional 16 user data sets. **Maximum:** One. **Prerequisites: #9431, #9165.**
User Sessions	**#9344**	Optional number of 31 available. **Maximum:** 16 with **#9431**, 31 with **#9165. Minimum:** One. **Prerequisites: #9431, #9165.**
System Activity	**#9149**	Specify to define concurrent device activity. **Maximum:** 31. **Minimum:** One. **Prerequisites: #9165.**
	#9150	Specify **#9150** once for each device that is operational when host is active. **Prerequisites: #9431.**
	#9151	Specify **#9151** once for each additional device that is operational when host is inactive. **Prerequisites: #9431.**
RJE Function for #9165	**#9541**	Specify only if required. **Prerequisites: #9165.**
	#9542	RJE Console. One required. **Prerequisites: #9541.**
	#9543	Specify if RJE Reader is required. **Maximum:** One. **Prerequisites: #9541.**
	#9544	Specify if RJE Writer is required. **Maximum:** One. **Prerequisites: #9541.**
	#9545	Line Printer. **Maximum:** Two. **Prerequisites: #9541.**
	#9546	RJE Logical Unit. **Maximum:** Five. **Minimum:** One. **Prerequisites: #9541.**
Test Site	**#9595**	To Designate a 3791 location as a test site for Mandatory Control Code Engineering Changes.
Alternate Mailing Address	**#9596**	To designate that an alternate mailing address is available for Control Code Engineering Changes

Support Functions (#9169): Configuration Support **#9169** provides all the functions of Configuration Support **#9431** and **#9165**. Only the following functions require ordering for Configuration Support **#9169**.

Line Printer	**#9561**	132 print positions. **Prerequisites: #9169.**
System Activity	**#9149**	Specify to define concurrent device activity. **Minimum:** One. **Maximum:** 31. **Prerequisites: #9169.**
Batch Data Exchange via Diskette/Tape	**#9037**	Optional, order only if required. **Prerequisites: #9169** and #6301, #6302, #6303, #1515.
RJE Function	**#9541**	Specify only if required. **Prerequisites: #9169.**
Test Site	**#9595**	To designate a 3791 location as a test site for Mandatory Control Code Engineering Changes.
Additional User Sessions	**#9345**	Optional, order only if required. Provides 15 additional user sessions. Basic system provides 16 user sessions. **Prerequisites: #9169.**

3791 Controller Mdls 1, 2 (cont'd)

3790 Communication System/Data Entry Configuration (#9175 or #9195): The selection of the following function and attachment specify codes is required to complete the 3791 configuration. The prerequisite for each specify code will indicate the availability of that capability with the selected Configuration Support (**#9175** or **#9195**). **Limitations:** Not available with Configuration Support **#9431, #9165, #9169. Prerequisites: #9175** or **#9195. Field Installation:** Yes.

Function	Specify	Comment
1-6 stations	#9156	Specify if maximum number of stations planned for attachment is six. **Prerequisites: #9175** or **#9195. Field Installation:** Yes.
1-9 stations	#9157	Specify if maximum number of stations planned for attachment is nine. **Prerequisites: #9175** or **#9195. Field Installation:** Yes.
1-12 stations	#9158	Specify if maximum number of stations planned for attachment is twelve. **Prerequisites: #9175** or **#9195. Field Installation:** Yes.
User-Programmable Subroutines	#9850	Specify only if required. **Prerequisites: #9175** or **#9195** on 3791 and #7500 on 3792.
Line Printer	#9561	132 print positions. **Prerequisites: #9175** or **#9195.**
Test Site	#9595	To Designate a 3791 location as a test site for Mandatory Control Code Engineering Changes.
Alternate Mailing Address	#9596	To designate that an alternate mailing address is available for Control Code Engineering Changes

SPECIAL FEATURES

Non-Communications Features

Control Storage Expansion (#1590): Provides capability for expansion of control storage. **Limitations:** Must be specified for Configuration Support **#9165, #9175** or **#9195**. Not available with **#9169. Maximum:** One. **Field Installation:** Yes. **Prerequisites: #9431, #9165, #9175** or **#9195.**

Control Storage Expansion Type I (#1591): Provides capability of expanding control storage. **Maximum:** One. **Field Installation:** Limited to those machines shipped after July 1, 1976 and at Factory EC level 744565 or higher. **Limitations:** Cannot be installed with Control Storage Expansion (#1590). Purchase customers must submit an RPQ for a field change from Control Storage Expansion (#1590). **Prerequisites: #9169.**

Control Storage Increment, Type I (#1602): Provides 8,192 positions of additional control storage. **Limitations:** Not available with **#9165, #9175** or **#9195**. See Note below. **Maximum:** One for **#9431, #9169. Field Installation:** Yes. **Prerequisites:** #1590 for **#9431**. #1591 for **#9169.**

Control Storage Increment, Type I-A (#1603): Provides 16,384 positions of additional control storage. **Limitations:** Three 1602s are required for Configuration Support **#9165**. Six 1603s are required for Configuration Support **#9169** and one is required for **#9175** or **#9195. Maximum:** Three for **#9431** or **#9165**. One for **#9175** or **#9195**. Seven with **#9169. Field Installation:** Yes. **Prerequisites:** #1590 for **#9431, #9165, #9175** or**#9195**. #1591 for **#9169.**

Control Storage Increment, Type II (#1612): Provides 8,192 positions of additional control storage. **Limitations:** Not available with **#9165, #9175** or **#9195**. See Note below. **Maximum:** One for **#9431, #9165, #9169. Field Installation:** Yes. **Prerequisites:** #1590 for **#9431**. #1591 for **#9169.**

Control Storage Increment, Type II-A (1613): 16,384 positions of additional control storage. **Limitations:** One #1613 is required for Configuration Support **#9165 and #9169.** Three are required for **#9175** or **#9195**. See 3793 Attachment features (#7901, #7902 or #7903) for additional restrictions. **Maximum:** One for **#9165, #9431**, three for **#9175** or **#9195**, five for **#9169. Field Installation:** Yes. **Prerequisites:** #1590 for **#9431, #9165, #9175** or **#9195**. #1591 for **#9169.**

Note: Customers who elect to purchase Storage Increment Type I or Type II and plan to order additional storage at a later date should consider purchase of Storage Increment Type I-A or Type II-A initially because some field upgrades of storage may require replacement of initial feature and installation of new feature.

Add'l Disk Heads (#3220, #3221): [#3220 for mdl 1A, #3221 for mdl 1B, 1C, 2A, 2B] Provides additional disk heads necessary for use with Configuration Support **#9165, #9169, #9175** or **#9195. Limitations:** One is required on a mdl 1A, 1B, 1C, 2A or 2B for Configuration Support **#9165 or #9169.** With Configuration Support **#9175** or **#9195,** one is required on a mdl 1B or 1C, two are required on a mdl 2A, and three are required on a mdl 2B. Not available with **#9431. Maximum:** One for **#9165**; three for **#9169, #9175** or **#9195. Field Installation:** Yes. **Prerequisites: #9165, #9169, #9175**or **#9195.** Machines shipped prior to July 1, 1976 and not at EC level 744209 or higher require the removal of disk storage. Mdls 2A and 2B with serial numbers 20113 through 20196, excluding numbers 20165, 20190 and 20194, at Factory EC level 744209 or higher require removal of disk storage in the second and third position to field install #3221. See chart below to verify replacement requirement of each disk storage (enclosure).

	Mdl 1A	Mdls 1B,1C,2A,2B
Label color on each disk storage (enclosure) indicates replacement necessary for additional heads.*	White	Orange
Label color on each disk storage (enclosure) indicates additional heads installable without replacement of enclosure.	Pink	Blue

* Adequate provision must be made for retaining data contained on all disk storage in machine and elimination of user-proprietary information. All replaced parts become the property of IBM.8

Line Printed, 80 Print Positions (#4710): [155 lpm - 6 lines per 2.54cm (1.0 in.)] Provides a line printer with maximum speeds of 155 lpm with 48-character set, 120 lpm with 64-character set, 80 lpm with 96-character set. Included as standard is one operator-interchangeable print belt (48-, 64-, or 96-character set) . ASCII or EBCDIC character set must be specified Capability to print on continuous fanfold paper up to 80 print positions on a 20cm (8.0 in.) print line with line spacing of 6 lines per 2.54cm (1.0 in.). Paper up to six parts plus carbon (maximum total thickness is 0.50mm or 0.020 in.) can be accommodated. Maximum paper width is 15.0 in. overall. Refer to form design reference guide for printers (GA24-3488) for form design considerations. Card stock is not recommended. A form-jam detection capability is provided. Order P/N 1136634 or equivalent for replacement ribbons. **Limitations:** Line printers on the 3791 and 3792 must have the same number of print positions . The 96- and ASCII character sets are not available with Configuration Support **#9175** or **#9195. Maximum:** One per 3791; with 3792, two per system. **Field Installation:** Yes. **Specify:** See "Print Belt Character Set" under "Specify" for ordering 48-, 64-, 96--character sets.

Line Printer, 132 Print Positions (#4711): [155 lpm - 6 lines per 2.54cm (1.0 in.)] Provides a line printer with maximum speeds of 155 lpm with 48-character set, 120 lpm with 64-character set, 80 lpm with 96-character set. Included as standard are one operator interchangeable print belt (48-, 64-, or 96-character set) . Capability to print on continuous fanfold paper up to 132 print positions ASCII or EBCDIC character set must be specified on a 33.5cm (13.2 in.) print line with line spacing of 6 lines per 2.54cm (1.0 in.). Paper of up to six parts plus carbon (maximum total thickness is 0.50mm or 0.020 in.) can be accommodated. Refer to *Forms Design Reference Guide for Printers* (GA24-3488) for form design considerations. Card stock is not recommended. A form-jam detection capability is provided. Order P/N 1136634 or equivalent for replacement ribbons. **Limitations:** Line printers on the 3791 and 3792 must have the same number of print positions. The 96- and ASCII character sets are not available with Configuration Support **#9175** or **#9195. Maximum:** One. **Field Installation:** Yes. **Specify:** See "Print Belt Character Set" under "Specify" for ordering 48-, 64-, 96-character sets.

Line Printer - 132 Print Positions (410 lpm) (#4715): Provides a higher speed line printer with maximum speeds of 410 lpm with 48-character set, 300 lpm with 64-character set, 230 lpm with 96-character set. Included as standard is one operator-interchangeable print belt (48-, 64-, or 96-character set) , and a forms stand which is an integral part of this feature. ASCII or EBCDIC character set must be specified. Capability to print on continuous fanfold paper up to 132 print positions on a 33.5cm (13.2 in.) print line with line spacing of 6 lines per 2.54cm (1 in.) with **#9431**. With Configuration Support **#9165** or **#9169**, line spacing of 6 or 8 lines per inch is available and is program selected. Paper of up to six parts plus carbon (maximum total thickness is 0.50mm or 0.020 in.) can be accommodated. Refer to *Forms Design Reference Guide for Printers* (GA24-3488) for forms design considerations. Card stock is not recommended. A form-jam detection capability is provided. Order P/N 1299160 or equivalent for replacement ribbons. **Limitations:** Line printer on the 3792 must have 132 print positions (#4713). The ASCII or EBCDIC character set must be specified not available with Configuration Support **#9175** or **#9195. Maximum:** One. **Field Installation:** Yes. **Specify:** See "Print Belt Character Set" under "Specify" for ordering 48-, 64-, 96-character sets.

Security Keylock (#6350): Allows the 3791 to be "powered-on" only with key. Removing the key does not turn power off. For additional or replacement keys, see "Accessories". **Maximum:** One. **Field Installation:** Yes.

3791 Controller Mdls 1, 2 (cont'd)

Magnetic Tape Attachment (#7840): Provides for the attachment of the 3411 Magnetic Tape and Control Unit mdl 1. Additional tape capacity is provided by attachment of the 3410 mdl 1 via the 3411 Magnetic Tape Unit. The total number of tape units (3410 and 3411) on a 3791 Controller is four. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #7003, #3211 or #3221 and **#9169, #9175** or **#9195**. **Limitations:** Not available with Configuration Support **#9431, #9165**. Configuration Support **#9175** or **#9195** does not support attachment of the 3410 Tape Unit mdl 1. Only the 3411 Single Density (#3211) and Dual Density (#3221) are supported by the 3791 Controller.

Device Attachment Type I (#7900): Allows attachment of up to three 3792 Auxiliary Control Units or four 3760 Dual Key Entry Station mdl 1s , or four 3760 Key Entry Stations mdl 3s, , or four 3762 Payment Transaction Processors, or any combination of four of these stations at a distance of 2,000 feet. Each 3760 mdl 1 can attach up to two 3760 mdl 2s. **Limitations:** All attached units must be the same machine type. The mixing of 3792 and 3760 units is not allowed, except for **#9195** which allows mixing of 3760 and 3762 units. **Maximum:** One. **Field Installation:** Yes. **Prerequisites: #9175 or #9195)** for 3760 attachment, **#9195** for 3760 and 3762 attachment, or (**#9431, #9165** or **#9169)** for 3792 attachment.

3793 Attachment (#7901): Allows one 3793 Keyboard-Printer to to be attached to the 3791. (See M3793 pages). **Limitations:** Cannot be installed with Configuration Support **#9175** or **#9195**. **Maximum:** For Configuration Support **#9165** the maximum is three. For Configuration Support **#9431** the maximum is three when Control Storage Increment Type II (#1612) or Type II-A (#1613) is installed. For Configuration Support **#9169** the maximum is three, however, if Control Storage Increment Type II (#1612) or more than one Type II-A (#1613) is installed, the maximum is one. Four per 3791 mdls 1C, 2A and 2B. One per 3791 mdls 1A and 1B. Mdls 1A and 1B require a 3793 Attachment, 2nd (#7902) for a second 3793, and an 3793 Attachment, Add'l (#7903) for a third or fourth. Maximum of two with Magnetic Tape Attachment (#7840). **Field Installation:** Yes.

3793 Attachment, 2nd (#7902): Allows a second 3793 to be attached to a 3791 mdl 1A or 1B. **Maximum:** One. **Limitations:** Not available with Configuration Support **#9169** when Control Storage Increment Type II (#1612) or more than one Control Storage Increment Type II-A (#1613) is installed. **Field Installation:** Yes. **Prerequisites:** #7901.

3793 Attachment, Add'l (#7903): Allows a third or fourth 3793 to be attached to a 3791 mdl 1A or 1B. **Limitations:** If Control Storage Increment Type II (#1612) or Type II-A (#1613) is installed, only three 3793s can be attached with Configuration Support **#9431**. For **#9165** or **#9169**, maximum is three 3793s. Not available with Magnetic Tape Attachment (#7840). **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** #7902.

Device Attachment Type II (#7911): Allows attachment of up to any combination of four 3277s and/or 3284s, 3286s, 3287s, 3288s attached to the 3791. For Display and Printer features supported by the 3790 System, see *3790 Communication Configurator,* GA27-2768, and *Introduction to the 3790 System* for details. **Limitations:** Not available with Configuration Support **#9175** or **#9195**). **Maximum:** One. **Field Installation:** Yes.

Device Attachment Type II, Add'l (#7912): Each feature allows attachment of any combination of up to four additional 3277s and/or 3284s, 3286s, 3287s, 3288s attached to the 3791. **Maximum:** Seven, but restricted to a maximum of 31 devices. **Prerequisites:** #7911. **Field Installation:** Yes. **Limitations:** If printer feature #4710, #4711 or #4715 is attached, maximum number of 3277s, 3284s, 3286s, 3287s and/or 3288s is restricted to 30 devices. If a 3792 is attached, maximum is six, with a maximum of 28 devices. The attachment of a line printer feature does not reduce the maximum of 28 devices.

Device Attachment Type I, Add'l (#7922): Allows attachment of up to four 3760 Dual Key Entry Station mdl 1s, or four 3760 Key Entry Station mdl 3s, or four 3762 Payment Transaction Processors or any combination of four of these stations at a distance of 2000 feet. Each 3760 mdl 1 can attach up to two 3760 mdl 2s. **Limitations:** A maximum of 24 operator positions is supported for attachment to a 3791 Controller. Not available with Configuration Support **#9431, #9165, #9169**. **Maximum:** One. **Field Installation:** Yes. **Prerequisites: #9175, #9195** and #7900.

The amount of control storage to be ordered for the 3790 Communication System (**#9431** or **#9169**) depends on both the quantity and type of attachments in the system configuration. The amount of control storage is fixed for **#9165**. See *3790 Communication System Configurator,* GA27-2768, to determine the correct ordering quantities of control storage.

Communications Features

Local Channel Attachment (#1515): Provides for direct attachment to any S/370 or 4300 processor* via an integrated byte and/or block multiplexer channel or via a 2870 byte multiplexer or 2880 Block Multiplexer Channel. Maximum distance from the channel is 200 feet. **Limitations:** Cannot be installed with SDLC Communications feature (#6301, #6302 or #6303). Not available on the block multiplexer channel with Configuration Support (**#9431**). **Maximum:** One. **Field Installation:** Yes.

*This feature attaches to only one channel of a multiprocessing system.

Data Link Adapter With Business Machine Clock (#3210): Required for attachment to data link through the 1200 bps Integrated Modem (#4781) or via #3703 at 1200 bps, to any external modem which does not provide its own clocking. Half-speed or 600 bps is not attainable with this feature. **Maximum:** Five. Maximum reduced by one for each #3211 attached. **Field Installation:** Yes. **Prerequisites: #9169. Limitations:** All 3276s and 3278s must have keyboards. Cannot be installed with **#9165, #9431, #9175** or **#9195**.

Data Link Adapter Without Business Machine Clock (#3211): Required for attachment to Data Link via #3703 and external modem which provides its own clocking of up to 9600 bps. **Maximum:** Five. Maximum reduced by one for each #3210 attached. **Field Installation:** Yes. **Prerequisites: #9169. Limitations:** Cannot be installed with Configuration Support **#9165, #9431, #9175** or **#9195**.

EIA Interface (#3701): Provides EIA Interface for the attachment of an IBM or other external modem. **Limitations:** Cannot be installed with the 1200 bps modems (#5500 or #5501). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #6301, #6302 or #6303.

EIA Interface (#3703): Provides EIA Interface for the attachment of an IBM or other external modem. **Maximum:** Five. **Field Installation:** Yes. **Prerequisites:** #3210 or #3211.

1200 bps Integrated Modem Nonswitched (#4781): Provides an integrated modem for communications from the Data Link Adapter over nonswitched lines. No external modem is required. **Specify:** Unless otherwise specified, 4-wire strapping will be provided. Specify **#9654** for 2-wire strapping. **Maximum:** Five. **Field Installation:** Yes. **Prerequisites:** #3210.

Modem, 1200 bps Integrated, Nonswitched (#5500): Provides an integrated modem for communication with the host system over nonswitched lines. No external modem is required. **Limitations:** Cannot be installed with communications features #3701 or #5501 or #6302 or #6303. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #6301. **Specify:** **#9651** for 4-wire strapping, or **#9652** for 2-wire strapping .

Modem, 1200 bps Integrated Switched (#5501): Provides an integrated modem with an answering capability for communication from the host system over switched lines via FCC registered protective circuitry of the CBS type or equivalent) provided by the user. The coupling device determines whether the answering capability is manual or automatic. **Prerequisites:** #6301. **Maximum:** One. **Field Installation:** Yes. **Limitations:** Cannot be installed with communications features #3701, #5500, #6302 or #6303.

SDLC Communication Feature With Business Machine Clock (#6301): Required for attachment to communication lines through the 1200 bps Integrated Modem (#5500 or #5501) or, via an EIA Interface (#3701), to any external modem which does not provide its own clocking. Half-speed or 600 bps is attainable with this feature. **Limitations:** Cannot be installed with SDLC features (#6302, #6303) or Local Channel Attachment (#1515). **Maximum:** One. **Field Installation:** Yes.

SDLC Communication Feature Without Business Machine Clock (#6302): Required for attachment to communication lines via an EIA Interface (#3701) and an external modem which provides its own clocking up to 2400 bps with **#9431** or **#9165**, and up to 4800 bps with **#9175** or **#9195**. **Limitations:** Cannot be installed with SDLC features (#6301, #6303), 1200 bps modem features (#5500 or #5501), or Local Channel Attachment (#1515). With Configuration Support **#9175** or **#9195**, the number of stations which may be active concurrently with host communications at 4800 bps is dependent on the workload. **Maximum:** One. **Field Installation:** Yes.

SDLC Communication Feature Without Business Machine Clock (#6303): Required for attachment to communication lines via an EIA Interface (#3701) and an external modem which provides its own clocking of up to 9600 bps. **Limitations:** Cannot be installed with communication features #1515, #5500 or #5501 , #6301, #6302 or Configuration Support **#9431, #9175** or **#9195**. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS

The following model changes may be field installed: Model 1C to models 2A and 2B.

Model upgrade requires replacement of disk storage unit. Adequate provision must be made for retaining data contained on disk storage unit and elimination of user-proprietary information.

ACCESSORIES

Forms Stand (#4450): [For 155 lpm Line Printer features #4710 and #4711 only] A 2-shelf forms stand that permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after print. A forms stand is an integral part of the 410 lpm

3791 Controller Mdls 1, 2 (cont'd)

Line Printer feature (#4715). For shipment with machine, order by feature number.

Cables: Cables to attach 3790 units may be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of these cables. Coaxial cables, connections, and accessories for the 3277 and 3288 are applicable when these units are attached to the 3790 system. Refer to M3270 pages for part numbers.

Unit	Cable Assm No	Use	Maximum Length	Notes
3791	1832533	Keyboard Printer	48 ft	1
3792	1832533	Keyboard Printer	48 ft	1
	1454167	75 Cond. Cable Bulk		
	1836445(P/N)	Connector Group		2
3791	2577672	Aux. Control Unit	2000 ft	3
3791	2577672	3760 mdl 1 & 3	2000 ft	3
3791	2577672	3732/3736 (indoor)	2000 ft	
3791	1833108	3732/3736 (outdoor)	2000 ft	

Notes:

1. Communication cable consisting of bulk cable #1454167 and connector group #1836445.
2. Contains connector assemblies for both ends of communication cable.
3. Indoor Cable. For coax wire and connector kit part numbers, refer to M3270 pages.

Locks and Keys: The 3791 with the Security Key Lock (#6350) is shipped with two keys. Additional keys may be purchased only from IBM. A letter of authorization must accompany order and serial number of lock must be indicated. .

Print Belt, Add'l: A metal belt with engraved font that permits the customer to obtain more than one character set print belt for various applications. See "Specify" for restrictions and limitations. The belt can be used interchangeably with the one provided on the machine.

	Feature
155 lpm Max - Available in EBCDIC and ASCII character arrangements.	
48-character ASCII	**#5811****
64-character ASCII	**#5812****
94-character ASCII	**#5813****
48-character EBCDIC	**#5821**
94-character EBCDIC	**#5823**
96-char EBCDIC (word processing) Courier Typestyle	**#5831**
96-char EBCDIC (word processing) Artisan Typestyle	**#5832**

** ASCII Feature **(#9022)** required.

SUPPLIES

Contact IBM.

3791 CONTROLLER MDLS 11, 12

PURPOSE

The 3791 Controller, models 11C, 12A or 12B, serves as an intelligent base for clusters of operator stations attached to the 3730 Distributed Office Communication System.

MODELS

Model 11C	C11	Provides 10 million bytes* of disk storage
Model 12A	A11	Provides 20 million bytes* of disk storage
Model 12B	B11	Provides 30 million bytes* of disk storage

*The minimum disk storage available for data storage and user programs (based on a maximum 3791 configuration) is:

Mdl 11C: 5.2 million bytes
Mdl 12A: 14.5 million bytes
Mdl 12B: 23.8 million bytes

Maximum: One 3791 per 3730 system.

Prerequisites: Local Channel Attachment feature (#1515), or one SDLC Communication feature (#6301, #6302 or #6303) is required for CE maintenance purposes. To operate a 3730 system, at least one 3732 Text Display Station with keyboard and either a 3736 Printer or a 3791 Line Printer feature is required.

HIGHLIGHTS

The 3791 Controller mdl 11C, 12A or 12B with configuration support **#9171** installed, serves as the Controller for the 3730 Distributed Office Communication System to support the 3730 functions of document creation, editing, storage, retrieval, formatting, printing, archiving and (with **#9275**) automated text.

Additional controller features and facilities include:

- Non-removable disk storage for customer use
- Line printer feature
- Host system attachment (**#9285**) through an SDLC communications feature, or through a local channel attachment feature.

Communication Facilities: Direct Attachment to a S/370 or 3031, 3032, 3033, 4331 or 4341 processor byte and/or block multiplexer channel utilizing Local Channel Attachment (#1515).

Synchronous Data Link Control (SDLC) using switched point-to-point lines at speeds of up to 2400 bps, or nonswitched point-to-point, or nonswitched multipoint lines at speeds of up to 9600 bps subject to carrier availability via the 3704 or 3705. See M2700 pages.

For the 3791-to-3704/3705 SDLC link, IBM offers a 1200 bps integrated modem or an EIA feature for the attachment of external modems.

Note: For communication capabilities and modem attachment data, see M2700, 3863, 3864, 3865, 3872, 3791, 3792, 3704, or 3705 pages for further information.

Host/3791 Communication:

Byte and/or Block multiplexer channel
1200 bps Integrated Modem, Nonswitched
1200 bps Integrated Modem, Switched
3863 Modem, 2400 bps Switched and Nonswitched
3864 Modem, 4800 bps Switched and Nonswitched
3865 Modem, 9600 bps Nonswitched
3872 Modem, Nonswitched
3872 Modem, Switched
TCTS Dataroute Network at 2400, 4800 or 9600 bps (Canada)
CN/CPT Infodat Network at 2400, 4800 or 9600 bps (Canada)
Facilities K3M, K4M and K5M at 2400, 4800 or 9600 bps (Canada)
NTT DDC Network at 2400, 4800 or 9600 bps (Japan)
NTT DDX Network at 2400, 4800 or 9600 bps (Japan)

3791 Test Site Designation (#9595): The purpose of **#9595** is to provide the 3730 customer with the ability to designate a test site location at which he wants to install a mandatory Microcode Engineering Change. Receipt of changes at this location will occur before a new production unit can reach the customer network and before the change is distributed to other installed locations requiring the change.

This feature should be limited to one per network.

3791 Alternate Mailing Address (#9596) for Microcode Updates: **#9596** provides the 3730 customer with the option of having Mandatory Microcode Updates shipped to a single address, generally a central site, for better network management control. The alternate address is controlled by Field Engineering through assignment of a Teleprocessing Control Number (TPC#) or Microcode Control Number (MC#). Redistribution of the micocode updates is the responsibility of the customer.

Installation of the Mandatory Microcode Engineering Change should be coordinated between the Central Site FE manager and the customer central site coordinator to ensure a smooth and non-disruptive upgrade.

Control Storage Features: The amount of control storage to be ordered for the 3730 Distributed Office Communication System (**#9171**), depends on both the quantity and type of attachments in the system configuration. See *3790 Communication System Configurator,* GA27-2768 to determine the correct ordering quantities of control storage.

Publications: Refer to the latest level of *IBM System/370 Bibliography of Industry Systems and Application Programs,* GC20-0370, for details of 3791 and 3730 system publications.

SPECIFY

For details of specify codes, refer to *3790 Communication System Configurator,* GA27-2768.

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Moisture proof plug – **#9902** for 208V or **#9904** for 230V. Locking plug – **#9884** for 208V, or **#9886** for 230V.
- Color: [available at time of manufacture only] Blue (**#9043**), Red (**#9041**), Gray (**#9045**), Yellow (**#9042**).
- Up-ending Kit (in the event the 3791 must be placed on end to enter installation area): Specify **#9840**.
- Cables: Contact IBM.
- Specify **#9022** for ASCII support: ASCII support is provided for the Host Link, Diskette, 3277, 3284, 3286, 3287, 3288, 3732, 3736 and 3791 Line Printers (#4710, #4711 or #4715). Only ASCII support type B is provided for the 3287, 3732 and 3736. **Prerequisites:** **#9171** with **#9275**.
- Print Belt Character Set: Specify for 3791 Line Printer (feature codes #4710, #4711 or #4715) one of the following. These specify codes are available at time of manufacture only.)

  If additional print belts are required, see "Accessories". The 48-character and 128-character print belts can be used for ASCII or EBCDIC.

  #9071 -- 48-char set, EBCDIC
  #9072 -- 64-char set, EBCDIC
  #9073 -- 96-char set, EBCDIC

  #9071 -- 48-char set, ASCII
  #9074 -- 64-char set, ASCII
  #9075 -- 96-char set, ASCII
  #9076 -- 128-char set, DP/WP EBCDIC (1)
  #9077 -- 96-char set, WP EBCDIC - Courier (2)
  #9078 -- 96-char set, WP EBCDIC - Artisan (2)

  (1) Allows text and data to be printed in 3730-3790 system without the need to change print belts.

  (2) Cannot be installed with #4715.
- Configuration Support: Specify **#9171** for 3730 Distributed Office Communication System, including support for 3732 Text Display Station and 3736 Printer. **Field Installation:** Yes. **Limitations:** Not available with mdl 1A, 1B, 1C, 2A or 2B or with Configuration Support **#9431, #9155, #9165, #9169, #9175** or **#9195**.

Configuration: The following function and attachment specify codes must be selected to support the terminals to be attached to a 3791 mdl 11C, 12A or 12B.

3793 Attachment	**#9011**	Specify that a 3793 is to be attached by ordering quantity. **Maximum:** One. **Prerequisites:** **#9275**.
3277, 3284, 3286, 3287, 3288 Attachment	**#9200**	Specify total number of devices attached by ordering quantity. **Prerequisites:** **#9275**. **Maximum:** 29.
3732,3736 Attach	**#9016**	Specify combined total of 3732s and 3736s by ordering quantity. **Maximum:** 30 if **#9275** is specified ... 16 if **#9275** is not specified.

Support Functions

Functions	Specify	Comment
Line Printer Support	**#9561**	132 print positions.
System Activity	**#9149**	Specify to define concurrent device activity. **Minimum:** One. **Maximum:** 31. **Prerequisites:** **#9275**.
Batch Data Exchange via Diskette	**#9037**	Optional, order only if required. Required for support of user program ing when **#9285** is not specified. **Maximum:** One. **Prerequisites:** **#9275**.
RJE Function	**#9541**	Specify only if required. Cannot be installed if Magnetic Tape Attachment

3791 Controller Mdls 11, 12 (cont'd)

		(#7840) is installed. **Maximum**: One. **Prerequisites**: **#9285** with **#9011** or **#9200**.
Test Site	**#9595**	To designate a 3791 location as a test site for Mandatory Control Code Engineering Changes. **Prerequisites**: **#9285**. **Limitations**: One per network.
Alternate Mailing Address	**#9596**	To designate that an alternate mailing address is available for microcode updates.
Additional User Sessions	**#9345**	Optional, order only if required. Provides 15 additional user sessions. Basic system provides 16 user sessions. **Prerequisites**: **#9275**.
Host Communication	**#9285**	Optional. Required for applications involving host system communications. Required for support of user programming when **#9037** is not specified. **Maximum**: One. **Prerequisites**: **#9275** with #1515, #6301, #6302 or #6303.
Extended Function	**#9275**	Optional. Required for support of automated text, user application programming and 3730-3790 concurrent operations. **Maximum**: One.

SPECIAL FEATURES

Non-Communication Features

Local Channel Attachment (#1515): Provides for direct attachment to any S/370 or 4300 processor* via an integrated byte and/or block multiplexer channel or via a 2870 byte multiplexer or 2880 block multiplexer channel. Maximum distance from the channel is 200 feet. **Limitations**: Cannot be installed with SDLC Communications feature (#6301, #6302 or #6303). **Maximum**: One. **Field Installation**: Yes.

* This feature attaches to only one channel of a multiprocessing system.

Add'l Disk Heads (#3221): Provides additional disk heads to improve performance in certain configurations and for certain applications. **Prerequisites**: **#9275, #9285**. **Maximum**: One additional head on mdl 12A. Two additional heads on mdl 12B. **Limitations**: Cannot be installed on 3791 mdl 11C. **Field Installation**: Yes.

Line Printer, 80 Print Positions (#4710): [155 lpm - 6 lines per 2.54cm (inch)] Provides a line printer with maximum speeds of 155 lpm with 48-character set, 120 lpm with 64-character set, 80 lpm with 96-character set and 40 lpm with 128-character set. Included as standard is one operator-interchangeable print belt (48-, 64-, 96-, or 128-character set). Capability to print on continuous fanfold paper up to 80 print positions on an 20.0cm (8.0 in.) print line with line spacing of 6 lines per 2.54cm (inch). Paper up to six parts plus carbon (maximum total thickness is 0.50mm) can be accommodated. Maximum paper width is 15.0 in. overall. Refer to *Forms Design Reference Guide For Printers* (GA24-3488) for form design considerations. Card stock is not recommended. A form-jam detection capability is provided. Order P/N 1136634 or equivalent for replacement ribbons. **Maximum**: One per 3791. **Field Installation**: Yes. **Specify**: See "Print Belt Character Set" under "Specify" for ordering 48-, 64-, 96- or 128-character sets.

Line Printer, 132 Print Positions (#4711): [155 lpm - 6 lines per 2.54cm (inch)] Provides a line printer with maximum speeds of 155 lpm with 48-character set, 120 lpm with 64-character set, 80 lpm with 96-character set and 40 lpm with 128-character set. Included as standard is one operator interchangeable print belt (48-, 64-, 96-, 128-character set). Capability to print on continuous fanfold paper up to 132 print positions ASCII or EBCDIC character set must be specified on a 33.5cm (13.2 inch) print line with line spacing of 6 lines per 2.54cm (inch). Paper of up to six parts plus carbon (maximum total thickness is 0.50mm or 0.020 in.) can be accommodated. Refer to *Forms Design Reference Guide For Printers* (GA24-3488) for form design considerations. Card stock is not recommended. A form-jam detection capability is provided. Order P/N 1136634 or equivalent for replacement ribbons. **Maximum**: One. **Field Installation**: Yes. **Specify**: See "Print Belt Character Set" under "Specify" for ordering 48-, 64-, 96- or 128-character sets.

Line Printer - 132 Print Positions (410 lpm) (#4715): Provides a higher speed line printer with maximum speeds of 410 lpm with 48-character set, 300 lpm with 64-character set, 230 lpm with 96-character set, and 160 lpm with 128-character set. Included as standard is one operator-interchangeable print belt (48-, 64-, 96- or 128-character set), and a forms stand which is an integral part of this feature. ASCII or EBCDIC character set must be specified. Capability to print on continuous fanfold paper up to 132 print positions on a 33.5cm (13.2 in.) print line with line spacing of 6 lines per 2.54cm (inch) with **#9431**. Paper of up to six parts plus carbon (maximum total thickness is 0.50mm or 0.020 in.) can be accommodated. Refer to *Forms Design Reference Guide For Printers* (GA24-3488) for forms design considerations. Card stock is not recommended. A form-jam detection capability is provided. Order P/N 1299160 or equivalent for replacement ribbons. **Maximum**: One. **Field Installation**: Yes. **Specify**: See "Print Belt Character Set" under "Specify" for ordering 48-, 64-, 96- or 128-character sets.

Security Keylock (#6350): Allows the 3791 to be "powered-on" only with key. Removing the key does not turn power off. For additional or replacement keys, see "Accessories". **Maximum**: One. **Field Installation**: Yes.

Magnetic Tape Attachment (#7840): Provides for the attachment of the 3411 Magnetic Tape and Control Unit mdl 1. Additional tape capacity is provided by attachment of the 3410 mdl 1 via the 3411 Magnetic Tape Unit. The total number of tape units (3410 and 3411) on a 3791 Controller is four. **Maximum**: One. **Field Installation**: Yes. **Prerequisites**: #7003, #3211 or #3221 and **#9171** with **#9275**. **Limitations**: Only 3411 Single Density (#3211) and Dual Density (#3221) are supported by the 3791 Controller. #7840 cannot be installed with the RJE Function (**#9541**).

3793 Attachment (#7901): Allows one 3793 Keyboard-Printer to to be attached to the 3791. See M3793 pages. **Prerequisites**: **#9011**. **Maximum**: One. **Field Installation**: Yes.

Device Attachment Type II, Add'l (#7912): Each feature allows attachment of any combination of up to four additional 3277s and/or 3284s, 3286s, 3287s, 3288s, 3732s, 3736s to be attached to the 3791. (The first four devices can be attached with **#9171** only specified.) **Maximum**: Seven, but restricted to a maximum of 31 devices. **Prerequisites**: **#9016** to attach additional 3732s and 3736s, or **#9016** with **#9200** to attach additional 3277s, 3284s, 3286s, 3287s, 3288s, 3732s and 3736s. **Field Installation**: Yes. **Limitations**: All 3277s and 3732s must have a keyboard. If printer feature #4710, #4711 or #4715 is attached, maximum number of devices is restricted to 30.

Control Storage Increment, Type I-A (#1603): Provides 16,384 positions of additional control storage. **Maximum**: One. **Field Installation**: Yes.

Control Storage Increment, Type II-A (#1613): 16,384 positions of additional control storage. **Maximum**: Two. **Field Installation**: Yes.

Communication Features

EIA Interface (#3701): Provides EIA Interface for the attachment of an IBM or other external modem. **Limitations**: Cannot be installed with the 1200 bps modems (#5500 or #5501). **Maximum**: One. **Field Installation**: Yes. **Prerequisites**: #6301, #6302 or #6303.

Modem, 1200 bps Integrated, Nonswitched (#5500): Provides an integrated modem for communication with the host system over nonswitched lines. No external modem is required. **Limitations**: Cannot be installed with communications features #3701 or #5501 or #6302 or #6303. **Maximum**: One. **Field Installation**: Yes. **Prerequisites**: #6301. **Specify**: **#9651** for 4-wire strapping, or **#9652** for 2-wire strapping .

Modem, 1200 bps Integrated Switched (#5501): Provides an integrated modem with an answering capability for communication from the host system over switched lines via FCC registered protective circuitry of the CBS type or equivalent) provided by the user. The coupling device determines whether the answering capability is manual or automatic. **Prerequisites**: #6301. **Maximum**: One. **Field Installation**: Yes. **Limitations**: Cannot be installed with communications features #3701, #5500, #6302 or #6303.

SDLC Communication Feature With Business Machine Clock (#6301): Required for attachment to communication lines through the 1200 bps Integrated Modem (#5500 or #5501 or, via an EIA Interface (#3701), to any external modem which does not provide its own clocking. Half-speed or 600 bps is attainable with this feature. **Limitations**: Cannot be installed with SDLC features (#6302, #6303) or Local Channel Attachment (#1515). **Maximum**: One. **Field Installation**: Yes.

SDLC Communication Feature Without Business Machine Clock (#6302): Required for attachment to communication lines via an EIA Interface (#3701) and an external modem which provides its own clocking up to 2400 bps with **#9431** or **#9165**, and up to 4800 bps with **#9155, #9175** or **#9195**. **Limitations**: Cannot be installed with SDLC features (#6301, #6303), 1200 bps Modem features (#5500), or Local Channel Attachment (#1515). **Maximum**: One. **Field Installation**: Yes.

SDLC Communication Feature Without Business Machine Clock (#6303): Required for attachment to communication lines via an EIA Interface (#3701) and an external modem which provides its own clocking of up to 9600 bps. **Limitations**: Cannot be installed with communication features #1515, #5500 or #5501 , #6301, #6302. **Maximum**: One. **Field Installation**: Yes.

3791 Controller Mdls 11, 12 (cont'd)

MODEL CONVERSIONS

The following model changes may be field installed:

From/To	11C	12A	12B
1C*	X	X	X
2A*		X	X
2B*			X
11C		X	X
12A			X

* For field conversions of purchase 3791 models 1C, 2A or 2B to models 11C, 12A or 12B, call the 3790 Marketing Center Manager for assistance in planning the model conversion.

Model upgrade requires replacement of disk storage unit. Adequate provision must be made for retaining data contained on disk storage unit and elimination of user-proprietary information.

ACCESSORIES

Forms Stand (#4450): [For 155 lpm Line Printer features #4710 and #4711 only] A 2-shelf forms stand that permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after print. A forms stand is an integral part of the 410 lpm Line Printer feature (#4715). For shipment with machine, order by feature number. . Order via MSORDER (Category = Supplies/ Accessories; Group Code = 31) on AAS.@SS@

Cables: Cables to attach 3790 units may be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of these cables. Coaxial cables, connections, and accessories for the 3277 and 3288 are applicable when these units are attached to the 3790 system. Refer to M3270 pages for part numbers.

Unit	Cable Assm No	Use	Maximum Length	Notes
3791	1832533	Keyboard Printer	48 ft	1
3792	1832533	Keyboard Printer	48 ft	1
	1454167	75 Cond. Cable Bulk		
	1836445 (P/N)	Connector Group		2
3791	2577672	Aux. Control Unit	2000 ft	3
3791	2577672	3760 mdl 1 & 3	2000 ft	3
3791	2577672	3732/3736 (indoor)	2000 ft	
3791	1833108	3732/3736 (outdoor)	2000 ft	

Notes:

1. Communication cable consisting of bulk cable #1454167 and connector group #1836445.
2. Contains connector assemblies for both ends of communication cable.
3. Indoor Cable. For coax wire and connector kit part numbers, refer to M3270 pages.

Locks and Keys: The 3791 with the Security Key Lock (#6350) is shipped with two keys. Additional keys may be purchased only from IBM. A letter of authorization must accompany order and serial number of lock must be indicated.

Print Belt, Add'l: A metal belt with engraved font that permits the customer to obtain more than one character set print belt for various applications. See "Specify" for restrictions and limitations. The belt can be used interchangeably with the one provided on the machine.

	Feature

SUPPLIES

Contact IBM.

3792 AUXILIARY CONTROL UNIT

PURPOSE

Provides for the attachment of up to four 3793 Keyboard Printers, up to two communications lines for 2741 Communication Terminals, and as a feature, a line printer ... see "Special Features". The 3792 can be attached to the 3791 at a distance up to 2,000 feet.

MODELS

Model 1: 001

Limitations: Only one 3792 Line Printer feature (#4712 or #4713) can be attached to a 3790 system. The one printer feature may be on any one of the three 3792 control units attachable to the 3791 controller. If Line Printer (#4712 or #4713) is installed, then the combined total of 2741 lines and 3793s cannot exceed four.

Prerequisites: A 3791 Controller equipped with #7900.

Maximum: Three per 3791 Controller.

HIGHLIGHTS

Up to four 3793 Keyboard Printers and up to two communications lines can be attached to the 3792 as a subcluster to the 3791. The 3792 attaches to the 3791 via Device Attachment Type I (#7900) on the 3791 at a distance of up to 2,000 feet. Buffering, controlling, and checking of input and output data are provided.

Communications Facilities: See M2700 pages.

Modems: (3792/2741 Communications)

Leased Line Adapter (#5400) on the 3792.

Publications: GC20-0370

SPECIFY

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Locking plug -- **#9880** for 115V, **#9884** for 208V, **#9886** for 230V ... non-locking plug -- **#9881** for 115V, **#9885** for 208V, **#9887** for 230V.
- Color: [Available at time of manufacture only] **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray.
- Print Belt Character Set: Specify for 3792 Line Printer (#4712 or #4713). These specify codes are available at time of manufacture only. See "Accessories" if more than one print belt is required.

  48-Character Set **#9071** EBCDIC
  64-Character Set **#9072** EBCDIC
  96-Character Set **#9073** EBCDIC
- Attachment Position on the 3791: **#9110** for first 3792, **#9120** for second 3792, **#9130** for third 3792.

SPECIAL FEATURES

Non-Communication Features:

Control Storage Increment (#1622): Provides an 8,192 byte increment of control storage. Whether additional control storage is to be ordered is dependent upon specify features and the quantities and types of attachments in the 3790 system configuration. See *IBM 3790 Communication System Configuration* (GA27-2768) , for details. **Maximum:** One. **Field Installation:** Yes.

Line Printer - 80 Print Positions 155 lpm Max. (#4712): Provides a line printer with maximum speeds of 155 lpm with 48-character set, 120 lpm with 64-character set, and 80 lpm with 96-character set. Included as standard is one operator-interchangeable print belt (48-, 64-, or 96-character set). Capacility to print on continuous fan fold paper up to 80 print positions on a 20cm (8 inch) print line, 6 lines per 2.54cm (inch). Paper up to six parts plus carbon can be accommodated. Maximum total thickness is 0.50mm (0.020 inches). Maximum paper width is 15 inches overall. Card stock is not recommended. A form-jam detection capability is provided. See "Supplies" for ribbon. **Limitations:** Line printers on the 3791 and 3792 must have the same number of print positions. **Maximum:** One. **Field Installation:** Yes. **Specify:** See "Print Belt Character Set" under "Specify" for ordering 48-, 64-, 96-character sets.

Line Printer - 132 Print Positions 155 lpm Max. (#4713): Provides a line printer with maximum speeds of 155 lpm with 48-character set, 120 lpm with 64-character set, and 80 lpm with 96-character set. Included as standard is one operator-interchangeable print belt (48-, 64-, 96-character set). Capability to print on continuous fan fold paper up to 132 print positions on a 38.1cm (15 inch) print line, 6 lines per 2.54cm (inch). Paper up to six parts plus carbon, can be accommodated. Maximum total thickness is 0.50mm (0.020 inches) Card stock is not recommended. A form-jam detection capability is provided. See "Supplies" for ribbon. **Limitations:** Line printers on the 3791 and 3792 must have the same number of print positions. **Maximum:** One. **Field Installation:** Yes. **Specify:** See "Print Belt Character Set" under Specify for ordering 48-, 64-, 96-character sets.

3793 Attachment (#7901): To attach one 3793 Keyboard Printer to the 3792 ... see M3793 page for details. **Limitations:** If a Line Printer (#4712, #4713) is installed, then the combined total of 2741s and 3793s cannot exceed four. **Maximum:** Four. **Field Installation:** Yes.

Communications Features

Adapter Base (#1021): Provides for the installation of up to two Asynchronous Communications Controls (#1081). **Maximum:** One. **Field Installation:** Yes.

Asynchronous Communications Control (#1081): Provides for the installation of the EIA Interface (#3701) for external modems, or an IBM Leased Line Adapter (#5400) for communications with a 2741. **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** #1021.

EIA Interface (#3701): Provides EIA Interface and cable for the attachment of an IBM or other external modem ... refer to M2700 pages. Other external non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. **Limitations:** Specify codes **#9001** (1st #5400) and **#9004** (2nd #3701) are mutually exclusive. Specify codes **#9002** (2nd #5400) and **#9003** (1st #3701) are mutually exclusive. **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** #1081. The 3792 Communications Support required on the 3791 should specify whether External Modem attached to the 3792 will or will not have auto-answer. See "3792 Communications Support" under "Specify" on 3791 page. **Specify:** **#9003** for first #3701 feature, **#9004** for second feature.

IBM Leased Line Adapter (#5400): Provides a modem for communications with 2741 terminals via point-to-point nonswitched communications lines. **Limitations:** Specify codes **#9001** (1st #5400) and **#9004** (2nd #3701) are mutually exclusive. Specify codes **#9002** (2nd #5400) and **#9003** (1st #3701) are mutually exclusive. **Maximum:** Two. **Field Installation:** Yes. **Prerequisites:** #1081. **Specify:** **#9651** for 4-wire strapping (if Receive Interrupt feature is used by the 2741, 4-wire strapping is required); or **#9652** for 2-wire strapping ... **#9001** for first #5400 feature, **#9002** for second #5400 feature.

Security Keylock (#6350): Allows the 3792 to operate only when the key is in place, removing the key causes operation to stop. For additional or replacement keys, see "Accessories". **Maximum:** One. **Field Installation:** Yes.

ACCESSORIES

Forms Stand (#4450): Permits placement of continuous forms (out of carton) on stand above floor level and provides for stacking after printing. Available on a purchase-only basis. For shipment with machine, order the feature number indicated. This accessory is a two-shelf forms stand.

Locks and Keys: The 3792 with Security Keylock (#6350) is shipped with two keys. Additional keys may be purchased only from IBM. A letter of authorization must accompany the order and serial number of keylock must be included.

Print Belts, Add'l: Permits customer to obtain more than one Character set print belt for various applications.

48-char ASCII **#5811**	48-char EBCDIC **#5821**
64-char ASCII **#5812**	64-char EBCDIC **#5822**
94-char ASCII **#5813**	94-char EBCDIC **#5823**

SUPPLIES

Ribbons: For replacement ribbons on #4712 and #4713 Printers, order P/N 1136634 (or equivalent). Contact IBM.

3793 KEYBOARD-PRINTER

PURPOSE

Provides printed hard-copy and key data-entry facilities as an attachment to the 3791 Controller or the 3792 Auxiliary Control Unit.

MODELS

Model 1 001

HIGHLIGHTS

A modified Selectric® II typewriter terminal oriented to the functions of the 3790 system. The 3793 can be located up to 48 feet from the 3791 or 3792, with the customer responsible for the connecting cable. See the *Installation Planning Manual* for details. **Prerequisites:** One 3793 attachment (#7901, #7902 or #7903) on a 3791 or 3792 per 3793.

Keyboards: Includes an EBCDIC keyboard with operator guidance lights and switches.

Printer: A 15.5 cps printer (6 lines per inch) with friction-feed platen or, optionally, pin-feed platen. A Courier 72 print element (P/N 1167043) is supplied. 3790 programs can provide vertical forms movement and automatic print element positioning.

SPECIFY

- Voltage (115V AC, 1-phase, 60 Hz): **#9881** for non-locking plug.

SPECIAL FEATURES

Power Line Keylock (#5560): A key-operated switch in the power cord. When switch is in the OFF position, no action is possible at the 3793. Two keys are supplied with the feature. See "Accessories" for additional or replacement keys. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS (None)

ACCESSORIES

Locks and Keys: The 3793 Powerline Keylock (#5560) is shipped with two keys. Additional or replacement keys may be purchased from IBM. **Note:** Without Key Identification Number, a new feature (#5560) must be ordered.

Platens, Pinfeed: For feeding of continuous forms that have pre-punched feed holes. On any one machine, one pinfeed platen may be ordered for plant installation in lieu of the standard solid (friction feed) platen. The platen becomes the property of the customer and cannot be returned for credit.

Specify:

1) Feature **#9509**

2) Line spacing and hole-to-hole width: One feature number, depending upon forms width and line spacing, from "Line Spacing" table below. (On the 3793, only six lines per inch is available).

Line Spacing: With **#9509**, one of the following feature numbers must be specified.

Overall Forms Width	Hole-to-Hole Width	Writing Line	Feature Number
5-3/4"	5-1/4"	4-5/8"	**#9151**
6-1/2"	6"	5-3/8"	**#9152**
8"	7-1/2"	6-7/8"	**#9153**
8-1/2"	8"	7-3/8"	**#9154**
9-1/2"	9"	8-3/8"	**#9155**
9-7/8"	9-3/8"	8-3/4"	**#9156**
10-3/8"	9-7/8"	9-1/4"	**#9157**
10-1/2"	10"	9-3/8"	**#9158**
10-5/8"	10-1/8"	9-1/2"	**#9159**
11-3/4"	11-1/4"	10-5/8"	**#9160**
12"	11-1/2"	10-7/8"	**#9161**
13"	12-1/2"	11-7/8"	**#9167**
13-5/8"	13-1/8"	12-1/2"	**#9162**

SUPPLIES

Contact IBM.

3800 PRINTING SUBSYSTEM MDL 1

PURPOSE

The 3800 model 1 is the printer output unit for S/370 models 145, 145-3, 148, 155-II, 158, 165-II, 168, 3031, 3032, 3033, 3081, 3083, 3084 and 4300 Processor. A feature allows data input from magnetic tape without printer output unit attachment to a system.

MODELS

Model 1 001

HIGHLIGHTS

Prints on single part continuous forms providing 50 discrete paper sizes . Printing is repeated for multiple copies, and every copy is of "original" quality.

PRINT SPEED RANGE:

Common Use Option

Forms Length Inches	Forms Per Min. Up to:	Lines Per Minute* 6 lpi Up to:	8 lpi Up to:	12 lpi Up to:
3-1/2	526	7,890	10,520	15,780
5-1/2	334	9,018	12,024	18,036
7	263	9,468	12,624	18,936
8-1/2	215	9,675	12,900	19,350
11	167	10,020	13,360	20,040

* Single Copy Speeds

Printer job throughput can vary depending upon form length, number of copies needed, and functions exercised.

52K-byte storage is standard for page buffering. Storage is reduced to 42K when data input is from magnetic tape in lieu of system.

Pitches: 10, 12 and 15 characters per inch (cpi) are standard.

Print Line Maximums: of 136 positions at 10 cpi, 163 positions at 12 cpi, 204 positions at 15 cpi ... pitches (10, 12 and 15 cpi) can be intermixed within a page or line ... vertical line spacings are 6, 8, and 12 lines per inch, with intermixed line spacing within a page being possible.

STANDARD CHARACTER SETS:

Character Style	Pitch (cpi) 10	12	15	Special Under-scored
Gothic	X	X	X	Yes
Gothic 15 Condensed			X	Yes
Text 1 (Upper Case)	X			Yes
Text 2 (Lower Case)	X			Yes
OCR A	X			
OCR B	X			
Format	X	X	X	
Katakana	X	X		

Note: Includes all standard World Trade National Use Graphics.

Character sets are organized into blocks of up to 64 characters and are held in subsystem read-only storage.

The 3800 Printing Subsystem has electronic character generation using Writable Character Generation Storage--128 Writable Character Generation Storage positions are standard and organized into two 64-character Writable Character Generation Modules (WCGM) ... character sets are program-selected without operator intervention and dynamically loaded into hardware WCGMs -- when operating offline under control of Tape-to-Printing Subsystem (#7810), character sets are loaded into read only storage (WCGM's) by the operator through the operator panel, or by the 3800 control file tape which is an output of the Utility Program Product, 5748-UT2. Customer designed characters require use of the Utility Program. ... an additional increment of 127 Writable Character Generation Storage positions (optional) provides dynamic storage for printing four character styles and/or pitches with one data set -- this represents up to 255 graphics online with no throughput loss ... dynamic storage allows character substitution under program control; a customer may design his/her own characters ... When operating under control of #7810, customer-designed characters require use of Utility Program Product 5748-UT2 .

By using the new maximum print size of 204 positions, Gothic 15 style reports (15 characters/inch at 8 lines/inch) can be reduced from 11 x 14-7/8 inches to the more convenient size of 8-1/2 x 11 inches thereby increasing throughput while reducing both forms costs and filing space requirements. The application of 12 lpi vertical spacing with the Gothic 15 Condensed character set can result in a further reduction in paper volume of up to about 30% beyond the savings projected in reducing page sizes by applying the 15 pitch character set at 8 lpi.

Optical Character Recognition (OCR): Printing alphameric OCR A and the less stylized OCR B fonts can be intermixed with non-OCR fonts with no reduction in printing throughput. Documents may be processed by the 1287, 1288 and 3886 Optical Character Readers. Refer to the appropriate sales manual pages for specific capabilities.

Note: The OCR characters are designed to be representative of (but not always identical to) the mean character (shape) centerline described in the "United States of America Standard Character Set for Optical Character Recognition, size A, USAS X3.17-1966" for OCR-A font (also referred to as ANSCS OCR) and the "European Computer Manufacturers Association's Standard ECMA-11 for Alphanumeric Character Set OCR-B for Optical Recognition 2nd Edition, October 1971" for OCR-B font.

Text Character Set: Uses upper and lower case characters, serif design, special graphics, with no reduction in throughput.

Format: Is in 10, 12 and 15 pitch, with merge format and data, and is program-controlled. Format 10, 12, and 15 pitch - merge format and data - program controlled for on-line operation, for off-line with feature #7810 format character sets require Utility Program Product 5748-UT2.

Copy Modification Function: Identifies copies with legends, phrases or names (e.g., "Customer Copy", "For Accounting Use Only", etc.), addresses each report copy to speed distribution, spots carbon or field blockout functions, is identification and deletion program controlled; has customized forms with the identification, deletion and formatting functions. When operating under control of #7810, Copy Modification Function requires use of Utility Program Product 5748-UT2.

Forms Overlay: Optical image system prints high quality document and report formats, designs or other constant data, merge format and data, and is program controlled. When operating under control of #7810, overlay is invoked from the operators panel or by the Utility Program Product 5748-UT2.

Single Part Continuous Form Output: Includes custom print forms, and features no deleaving, no carbon disposal, faster turnaround, program control of copy quantity, with up to 255 copies. Job separation is by perforation marking use Mark Form function.

Optional Burster-Trimmer-Stacker Output: Burster/trimmer bottlenecks eliminated ... offset separation between data set copies ... removal of output while running ... first-in, first-out job sequence ... trimmed edges.

Optional Channel Switching: Manual switches provide system configuration flexibility through the use of the 2914 Manual Switch mdl 1 (RPQ 880882) or the Two Channel Switch feature (#8170), automatic switching is provided by the Dynamic Two Channel Switch feature (#8171) for two processors in a tightly coupled MP configuration, and two channels on a single processor providing alternate path capability.

Laser Safety: The 3800 contains a laser assembly. In IBM's opinion, the 3800, including the laser assembly, is designed to comply with the safety standards of the U.S. Department of Health, Education and Welfare (21 CFR 1040). Separate registrations by the customer may be required by some states.

Limitation: Prints on discrete form sizes in either of two standards. Common Use Standard utilizes five forms depths (3-1/2, 5-1/2, 7, 8-1/2 and 11 inches) and ten forms widths (measured edge to edge: 6-1/2, 8-1/2, 9-1/2, 9-7/8, 10-5/8, 11, 12, 13-5/8, 14.3 and, 14-7/8 inches) which permute to 50 discrete sizes. Forms are refolded into lengths of 7 (2 x 3-1/2), 8-1/2, and 11 inches (2 x 5-1/2).

Character and forms overlay printing are restricted from the first and last half inches of forms lengths. A printed line can begin a minimum of 0.5 inches from the left page edge and must end no nearer than 0.8 inches from the right-side edge of the paper for all widths except the 14-7/8 inch width for which the printed lines must end at least 0.675 inches from the right.

Paper must be from 15 lb (56.4 g/m^2) to 24 lb (90.2 g/m^2) basic weight except for OCR for which the minimum paper weight is 20 lb (75.3 g/m^2). See GA26-1633-0 for details of weight and other forms considerations. Left-hand side of form is a fixed location in the machine, and print line adjustment is made by electronically moving the line. First print positions can move to the right 5.7 inches but will cause an equivalent number of positions at the right end to be moved beyond the above-defined print line boundaries.

It is recommended that printing not occur within 0.100 inches of any binder holes or corner cuts within the form.

Prerequisites: A control unit position on a system channel and/or Tape-to-Printing Subsystem Feature (#7810).

S/370 mdl 145 (excluding 3145-3) -- byte multiplexer channel (standard), selector channels (first one is standard), block multiplexer channels (special features) ... see M3145 pages. Attachment to the byte multiplexer channel is not recommended. Selector channel attachment is not recommended unless dedicated.

S/370 mdl 145-3, 148 -- byte multiplexer channel (standard), block multiplexer channels ... see M3145-3, 3148 pages. Attachment to the byte multiplexer channel is not recommended.

S/370 mdl 155II, 158 -- byte multiplexer channel (standard), 2nd byte multiplexer channel (special feature), block multiplexer channels (first two are standard) ... see M3155, 3158, 3158-3 pages.

3800 Printing Subsystem Mdl 1 (cont'd)

S/370 mdl 165II, 168 -- Selector channel of 2860, basic multiplexer channel of 2870, selector subchannel (special feature) of 2870, shared or non-shared subchannel of 2880 ... see M2860, 2870, 2880 pages. Selector channel attachment is not recommended unless dedicated.

3031 or 3032 Processor -- byte multiplexer channel (one is standard), block multiplexer channels (five are standard) ... see M3031, 3032 pages.

3033 Processor -- byte multiplexer channels (two are standard), block multiplexer channels (ten are standard) ... see M3033 pages.

3081, 3083, 3084 Processor -- byte multiplexer channels, block multiplexer channels ... see M3081, 3083, 3084 pages. Attachment to a byte multiplexer mode channel is not recommended.

4300 Processor -- byte multiplexer channel, block multiplexer channel. Attachment to the byte multiplexer is not recommended.

Tape-to-Printing Subsystem (#7810) -- in lieu of or in addition to system channel attachments above ... see "Special Features".

SPECIFY

- Voltage: (AC, 3-phase, 4 wire, 60 Hz): **#9903** for 208V or **#9905** for 230V ... must be consistent with system voltage.
- Color (for end cover only; machine is cloud white):

  Blue **#9043** Red **#9041**
  Gray **#9045** Yellow **#9042**

- Tool Kit:

  For rental customer, select one:

  - First 3800 (mdl 1 or 3) ordered, specify **#9330** when ordering a mdl 1.
  - If unit ordered is second or higher 3800 mdl 1 or 3 to be installed, no additional tool kit is required.
  - If required for a multiple machine installation because of physical locations of machines, an additional tool kit(s) is available on a no-charge MES. (See 3800-3 pages if a mdl is at the alternate location.)

  For purchase customer, select one:

  - For each new purchase 3800 mdl 1, specify **#9330.**
  - When installed 3800 mdl 1s are purchased, a tool kit **(#9330)** is to be ordered on a no-charge MES for each machine.

  Note: A Tool Kit **(#9220)** is required with Burster-Trimmer-Stacker (#1490) ... see #1490 below.

SPECIAL FEATURES

Burster-Trimmer-Stacker (#1490): Provides an additional output stacking mode. Bursts the five forms lengths to individual sheets and stacks sheets sequentially. It also trims the left and right 12.7mm (0.5 inch) carrier strips from output sheet. **Maximum:** One. **Field Installation:** Yes. **Specify:** One tool kit.

For rental customer -- specify **#9220** for first Burster-Trimmer-Stacker feature ordered for a customer. If required for a multiple machine installation because of physical machine locations, an additional tool kit(s) is available on a no-charge MES.

For purchase -- specify **#9220** on each Burster-Trimmer-Stacker feature order. When installed Burster-Trimmer-Stackers are purchased, a tool kit is to be ordered on a no-charge MES for each feature.

127 Writable Character Generation Storage Positions, Add'l (#5401): Additional increment of 127 positions allows up to 255 graphics to be printed within a data set. **Maximum:** One. **Field Installation:** Yes.

Tape-To-Printing Subsystem Feature (#7810): Allows the 3800 to be operated from magnetic tape data. Either 3411/3410 or 3803/3420 tape systems may be attached. With the feature installed, the 3800 may be operated either offline under operator control or online. Up to eight tape control units may be attached provided that power sequencing and control connection for all other than one are provided by a system; and provided that all 3803 control units have at least one path, which may be switchable, to a S/360, S/370 or 4300 processor. This feature will accept the non-IBM system print tape formats described below. **Burroughs:** B7000/B6000 Print Backup Tapes. For further detail refer the customer to:

B7000/B6000 Series System Software Operational Guide Volume 1 (Form #5001563), Section 1 (Backup)

Tape files must be 7- or 9- track, EBCDIC coding, and ANSI (USASI) standard tape labels and data formats. For further detail refer the customer to *B7000/B6000 Series I/O System Reference Manual* (form #5001779).

For definition of line printer control words, refer the customer to: *Burroughs B6700 Handbook*, (form #5000276).

Honeywell: Series 60 (level 66/6000) Bulk Media Conversion program formats and Standard System formats that have the following characteristics:

- Variable length records
- Binary or BCD mode
- 7- or 9- track
- Standard labeled or non-labeled
- Low or high density
- Standard printer commands with or without edit characters

For further details refer the customer to the following Honeywell publications:

DD11 Bulk Media Conversion
DD07 File and Record Control
DB82A I/O Programming

Sperry Univac: 1100 series systems System Data Format (SDF) Symbiont print tape. For further detail refer the customer to:

Sperry Univac 1100 Series Executive System Volume 3 System Processors (form #4144.3).

Tape files may be 7- or 9- track, Field Data or ASCII

For further description of tape labels and file format and definition of line printer control functions refer the customer to:

Sperry Univac 1100 Series Executive System Volume 2 EXEC (form #4144.2).

Limitations: Selection of the non-IBM system tape format to be used must be made by the operator before printing.

Where more than one print character is represented by one 8-bit byte (data packing) on the non-IBM system print tape, applications using character densities above 8160 characters per 11 inch page may impact 3800 overall throughput and must be evaluated.

When using non-IBM system print tape formats, control tapes produced by IBM 3800 Tape-to-Printing Subsystem Feature Utility (Program Product 5748-UT2) are supported only with an IBM record format of VBM (variable length block machine language) with standard IBM labels or no labels.

Maximum: One: **Field Installation:** Yes.

Channel Attachment Features, or Tape-to-Printing Subsystem feature #7810 in lieu of or in addition to channel attachment.

Remote Switch Attachment (#6148): To attach the Two-Channel Switch (#8170) to a configuration control panel. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #8170.

Two-Channel Switch (#8170): To attach the 3800 to two S/370 or 4300 processor channels which may be on the same processor or on two different processors (both interfaces must have the same device address). The Two-Channel Switch will allow operation on only one channel at a time. Selection of the channel which is to be operable is by means of manual switches on the control panel. **Maximum:** One. **Field Installation:** Yes.

Dynamic Two Channel Switch (#8171): Provides the additional capability of an automatic two-channel switch. The switch is designed to furnish symmetric two-processor support for tightly coupled multiprocessor systems, and to be attached to two channels from a single processor in order to provide alternate path capability. For either tightly coupled multiprocessor or single processor attachments, data transfer occurs on only one channel path at a time. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #8170.

MODEL CONVERSIONS

A purchased 3800 model 1 can be field converted to a 3800 model 3 by MES ... see 3800 model 3 pages.

ACCESSORIES (None)

SUPPLIES

Contact IBM.

3800 PRINTING SUBSYSTEM MDL 3

PURPOSE

Printer output unit for S/370 models 158, 168, and the 3031, 3032, 3033, 3081, 3083, 3084, 4341, 4361 and 4381 Processors.

Note: Operating System support for the mdl 3 is provided only under MVS/SP Version 1.

MODELS

Model 3 003

Prerequisites: A control unit position on a system channel is required.

Note: The mdl 3 does not provide for attachment to a byte multiplexer channel.

S/370 mdl 158: Block multiplexer channels (first two are standard). The mdl 158-1 requires EC 278240 to operate with the 3800 mdl 3. The mdl 158-3 requires EC 278249 to operate with the 3800 mdl 3. the use of short cables (under 70 feet in length) between the processor and the 3800-3 may cause overruns, contact your local Field Engineering installation planning representative ... see M3158-1, 3158-3 pages.

S/370 mdl 168: Selector channel of 2860, selector subchannel (special feature) of 2870, shared or non-shared subchannel of 2880 ... see M2860, 2870, 2880 pages. Selector channel attachment is not recommended unless dedicated to the printer ... see M3168 pages.

3031 or 3032 Processor: Block multiplexer channels (five are standard) ... the 3031 and 3032 require EC 279679 to operate with the 3800 Mdl 3 ... the use of short cables (under 70 feet in length) between the processor and the 3800-3 may cause overruns, contact your local Field Engineering installation planning representative ... see M3031 and 3032 pages.

3033 Processor: On mdls U, A, and M block multiplexer channels (ten are standard); on Mdl Group N block multiplexer channels (five are standard, five are optional); on Mdl Group S block multiplexer channel (five are standard) ... the 3033 requires EC 279679 to operate with the 3800 mdl 3 ... the use of short cables (under 70 feet in length) between the processor and the 3800-3 may cause overruns, contact your local Field Engineering installation planning representative ... see M3033 pages.

3081 Processor: Block multiplexer channels (up to 24 possible, 20 if 4 byte multiplexer channels are installed) ... the 3081 requires system EC 213971 (including microcode EC 214788) to operate with the 3800 mdl 3 ... see M3081 pages.

3083 Processor: Block multiplexer channels (up to 24 possible, 20 if 4 byte multiplexer channels are installed) ... see M3083 pages.

3084 Processor: Block multiplexer channels (up to 24 possible per side, 20 if 4 byte multiplexer channels are installed) ... see M3084 pages.

4300 Processor: Block multiplexer channel ... see M4341, 4361, 4381 pages.

HIGHLIGHTS

The 3800 mdl 3 offers new printing functions and improved print density with 240x240 picture elements (pels) per square inch, a 2.2 times improvement over the 3800 mdl 1. There are two modes of operation - Compatibility mode which prints 3800 mdl 1 applications with a minimum of change to the application - and "all-points-addressable" mode which prints complex pages for image, text, graphics, and system printing applications. All-points-addressable mode is also called Page mode.

The mdl 3 prints on single part continuous forms providing 50 discrete paper sizes. Printing is repeated for multiple copies and every copy is "original" quality.

Printing throughput can vary depending on form length, number of copies needed, and functions exercised. Throughput of up to 20,040 lines per minute can be achieved -- see accompanying table.

Print Speed Range: The following speeds apply to the 3800 mdl 3 in Compatibility mode. The number of characters per line depends upon the form width being used. The speeds shown for 12 lpi are applicable when a maximum of 190 characters, including blanks, are printed on each line.

Common Use Option

Forms	Forms	Lines Per Minute *			
Length (inches)	Per Min. Up To:	6 lpi Up to:	8 lpi Up to:	10 lpi Up to:	12 lpi Up to:
3-1/2	526	7,890	10,520	13,150	15,780
5-1/2	334	9,018	12,024	15,030	18,036
7	263	9,468	12,624	15,780	18,936
8-1/2	215	9,675	12,900	16,125	19,350
11	167	10,020	13,360	16,700	20,040

* Single copy speeds

Compatibility Mode: When operating in Compatibiiity mode the mdl 3 can perform the functions of the 3800 mdl 1, plus print at 10 lines per inch. This provides for easy migration of 3800 mdl 1 applications.

Note: The mdl 3 does not have a Tape-to-Printing Subsystem feature which is available for the 3800 mdl 1.

In Compatibility Mode the 3800 mdl 1 electronic character generation is emulated, providing 255 WCGM storage positions, organized in four 64-character Writeable Character Generation Modules (WCGM). Character sets are program selected without operator intervention and dynamically loaded into hardware WCGMs. Dynamic storage allows character substitution under program control. Customers may design their own characters. The following standard 3800 mdl 1 character sets are provided with Data Facility Device Support Release 1.6 for 240x240 pel printing:

Character Sets Standard

Character Style	Pitch (cpi) 10	12	15	Special Underscored
Gothic	X	X	X	Yes
Gothic 15 Condensed	X			Yes
Text 1 (Upper Case)	X			Yes
Text 2 (Lower Case)	X			Yes
OCR A	X			
OCR B	X			
Format	X	X	X	
Katakana	X	X	X	

The sixteen "fonts" provided with Document Composition Facility (5748-XX9), Release 2, are also provided in 240x240 pel form. Twenty-three fonts from the 6670 have been prepared for use with the 3800 mdl 3 in Compatibility mode. These characters were originally designed for 240x240 pel printing.

Customers can convert existing customer-created 3800 mdl 1 character sets or create new characters in the 240x240 pel density -- see Character Conversion Aid announcement letter.

All-Points-Addressable Mode: This mode is not supported by IBM software.

New printer commands provide the following functions: Characters can be positioned at any defined point on the printable area of the page. Alphameric text can be generated in three orientations (one horizontal and two vertical). Proportional-spaced and fixed-space fonts ranging in size from 4 to 36 "points" can be printed. (A "point" is 1/72 inch and is a measure of character size. This should not be confused with a printable raster point, also called a pel.)

With the base machine multiple fonts can be mixed within one data set. The number of fonts which can be present in the base machine depends upon the character size and the number of characters in the font. Fonts can be loaded from the host into the printer and stored on the internal diskette (with user provided programming) or in raster pattern storage.

Solid and dashed lines can be generated horizontally and vertically from any defined point in the printable area of the page for any specified length as long as the line remains within the printable area of the page.

Raster images of logos, signatures, drawings and photographs up to full-page size can be printed. The images are printed in raster form of 240x240 dots per square inch. Images in raster form of 120x120 dots per square inch are accepted. For these the printer generates four dots for each one indicated, producing a facsimile the same size as the original. The Accumulator feature (#1010) is required for images larger than those which can be held in the raster pattern storage where the image size depends on the raster pattern storage installed and the amount required for fonts. (Images cannot be printed in compatibility mode.)

Quality considerations in the printing of images are similar to those for printing a forms overlay, e.g., line widths and large dark areas. These guidelines and restrictions are presented in the *Forms Design Reference Guide for the IBM 3800 Printing Subsystem,* GA26-1633.

A major extension has been made to provide "electronic overlay generation". The new capabilities allow a form to be printed from a sequence of printer commands which print lines (creating boxes), constant alphameric text, shaded areas, and images for signatures, logos, etc. This information (the electronic overlay) is merged by the printer with the variable data for a given page and printed. This capability will allow many custom forms of different sizes to be printed on blank paper.

Multiple electronic overlays can be held in the base printer and used on demand within one application. The maximum addressable number is 127. The maximum for an application will depend on the complexity of the electronic overlay and the demands made by the application on the control storage. Up to eight electronic overlays can be merged onto a

3800 Printing Subsystem Mdl 3 (cont'd)

single page. (Dependent upon the complexity, throughput may be impacted.)

Storage: A control storage of 512K bytes is provided in the base printer. This provides storage for the microcode, page buffers, tables associated with character fonts, etc. ... a raster pattern storage with 256K bytes is provided in the base machine for multiple character sets and for limited storage of image data. Up to 512K bytes total is available by an incremental feature of 256K bytes. Fonts are stored in raster pattern storage and the amount of storage required is a function of the character size and the number of characters in the font. A font can have a maximum of 256 characters. ... An Accumulator feature (#1010) may be added. It allows more complex pages to be created for printing. The first increment is 768K bytes with one additional increment of 256K bytes, for a total of 1,024K bytes.

ADDITIONAL HIGHLIGHTS

(Note: Some of the following highlights apply to the mdl 3 only when operating in compatibility mode and are so indicated.)

Gothic 15: (15 characters/inch at 8 or 10 lines/inch) - 11" x 14-7/8" reports can be reduced to 8-1/2" x 11" ... convenient size ... increased throughput, reduced forms cost, reduced filing space by using the maximum print span of 204 positions. The application of 12 lpi vertical spacing with the Gothic 15 Condensed character set can result in a reduction in paper volume of up to about 30% beyond the savings projected in reducing page sizes by applying the 15 pitch character set at 8 lpi.

Optical Character Recognition (OCR) Printing: Alphameric OCR A and the less stylized OCR B fonts can be intermixed with non-OCR fonts with no reduction in printing throughput. Documents may be processed by the 1287, 1288, 3762 and 3886 Optical Character Readers. Refer to the appropriate pages for specific capabilities.

Note: The OCR-A characters are designed to be representative of (but not always identical to) the mean character (shape) centerline described in the *United States of America Standard Character Set for Optical Character Recognition, Size A, USAS X3.17-1977*. The OCR-B characters are designed to be representative of (but not always identical to) the mean character (shape) centerline described in the *United States of America Standard Character Set for Optical Character Recognition, Size B, USAS X3.17-1975* and the *European Computer Manufacturers Association's Standard ECMA-11 for Alphanumeric Character Set OCR-B for Optical Recognition,* (EMCA 11-1975).

Text Character Set: Upper and lower case characters with serifs ... special graphics ... no reduction in throughput. **Note:** The mdl 3 has extensive text capabilities in the all-points-addressable mode plus the availability of some 6670 fonts which can be used in compatibility mode.

Format 10, 12 and 15 Pitch: Merge format and data ... program controlled for online operation (compatibility mode only).

Copy Modification Function (Compatibility mode only): Identify copies with legends, phrases, or names (e.g., Customer Copy, For Accounting Purposes Only, etc.) ... address each report copy to speed distribution ... spot carbon or field blockout functions ... identification and deletion program controlled. Provides customized forms with the identification, deletion and formatting functions.

Forms Overlay (both modes): Optical image system ... prints high quality document and report formats, designs or other constant data ... merge format and data ... program controlled.

Single Part Continuous Form Output: Including custom printed forms ... no deleaving ... no carbon disposal ... faster job separation making use of the Mark Form function.

Optional Burster-Trimmer-Stacker Output: Eliminates bursting and deleaving bottlenecks ... offset separation between data set copies ... remove output while printing ... first-in, first-out job sequence ... trimmed edges.

Optional Channel Switching: Manual switches provide system configuration flexibility through the use of the 3814 Switching Management System, or the 2914 Manual Switch mdl 1 (RPQ 880882), or the Two-Channel Switch (#8180) ... automatic switching is provided by the Dynamic Two-Channel Switch (#8181) for two processors in a tightly coupled multiprocessing configuration, and two channels on a single CPU providing alternate path capability.

Laser Safety: The 3800 contains a laser assembly. In IBM's opinion, the 3800, including the laser assembly, is designed to comply with the safety standards of the United States Department of Health, Education and Welfare (21 CFR 1040). Separate registrations by the customer may be required by some states.

Forms: Prints on discrete form sizes. Utilizes five form depths: 3-1/2", 5-1/2", 7", 8-1/2" and 11" ... ten form widths measured edge to edge: 6-1/2", 8-1/2", 9-1/2", 9-7/8", 10-5/8", 11", 12", 12-5/8", 14.3", 14-7/8" which permutes to 50 discrete sizes. Forms are refolded in 7" (2 x 3-1/2), 8-1/2" and 11" (2 x 5-1/2) in lengths.

Character and forms overlay printing are restricted from first and last 0.5 inch of forms length. A printed line can begin a minimum of 0.5 inch from the left paper edge and cannot exceed a length to position a character nearer than 0.5 inch from the right paper edge for all widths except 14-7/8" in compatibility mode where the stated dimension is 0.775 inch from the right.

Paper must be from 15 lb to 24 lb basis weight. See *Forms Design Reference Guide for the IBM 3800 Printing Subsystem,* (GA26-1633) for details of weight and other forms considerations. Left-hand side of form is a fixed location in the machine, print line adjustment is by electronically moving the line. First print position can move to the right 5.7 inches (compatibility mode only) but will cause an equivalent number of positions at the right end to be moved beyond the above defined print line boundaries. It is recommended that printing not occur within 0.100 inches of any binder holes or corner cuts within the form.

Publications: GA32-0049, GA32-0050, SH35-0051, GA26-1633, GC20-0001.

SPECIFY

- Voltage (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V, or **#9915** for 240V. Note: 240V AC is compatible with 230V AC systems.
- Color (for end cover only, machine color is cloud white): **#9041** for red, **#9042** for yellow, **#9043** for blue, or **#9045** for gray.
- Tool Kit: For rental or Term Lease (ICC) customer, select one:
  1. First 3800 mdl 1 or 3 ordered, specify **#9330** when ordering a mdl 3.
  2. If unit ordered is second or higher 3800 mdl 3 to be installed, no additional tool kit is required.
  3. If a 3800 mdl 1 is installed and a mdl 3 is ordered to supplement or replace the mdl 1, specify **#9331** (Special Tool Group) which will bring the existing tool kit up to the level required for the mdl 3.
  4. If 3800 mdl 1 is being field converted to a mdl 3, specify **#9331** (Special Tool Group) which will bring the existing tool kit up to the level required for the mdl 3.
  5. If required for a multiple machine installation, because of physical machine locations, an additional tool kit(s) is available on a no-charge MES.

  For purchase customer, select one:

  1. For each new purchase 3800 mdl 3, specify **#9330**.
  2. When rental 3800 mdl 3s are purchased, a tool kit **(#9330)** is to be ordered on a no-charge MES for each machine.
  3. When a purchased mdl 1 is being field converted to a mdl 3, specify **#9331** (Special Tool Group) which will bring the existing tool kit up to the level required for the mdl 3.

  Note: A Tool Kit **(#9220)** is required with Burster-Trimmer-Stacker (#1490) ... see #1490 below.

SPECIAL FEATURES

Accumulator (#1010): The accumulator is used to generate complex pages that require more fonts than can be held in raster pattern storage. The page can be viewed as having been created in layers (each layer associated with a set of fonts or images). The layers are "accumulated" until the complex page is complete. Images which are too large for raster pattern storage are placed in the accumulator for printing. This feature provides 768K bytes of storage which will hold data for up to 106 square inches of image. **Maximum:** One. **Field Installation:** Yes.

Accumulator Expansion (#1021): This feature adds 256K bytes of storage to the Accumulator (#1010) for a total of 1024K bytes which will hold data for up to 142 square inches of image. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1010. .

Burster-Trimmer-Stacker (#1490): Provides an additional output stacking method. Bursts the five forms lengths to individual sheets and stacks sheets sequentially. Also trims left and right 0.5 inch carrier strip from output sheet. **Maximum:** One. **Field Installation:** Yes. **Prerequisites: #9220.** For rental customer -- specify **#9220** for first Burster-Trimmer-Stacker feature ordered for a customer. If required for a multiple machine installation because of physical machine locations, an additional tool kit(s) is available on a no-charge MES. For purchase customer -- specify **#9220** on each Burster-Trimmer-Stacker feature order. When installed Burster-Trimmer-Stackers are purchased, a tool kit is to be ordered on a no-charge MES for each feature.

Raster Pattern Storage, Add'l (#5410): Base machine comes with 256K bytes, storage maximum is 512K bytes in one additional storage increment of 256K bytes. Provides font storage for multiple character sets and can be used to hold small images. **Maximum:** One. **Field Installation:** Yes.

3800 Printing Subsystem Mdl 3 (cont'd)

Remote Switch Attachment (#6158): To attach the Two-Channel Switch (#8180) to a configuration control panel. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #8180.

Two-Channel Switch (#8180): To attach the 3800 to two S/370, 30XX, or 4300 Processor channels which may be on the same CPU or on two different CPUs. The two interfaces can have different addresses. The two-channel switch will allow operation on only one channel at a time. Selection of the channel which is to be operable is by means of manual switches on the control panel. **Maximum:** One. **Field Installation:** Yes.

Dynamic Two-Channel Switch (#8181): Provides the additional capability of an automatic two-channel switch. The switch is designed to furnish symmetric two-processor support for tightly coupled multiprocessor systems and to attach to two channels from a single CPU to provide alternate path capability. For either tightly coupled multiprocessors or single CPU attachments, data transfer occurs only one channel path at a time. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #8180.

MODEL CONVERSION

3800 model 1s which are purchased or under an ICC Term Lease can be converted to a model 3 by MES. Conversion from a 3800 model 3 to a 3800 model 1 is not available.

ACCESSORIES (None)

SUPPLIES

Contact IBM.

3803 TAPE CONTROL MDL 1

PURPOSE

Control unit for 3420 Magnetic Tape Units models 3, 5, 7 for S/370 (except models 115 and 125) and 4300 processors.

MODELS

Model 1 001

Limitations: Attachable to all S/370 and 4300 processors except S/370 mdl 115 and 125. S/370 mdl 135, 135-3 and 138 are not supported on byte multiplexer channel for concurrent operation with Integrated File Adapter, Integrated Communications Adapter, Selector Channel on 3135-3, 3138.

Attachable to 4300 processors. For considerations, see *4331 Channel Characteristics,* GA33-1527 (Mdl Group 1), GA33-1535 (Mdl Group 2), GA33-1550 (Mdl Group 11) or GA33-1567 (4361). **Note:** 3803 cannot be attached to a byte multiplexer channel on the 4341 Processor.

3420 mdls 4, 6 or 8 cannot be addressed through a 3803 mdl 1.

Prerequisites: A control unit position on a S/370 or 4300 processor channel or Tape-to-printing Subsystem feature (#7810) on a 3800 Printing Subsystem. When used with a 3800 with feature #7810, at least one path, which may be switchable, must be provided to a S/370 or 4300 processor. When multiple control units (up to eight are allowable) are connected to a 3800, all other than one must have power sequencing and control connection provided by a system.

For S/360 mdl 30: If the 3803 Tape Control is attached to the 2030 Selector Channel via the 1400 Magnetic Tape Compatibility feature (#4468), the 3420/1400 Compatibility (**#9750**) is required on the 2030.

HIGHLIGHTS

Single channel control for up to eight 3420 tape units. Through special switching features, up to 16 tape drives can be addressed through any of four 3803 control units. Features are offered to provide performance at 556 and 800 bpi in the 7-track NRZI format or at 800 bpi in the 9-track NRZI format or at 1600 bpi phase encoded.

The following table indicates feature numbers for corresponding functions:

Subsystem Function	Feature Name	3420 Tape Unit	3803 Control Unit
1600 bpi PE 9-track only	Single Density	#6631	#9570
1600 bpi PE/800 bpi NRZI 9-track	Dual Density	#3550	#3551
1600 bpi PE/800 bpi NRZI 7-track	Seven-track	#6407*	#6408

* Tape unit will only read or write 7-track tape.

Publications: S/370 -- GC20-0001

SPECIFY

- Voltage (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V or **#9905** for 230V ... must be consistent with system voltage
- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, **#9046** for white.
- Tape Type: Either Dual Density (#3551) or Seven-track (#6408) must be ordered unless Single Density (**#9570**)is specified. Only one of the three features may be installed.
- Tape Switching: If a tape switching configuration is being ordered, the 3803 must be equipped with a Communicator 1-2, **#9071**, for a control unit with the 2-control Switch (#1792), 3-control Switch (#1793), or 4-control Switch (#1794). Communicator 3-4 (**#9073**) for a control unit included in a 3x16 or 4x16 switching configuration which does not have features #1792, #1793 or #1794. If a Communicator feature is ordered for a 3803 without a switching feature, no tape units can be attached to that control unit. See "Tape Switching".

SPECIAL FEATURES

Dual Density (#3551): Provides for attachment of tape units equipped with Dual Density (#3550) to read and write tapes at either 1600 bpi PE or 800 bpi NRZI 9-track. Tape units equipped with Single Density (#6631) can also be attached. **Limitations:** Cannot be installed in the same control unit with either Single Density (**#9570**) or Seven-track (#6408). **Field Installation:** Yes.

Remote Switch Attachment (#6148): Provides for remote operation of the Two-channel Switch (#8100) on the 3803 mdl 1 from a remote console such as the configuration control panel (3058 or 3068) for a S/370 mdl 158MP or 168MP. Operation of the switch on the remote console will result in the same function as operation of the 3803 switch. The 3803 switches will be functionally inoperative when this feature is installed. The cable to the remote console is not provided by this feature. The cable used must contain three wires for each Enable/Disable switch to be installed. Each line must have a total loop resistance of less than 75 ohms when the remote switch completes the path. For operation with the 2925 mdl 10, 3058 or 3068, cable P/N 5351178 is required and should be ordered on a separate MES. **Field Installation:** Yes.

Seven-track (#6408): Provides for attachment of tape units equipped with Seven-track (#6407) to read and write tapes at either 556 or 800 bpi in the 7-track format compatible with tapes written by 729, 7330, 7335, and 2400 series tape units equipped with 7-track read/write heads. Includes the translator function which, when used, causes 8-bit bytes from the I/O interface to be written on tape as 6-bit BCD characters and 6-bit BCD characters read from tape to be translated into their EBCDIC equivalents. The Data Conversion function, also included, allows reading and writing of 8-bit bytes on 7-track tape by converting four tape characters into three storage bytes and vice versa. Tape units equipped with Single Density (#6631) can also be attached. **Limitations:** Cannot be installed in the same control unit with either Single Density (**#9570**) or Dual Density (#3551). Tape units operating in 1600 bpi PE mode can also be attached. **Field Installation:** Yes.

Two-channel Switch (#8100): Permits connection of the 3803 Tape Control to a second channel. Alternate path switching between two channels on the same system is under program control. Partitioning of attached tape units between channels on two different systems can be done using current procedures for logical device partitioning. These procedures involve the proper use of the operator commands, VARY ON/VARY OFF (OS) or DVCDN/DVCUP (DOS). Further information concerning this type of operation is contained in the *3803/3420 Sales and Systems Guide,* ZZ20-2254. **Field Installation:** Yes.

Tape Switching: Switching configurations, via two, three or four control units, are available to provide access to:

(a) Up to eight tape units attached to a single control unit;

(b) Up to 16 tape units, with eight attached to each of two control units.

All switchable tape units must be attached to the control units equipped with the switching features (2-control Switch, 3-control Switch or 4-control Switch). Each control unit must be equipped with the appropriate Single Density, Dual Density, or Seven-track feature for any any drive in the pool to which it has access.

The table below indicates features required for the available switching options.

Switching Options	Features Required	Feature Numbers On 1st 3803	On 2nd 3803	On 3rd 3803	On 4th 3803
2 x 8	Communicator 1-2	**#9071**	**#9071**	----	----
	2-Control Switch	#1792	----	----	----
3 x 8	Communicator 1-2	**#9071**	**#9071**	**#9071**	----
	3-Control Switch	#1793	----	----	----
4 x 8	Communicator 1-2	**#9071**	**#9071**	**#9071**	**#9071**
	4-Control Switch	#1794	----	----	----
2 x 16	Communicator 1-2	**#9071**	**#9071**	----	----
	2-Control Switch	#1792	#1792	----	----
3 x 16	Communicator 1-2	**#9071**	**#9071**	----	----
	Communicator 3-4	----	----	**#9073**	----
	3-Control Switch	#1793	#1793	----	----
4 x 16	Communicator 1-2	**#9071**	**#9071**	----	----
	Communicator 3-4	----	----	**#9073**	**#9073**
	4-Control Switch	#1794	#1794	----	----

Note: For assistance in ordering, refer to subsystem description manual, GA32-0020 or GA32-0021, for graphic presentation of switching configurations.

3420/3803 Attachment Possibilities

Notes:

1) All 3803s, irrespective of feature mix, can control tape drives operating in 1600 bpi PE mode.

2) No 3803 can have the capability to control tape drives with nine-track NRZI features and tape drives with seven-track NRZI features.

3) It is not possible to have more than one of the feature numbers listed in the following table in any one unit (3803 or 3420).

3803 Tape Control Mdl 1 (cont'd)

3420 mdls 3, 5 & 7 Features	3803 with Single Density (#9570)	3803 with Dual Density (#3551)	3803 with Seven-Track (#6408)
#6631 Single Density 1600 bpi PE	Yes	Yes	Yes
#3550 Double Density operating in 1600 bpi PE mode	Yes	Yes	Yes
#3550 Double Density operating in 800 bpi NRZI mode	No	Yes	No
#6407 7-Track 556 or 800 bpi NRZI	No	No	Yes

MODEL CONVERSIONS

A 3803 model 1 may be converted to a 3803 model 2 or model 3 in the field. If the 9-track NRZI feature is installed, it will be removed when the 3803 model 1 is converted to a model 2.

ACCESSORIES (None)

SUPPLIES (None)

3803 TAPE CONTROL MDL 2

PURPOSE

Control unit for 3420 Magnetic Tape Units models 3 through 8 for S/370 (except models 115 and 125) and 4300 processors.

MODELS

Model 2 002

Prerequisites: Control unit position on S/370 or 4300 processor channel or Tape-To-Printing Subsystem feature (#7810) on a 3800 Printing Subsystem. When used with a 3800 with feature #7810, at least one path, which may be switchable, must be provided to a S/360, S/370 or 4300 processor. When multiple control units (up to 8 are allowable) are connected to a 3800, all other than one must have power sequencing and control connection provided by a system. If attached to a 2860, a 3803 Mdl 2 Attachment (#7850) is required on each channel to which 3803 mdl 2s are attached. For #7850, specify **#9181** for the first channel of a 2860 ... **#9182** for the second channel ... **#9183** for the third channel. See M2860 pages.

HIGHLIGHTS

- Standard control unit provides 6250 and 1600 bpi densities.
- 6250 Encoding/Checking Logic allows error correction without stopping or interrupting the read/write operation for any single track or combinations of two tracks simultaneously. Errors may be corrected in all nine tracks of a single data block providing they occur in combinations of no more than two tracks at a time. Long tape blocks are subdivided by resync bursts which are inserted within the block to allow error tracks to return to full operation when reading forward, thereby restoring maximum error correction capability.
- Optional features provide 9-track (800 bpi) NRZI, or 9-track (800 bpi) NRZI with 7-track (800, 556, 200 bpi) NRZI formats.
- Nine-track NRZI with Seven-Track NRZI features permit mixing 9- and 7-track tape units on the same 3803 mdl 2.

The following table indicates features for corresponding functions:

Subsystem Density	Control Unit 3803 mdl 2		Tape Unit 3420-3,5,7	Tape Unit 3420-4,6,8
	Feature Name	Feature #	Feature #	Feature #
9T-6250	--	Standard	N/A	#6420
9T-6250+1600	--	Standard	#6631	#6425
9T-6250+1600 +800	Nine-Track NRZI	#5310	#3550	N/A
9T-6250+1600 +800 with 7T-800-556-200	Seven-Track NRZI	#6320*	#6407	N/A

* Requires #5310.

- A pool of up to 16 tape units may be switched between 2, 3 or 4 control units.
- A 3803, via a two-channel switch, connects to two channels of the same system or two channels of different systems.
- Properly featured, a 3803 mdl 2 provides signal and power attachment for up to eight 3420 mdls 3, 4, 5, 6, 7. Mdl 8s may be attached as described under "Limitations".

System Attachment: The 3803 mdl 2 attaches to S/370 or 4300 processor via the indicated channels:

System	3420 mdl 4	3420 mdl 6	3420 mdl 8
135	Selector*	Selector*	Selector*
135-3,138	Blk Mltplxr	Blk Mltplxr	Blk Mltplxr
145	Selector*	Selector*	Selector*
145-3,148	Blk Mltplxr	Blk Mltplxr	Blk Mltplxr
155,158	Blk Mltplxr	Blk Mltplxr	Blk Mltplxr
165,168,195	2860/2880	2860/2880	2860/2880
3031,3032, 3033	Blk Mltplxr	Blk Mltplxr	Blk Mltplxr
3081,3083, 3084	Blk Mltplxr	Blk Mltplxr	Blk Mltplxr
4331	Blk Mltplxr	Note 1	Note 1
4341,4361, 4381	Blk Mltplxr	Blk Mltplxr	Blk Mltplxr

* With or without Block Multiplexer Channel (#1421).
Note 1: Not attachable to Mdl Group 1

Limitations: [1] 3803 mdl 2 attachment to S/370 mdls 135, 135-3, 138, 145, 145-3 and 148 is configuration-sensitive because of potential system overrun. Consult *System/370 Model 135 Channel Characteristics* (GA33-3010) or *System/370 Model 145 Channel Characteristics* (GA24-3573) ... [2] The 3803 mdl 2 is not supported for attachment to byte multiplexer, multiplexer, or 2870 selector subchannels ... [3] The 3803 mdl 2 operating with 3420 mdl 8s is limited to a maximum channel-to-control unit (total x dimension) cable length of 119 feet to the 2880 or selector channel of a S/370 mdl 145, 119 feet to the block multiplexer channel of a S/370 mdl 145-3 or 148, 103 feet to the block multiplexer channel of a S/370 mdl 155, 3032 or 3033, and 72 feet to a 2860 ... [4] The 3803 mdl 2 provides power and signal connections for 3420 tape drives. Up to eight drives of any mdl can be signal-connected to a 3803 mdl 2. Note that 3420 mdls 4, 6 and 8 must signal-connect to a 3803 mdl 2. ... [5] For 4331 considerations see the *4331 Channel Characteristics,* GA33-1527 (Mdl Group 1), GA33-1535 (Mdl Group 2) or GA33-1550 (Mdl Group 11).

One 3803, either mdl 1 or mdl 2, provides power for up to eight 3420 mdls 3, 4, 5, 6 or 7. When the tape subsystem includes 3420 mdl 8s, one 3803, mdl 1 or mdl 2, may power a maximum of six 3420 mdl 8s or combinations of drives as listed in the table below.

The maximum number of drives which may be powered from one 3803 without **#9001** (Auxiliary AC Power Supply) are listed below.

Number of 3420 Mdl 8s	and	Number of 3420 Mdl 7s	and	Number of 3420 Mdls 3-6
6		0		0
5		1		0
5		0		2
4		2		1
4		1		2
4		0		3
3		4		0
3		3		1
3		2		2
3		1		4
3		0		5
2		5		0
2		4		2
2		3		3
2		2		4
2		1		5
2		0		6
1		*		*

* If only one 3420 mdl 8, then any combination of seven additional tape units is permissible.

When the subsystem includes more than one 3803 mdl 2 and the number of tape drives which must be signal-connected to a control unit exceeds the maximum number of drives which may be powered from one 3803 (see table above), obtain power from another control unit using a separate power cable (Group 144). Separate signal cable (Group 143) is also available.

A power supply feature (**#9001**) is available which allows eight 3420s of any mdl to be powered from one 3803 mdl 2 ... see "Specify". This feature is necessary only if: [1] The subsystem includes only one 3803 mdl 2 and the drives to be powered from it exceed the maximum specified in the table above, or [2] The power load still exceeds the table limitations for a 3803 when distribution by re-cabling with separate power and signal cables has been considered.

Bibliography: GC20-0001

SPECIFY

- Voltage (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V or **#9905** for 230V ... must be consistent with system voltage.!47u
- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, **#9046** for white.
- Density: 6250 and 1600 bpi are standard and do not need to be specified. In addition, order Nine-Track NRZI (#5310) or Seven-Track NRZI (#6320) if required ... see "Special Features".
- Tape Switching: If a tape-switching configuration is being ordered, the 3803 must be equipped with a Communicator (**#9071** or **#9073**) ... see table under "Tape Switching" below. If a Communicator feature is ordered for a 3803 without a switching feature, no tape units can be signal-attached to that control unit.
- Auxiliary AC Power Supply: **#9001**. Required to power more than six 3420 mdl 8s from one 3803 mdl 2.

  Also may be required to power 3420 mdl 8s in combination with other drives ... see "Limitations" above. Requires 100 ampere power source.

SPECIAL FEATURES

Nine-Track NRZI (#5310): Required for the attachment of 3420 mdls 3, 5 or 7 equipped with Dual Density (#3550). Allows attached tape drives to read and write data in a 9-track 800 bpi format as well as 1600 bpi (Phase Encoded) format. **Field Installation:** Yes.

Remote Switch Attachment (#6148): Provides for remote operation of the Two-Channel Switch (#8100) on the 3803 mdl 2 from a remote console such as the configuration control panel (3058 or 3068) for a

3803 Tape Control Mdl 2 (cont'd)

S/370 mdl 158MP or 168MP. Operation of the switch on the remote console will result in the same function as operation of the 3803 switch. The 3803 switches will be functionally inoperative when this feature is installed. The cable to the remote console is not provided by this feature. The cable used must contain three wires for each Enable/Disable switch to be installed. Each line must have a total loop resistance of less than 75 ohms when the remote switch completes the path. For operation with the 2925 mdl 10, 3058 or 3068, cable P/N 5351178 is required and should be ordered on a separate MES. **Field Installation:** Yes.

Seven-Track NRZI (#6320): Required for the attachment of 3420 mdls 3, 5 or 7 equipped with Seven-Track (#6407). Allows attached tape drives to read and write data in 7-track/200, 556 or 800 bpi format. **Prerequisites:** #5310. **Field Installation:** Yes.

Two-Channel Switch (#8100): Permits connection of the 3803 to a second channel. Alternate path switching between two channels on the same system is under program control. Partitioning of attached tape units between channels on two different systems can be done using current procedures for logical device partitioning. The procedures involve the proper use of the operator commands, VARY ONLINE/VARY OFFLINE (OS) or DVCDN/DVCUP (DOS). **Field Installation:** Yes.

Tape Switching (#1792-#1794): Switching configurations, via two, three or four control units are available to provide access to:

(a) Up to eight tape units attached to a single control unit.

(b) Up to 16 tape units, with eight attached to each of two control units.

All switchable tape units must be signal-attached to the control units equipped with the switching features (2-Control Switch, 3-Control Switch or 4-Control Switch). Each control unit must be equipped with the appropriate density feature for any drive in the pool to which it has access. **Field Installation:** Yes.

The following table indicates features required for the available switching options.

Switching Options	Features Required	Feature Numbers On 1st 3803	On 2nd 3803	On 3rd 3803	On 4th 3803
2 x 8	Communicator 1-2	**#9071**	**#9071**	----	----
	2-Control Switch	#1792	----	----	----
3 x 8	Communicator 1-2	**#9071**	**#9071**	**#9071**	----
	3-Control Switch	#1793	----	----	----
4 x 8	Communicator 1-2	**#9071**	**#9071**	**#9071**	**#9071**
	4-Control Switch	#1794	----	----	----
2 x 16	Communicator 1-2	**#9071**	**#9071**	----	----
	2-Control Switch	#1792	#1792	----	----
3 x 16	Communicator 1-2	**#9071**	**#9071**	----	----
	Communicator 3-4	----	----	**#9073**	----
	3-Control Switch	#1793	#1793	----	----
4 x 16	Communicator 1-2	**#9071**	**#9071**	----	----
	Communicator 3-4	----	----	**#9073**	**#9073**
	4-Control Switch	#1794	#1794	----	----

Note: For assistance in ordering, refer to subsystem description manual, GA32-0020 or GA32-0021, for graphic presentation of switching configurations.

MODEL CONVERSIONS

A 3800 model 1 may be converted to a 3800 model 2 in the field. Customer price quotations and customer order acknowledgement letters for Purchase MESs must state: "Installation of this model change involves the removal of parts which become the property of IBM."

ACCESSORIES (None)

SUPPLIES (None)

3811 PRINTER CONTROL UNIT

PURPOSE

Control unit for the 3211 Printer in a S/360 model 22, 30, 40, 50, 65, 67 (in 65 mode), 75, 85, 195 or any S/370 processor (except 3115 or 3125), or any 4300 processor.

MODELS

Model 1 001

HIGHLIGHTS

The 3811 provides the necessary controls for attaching the 3211 Printer to the I/O channels provided by the processing system. It contains all the necessary electronic controls and buffering to adapt the mechanical printer to the channel. The control unit (3811) and the mechanical printer (3211) are physically attached to each other.

The logic, buffers and controls of the Universal Character Set and Forms Control Buffer are located in the 3811.

Prerequisites: The 3811 requires a control unit position on a system channel.

S/360 mdl 22, 30, 40, 50: Multiplexer channel (standard), selector channels (special features, except on 2022 one selector channel is standard).

S/360 mdl 65, 75: Selector channel of 2860, basic multiplexer channel of 2870, selector subchannels (special features) on 2870 ... see M2860, 2870 pages.

S/360 mdl 67: Basic multiplexer channel of 2870 ... see M2870 pages.

S/360 mdl 85, 195, S/370 mdl 165, 168, 195: Selector channel of 2860, basic multiplexer channel of 2870, selector subchannels (special features) of 2870, the shared subchannels or non-shared subchannels (non-shared attachment is recommended) of a 2880 Block Multiplexer Channel ... see M2860, 2870, 2880 pages.

S/370 mdl 135: Multiplexer channel (standard), selector channels (special features), block multiplexer channel (special feature) ... see M3135 pages.

S/370 mdl 135-3: Byte multiplexer channel (standard), block multiplexer channel (special feature) ... see M3135-3 pages.

S/370 mdl 138: Byte multiplexer channel (standard), block multiplexer channel (standard) ... see M3138 pages.

S/370 mdl 145: Byte multiplexer channel (standard), selector channels, block multiplexer channels (special features) ... see M3145 pages.

S/370 mdl 145-3: Byte multiplexer channel (standard), block multiplexer channels ... see M3145-3 pages.

S/370 mdl 148: Byte multiplexer channel (standard), block multiplexer channels (standard) ... see M3148 pages.

S/370 mdl 155, 158: Multiplexer channel (standard), second byte multiplexer channel (special feature), block multiplexer channels (first two are standard) ... see M3155, 3158 pages.

3031, 3032 Processor: Byte multiplexer channel (one is standard), block multiplexer channels (five are standard) ... see M3031, 3032 pages.

3033 Processor: Byte multiplexer channels (two are standard), block multiplexer channels (ten are standard) ... see M3033 pages.

4300 Processor: Byte multiplexer channel, block multiplexer channels ... see M4321, 4331, 4341, 4361, 4381 pages.

3081, 3083, 3084 Processor: Byte multiplexer channels, block multiplexer channels ... see M3081, 3083, 3084 pages.

Print Positions, 18 Add'l (#5553): Controls for Print Positions, 18 Add'l (#5554) on the 3211 Printer. **Field Installation:** Yes.

MODEL CONVERSIONS (None)

ACCESSORIES (None)

SUPPLIES (None)

3814 SWITCHING MANAGEMENT SYSTEM

PURPOSE

Provides channel to control unit(s) switching under single point control in combinations up to 128 nodes or a single switch matrix as large as 8x16 or 16x8. Switching can be effected at up to four locations which may be as distant as 305 meters (1,000 feet) from each other and connected via customer-supplied loop cable which begins and ends at the model A controller. Power sequencing of switched control units and single location control of control unit two-channel switches can also be managed by the 3814.

MODELS

Controller	Remote Unit	Expansion Unit --- contains
Model A1 (A01)	**B1** (B01)	**C1** (C01) one 4x4 switch
Model A2 (A02)	**B2** (B02)	**C2** (C02) one 4x8 switch
Model A3 (A03)	**B3** (B03)	**C3** (C03) one 8x4 switch
Model A4 (A04)	**B4** (B04)	**C4** (C04) two 4x4 switches

Model Bs require a model A as a prerequisite and can function as a logical expansion of a primary switching location or, if logically independent, can be up to 305 meters distant. Model Cs attach to either model As or Bs and provide up to 32 nodes which may be logically combined with their prerequisite model to provide larger switching matrixes. An alternate Model A Controller can be attached to the loop with feature #1430. Switching control to the alternate controller may be performed under operator control. This switchover is automatic in the event of some controller malfunctions or control power loss. Operator control is via 3604 Model 6 at the primary location but also may be via a second 3604 Model 6 up to 305 meters away. With feature #1420, a maximum of two 3278 Model 2s can be used for operator control. One 3278 Model 2, with the Control Unit Switch Accessory Feature (part #1743301), can be shared between two 3814 subsystems. A maximum of three 3287 Model 1s or 2s can be attached with feature #1420 providing hard copy of audit trails and configurations. These printers may be shared with other 3814 systems by using a coax selection switch. When a 3278 is installed for operator control, a 3604 Model 6 is optional.

Authorization to operate the 3814 is incorporated into the product and under control of passwords. With feature #1420 an additional authority level and 32 passwords are provided. A time stamped audit-trail of configuration changes is provided for display and/or printing. The use of installation defined names for configurations, logical channel/control unit interfaces, logical matrices and control unit identification is provided with feature #1420.

The 3814 can switch either data streaming or non-data streaming devices.

Nomenclature: The first number of the switch expression specifies the number of channels and the second number indicates the number of switchable interfaces (with one or more control units). Thus, a 4x8 designates a switch capable of connecting any of four channels to any combination of eight switchable interfaces. The intersections of the channel and switchable interfaces within the 3814 are called nodes and, taken together, comprise the switch matrix. Thus, a 4x8 switch has a switch matrix of 32 nodes.

Limitations: The 3814 is designed to function only in a raised floor machine room environment. The 1419 equipped with #7720 or #7730 (single or dual address adapter) requires external interrupt features on the associated CPUs to enable the 1419s to operate. These features are not supported by the 3814. Channel and control unit cable length restrictions must be observed.

Note: Contact Special Product Marketing for 2835/2305 attachment information.

Prerequisites: Every 3814 requires one mdl A Controller with a 3604 mdl 6. #1050 (Audible Alarm) is recommended for installation. A 1.8 meter (6 foot) power cord is supplied with the 3604 mdl 6; if a 4.3 meter (14 foot) power cord is desired, order RPQ 8P0898 for the 3604 mdl 6 (for factory install only), at no charge. The 3814 attaches to byte and block multiplexer channels of any S/370 mdl 135 and up, 3031, 3032, 3033, 3081, 3083, 3084, 4331, 4341, 4361, or 4381 Processor.

HIGHLIGHTS

Provides capability to receive, interconnect and repower both in-bound and out-bound lines of the standard IBM S/360 and S/370 I/O Interface ... implementation includes an integrated microcode driven processor ... confirmation mechanism ensures switching has been effected ... quick change of configurations via prestored configuration specifications ... storage for up to 80 configurations including current and prior configuration ... an additional 384 crosspoint configurations with feature #1420 ... standard operation permits channel switching only when channel interface is inactive ... switches channels having the Two-Byte Interface but such configurations physically use twice the nodes of other channel to control unit switching ... operator can display current configuration status without affecting on-going operations ... permits up to four physical locations per 3814 for one logical or multiple logical switches ... provides single control point for control units with the two-channel switch and remote switch attachment features ... provides storage for up to 7 two-channel switch combinations including current and prior configurations ... An additional 320 two-channel switch stored configurations with feature #1420 ... 64 multiple configurations, each one specifying a list of up to 32 crosspoint and/or two-channel switch configurations ... provides for power sequencing of attached control units ... each 3814 mdl may be placed under power sequence control of up to four processors so that it will be powered-on via the powering of the first processor and powered-off via the last processor to power down.

RAS Characteristics: The 3814 enters a diagnostic check-out procedure as part of the power-on sequence. Once in operation, operating elements are continuously monitored to detect malfunctioning hardware within the 3814. Upon detection of certain malfunctions, an audible alarm and a visual indicator alert operators to a potential problem. Error indicators are saved within the system for assisting in later diagnosis. Since on-going use of the switchable configuration may continue, the user may not have experienced impact and the net result of the detected failure may be an early alert to a pending problem.

The modularity of the 3814 power design and the ability to isolate power contribute greatly to its serviceability. Since the channel switching function remains static between changes and the CE may power-down and power-up individual frames and portions of the system, he may effect repair of failing elements of the 3814 while customer use of other elements continues. One may power-down, repair the failing element, and power-up the isolated portion of the system and return it to operational use. Major elements of the 3814s to which the above description applies are: The 3814 processor and its storage, the diskette drive, the channel interface switches, the 4x4 switch elements, some power supplies and the 3604 mdl 6. The Alternate Controller Feature allows duplication of the control function in a 3814 system.

Configuration Guidance: Refer to Tables A, B or C for the mdl/feature combinations recommended for various I/O switching requirements. If requirements are for multiple remote switches, apply the formula outlined under the heading, "Multiple Remote Switches". These tables are not intended to reflect all possible configuration options. If the Alternate Controller Adapter Feature is installed, the appropriate Model A will be substituted for a Model B.

SINGLE SWITCH CONFIGURATIONS (TABLE A)

Switch Size	Model/Feature Required
4x4	A01
4x8	A02 or A02 + B01
4x12	A02 + C01 or A02 + B01
4x16	A02 + C02 or A02 + B02
8x4	A03 + A01 + **#1531** + B01
8x8	A02 + **#9721** + C02 + #1521 or A02 + **#1531** + 1532 + B02
8x12	A03 + C03 + B03 or A03 + B03 + B03
8x16	A03 + **#9721** + C02 + #1521 + B02 + **#9721** + C02 + #1521
12x4	A03 + **#9720** + C01 + #1520 or A03 + **#1532** + B01
16x4	A03 + **#9720** + C03 + #1520 or A03 + **#1532** + B03
16x8	A02 + **#9721** + C02 + #1521 + #1531+ **#1532** + B02 + #9721 + C02 + #1521

MULTIPLE PRIMARY OR MULTIPLE REMOTE SWITCHES (TABLE B)

Switch Combinations	Primary Location Mdl/Feat. Req'd	Remote Location Mdl/Feat. Req'd
2(4x4)	A04	B04
3(4x4)	A04 + C01	B04 + C01
4(4x4)	A04 + C04	B04 + C04
(4x8) + (4x4)	A02 + C01	B02 + C01
(4x8) + 2(4x4)	A02 + C04	B02 + C04
(4x8) + (4x8)	A02 + C02	B02 + C02
(8x4) + (4x4)	A03 + C01	B03 + C01
(8x4) + 2(4x4)	A03 + C04	B03 + C04
(8x4) + (4x8)	A03 + C02	B03 + C02
(8x4) + (8x4)	A03 + C03	B03 + C03

Note that either the mdl/feature at the primary or the remote locations can easily satisfy the requirements outlined under switch combinations. Also, any mdl B requires a prerequisite mdl A.

3814 Switching Management System (cont'd)

SWITCH COMBINATIONS INCLUDING AN 8x8 OR GREATER (TABLE C)

Switch Combinations	Mdl/Feat. Required
(8x8) + any combination from Table B	Table A Build-up + Remote Build-up from Table B
(8x12) + (4x4)	Table A + C01
(8x12) + 2(4x4)	Table A + C04
(8x12) + (4x8)	Table A + C02
(8x12) + (8x4)	Table A + C03
(12x4) + (4x4)	Table A + C01 + C04
(12x4) + any combination from Table B	Table A + Remote Build-up from Table B
(12x8) + (4x4)	Table A + C01
(12x8) + 2(4x4)	Table A + C04
(12x8) + (4x8)	Table A + C02
(12x8) + (8x4)	Table A + C03
(16x4) + any combination from Table B	Table A + Remote Build-up from Table B

Multiple Remote Switches: Where the requirement is for multiple remote switches, the following formula should be used. No more than three remote locations are permitted. Using the switch definition from Table A or B, calculate the number of nodes by location by multiplying the switch expression. Substitution in the tables of an appropriate mdl B Remote Unit may be required in lieu of the equivalent size A or C mdl.

(NUMBER OF PRIMARY NODES) + (NUMBER OF REMOTE NODES, 1st LOCATION) + (NUMBER OF REMOTE NODES, 2nd LOCATION) + (NUMBER OF REMOTE NODES, 3rd LOCATION) LT/EQ 128 [cannot exceed 128].

For additional configuration guidance, refer to the *IBM 3814 Switching Management System Product Description Manual,* GA22-7075.

Stored Configurations: The number of stored configurations is determined by the following formula:

$$N = 10 \times \frac{Ch \times CU}{16}$$

Where N is the number of configurations stored per logical switch. The previous and current configurations always occupy configurations number 0 and 1, respectively.

For example, each 4x4 can have eight customer-defined configurations, plus previous and current. An 8x16 has 78 defined plus previous plus current.

Ch is the number of channel interfaces on the logical switch

CU is the number of control unit interfaces on the logical switch

SPECIFY

- Voltage (AC, 1-phase, 3-wire, 60 Hz): **#9902** for 208V, **#9914** for 240V.
- Cable for 3604 mdl 6. See "Accessories".
- Color: [A or B mdls] **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, **#9065** for pebble gray, **#9066** for pearl white.
- Unit Emergency Power Off: UEPO switches are located on mdl A Controllers and mdl B Remote Units. Depression of UEPO instantly drops power in any mdls making up the Switching Management System which are interconnected for power sequencing as well as control units which are under its power sequencing control.

  Specify **#9720** on mdl A3, A4, B3 or B4 when ordering special feature #1520 on an attached mdl C1, C3 or C4. **#9720** must be removed if mdl C1, C3 or C4 is detached. #9720 requires the appropriate C Model at installation.

  Specify **#9721** on mdl A2, A4, B2 or B4 when ordering special feature #1521 on an attached mdl C2 or C4. **#9721** must be removed if mdl C2 or C4 is detached. #9721 requires the appropriate C Model at installation.

SPECIAL FEATURES

Expanded Storage (#1410): [Mdl A] Required when #1420 or #1430 or both. **Maximum:** One per mdl A. **Field Installation:** Yes.

Display/Printer Attachment (#1420): [Mdl A] Provides attachment of up to two 3278 mdl 2s, three 3287 mdl 1s or 2s, additional stored crosspoint and two-channel switch configurations, additional 32 security passwords across 4 authority levels and the capability to assign installation defined names for configurations, and time stamped audit-trail of configuration switching activity for display on the console. **Prerequisites:** #1410. **Maximum:** One per mdl A. **Field Installation:** Yes.

Alternate Controller (#1430): [Mdl A] Provides backup to the mdl A in a system through the attachment of a second mdl A. Both A mdls must have this feature installed. The Alternate Controller takes the place of one mdl B switching unit on a 3814 configuration. **Prerequisites:** #1410. **Maximum:** One per mdl A. **Field Installation:** Yes.

Channel Expansion Internal - Four Control Unit Interfaces (#1520): [Mdls C] Required when combining a mdl C with a mdl A or B for the purpose of expanding the number of channel interfaces. This feature is required when combining a 4x4 (C1) or 8x4 (C3/C4) with an 8x4 (A3/A4/B3/B4) to create a 12x4 or 16x4 switch. **Prerequisites:** mdls A3, A4, B3 or B4 with specify **#9720**. **Limitations:** A4 or B4 mdls must be cabled as an 8x4. Cannot be installed with #1521. **Maximum:** One per mdl C1, C3 or C4. **Field Installation:** Yes.

Channel Expansion Internal - Eight Control Unit Interfaces (#1521): [C mdls] Required when combining a mdl C with a mdl A or B for the purpose of expanding the number of channel interfaces. This feature is required when combining a 4x8 (C2/C4) with a 4x8 (A2/A4/B2/B4) to create an 8x8 switch. **Prerequisites:** Mdls A2, A4, B2 or B4 with specify **#9721**. **Limitations:** A4 or B4 mdls must be cabled as a 4x8. Cannot be installed with #1520. **Maximum:** One per mdl C2 or C4. **Field Installation:** Yes.

Channel Expansion External (#1531, #1532): #1531 for first 4x4, #1532 for second 4x4. This feature provides an external cable connection for the control unit input of a 4x4 matrix for the purpose of expanding the number of channel interfaces for an A, B or C mdl. #1531 is required to allow connection through external cables to control unit inputs of the first 4x4 matrix in mdls A1, B1, C1, A2, B2, C2, A4, B4 or C4. #1532 is required to allow connection through external cables to control unit input of the second 4x4 matrix in mdls A2, B2, C2, A3, B3, C3, A4, B4 or C4. #1531 is required to create an 8x4 switch within an A4, B4 or C4. The #1531, #1532 may exist without the connection of external cables. **Prerequisites:** A, B or C mdls -- when expanding the channels on an 8-channel switch, #1531 and #1532 are required. **Limitations:** #1531 cannot be installed on A or B mdls with **#9721**. #1532 cannot be installed on A or B mdls with **#9720** or **#9721**. #1531 cannot be installed on A3, B3 or C3 mdls. #1532 cannot be installed on A1, B1 or C1 mdls. **Maximum:** One #1531 for mdl A1, B1, C1, A2, B2, C2, A4, B4 or C4. One #1532 for A2, B2, C2, A3, B3, C3, A4, B4 or C4 mdls. **Field Installation:** Yes.

Control Unit Power Sequencing (#1811, #1812, #1813, #1814): Each feature provides power sequencing control for up to four control units attached to any mdl 3814. #1811 for first group of control units, #1812 for second group of control units, #1813 for third group of control units, #1814 for fourth group of control units. **Limitations:** Features must be installed in sequence. **Maximum:** One each per mdl A, B or C. **Field Installation:** Yes.

Remote Two-Channel Switch Control - Basic (#6010): Provides single point control for the remote enable/disable function on control units having two-channel switches with remote switch attachment features. #6010 provides for control of eight pairs of interface selections. **Prerequisites:** Two-channel Switch and Remote Switch Attachment and/or Two-channel Switch, Add'l and Remote Switch Attachment, Add'l required on affected control units. **Maximum:** One per mdl A, B or C. **Field Installation:** Yes.

Remote Two-Channel Switch Control - Additional (#6011, #6012, #6013): Provides expansion of the two-channel switch control capability for controlling eight additional pairs of interface selections. #6011 for first additional, #6012 for second additional, #6013 for third additional. **Limitations:** Features must be installed in sequence. **Prerequisites:** #6010 ... Two-channel Switch and Remote Switch Attachment and/or Two-channel Switch, Add'l and Remote Switch Attachment, Add'l required on affected control units. **Maximum:** Three groups of eight per mdl A, B or C. **Field Installation:** Yes.

System Power Sequencing - Add'l (#6350): Provides power sequencing control from the 5th through 8th system. **Maximum:** One per mdl A, B or C. **Field Installation:** Yes.

MODEL CONVERSIONS

The following model changes are field installable -- model A1 to A4, model B1 to B4, model C1 to C4. All other model changes are available at time of manufacture only.

ACCESSORIES

Cables: Cables to interconnect 3604-6 units and/or 3278 and/or 3287 units and 3814 units may be purchased from IBM or a customer selected source. See *IBM Input/Output Equipment Installation Manual - Physical Planning: System/360, System/370, 4300 Processors,* GC22-7064, for cable and connector specifications.

Assembled cables may be purchased from IBM. Specify cable assembly number. Allow a lead time of 6 weeks.

Item	Number	Description	Max Length

Assm.	1563155	Loop Cable Assm. (indoor)	304.8m (1,000 ft)

SUPPLIES (None)

3830 STORAGE CONTROL MDL 1, 2

PURPOSE

Control unit for 3330, 3333, 3340, 3344 or 3350 disk storage.

MODELS

Model 1 001 — [NO LONGER AVAILABLE] Provides for attachment of up to four 3330 modules in any combination of models 1 and/or 2. Attaches to S/360 model 195 or S/370 models 165, 168 or 195 via a 2880 Block Multiplexer Channel. Attachment to the S/370 models 135 or 145 is made via the system block multiplexer channel or selector channel and to the 135-3, 138, 145-3 and 148 via the block multiplexer channel. Attachment to S/370 models 155 or 158 is made via the system's block multiplexer channel. Attachment to a 3031, 3032 or 3033 Processor is made via a block multiplexer channel. Attaches to the 4341 or 4381 Processor via a block multiplexer channel.

Model 2 002 — Provides for the attachment of 3333s (models 1 and/or 11) and/or 3340 model A2s and/or 3350 model A2s/A2Fs ... see DASD Configuration under "Specify". Additional storage is provided by attaching 3330 modules to the 3333 or by attaching 3340 model Bs and/or 3344s to the 3340 model A2 or by attaching 3350 model Bs and/or a model C to the 3350 model A2/A2F ... see DASD Configuration under "Specify" and M3330, 3333, 3340, 3344, 3350 pages.

Attaches to S/360 model 195 or S/370 models 165, 168 or 195 via a 2880 Block Multiplexer Channel. Attachment to S/370 model 135 (see "Limitations") or 145 is made via the system's block multiplexer channel or selector channel and to the 135-3, 138, 145-3 and 148 via the block multiplexer channel. Attachment to S/370 model 155 or 158 is made via the system's block multiplexer channel. Attachment to a 3031, 3032, 3033, 3081, 3083 or 3084 Processor is made via a block multiplexer channel. Attaches to the 4341 or 4381 Processor via a block multiplexer channel and to the 4331 (Model Group 2) or 4361 Processor via the High-Speed Block Multiplexer Channel.

Prerequisites

[1] The 3830 mdl 1 is designed for interconnected operation with 3330 Disk Storages. Customers who wish to order a 3830 mdl 1 for stand-alone or individual use should submit an RPQ to provide the necessary safety elements (covers, cable connectors, etc.) to complete the unit for a non-standard (i.e., not interconnected as part of a 3330 facility) environment. In lieu of the RPQ, the customer may provide safety elements equivalent to the standard 3830 mdl 1/3330 configuration or that provided by the RPQ. If not provided, the unit will be offered on a purchase-only basis. See "Specify". Agreement for IBM to install and maintain the 3830 mdl 1 in any non-standard environment must be reviewed with FE Regional Management prior to making a commitment to the customer.

[2] An available control unit position on a channel. One unshared subchannel for each drive attached on a system block multiplexer channel or a 2880 Block Multiplexer Channel. For S/360 (3330 series only) mdl 195 and S/370 mdl 165, 168, 195, see M2880 pages. For S/370, mdls 135 and 145, and 4300 processors, a system block multiplexer channel is required for support of block multiplexing and rotational position sensing ... see M3333, 3330, 3340, 3344 and 3350 pages. If this support is not required, attachment to a system selector channel is permitted.

Limitations: [1] See M3333, 3330, 3340, 3344 and 3350 pages for system support limitations ... [2] in S/370 mdl 135, 135-3, 138, when a 3830 mdl 2 is attached to a block multiplexer channel, only 16 logical devices will operate in this mode even if more than 16 logical devices are attached.

HIGHLIGHTS

File organization and format are under program control ... command structure permits flexible and efficient processing of either randomly or sequentially organized files. Data integrity is provided through extensive error detection and correction capabilities.

Standard Features ... include the following:

Command Chaining: Allows sequential records within a cylinder to be read/written by a sequence of channel commands without rotational delays between records.

Record Overflow: Storage efficiency is obtained by allowing records to span track boundaries within a cylinder.

Bibliography: GC20-0001

SPECIFY

- Voltage (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V, **#9905** for 230V ... must be consistent with 3330, 3333 or 3340 voltage.
- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, **#9046** for white.
- Non-standard Environment: **#9485** must be specified if the 3830 mdl 1 is not to be installed as part of a 3330 facility. Also see "Prerequisites" above.
- DASD Configuration (3830 mdl 2): The available combinations of storage devices which can be attached are shown in the tables below. One, two or three Xs in a vertical column indicate the type of machine(s) listed under DASD Configuration which can be attached when the "Required DASD Specify Features" are installed. Based on the DASD, and the Special Features listed below being ordered for them, order the Required DASD Specify Feature(s) from the appropriate table.

3830 Storage Control Mdl 1, 2 (cont'd)

3830 MDL 2 WITH OR WITHOUT TWO-CHANNEL SWITCH (#8170)

DASD Configuration		Required DASD Specify Features (2)													
		(1) 9313	(1) 9314	(1) 9314 9190	(1,3) 9315			(1,3) 9315 9190			(1,4 9317		(1,5) 9318	
3333 Only	One or two 3333s with associated 3330s	x	x

3333 3340 3350 -not 3344	3333s, 3340 mdl A2s and 3350 mdl A2/A2Fs (any combination of 2, 3, or 4) with associated drives													x
	String Switch (#8150) on any 3333, 3340 mdl A2, or 3350 mdl A2/ A2F, C2/C2F and/ or Fixed Head feature (#4301/ #4302) on any 3340													x

Notes:

(1) ISC diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchased machines to include any number of diskette-only changes ordered on the same diskette.

(2) Any change to an installed DASD configuration requires an MES *ONLY* if the new configuration indicates that a different Specify and/or Special Feature(s) is required. The MES must include addition of any new Specify and/or Special Features not previously installed *AND* removal of any not listed as required for the new configuration.

(3) Control Store Extension (#2150) is prerequisite. With **#9315**, the 3830 mdl 2 requires 32 contiguous device addresses regardless of the number of drives attached.

(4) Control Store Extension (#2150) and Register Expansion (#6111) are prerequisites. For configurations in this group the 3830 mdl 2 uses 64 contiguous device addresses irrespective of the number of drives attached. The 3340 mdl A2s on the first and third strings may attach up to three 3340 mdl B1s, B2s, and/or 3344s in any combination. The 3340 mdl A2 on the second string may attach up to three 3340 mdl B1/B2s. The 3340 mdl A2 on the fourth string may attach one 3340 mdl B1 or B2.

(5) Expanded Control Store (#2151), Control Store Expansion (#2150) and Register Expansion (#6111) are prerequisites. For configurations in this group the 3830 mdl 2 uses 8 or 16 or 32 or 64 device addresses depending upon the DASD configuration installed and whether any 3350 drive is in 3330-1 compatibility mode.

	String Switch (#8150) on any 3333, 3340 mdl A2, or 3350 mdl A2/ A2F, C2/C2F and/ or Fixed Head feature (#4301/ #4302) on any 3340										x

Notes: For explanations, see *Notes* following the Table "3830 Mdl 2 With or Without Two-Channel Switch (#8170)".

SPECIAL FEATURES

Control Store Extension (#2150): [Mdl 2] Provides additional control store for microprogram use ... see DASD Configuration under "Specify" to determine when required. **Prerequisites:** A Specify Feature must also be ordered ... see "Notes" under DASD Configuration Charts above to determine which is required. **Field Installation:** Yes. **Maximum:** One.

Expanded Control Store (#2151): [Mdl 2] Provides additional control store for microprogram use ... see DASD Configuration under "Specify" to determine when required. **Prerequisites:** #2150. A Specify Feature must also be ordered ... see "Notes" under DASD Configuration Charts to determine which is required. **Note:** Customer price quotations and customer order acknowledgement letters must state: "Installation of this feature involves removal of parts which become the property of IBM." **Maximum:** One. **Field Installation:** Yes.

Register Expansion (#6111): [Mdl 2] Provides additional registers for microprogram use ... see DASD Configuration under "Specify" to determine when required. **Prerequisites:** A Specify Feature must also be ordered ... see "Notes" under DASD Configuration Charts to determine which is required. **Field Installation:** Yes. **Maximum:** One.

Remote Switch Attachment (#6148): [Mdl 2] To attach the Two-Channel Switch (#8170) to a configuration control panel. **Field Installation:** Yes.

Remote Switch Attachment, Add'l (#6149): [Mdl 2] To attach the Two-Channel Switch, Add'l (#8171) to a configuration control panel. **Field Installation:** Yes.

Two-Channel Switch (#8170): To attach the 3830 to a second channel ... the two channels may be on the same processor or different processors. An available control unit position is required on each channel ... see item [2] under "Prerequisites". Switching is under program control. The 3830 can be dedicated to a single channel by means of an Enable/Disable switch. **Field Installation:** Yes. **Maximum:** One.

Two-Channel Switch, Add'l (#8171): Adds switching for two additional channels to a 3830 with Two-Channel Switch (#8170), providing four channel switch capability. **Limitations:** Only two channels of the four available can be attached to the same processor. Cannot be installed if Fixed Head feature (#4301/#4302) is installed on any 3340. **Field Installation:** Yes. **Maximum:** One. **Prerequisites:**

3830 Storage Control Mdl 1, 2 (cont'd)

#8170. #2151 and/or #2150 are also required in certain 3830 mdl 2 configurations ... see DASD Configuration under "Specify".

MODEL CONVERSIONS

Model 1 to model 2 is field installable ... an additional 15 amp AC power outlet is required. Model 2 to model 1 is not recommended for field installation.

ACCESSORIES (None)

SUPPLIES (None)

3830 STORAGE CONTROL MDL 3

PURPOSE

Provides for the attachment of 3333/3330/3350 DASD in a 3850 Mass Storage System.

MODELS

Model 3 003

Prerequisites: The 3830 mdl 3 must have the Two-Channel Switch (#8170) and Control Store Extension (#2150). One channel interface attaches to the 3851 MSF and one channel interface attaches to the host processor.

Limitations

[1] A maximum of four 3830 mdl 3s may be attached to a S/370, 4341 or 4381 Processor block multiplexer channel. If 3830 mdl 1s or 2s and/or Integrated Storage Controls (#4650) are attached to the same block multiplexer channel, the maximum number of 3830 mdl 3s will be reduced. Consult *IBM 3850 Mass Storage (MSS) Installation Planning, and Table Create,* GC35-0028, for total system limitations.

[2] String Switch (#8150) may be installed on the 3333/3350 in a 3850 MSS for additional availability. Installation is not recommended in a mixed MSS/Non-MSS environment. See M3333, 3350 pages for additional limitations.

[3] 3340 DASD cannot be installed on the 3830 mdl 3.

HIGHLIGHTS

Virtual Disk Storage: Provides up to 64 unique addresses for each channel interface.

Channel Interfaces: Up to three processor channel interfaces are available, providing up to 192 unique addresses on each 3830 mdl 3.

Drives: Up to 32 DASD spindles of 3333/3330 mdls 1, 2 and 11 and 3350 mdls A2/A2F, B2/B2F and C2/C2F can be attached. A 3830 mdl 3 with **#9320** can operate any combination of up to four 3333 mdls 1 and 11 with associated 3330 mdls 1, 2 and 11 and/or native 3350 mdls A2/A2F with associated native 3350 mdls B2/B2F and C2/C2F. A 3830 mdl 3 with #6250 can operate up to four 3350 mdls A2/A2F with associated 3350 mdls B2/B2F and C2/C2F in either native or 3330 mdl 11 mode. See M3333, 3330 and 3350 pages for additional information.

Staging Drives: Up to sixteen 3333 mdl 1/3330 mdl 1 or 2 storage devices can be designated as staging drives. 3333/3330 mdl 11 or 3350 in 3330 mdl 11 mode may also be used for staging drives; however, each mdl 11 or 3350 in mdl 11 mode drive designated as a staging drive is equivalent to two mdl 1 or mdl 2 drives. These staging drives will be used by the 3850 Mass Storage System to provide virtual storage. See note on M3333 pages for feature changes required when 3333s are retained for use with a 3851.

Staging Paths: The 3830 mdl 3 contains control store for data buffering and microcode. This accomplishes data staging without using S/370, 4341 or 4381 Processor channels or memory.

Real Drives: Up to a maximum of 32 attached drives may be designated as "real". Each Real drive uses one of the 192 unique 3830 addresses. All 3350 drives attached to a 3830 mdl 3 with **#9320** must be designated as Real in 3350 native mode only. 3350 drives attached to a 3830 mdl 3 with #6250 may be designated as Real in 3350 native or 3330 mdl 11 mode.

Virtual Storage: All data stored in the 3850 Mass Storage System appears to the system as residing on a 3333/3330 storage device with all the data handling capabilities of the 3330 available.

Bibliography: GC20-0001

SPECIFY

- Voltage (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V, **#9905** for 230V ... must be consistent with 3330 or 3333 voltage.
- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, **#9046** for white.
- DASD Designation: **#9313** ‡ for 3333/3330 DASD, or **#9320** ‡ for 3333/3330/3350 DASD.

SPECIAL FEATURES

Control Store Extension (#2150): [req'd] Provides additional control store for microprogram use. **Field Installation:** Yes.

Expanded Control Store (#2151): Provides additional control store for microprogram use. Required if 3350 DASD is attached. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #2150.

Control Store, Add'l (#2152): Provides additional control store for microprogram use. Required if 3350 DASD is attached. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #2150, #6111 and #2151.

Register Expansion (#6111): Provides additional registers for microprogram use. Required if 3350 DASD is attached. **Field Installation:** Yes. **Maximum:** One.

Remote Switch Attachment (#6148): To attach the Two-Channel Switch (#8170) to a configuration panel. **Maximum:** One. **Field Installation:** Yes.

Remote Switch Attachment, Add'l (#6149): To attach the Two-Channel Switch, Add'l (#8171) to a configuration panel. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #6148.

3350 Staging (#6250): Provides for staging to 3350 drives in 3330 mdl 11 mode and access to Real 3350 in either native or 3330 mdl 11 mode. **Limitations:** Attachment of 3333 mdls 1/11, 3330 mdls 1, 2 or 11 is mutually exclusive with #6250. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #2152 and #6111.

Two-Channel Switch (#8170): [req'd] Provides system channel attachment capability for the 3830 mdl 3. One channel interface attaches to the 3851 MSF and one channel interface attaches to the host processor. An available control unit position is required. See "Prerequisites" and "Limitations". **Field Installation:** Yes.

Two-Channel Switch, Add'l (#8171): Provides attachment for two additional channels to a 3830 mdl 3, providing three processor channel switch capability. **Limitations:** Only two of the three channel interfaces can be attached to channels on the same processor. **Maximum:** One ... see "Prerequisites" and "Limitations". **Field Installation:** Yes. **Prerequisites:** #8170.

MODEL CONVERSIONS

Model 2 can be field changed to a model 3. MES order for model change must include correct serial number and all installed and on-order features and RPQs on the 3830 model 2 to be changed. It must also include removal of any of the following which are installed: **#9190, #9314, #9315, #9317, #9318, #9841.** Prior to ordering the model change, installed and on-order RPQs should be resubmitted to IBM. Control Store Extension (#2150) and Two-Channel Switch (#8170) must be previously installed or installed concurrently with the model upgrade. For customers who wish to have an installed 3830 model 1 converted directly to a 3830 model 3, submit an RPQ. The 3830 mdl 3 to mdl 2 conversion is not recommended for field installation.

ACCESSORIES (None)

SUPPLIES (None)

‡ ISC diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchased machines to include any number of diskette-only changes ordered on the same diskette.

3838 ARRAY PROCESSOR

PURPOSE

An auxiliary processing unit for S/370 mdl 145, 148, 158, 168, 3031, 3032, 3033, 3081, 3083, 3084, 4361, 4381, 4341 Processor and the 3042 Attached Processor model 2, which attaches on a Block Multiplexer Channel. Processes single precision floating point vector operations found in seismic trace processing and other applications.

MODELS

Model 1	001	Contains 256K bytes of bulk storage
Model 2	002	Contains 512K bytes of bulk storage
Model 3	003	Contains 1,024K bytes of bulk storage

Prerequisites:

1. A control unit position on a system block multiplexer channel.
2. For S/370 mdl 168 configuration, if feature #7850 (Two-Byte Interface) is specified the 2880 must also have the appropriate Two-Byte Interface (#7850 or #7851).
3. For S/370 mdl 145, Word Buffer (#8810) is required on the 145 to achieve maximum rated block multiplexer transfer rate.
4. For a 3032 or 3033 Processor configuration if Two-Byte Interface (#7850) is specified, the 3032 or 3033, or 3042 Attached Processor mdl 2 channel to which the 3838 is to be attached must also have the appropriate Two-Byte Interface (#7850).
5. For a 3031, 3032, or 3033 Processor, and a 3042 Attached Processor mdl 2 configuration, if Data Streaming Feature (#4850) is specified on the 3838 with its prerequisite, the channel to which the 3838 attaches must also have the appropriate Data Streaming Feature (#4850) installed.

Limitations: Multiple 3838s; and/or other I/O devices on the same channel may degrade performance. The 3838 is supported only on S/370 mdls 145, 148, 158, 168, 4341, 4361, 4381 with OS/VS1, and mdls 158, 168, 3031, 3032, 3033, 3081, 3083, 3084, 4341, 4361, 4381 with OS/VS2 MVS. Multiple 3838 Array Processors attached to a single S/370 or 4341 Processor host should each have identical algorithm sets because VPSS allocates ports based only on bulk store partition size and shared versus exclusive usage.

Minimum System Requirements:

1. S/370 mdl 145, 148, 158, 168 or 3031, 3032, 3033, 3081, 3083, 3084, 4341, 4361, 4381 with block multiplexer channel.
2. Nine track, 1600 bpi PE magnetic tape (factory order note specifying type and density, if other).
3. MVS Release 3.8 or MVS/System Product Releases 1, 2 or 3, or System Extensions with MVS/Release 3.8. Additionally, the Vector Processing Subsystem (VPSS) Independent Release must be installed.

OS/VS1 Release 6 with Selectable Unit for Subsystem Attachment Support (SU6), and EREP (SU1).

CE maintenance and service capability is affected if any of the above are not part of the system configuration.

HIGHLIGHTS

Permits systems with a high content of vector processing operations to execute the vector work in parallel with processor host processing thereby releasing the processor for other multiprogrammed system tasks. User programmable by coding available instructions to define complete processing sequences. Contains five functional components each capable of overlapped or concurrent operation to sustain processing performance.

Channel Interface: Allows data and control information to transfer in block multiplexer mode at data rates of 1.5MB/sec. in single byte transfers with the processors listed above.

When attached at 3MB/sec. on a two-byte interface, to a S/370 mdl 168, a 3032, 3033 Processor, or a 3042 Attached Processor mdl 2, with the two-byte interface feature on the 3838, the 2880 channels on the 168 must be equipped with a similar feature (#7850 or #7851), and the 3032, 3033 and 3042 Attached Processor mdl 2 channels, to which it is attached, must be equipped with (#7850).

When attached to a 3031, 3032, 3033 Processor or the 3042 Attached Processor mdl 2, with data streaming feature on the 3838, in data streaming mode, at up to 3MB/sec., the Processors must be equipped with Data Streaming Feature (#4850). (On the 3081, 3083, 3084, 4341, 4361 and 4381 data streaming is standard.)

Bulk Storage: Provides independent data storage for up to seven concurrent 3838 users. Seven is the upper limit on 3838 user partitions but is not restrictive of the number of host regions executing 3838 destined jobs. The user partitions may be shared or exclusive. Receives input data from the host and buffers for processing. During processing of algorithm sequences, provides initial, intermediate, and final result data storage. Final results are subsequently transmitted to the host under control of a pending CCW on the block multiplexer channel.

Data Transfer Controller: Provides multiplexing of the internal data busses for concurrent transfers of data between the functional elements.

Arithmetic Processor: Controls algorithm execution for processing vectors through the 100ns/stage pipelined arithmetic unit. Algorithms can be utilized in the application program of individual users to provide comprehensive processing techniques unique to each user. Algorithm control store may be expanded from the basic 16,384 bytes for all mdls with the control store additional feature (#1551) which provides an additional 16,384 bytes of control storage.

Control Processor: Manages the total 3838 subsystem functional operation, synchronizing all data transfers and arithmetic operations, performing logical decisions in algorithm chains, and sequencing multiple users problems through the array processor.

The Instruction Set includes the following vector processing algorithms and logic operations:

Algorithm/Mnemonic:

a) **Arithmetic Instructions (Standard)**
- Vector Move (VMV)
- Vector Move Convert (VMC)
- Scalar Move (SMV)
- Zero Move (ZMV)
- Vector Floating Point to Fixed Point Conversion (VFX)
- Convolving Multiply (CVM)
- Quadratic Interpolation (INT)
- Vector Element-by-Element Sum (VES)
- Scalar Element-by-Element Sum (SSUM)
- Vector Element-by-Element Multiply (VEM)
- Scalar Multiply (SMY)
- Sum of Squares (SSQ)
- Fast Fourier Transform (Forward Real) (FTFR)
- Fast Fourier Transform (Forward Complex) (FTFC)
- Fast Fourier Transform (Inverse Real) (IFTR)
- Fast Fourier Transform (Inverse Complex) (IFTC)
- Complex Multiply (CEM)
- Scalar Complex Multiply (SCEM)
- Complex Multiply (Complex Conjugate) (CMCC)
- Complex Multiply (Conjugate Output) (CMCO)
- Scalar Complex Multiply (Conjugate Output) (SCMC)
- Signed Square Array (SSA)
- Sum of Vector Elements (SVE)
- Array Scan for Maximum (MAX)
- Vector Inner Product (VIP)
- Vector Element Limit (LIM)
- Divide (DIV)
- Scalar Divide (SDIV)
- Square Root (SQRT)
- Nth Zero Crossing (NZCP/NZON)
- Wiener-Levinson (WLEV)

b) **Arithmetic Instructions (Optional)**
- Polynomial Expansion (POLY) (**#9301**)
- Logarithm (LOG) (**#9302**)
- Exponential (EXP) (**#9303**)
- Tangent (TAN) (**#9304**)
- Arctangent (ATAN/ATN2) (**#9305**)
- Recursive Filter (REC) (**#9307**)
- Vector Reverse (REV) (**#9308**)

c) **Logic/Index Instructions**
- Move Index to Index (XMV)
- Move Bulk Storage to Index (XMVS)
- Move Index to Bulk Storage (XMVX)
- Move Immediate to Index (XMVI)
- Add Index to Index (XAD)
- Add Immediate to Index (XADI)
- Subtract Index from Index (XXSE)
- Subtract Immediate from Index (XSBI)
- Multiply Index times Index (XML)
- Multiply Immediate times Index (XMLI)
- Divide Index into Index (XDV)
- Divide Immediate into Index (SDVI)
- Divide Index into Immediate (XDIR)
- Compare Index: Index (SC)
- Decrement and Compare Index: Index (XDC)
- Compare Floating Point Index: Index (XCF)
- Compare Floating Point Index: Immediate (XCFI)
- Compare Index: Immediate (XCI)
- Decrement and Compare Index: Immediate (XDCI)
- Branch on Count Loop (XBCT)
- Unconditional Branch (XGO)

d) **VPSS Instructions**
- Label Definition (XID)
- Move Data to/from S/370/4341, 4361 or 4381 Processor and 3838 Bulk Storage (VPUT/VGET)

3838 Array Processor (cont'd)

Move Data to/from S/370/4341, 4361 or 4381 Processor and 3838 Index (VPUTX/VGETX)

A brief description of the vector processing algorithm follows:

Vector Element Sum (VES): The VES operation provides a resultant vector Y, the elements of which are a sum of the corresponding elements in vector X and vector or scalar U.

Vector Element Multiply (VEM), Scalar Multiply (SMY), or Signed Square Array (SSA): The VEM operation provides a resultant vector Y, the elements of which are a product of the corresponding elements in vectors X and U. The SMY operation is a special case of VEM for which U is a scalar quantity. The SSA operation uses the VEM algorithm with two specifications of the X array as the inputs. A sign control option exercised on the first call of the X array allows the sign of the X array to be retained.

Vector Move Convert (VMC): The VMC operation has four subforms, each of which load the Y vector from the X vector. One form (VMV) moves vectors in bulk store, the second form (VMC) converts the X vector from fixed point integer to floating point, the third form (SMV) is used to load a single value (scalar) into all locations of the Y vector, and the fourth form (ZMV) is a scalar load where zero is specified as the scalar value of X.

Sum of Squares (SSQ) or Vector Inner Product (VIP): The SSQ operation takes a vector X and multiplies it on an element-by-element basis with a replica of itself. It then performs an algebraic sum of these squared elements and returns the single element result to a single element Y. Its VIP operation multiplies on an element-by-element basis, a vector U by a vector X. It then performs an algebraic sum of the resultant products and generates a single element result, Y.

Vector Floating Point to Fixed Point Conversion (VFX): The VFX operation converts a copy of the floating point vector X into a fixed point format, and stores it in Y.

Sum or Vector Elements (SVE): The SVE operation performs an algebraic sum of the elements of an X vector and places the sum in a single element, Y.

Array Scan For Maximum (MAX): The MAX operation scans the input vector X and returns in the two element Y vector the maximum value (after application or sign control) and the count of which element in X had that value.

Vector Element Limit (LIM): The LIM operation replaces the elements of the input vector X with specified minimum and/or maximum values if the input values exceed specified minimum or maximum limit values.

Convolving Multiply (CVM): Resultant vector Y with elements that are a discrete model correlation of the elements in vectors X and U or, by appropriate transposition and translation of the elements in U or X, convolution may be performed.

Divide (DIV): The DIV operation divides input vector U (or scalar (SDIV)) by a second input vector X and places the result in output vector Y.

Nth Zero Crossing (NZCP/NZCN): The NZCP/NZCN operation scans an input vector X and returns in the Y vector:

1) The count of the element X that represents the Nth time the data transitioned between positive and negative, and
2) The total number of zero crossings. The scan may be in order of increasing index (NZCP) or decreasing index (NZCN).

Quadratic Interpolation (INT): The INT operation performs a table lookup and interpolation function on a table of given data, and set of indicators into this table. The interpolation calculation is along a parabola drawn two points to the left and one point to the right of the chosen location, except where the chosen location is within the first input interval in which case the interpolation is based on one point to the left and two points to the right of the chosen point.

Complex Multiply (CEM): The CEM operation provides a resultant vector Y with complex elements from input vectors X and U each of which have complex elements. The operation may be specified to perform Complex Multiply (CEM), Scalar Complex Multiply (SCEM), Complex Multiply (Complex Conjugate) (CMCC), Complex Multiply (Conjugate Output) (CMCO) or Scalar Complex Multiply (Conjugate Output) (SCMC).

Square Root (SQRT): The SQRT operation takes the square root or the magnitude of an input vector or scalar X and places the result in output vector or scalar Y.

Wiener-Levinson Filter (WLEV): The WLEV operation accepts as its input a characterization of a signal and the type of noise encountered when reading that signal, and produces as an output the coefficients for a digital filter to remove the noise. These coefficients are chosen to minimize the RMS error in the output of a filter when the input consists of the expected signal, plus noise of the expected type.

Fast Fourier Transform (FFT): The FFT operation forms the forward or inverse Fast Fourier Transform in either of two modes: one where the time domain data is know to be complex (FFTC and IFTC) and one where it is real data (FFTR and IFTR).

Polynomial (POLY) (#9301): The POLY operation applies up to a 24th order polynomial expansion to the input vector X using coefficients provided in the U vector. **Prerequisites:** If Recursive Filter (REC) (**#9307**) or certain Algorithm Design and Development Service additions have been selected in the standard machine, then Arithmetic Element Control Storage Additional (#1551) is required.

Logarithm (LOG) (#9302): The LOG operation determines the logarithm to the base e of an input vector X. **Prerequisites:** POLY (**#9301**) and Arithmetic Element Control Storage Additional (#1551).

Exponential (EXP) (#9303): The EXP operation provides the antilog to the base e of an input vector X. **Prerequisites:** POLY (**#9301**) and Arithmetic Element Control Storage Additional (#1551).

Tangent (TAN) (#9304): The TAN operation provides the tangent Y of an input vector X. **Prerequisites:** POLY (**#9301**) and Arithmetic Element Control Storage Additional (#1551).

Arctangent (ATAN) (#9305): The ATAN operation provides the arctangent Y of an input vector X. The range of Y is 0 to pi radians. **Prerequisites:** POLY (**#9301**) and Arithmetic Element Control Storage Additional (#1551).

Arctangent 2 (ATN2) (#9305): This alternate version of Arctangent, ATN2, provides the arctangent, Y, of two input vectors, X (X axis) and U (Y axis). The range of Y is 0 to 2 pi radians. **Prerequisites:** POLY (**#9301**) and Arithmetic Element Control Storage Additional (#1551).

Recursive Filter (REC) (#9307): The REC algorithm implements a first order recursion equation where the elements of Y are a function of: previous values of Y, a Y coefficient vector U, an input vector X, and a scalar coefficient which is the first element of the U vector. **Prerequisites:** If Polynomial Expansion (POLY) (**#9301**) or certain Algorithm Design and Development Service additions have been selected in the standard machine, then Arithmetic Element Control Storage Additional (#1551) is required.

Vector Reverse (REV) (#9308): The REV operation reverses the ordering of real data for an input vector X.

Control Storage Requirements: The instruction set available on the 3838 consists of logic operations which are executed in the control processor and vector operations which are executed by the arithmetic processor. The arithmetic processor contains a 16,834 byte reloadable control store which contains the algorithms necessary to accomplish the vector operations. These are loaded when the 3838 is IPL/IMPLed from the host system. Selected arithmetic instructions from the optional arithmetic algorithms may be added to the standard arithmetic algorithms, or additional algorithms may be added to the product via the Algorithm Design and Development Service capability. When the capacity of the 16,384 bytes or control store is exceeded it is necessary to add feature #1551 Control Storage Additional (see "Special Features").

Algorithm Prerequisites: Prerequisite machine or specify features for optional algorithms are as follows:

1. Vector Reverse (REV) (**#9308**) and either POLY (**#9301**) or REC (**#9307**) can be added to the standard machine.
2. Polynomial Expansion (POLY) (**#9301**) is a prerequisite for LOG (**#9302**), EXP (**#9303**), TAN (**#9304**) and ATAN/ATN2 (**#9305**).
3. Any or all of the remaining optional algorithms (POLY) (**#9301**) or REC (**#9307**), LOG (**#9302**), EXP (**#9303**), TAN (**#9304**) and ATAN/ATN2 (**#9305**) require Arithmetic Element Control Storage Additional (#1551).
4. Algorithms provided by the Algorithm Design and Development Service may or may not require Arithmetic Element Control Storage Additional (#1551) depending upon optional algorithm selections or complexity.

3838 Array Processor (cont'd)

SPECIAL FEATURES

Two-Byte Interface (#7850): Provides two-byte parallel transfer on the 2880 Block Multiplexer Channel to achieve data transfer rates up to 3.0MB/sec. **Maximum:** One. **Prerequisites:** #7850 or #7851 on 2880, or #7850 on a 3032, 3033, or 3042 Attached Processor mdl 2. **Field Installation:** Yes.

Data Streaming Feature (#4850): Provides attachment of the 3838 in Data Streaming Mode to channels on the 303X, 3042 Attached Processor mdl 2, 4341, 4361, 4381, 3081, 3083, and 3084. **Limitations:** The 3838 must be transferring data to and from the host processor channels in 4-byte (full word) multiples. **Maximum:** One per 3838. **Prerequisites:** On the 3838, #7850 is a prerequisite. If attached to the 303X and 3042 mdl 2, #4850 is required on the processor. **Field Installation:** Yes. Parts removed in the installation of this feature become the property of IBM.

Arithmetic Element Control Storage, Add'l (#1551): An additional 16,384 bytes of control store for additional algorithm capabilities. Custom algorithms are requested by Algorithm Design and Development Service. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS

Field Installable.

ACCESSORIES (None)

SUPPLIES (None)

3843 LOOP CONTROL UNIT

PURPOSE

A signal converting unit used to provide loop capability at remote locations via a telecommunications link to one of the following:

- IBM 3630 Plant Communication System
- IBM 4331 Mdl Group 1 or 2 Processor
- IBM 8100 Information System.

The 3843 must be installed at the same site as the loop. The 3843 controls loop operation and provides an EIA/CCITT interface for attachment of an external synchronous modem. External non-IBM modems may be attached subject to the Multiple Supplier Systems Bulletin. Refer to M2700 pages.

MODELS (None)

HIGHLIGHTS

A 3843 loop may be up to 3.2 cable kilometers (2 cable miles) in length. All terminals that can attach to a 3631/3632 loop, a 3842 loop, an 8100 direct attached loop or 4331 loop via the 4331 loop adapter may be attached to the 3843 loop. The 3843 controls polling and with one poll command addressed to it, can provide responses from all loop attached terminals.

The 3843 operates at loop speeds of up to 9600 bps and will transmit/receive data over the telecommunication link at a speeds of 2400, 4800 or 9600 bps.

Communications: The 3843 functions with a synchronous modem (modem clocking) that transmits at 2400, 4800 or 9600 bps on a 2- or 4wire half-duplex nonswitched telecommunication link, with or without backup on the public switched network. The electrical characteristics of the EIA/CCITT interface comply with EIA recommendations RS232C and RS334 (for U.S.), CCITT recommendations (1976) V.24/V.28, ISO standard 2110 and other relevant CCITT recommendations. The interface supports modems functioning as recommended in CCITT V.26, V.27, V.27 and V.29. The 3843 also supports the test control line used by IBM modems. IBM modem attachment support:

IBM MODEMS	Speed (bps)	Line
3863 - 001	2400/1200	Nonswitched voice grade
3864 - 001	4800/2400	Nonswitched voice grade
3865 -001/002	9600/4800	Nonswitched voice grade
3872 - 001	2400/1200	Nonswitched voice grade

Four wire switched network backup operation with manual call and auto answer is available on 3863 mdl 1, 3864 mdl 1 and 3865 mdls 1 and 2. For communications capabilities, product utilization and special features, see M2700, 3863, 3864, 3865 and 3872 pages.

Nonswitched Lines: PTT (common carrier) provided telecommunication lines of voice grade quality. The actual line specification is dependent upon the attached modem selected to support the 3843. Duplex 4-wire required for multipoint and also recommended for point-to-point.

Privately Owned Communication Facilities: Equivalent to the above.

Public Switched Telecommunication Networks: The customer must be advised that satisfactory data transmission depends on the characteristics of the particular switched network facilities being used. Refer to M2700 pages for further details.

International Facilities: Transmission of data between the United States and Canada on nonswitched facilities is supported (US type 3002, Canada schedule 4, type 4). For Data transmission between all countries, request your country TP coordinator to contact the coordinator in the other countries involved to determine the availability of the required telecommunication facilities.

Related Equipment: The 3843 communicates with an appropriately configured 3631 or 3632 with EIA/CCITT Interface - data link (#3703) and data link adapter (#3211), a 4331 Mdl Group 1 or 2 Processor with data link adapter (#4840) or to an 8100 system with EIA interface adapter (#3701) and communications adapter without clock-SDLC (#1602). For communications capabilities, product utilization and special features, refer to M2700, 3630, 3631, 3632, 4331, 8101, 8130 and 8140 pages.

Customer Setup: The 3843 is designated for customer setup (CSU). This provides the customer with early availability. All selectable options and the address will be set at the plant from customer order information. Because none of the selectable options nor the address are accessible to the customer, a change of modem, data rate or location may require modifications to the 3843 by Field Engineering.

Problem Determination Aids: Can execute on-line diagnostic commands to perform self-tests, to assist in locating loop wiring or terminal failures at the remote site.

A Speed Select Switch is provided. This allows the 3843 to switch loop data speed to half-speed providing the externally attached modem has a half-speed capability. Modems with this capability can also be remotely switched to half-speed operation via the Speed Select Switch if they provide a "Data Rate Select" control line to the 3843.

Off-line tests are provided to perform self tests of the 3843 with or without involving loop wiring and/or loop terminals.

Physical Environments: The 3843 Loop Control Unit has been designed for operation in physical environments characteristic of office areas. See *IBM 3630 Plant Communication System, System Description*, GA24-3652 or *Introduction to the 8100 Information System*, GA27-2875.

Customer Responsibilities: The customer must be informed of his responsibilities as detailed in the M2700 pages and the pertinent section of the *IBM 3630 Installation Manual Physical Planning*, GA24-3675, and the *IBM System 3630 Plant Communications System Loop Installation - Physical Planning*, GA24-3676, or the *IBM 8100 Information System Site Planning and Preparation Guide for IBM 8101, IBM 8130, IBM 8140*, GA27-2844 or the *4331 Processor Installation Manual-Physical Planning*, GA24-3667.

The customer is responsible for the following:

- Arrangement for price quotations, installation and all costs of external modem and its associated equipment, services, and telecommunication facilities.
- Purchase, installation, testing, and maintenance of the loop cabling systems. Purchase a Loop Continuity and Relay Tester, if required. (See *IBM 8100 Information System Loop Installation Manual - Physical Planning Guide*, GA27-2878 or the *4331 Processor Installation Manual-Physical Planning*, GA24-3667.
- When installed on a 3630 Plant Communication System, The 3843 must be installed near a 3643. When installed on an 8100 System, the 3843 must be installed near a 3276 Control Unit Display Station, a 3278 Display Station, or an 8775 Display Terminal. When installed on a 4331 System, the 3843 must be installed near a 3641 or 3643 terminal when 3640 terminals are attached, when only 3287, 3775, 3276, or 3274 with their associated terminals are attached, test invocation is only possible from the Ops. Console. These devices are required for remote loop installation, problem determination procedures, and maintenance.
- Providing voice communications between the 3843 and the controller/processor locations to coordinate tests. The voice facility must be located in such a way that the operator can use it while operating the controls on the front of the 3843.
- Providing a wrap type Loop Station Connector for the 3843.
- Unpacking, physical setup, and connection of cables at setup time.
- Notifying IBM of intent to relocate the unit and following IBM instructions for relocation.
- Disconnecting, packing, and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be furnished by IBM.
- Physical setup, connection of cables to communication lines/modems and IBM devices incorporating protected customer access areas, switch settings and check out.
- Contact Field Engineering to make cable connections of IBM CSU units to non-CSU units where access areas are not provided.

Bibliography: *IBM 3630 Plant Communication System, System Description*, GA24-3652

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (AC, 1-phase, 3-wire, 60 Hz): 115V (usable on 120V): **#9880** for locking plug, or **#9881** for non-locking plug. 208V: **#9884** for locking plug, **#9885** for non-locking plug. 230V: **#9886** for locking plug, **#9887** for non-locking plug.
- **Data Rate:** **#9822** for 2400 bps; **#9823** for 4800 bps; **#9825** for 9600 bps. See Note below.
- 3843 Address: **#9587** must be specified on all orders— supplemental specs available for giving one EBCDIC byte address. Any two "Hex" characters, excluding "00" and "FF", may be used. Refer to: *IBM 3630 System Description*, GA24-3678, *IBM 3630 Programmers Guide*, GC24-5174, *IBM 3630 Plant Communication System Planning Guide*, GA24-3685, *IBM 8100 DPPX Administration Guide*, SC27-0403, *IBM 4331 Processor Summary I/O and Communication Configurator*, GA33-1523, *IBM 4331 Loop Operating Procedures and Problem Determination*, GA33-1538. On a multipoint network, each 3843 must be assigned a unique address. See Note below.
- Modem: **#9350** for connection to an IBM 3872 Modem; **#9351** for connection to an IBM 3863, 3864, 3865, or 3874 Modem; **#9352** for connection to a non-IBM modem. See Note below.
- Related Equipment: To provide applicable documentation, specify **#9560** if the 3843 will be part of a 3630 System, **#9569** if the 3843

3843 Loop Control Unit (cont'd)

will be part of an 8100 System or **#9565** if the 3843 will be part of a 4331 Processor.

- Loop Station Connector Cable: A 2.1m (7 ft) cable is provided as standard. If a 4.2m (14 ft) cable is desired, specify **#9410**.
- Interconnection Cable to Modem: A 6.0m (20 ft) interconnection cable is provided as standard for attachment to the modem. If other than a 6.0m cable is required, specify **#9021** and indicate 10 for a 3.0m (10 ft) cable, 30 for a 9.0m (30 ft) cable, or 40 for a 12.0m (40 ft) cable.

Note: "Data Rate", "3843 Address" and "Modem" type can be altered by service personnel. Instructions are contained in the maintenance manual. Do not submit an MES order to change these items.

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES (None)

SUPPLIES (None)

3845 DATA ENCRYPTION DEVICE

PURPOSE

A table top or shelf mounted encryption/decryption device for data transmitted over a communication line. The 3845 is positioned between a data terminal equipment (DTE) and a data communications equipment (DCE), one at each end of a half-duplex or duplex communication line. The 3845 will operate with Start/Stop (S/S), Binary Synchronous Communications (BSC), or Synchronous Data Link Control (SDLC) protocol at speeds ranging from 110 bps to 19,200 bps. See 'Limitations' under "Communications".

Attachable Devices: The 3845 is transparent to the DCE and the DTE. Control signals used by the 3845 are redriven in compliance with the EIA-CCITT specification. All other signals are cable fed through the 3845. The 3845 will attach wherever EIA RS-232-C/CCITT V.24 interface requirements are met.

MODELS

MODELS 1-3: For use with Start/Stop or SDLC line protocol (S/S-SDLC).

Model 1 001 — A single half-duplex unit operating on a 2- or 4-wire half-duplex communication.

Model 2 002 — A dual half-duplex unit, with each half duplex device completely independent of the other, operating over 2- or 4-wire half-duplex communication lines.

Model 3 003 — A full duplex unit operating over a full duplex communication line.

MODELS 11-13: For use with BSC, BSC with Business Machine Clock (BMC), or SDLC (BSC/SDLC or BSC with BMC).

Model 11 011 — A single half-duplex unit, operating on 2- or 4-wire half-duplex communication line in BSC/SDLC or BSC with BMC ... see "Specify Features".

Model 12 012 — A dual half-duplex unit, with each half-duplex device completely independent of the other, operating over 2- or 4-wire half-duplex lines in BSC/SDLC or BSC with BMC - see "Specify". **Limitations:** A model 12 must have both outputs either BSC/SDLC or BSC with BMC.

Model 13 013 — A full duplex unit operating over a full duplex communication line in BSC/SDLC or BSC with BMC - see "Specify".

Limitations: Operation at 19,200 bps may require the user to optimize cable length and quality. For additional information, refer to the *General Information Manual,* GA27-2865.

Prerequisites: (1) A S/S, BSC or SDLC communication line ... (2) compliance with EIA RS-232-C or CCITT V.24 ... (3) external modems, IBM or non-IBM ... (4) Personalization/ Key Entry Unit (accessory) available at site location. See M10000 pages.

Customer Setup (CSU): Machine only.

HIGHLIGHTS

A communication security device that provides encryption/decryption of digital data transmitted over a communication line. The 3845 implementation of Data Encryption Standard (DES) conforms to the U.S. National Bureau of Standards algorithm published as FIPS #46, January 15, 1977.

Two or more data encryption devices (3845 or 3846) are needed, one at each termination of a communication line (point-to-point or multipoint). **Limitations:** A 3845 or 3846 is required at each node in order to have message header information in the clear through that node.

The 3845 is cabled to the DTE via the cable that is provided by the DTE manufacturer for attachment to the DCE. Attachment from the 3845 to the DCE is by a cable provided with the 3845. One cable is provided per line function. **Limitations:** The cable provided with the 3845 is 1.5 meters (5.0 feet) long. This adds load capacitance to the DTE/DCE. See the *General Information Manual,* GA27-2865, for specific information on the additional capacitance.

An accessory, the Personalization/Key Entry Unit (P/KEU), must be available at each site location having a 3845. This accessory is used to enter the key variable, the seed, and to personalize the 3845 to the customer's communication line. The key variable is a 56 bit plus parity code, entered by the customer at a frequency consistent with his security requirements. The customer defines his own keys, selects them in a random manner, and enters them manually. The seed is 1 to 16 hexadecimal random characters used to initiate the synchronization message. The personalization consists of four hexadecimal characters of information that personalizes the 3845 to the communication facilities, such as line discipline, line speed, method of clocking, and synchronization message length.

The 3845 has a bypass switch that allows messages to be sent in the clear and is also used by the customer in fault isolation. A battery is provided that maintains power to the storage registers containing the key variable, seed, and personalization data when the 3845 AC power is removed.

Security is provided by the use of interlocks that remove power, including battery power, from the storage registers whenever the service cover is removed. The seed, key variable and personalization must be reentered when all power (battery and AC) is removed.

Communications: The 3845 mdls 1, 2 and 3 encrypt/decrypt data if the DTE/DCE: (a) conforms to interface EIA RS-232-C or CCITT V.24; (b) uses S/S or SDLC protocol; (c) operates on a half-duplex or duplex facility; (d) is within the speed of 110 to 9600 bps for asynchronous operation or the speed of up to 19,200 bps for synchronous operation; (e) uses a 7- or 8-bit code (exclusive of the required start and stop bits) for asynchronous operation or uses an 8-bit SDLC flag for SDLC operation; and (f) ensures an identical bit stream between transmit output and receive input functions of the 3845/3846 units on the same communication line.

The 3845 mdls 11, 12 and 13 encrypt/decrypt data if the DTE/DCE: (a) conforms to interface EIA RS-232-C or CCITT V.24; (b) uses BSC or SDLC protocol; (c) operates on a half-duplex or duplex facility; (d) is within the speed of up to 19,200 bps; (e) uses an EBCDIC or ASCII code (odd parity only) for BSC or uses an 8-bit SDLC flag for SDLC operation; and (f) insures an identical bit stream between transmit output and receive input functions of the 3845/3846 units on the same communication line.

Data Communications Equipment: External Data Communications Equipment must be used with the 3845. IBM external modems may be attached to the 3845:

Modem	Speed (bps)
3872	1200/2400

Problem Determination Procedure: A bypass switch is provided that allows transmission in the clear to permit determining whether a problem exists in the 3845 or in other equipment. See "Customer Responsibilities" below.

Problem determination is a customer responsibility that does not involve the customer engineer.

Customer Setup (CSU): The 3845 is designated as a customer setup device, thereby offering the customer relocation flexibility. CSU is a customer responsibility that does not involve the customer engineer.

Customer Responsibilities: The customer is responsible to: Provide an adequate site and other preparation, including Installation Planning ... receive at the customer's receiving dock, unpack and set up the 3845 ... connect cables to the 3845 and DCE ... personalize to the communication facility ... enter the seed ... enter the key variable ... use and follow the problem determination procedures and follow instructions for service of the 3845. **Note:** Appropriate procedures are provided by IBM with each unit for setup, personalization and entering the seed and key variable.

Maintenance: The customer may wish to replace a failing 3845 with a spare and must be advised to purchase spares for such use. The number of spare devices needed is dependent upon the number of devices the customer has installed, his application requirements, physical locations, and layouts.

IBM Service: Maintenance of the 3845 will normally be at a designated IBM Location . All maintenance, parts replacement, adjustments, and repair shall normally be performed at the designated IBM Location. It shall be the customer's responsibility to set up the equipment and to determine when remedial maintenance is required. When remedial maintenance is required, it shall be the customer's responsibility to determine the failing device, pack the device in the designated shipping container and ship it prepaid to the IBM Repair Center. IBM will pre-pay the transportation charges for return of the repaired device. There is no regularly scheduled preventive maintenance recommended by IBM on these devices.

The service is available under an *IBM Repair Center Service Amendment,* to the IBM Maintenance Agreement or on a Time and Material basis.

Customers with machines not under an IBM Maintenance Agreement have the option to ship the machines to the designated IBM location for repair under the *IBM Repair Center Machine Repair Authorization Form,* GX27-2981, in which case repair will be made (if the machine is repairable). Alternatively, upon request, the IBM Location will provide, for a minimum charge, an estimate of repair charges. This charge covers handling, inspection, adjustments, testing, return shipping charges and estimating of repair charges.

The 3845 is eligible for maintenance agreement service immediately following expiration of the service and parts warranty at the monthly charge shown under MMMC in "Prices".

If maintenance agreement service is not contracted for immediately following expiration of the service and parts warranty and the customer

3845 Data Encryption Device (cont'd)

wants maintenance agreement service, the customer may ship the machine(s) to the designated IBM location for an inspection.

If, on the basis of an inspection, the Designated IBM Location concludes that a machine is not repairable, no further work will be performed. The machine will be returned to the customer with a minimum charge to cover handling, inspection, testing and a return shipping charge.

In all other cases, the IBM Location will charge a minimum fee per machine to cover handling, inspection, adjustments, testing, and return shipping. In addition, all parts needed will be billed at IBM's prevailing parts prices and the additional time required for repairs will be billed at IBM's applicable service rates, if so authorized by the customer. The machine will then be eligible for maintenance agreement service.

Personalization/Key Entry Unit (P/KEU): Maintenance agreements are not available. Customer engineering on-site service will not be provided. During the warranty period, warranty service is available at the Designated IBM Location.

Configuration: The HONE Configurator, CFMODEM, is available to help in configuring the 3845/3846.

Bibliography: GA27-2865, *General Information Manual* ... GA27-2866, *Principles of Operation.*

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- For 3845 mdls 11, 12 and 13: Specify one ... installation available at time of manufacture only.

  #9110 - BSC/SDLC, or
  #9115 - BSC with BMC

- Line Voltage Plug:

  #9890 Power and line cord, single phase, 60 Hz, 115/120 volt lock plug

  #9891 Power and line cord, single phase, 60 Hz, 115/120 volt non-lock plug

- Line Cord Length: If the standard 2.8 meter (9 foot) power cable is not desired, specify:

  #9511 for 1.8 meter (6 foot) line cord
  #9512 for 3.7 meter (12 foot) line cord
  #9513 for 4.5 meter (15 foot) line cord

SPECIAL FEATURES (None)

Codes: SIU = 3845 ID = L80 SYSTYPE = 3045

MODEL CONVERSIONS

Available at time of manufacture only.

ACCESSORIES

For delivery with the machine, specify the appropriate Feature number on the 3845 machine order (except battery). For delivery at any other time, specify the appropriate Part Number on MSORDER (Category = Accessories/ Supplies) on AAS (except battery).

Personalization/Key Entry Unit: On the 3845, to enter the key variable, seed, and personalization data. One must be available at each site having a 3845.

Battery: A battery is needed to replace the installed battery. The replacement schedule is defined in the *Principles of Operation Manual.* Discharged batteries should be returned to IBM.

Feature Summary	P/N	Feature No.
Personalization/Key Entry Unit	**4407908**	**#9501**
Mounting Plates	**6813128**	**#9502**
Blank Panel	**4409058**	**#9503**
Battery	**6815261**	

Warranty: Services are available for Personalization/Key Entry Unit at the designated IBM Repair Center during the 90 day warranty period which commences 30 days following date of shipment from the Plant of Manufacture (Raleigh). It shall be the customers responsibility to determine the failing unit and if the unit is still under warranty to pack it in the designated shipping container and ship it pre-paid to the designated IBM Repair Center.

IBM Maintenance Agreements are not available. Field Engineering on-site service will not be provided.

SUPPLIES

None required with machine order.

3846 DATA ENCRYPTION DEVICE

PURPOSE

A rack-mounted encryption/decryption device for data transmitted over a communication line. The 3846 is positioned between a data terminal equipment (DTE) and a data communications equipment (DCE), one at each end of a half-duplex or duplex communication line. The 3846 will operate with Start/Stop (S/S), Binary Synchronous Communications (BSC), or Synchronous Data Link Control (SDLC) protocol at speeds ranging from 110 bps to 19,200 bps. See 'Limitations' under "Communications."

Attachable Devices: The 3846 is transparent to the DCE and the DTE. Control signals used by the 3846 are redriven in compliance with the EIA RS-232-C/CCITT V.24 specification. All other signals are cable fed through the 3846. The 3846 will attach wherever EIA RS-232-C/CCITT V.24 interface requirements are met.

MODELS

Model 1 001 — A power unit capable of providing power to one to four line function units.

Models 2-3

For use with Start/Stop or SDLC line protocol meeting EIA RS-232-C or CCITT V.24 interface. Requires a 3846 Model 1 for power.

Model 2 002 — A dual half-duplex line function unit, with each half-duplex device completely independent of the other, operating over 2- or 4-wire half-duplex communication lines.

Model 3 003 — A full duplex line function unit operating over a full duplex communication lines.

Models 12-13

For use with BSC, BSC with Business Machine Clock (BMC), or SDLC (BSC/SDLC or BSC with BMC). Requires a 3846 Model 1 for power.

Model 12 012 — A dual half-duplex line function unit, with each half-duplex device completely independent of the other, operating over 2- or 4-wire half-duplex communication lines in BSC/SDLC or BSC with BMC ... see "Specify". **Limitations:** A Model 12 must have both outputs either BSC/SDLC or BSC with BMC.

Model 13 013 — A full duplex line function unit operating over a full duplex communication line in BSC/SDLC or BSC with BMC ... see "Specify".

Limitations: Operation at 19,200 bps may require the user to optimize cable length and quality. For additional information, refer to the *General Information Manual,* GA27-2865.

Prerequisites: (1) A S/S, BSC or SDLC communication line ... (2) compliance with EIA RS-232-C or CCITT V.24 ... (3) external modems, IBM or non-IBM ... (4) a 3846 mdl 1 must be available to power a 3846 mdl 2, 3, 12 or 13 ... (5) Personalization/Key Entry Unit (accessory) available at site location ... (6) accessory mounting panel ... (7) accessory blank panel may be ordered, if desired ... see M10000 pages.

HIGHLIGHTS

A communication security device that provides encryption/decryption of digital data transmitted over a communication line. The 3846 implementation of Data Encryption Standard (DES) conforms to the U.S. National Bureau of Standards DES algorithm published as FIPS #46, January 15, 1977.

Two or more data encryption devices (3845 or 3846) are needed, one at each termination of a communication line (point-to-point or multipoint). Limitations: A 3845 or 3846 is required at each node in order to have message header information in the clear through that node.

The 3846 is cabled to the DTE via the cable that is provided by the DTE manufacturer for attachment to the DCE. Attachment from the 3846 to the DCE is by a cable provided with the 3846. One cable is provided per line function. Limitations: The cable provided with the 3846 is 1.5 meters (5.0 feet) long. This adds load capacitance to the DTE/DCE. See the *General Information Manual,* GA27-2865, for specific information on the additional capacitance.

An accessory, the Personalzation/Key Entry Unit (P/KEU), must be available at each site location having a 3846. This accessory is used to enter the key variable, the seed, and to personalize the 3846 to the customer's communication line. The key variable is a 56-bit plus parity code, entered by the customer at a frequency consistent with their security requirements. The customer defines his own keys, selects them in a random manner, and enters them manually. The seed is 1 to 16 hexadecimal random characters used to initiate the synchronization message. The personalization consists of four hexadecimal characters of information that personalizes the 3846 to the specific communication line characteristics, such as line discipline, line speed, method of clocking, and synchronous message length.

The 3846 depends on the customer providing a method of switching to enable the user send messages in the clear and for fault isolation. A battery is provided that maintains power to the storage registers containing the key variable, seed, and personalization data when the 3846 AC power is turned off.

Security is provided by the use of interlocks that remove power, including battery power, from the storage registers whenever a line function is removed from the rack or a service cover of a line function unit is removed. The seed, key variable and personalization must be reentered when all (battery and AC) power is removed.

Communications: The 3846 mdls 2 and 3 encrypt/decrypt data if the DTE/DCE: (a) Conforms to interface EIA RS-232-C or CCITT V.24; (b) uses S/S or SDLC protocol; (c) operates on a half-duplex or duplex facility; (d) is within the speed of 110 to 19,200 bps; (e) uses a 7- or 8-bit code (exclusive of the required start and stop bits) for asynchronous operation or uses an 8-bit SDLC flag for SDLC operation; and (f) ensures an identical bit stream between transmit output and receive input functions of the 3845/3846 units on the same communication line.

The 3846 mdls 12 and 13 encrypt/decrypt data if the DTE/DCE: (a) Conforms to interface EIA RS-232-C or CCITT V.24; (b) uses BSC or SDLC protocol; (c) operates on a half-duplex or duplex facility; (d) is within the speed of up to 19,200 bps; (e) uses an EBCDIC or ASCII code (odd parity only) for BSC or uses an 8-bit SDLC flag for SDLC operation; and (f) ensures an identical bit stream between transmit output and receive input functions of the 3845/3846 units on the same communication line.

Data Communications Equipment: External Data Communications Equipment must be used with the 3246. IBM external modems may be attached to the 3846:

Modem	Speed (bps)
3872	1200/2400

Problem Determination Procedure: A customer installed switch panel must be used to permit determining whether a problem exists in the 3846 or in other equipment. See "Customer Responsibilities" below.

Problem determination is a customer responsibility that does not involve the customer engineer.

Customer Setup (CSU): The 3846 is designated as a customer setup device, thereby offering the customer relocation flexibility. CSU is a customer responsibility that does not involve the customer engineer.

Customer Responsibilities: The customer is responsible to: Provide an adequate site and other preparation, including installation planning ... receive at the customer's receiving dock, unpack and set up the 3846 ... make the interconnection between the 3846 mdl 1 and the 3846 line function devices ... connect cables to the 3846 and DCE ... personalize to the communication facility ... enter the seed ... enter the key variable ... use and follow the problem determination procedures and follow instructions for service of the 3846 Note: Appropriate procedures are provided by IBM with each unit for setup, personalization and entering the seed and key variable.

Maintenance: The customer may wish to replace a failing 3846 with a spare and must be advised to purchase spares for such use. The number of spare devices needed is dependent upon the number of devices the customer has installed, his application requirements, physical locations, and layouts.

IBM Repair Center Service: Maintenance of the 3846 will normally be at a designated IBM Location . All maintenance, parts replacement, adjustments, and repair shall normally be performed at the designated IBM Location. It shall be the customer's responsibility to set up the equipment and to determine when remedial maintenance is required. When remedial maintenance is required, it shall be the customer's responsibility to determine the failing device, pack the device in the designated shipping container and ship it prepaid to the IBM Repair Center. IBM will pre-pay the transportation charges for return of the repaired device. There is no regularly scheduled preventive maintenance recommended by IBM on these devices.

The service is available under an *IBM Repair Center Maintenance Supplement* , to the IBM Maintenance Agreement or on a Time and Material basis .

Customers with machines not under an IBM Maintenance Agreement have the option to ship the machines to the designated IBM location for repair under the *IBM Repair Center Machine Repair Authorization Form,* GX27-2981 in which case repair will be made (if the machine is repairable). Alternatively, upon request, the IBM Location will provide, for a minimum charge, an estimate of repair charges. This charge covers handling, inspection, adjustments, testing, return shipping charges and estimating of repair charges.

The 3846 is eligible for maintenance agreement service immediately following expiration of the service and parts warranty at the monthly charge shown under MMMC in "Prices" .

3846 Data Encryption Device (cont'd)

If maintenance agreement service is not contracted for immediately following expiration of the service and parts warranty and the customer wants maintenance agreement service, the customer may ship the machine(s) to the designated IBM location for an inspection.

If, on the basis of an inspection, the Designated IBM Location concludes that a machine is not repairable, no further work will be performed. The machine will be returned to the customer with a minimum charge to cover handling, inspection, testing and a return shipping charge.

In all other cases, the IBM Location will charge a minimum fee per machine to cover handling, inspection, adjustments, testing, and return shipping. In addition, all parts needed will be billed at IBM's prevailing parts prices and the additional time required for repairs will be billed at IBM's applicable service rates, if so authorized by the customer. The machine will then be eligible for maintenance agreement service.

Personalization/Key Entry Unit (P/KEU) maintenance agreements are not available. Customer engineering on-site service will not be provided. During the warranty period, warranty service is available at the Designated IBM Location.

Configurator: The HONE Configurator, CFMODEM, is available to help in configuring the 3845/3846.

Bibliography: GA27-2865, *General Information Manual* ... GA27-2899, *Principles of Operation.*

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- For 3846 mdls 12 and 13: Specify one ... installation available at time of manufacture only.

  #9110 - BSC/SDLC, or
  #9115 - BSC with BMC

- Line Voltage Plug (for 3846 mdl 1 only):

  #9890 Power and line cord, single phase, 60 Hz, 115/120 volt lock plug

  #9891 Power and line cord, single phase, 60 Hz, 115/120 volt non-lock plug

- Line Cord Length (for 3846 mdl 1 only): If the standard 2.8 meter (9 foot) power cable is not desired, specify:

  #9511 for 1.8 meter (6 foot) line cord
  #9512 for 3.7 meter (12 foot) line cord
  #9513 for 4.5 meter (15 foot) line cord

SPECIAL FEATURES (None)

Codes: SIU=3846 ID=L90 SYSTYPE=3046

MODEL CONVERSIONS

Available at time of manufacture only.

ACCESSORIES

For delivery with the machine, specify the appropriate Feature number on the 3846 machine order (except battery). For delivery at any other time, specify the appropriate Part Number on MSORDER (Category = Accessories/ Supplies) on AAS (except battery).

Personalization/Key Entry Unit: On the 3846, to enter the key variable, seed, and personalization data. One must be available at each site having a 3846.

Mounting Plate: One unit is needed for each four of 3846 models 1, 2, 3, 12, 13 to permit placing the 3846 in a rack.

Blank Panel: A blank panel may be ordered to cover an unused 3846 opening in the accessory mounting plate.

Battery: A battery is needed to replace the installed battery. The replacement schedule is defined in the *Principles of Operation Manual.* Discharged batteries should be returned to IBM.

Feature Summary	P/N	Feature No.
Personalization/Key Entry Unit	**4407908**	**#9501**
Mounting Plates	**6813128**	**#9502**
Blank Panel	**4409058**	**#9503**
Battery	**6815261**	

Warranty: Services are available for Personalization/Key Entry Unit at the designated IBM Repair Center during the 90 day warranty period which commences 30 days following date of shipment from the Plant of Manufacture (Raleigh). It shall be the customers responsibility to determine the failing unit and if the unit is still under warranty to pack it in the designated shipping container and ship it pre-paid to the designated IBM Repair Center.

IBM Maintenance Agreements are not available. Field Engineering on-site service will not be provided.

SUPPLIES

None required with machine order.

3848 CRYPTOGRAPHIC UNIT

PURPOSE

An auxiliary unit that enciphers and deciphers data when attached to the Virtual Storage S/370 mdls 135-3 through 168, and the 4331, 4341, 4361, 4381, 3031, 3032, 3033, 3081, 3083 and 3084 Processors.

MODELS

Model 1 001

Prerequisites: Each 3848 requires a control unit position on a block multiplexer or selector channel.

A key entry unit (accessory) must be available for use with the 3848.

For communication security, the 3848 and the Cryptographic Unit Support Program Product require terminals that include the Encrypt/Decrypt feature (#3680) and either the ACF/VTAM (Program Product #5735-RC2), Encrypt/Decrypt feature (#6010), or ACF/TCAM Version 2 (Program #5735-RC3).

HIGHLIGHTS

Provides data encryption capability for file and communications applications. The encryption process implements the Data Encryption standard (DES) published by the U. S. National Bureau of Standards as Federal Information Processing Standard (FIPS) #46 January 15, 1977.

A block chaining mode of operation is used with the DES algorithm to further disguise formatted data.

The user selected master key is maintained securely in a special storage element protected by a battery during power off periods. The master key entry process is protected by a physical key.

Master key entry is performed via a small hand-held key entry unit available as an accessory.

Attachment can be to a block multiplexer or selector channel. The maximum data rate is 1.5 megabytes per second. When attached to channels capable of 3.0 megabyte/ second data streaming and operating in data streaming mode (CE selectable) the 3848 maximum data rate is 3.0 megabytes per second.

Definition of selected key-encrypting keys as two 56-bit values provides a greater effective key length than the single 56-bit DES key.

Programming Support: Support for the 3848 is provided by the Cryptographic Unit Support program product (5740-XY6). This program provides the access method, error recovery and error recording for one or more 3848 units. Additionally, it provides generation and management control functions for cryptographic keys.

Customer Responsibilities: Primary customer responsibilities for using the 3848 Cryptographic Processor are:

- Generating Cryptographic keys. The master key must be selected by the user. The Cryptographic Unit Support program product (5740-XY6) may be used to generate key-encrypting and data-encrypting keys.
- Providing adequate physical protection measures for the computer system to which the 3848 is attached. Access to the 3848 and the support program product should be limited to authorized users.
- Maintaining secure duplicate copies of the key-encrypting keys used. A lost key precludes decrypting and results in loss of data.

Minimum Systems Requirements: The 3848 was designed to operate with the Cryptographic Unit Support program product or its equivalent. In combination, these products assist in safeguarding sensitive information. Neither product alone can provide the same function or the same degree of security as this combination.

The use of the 3848 without the error recovery and recording functions of the Cryptographic Unit Support program product will reduce the availability and maintenance characteristics of the Cryptographic Unit.

The Cryptographic Unit Support Program Product is supported in OS/VS 2 MVS (Release 3.9) and OS/VS 1 environment. Use with OS/VS 1 requires the Basic Programming Extensions Program Product (5662-257).

Operation with the S/370 mdl 145 requires Advanced Control Program Support (#1001). Attachment to any channel of a mdl 145 with four selector channels installed, or to the third selector channel of a mdl 145 with three selector channels installed requires the Word Buffer (#8810) on the mdl 145.

Bibliography: GC20-0001

SPECIFY

Unless otherwise indicated, these specify features are only available at time of manufacture.

- Voltage (AC, single phase, 3 wire, 60 Hz): **#9902** for 208V, **#9914** for 240V (240V is compatible with 230V.)
- Power Cable Length: (Designed for below-floor cabling). If standard 4.3 meter (14 foot) cable is not desired, specify **#9986** for 1.8 meter (6 foot) cable.
- Color: **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, **#9065** for pebble grey, **#9066** for pearl white.

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES

Personalization/Key Entry Unit (#9501): This item is available on a purchase-only basis. Order by feature number for delivery with the 3848 or by **P/N 4407908** for delivery at any other time. To enter the master key and to facilitate certain service functions, one unit must be available at each site having one or more 3848 Cryptographic Units.

SUPPLIES (None)

3851 MASS STORAGE FACILITY (MSF)

PURPOSE

Large capacity storage and control facility for the 3850 Mass Storage System (MSS) for attaching to S/370 models 145, 145-3, 148, 155II, 158, 165II and 168, or a 3031, 3032, 3033, 3081, 3083, 3084 Processor, or a 4341 or 4381 Processor.

MODELS

A-Series	One Mass Storage Control
B-Series	Two Mass Storage Controls ... one MSC is the active control ... the second is an alternate control.

Model	Capacity Number of Cartridges	Capacity Max Bytes (Billions)	Data Recording Devices	Data Recording Control
A01/B01	706	35.3	2	1
A11/B11	2044	102.2	2	1
A21/B21	3382	169.1	2	1
A31/B31	4720	236.0	2	1
A02/B02	2044	102.2	4	2
A12/B12	3382	169.1	4	2
A22/B22	4720	236.0	4	2
A03/B03	3382	169.1	6	3
A13/B13	4720	236.0	6	3
A04/B04	4720	236.0	8	4

Maximum: Attaches to a maximum of four S/370s (any combination of UPs, MPs, APs) or 3031, 3032, 3033, 3081, 3083 or 3084 Processor Complexes (maximum two multiprocessor systems) or 4341 and 4381 Processors.

A maximum of two 3851 MSFs from the A-series of mdls or one 3851 MSF from the B-series of models can be included in the 3850 MSS.

In a 3850 MSS there is one active Mass Storage Control (MSC). It can address a total of eight 3850 MSS components: 3851 MSF control function, 3830 Storage Control mdl 3s, and Integrated Storage Controls (ISC) (#4650) with the Staging Adapter (#7220) on S/370 mdls 158 and 168. (Each ISC counts as two components). The number of 3850 MSS components addressed can be increased to 16 with installation of the MSC Twin Port Feature (#4901, #4902). A second MSC (either a B-series or the second A-series) may be designated as an alternate control.

Limitations: In a 3850 MSS configuration with one 3851 MSF (B-series) or two 3851 MSFs (A-series), both MSCs must be featured identically if complete backup is required. Note: On a 2880 Block Multiplexer Channel, Extended Unit Control Words (#3851, 3852) may be required to expand DASD device address capacity. The 155II Sysgen configuration is restricted by the maximum number of non-shared block multiplexer subchannels (in groups of eight). See the Channel Section of the *Guide to IBM System/370 Model 155*, GC20-1729, for description of assignment and number available. The total device addresses (real, virtual, non-existent, or non-Mass Storage System) SYSGENed may not exhaust the pool of nonshared UCWs.

HIGHLIGHTS

Included are the storage facility for data cartridges, Data Recording Devices (DRD) and their associated Data Recording Controls (DRC) for the transfer of data between the data cartridges and the 3350/3333/3330 Disk Storage devices, a Cartridge Access Station for the manual entry and removal of data cartridges, two accessors and their associated controls for the movement of data cartridges within the 3851, and a Mass Storage Control (MSC) for control of the 3850 MSS.

Prerequisites: A control unit position on a S/370 or a 4341 or 4381 Processor, byte or block multiplexer channel for each MSC -- one for each A-series MSF, two for a B-series MSF.

A minimum of one 3830 Storage Control mdl 3 on S/370 mdls 145, 145-3, 148, 155II, 158, 165II and 168, or a 3031, 3032, 3033, 3081, 3083, 3084 Processor, a 4341 or 4381 Processor or one Integrated Storage Control (#4650) with the Staging Adapter (#7220) on S/370 mdls 158 and 168.

A minimum of either two 3333 Disk Storage and Controls or two 3350 mdl A2/A2Fs. See "Note" on M3333 pages for feature changes required when 3333s are retained for use with a 3851.

Data Cartridges (P/N 2496971, Purchase Only) must be ordered separately ... contact IBM.

Bibliography: GC20-0001

SPECIFY

- Voltage: (AC, 3-phase, 4-wire 60 Hz): Specify **#9903** for 208V, **#9905** for 230V. Must be consistent with system voltage.
- Color: The accent panels above and below the cartridge access station are white. The two end covers on the 3851 MSF are gray. The remainder of the 3851 is available in **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, or **#9046** for white. **Field Installation:** Yes.
- In a 3850 MSS configuration with two A-series MSFs, specify **#9120** for the designated primary 3851 MSF and **#9121** for the secondary 3851 MSF.

SPECIAL FEATURES

Note: In a 3850 MSS configuration with one 3851 MSF (B-series) or two 3851 MSFs (A-series) both MSCs must be configured identically if complete backup is required.

Mass Storage Control Twin Port (#4901, #4902): [#4901 for A and B mdls ... #4902 for B mdls only] #4901 applies to the A-series MSC and the first MSC in a B-series. #4902 applies to the second MSC in a B-series, and requires #4901 as a prerequisite. Permits the MSC to address 8 additional, for a total of 16, 3850 MSS components: 3851 MSF control functions*, 3830 Storage Control mdl 3s on S/370 mdls 145, 145-3, 148, 155II, 158, 165II and 168, or 3031, 3032, 3033, 3081, 3083, 3084 Processor, or a 4341 or 4381 Processor, and ISC (#4650) with the Staging Adapter (#7220) on S/370 mdls 158 and 168. Each ISC has two paths and counts as two components.

*In a 3850 MSS configuration with two A-series mdls there are two 3851 MSF control function components.

Remote Switch Attachment (#6148): To control the two-channel interfaces on the basic 3851 MSF from a remote configuration control panel. Also controls the Two-Channel Switch, Add'l (#8171) if installed. For B mdls, this feature is associated with the primary MSC and must be installed in addition to #6150 below, which is associated with the alternate MSC. **Field Installation:** Yes.

Remote Switch Attachment (#6150): [B mdls] To control the two-channel interfaces on the basic 3851 (alternate MSC) from a remote configuration control panel. Also controls the Two-Channel Switch, Add'l (#8172) if installed. **Field Installation:** Yes. **Prerequisites:** #6148.

Two-Channel Switch, Add'l (#8171): Permits attachment to two additional S/370, 4341 or 4381 processor channels, providing a total of four S/370, 4341 or 4381 processor channel attachments. The channels can be on the same or different processors, to a maximum of four processors with no more than two channels to a single processor. For B mdls, the feature is associated with the active MSC and must be installed in addition to #8172 below, which is associated with the alternate MSC. **Field Installation:** Yes.

Two-Channel Switch, Add'l (#8172): [B mdls] Permits attachment to two additional S/370, 4341 or 4381 processor channels, providing a total of four S/370, 4341 or 4381 processor channel attachments. The channels may be on the same or different processors, to a maximum of four processors with no more than two channels to a single processor. **Field Installation:** Yes. **Prerequisites:** #8171.

MODEL CONVERSIONS

Field installable. Any A model can be upgraded to any larger A model or any B model. Any B model can be upgraded to any larger B model.

ACCESSORIES (None)

SUPPLIES (None)

3863 MODEM

PURPOSE

A 2400 bps modem used to provide communication products with a means for transmitting data over telecommunications channels (normally telephone lines). These advanced microprocessor-based modems significantly enhance communication network management and network problem determination. The modem diagnostic functions operate with Network Problem Determination Application (NPDA), providing probable cause of network errors ... alert messages on error threshold ... formatted modem test results.

MODELS

Model 1	001	Operates in half-duplex or duplex mode over 4-wire nonswitched duplex facilities. Operates in point-to-point, multipoint control, or multipoint tributary mode.
Model 2	002	Operates in half-duplex mode over 2-wire switched telecommunications networks. Operating mode is point-to-point.

Customer Setup: The 3863 is designated for Customer Setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance. Customer accessible setup switches are provided on the rear panel to enhance adaptability of the modem. For example, the mdl 1 modem may be configured for point-to-point, multipoint control or multipoint tributary operation with the setup switches. **Note:** Some changes of the setup switches may require SYSGEN changes in the program support.

HIGHLIGHTS

Sales Highlights:

- Volume purchase price reductions are available for quantity purchases..
- Modems ordered with no special features, or with only Extended Diagnostic feature (#7930), are considered standard configurations and are generally available in a short delivery time.
- Telecommunications cable adapters are available to connect the modem to an unusual circuit termination. See "Attachment to Facilities".
- A high density rack-mounted version of the 3863 mdl 1 is available for central teleprocessing installations. See section "Related Equipment" below and "M3868" pages.

Standard Features:

- Data Rate: 2400 bps with backup of 1200 bps.
- A microprocessor for signal processing.
- Auto Answer - Automatic answering of switched network calls - mdl 2 ... SNBU - mdl 1.
- Automatic Remote Speed Selection: The transmission speed of the remote modem follows the transmission speed (2400/1200 bps) of the local modem.
- Anti-Streaming: A multipoint tributary modem can automatically cut off transmission if a terminal holds "Request to Send" up longer than 40 seconds (an abnormal condition in IBM communication protocol). Customer switch option.
- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt in data mode.
- Line conditioning is not required.
- The protective circuitry required by the FCC (Federal Communications Commission) for direct attachment to the public switched network is contained in the modem.
- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- The modem diagnostic functions referred to as Link Problem Determination Aid (LPDA), operate with Systems Network Architecture (SNA) and associated program products . Under control of these programs, the modem accepts commands and initiates tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provide the network operator with the most probable cause of network problems. These program products are:
  1. Network Communication Control Facility (NCCF) Version 1 Release 2 (PP 5735-XX6).
  2. Network Problem Determination Application (NPDA) Version 2 (PP 5668-983). If either "Receive Signal Level Reporting" or "LPDA Functions on Tailed Links" is needed, Version 3 (PP 5668-920) is required.
  3. ACF/NCP Version 2 (PP 5735-XX1). **Note:** The functions "Receive Signal Level Reporting", and "LPDA Functions on Tailed Links" are not supported by this level.
- Modem provides its own clocking or will accept DTE (external) clocking.
- Extended Length Cable: The interconnecting cable between the business machine and the modem can be up to 100 meters (328 ft.) long when the modem is attached to an 3705, 3725, or 3726 Communications Controller or equivalent. See M3705, 3725, 3726 pages for details.

Optional Features:

See "Special Features" for detailed description.

- Extended Diagnostic Card: Enables NPDA to differentiate between modem failures, line failures and remote modem power loss.
- 4-Wire Switched Network Backup: Provides backup for nonswitched telecommunications facilities.
- Fan-Out: Provides for the attachment of up to three telecommunicating machines to one modem.
- LPDA Functions on Tailed Links: Allows tailed 3863 mdl 1 to respond to LPDA diagnostic commands.

Diagnostics: Built-in diagnostics: All modems will respond to diagnostic commands from the system that help provide status of any modem in the link, its attached terminal, and the quality of the received signal over the communication facility. Test requests and responses utilize the same data path and controls that are used by S/370 or 4300 processor or System/36 for data transmission. Thus diagnostic status/test requests can be interspersed with data requests without interrupting terminal sessions.

To report "Receive Signal Level", a 3863 mdl 1 must have serial number suffix code of **DH** or later. If the serial number suffix code is earlier, **RPQ 8Q0317** must be installed.

To respond to LPDA commands, a 3863 tailed to a 3865 with Data Multiplexer feature #3620 must have LPDA Function on Tailed Links feature #4791 installed.

The Network Problem Determination Application (NPDA) program product is an example of an IBM program product offering the capability to utilize the modem diagnostic functions for the collection, storage and retrieval of network error/management data. NPDA implemented under the Network Communication Control Facility (NCCF) program product has both summary and detailed level information for determining probable cause of network errors. Probable cause differentiates between errors in the communications controller, line, modem, modem interface or terminals.

NPDA will also utilize the new modem facilities to provide alert messages on error threshold and display formatted modem test results.

The System/36 Support Program (5727-SS1) includes an online problem determination facility that uses the 3863 built-in diagnostics. Using online problem determination, the system operator can invoke diagnostic tests from the System/36 operator console. These tests help the system operator locate the failing component (line, System/36, local modem, remote modem or remote workstation controller) when a remote workstation experiences data transmission problems.

In addition, tests can also be executed from the the modem operator panel. These manual tests include:

- Modem self-test -- this includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Modem/line transmit and receive tests -- allow testing of modem and line for switched network.
- Local loop-back test -- provides a "wrap" or loop-back at the line interface to allow terminal wrap tests through the modem.
- Remote loop-back test -- provides a wrap or loop-back at the remote modem to allow a DTE wrap test back through the local modem for nonswitched modems. This test does not require remote operator assistance.
- Loop test -- allows an end-to-end test to any modem on the link without remote operator assistance. This test is only available when operating over 4-wire telecommunications facilities.
- Lamp test -- tests all indicator lights on the operator panel.

COMMUNICATIONS FACILITIES MDL 1

Common Carrier Facilities: Common carrier-provided voiceband private line (nonswitched) channel, type 3002 (or equivalent) as described in the Bell System Technical Reference PUB 41004, dated October 1973.

Privately-owned Communication Facilities: Equivalent to above.

3863 Modem (cont'd)

COMMUNICATIONS FACILITIES MDL 2 AND MDL 1 WITH SWITCHED NETWORK BACKUP (#7953)

Public Switched Network: 2-wire switched line with an exclusion key telephone. The customer must be informed that satisfactory transmission of data depends upon the characteristics of the particular switched network connection being used. Refer to the M2700 pages for further details.

International Facilities: Request IBMto contact IBM coordinators of the other countries involved to determine the availability of such facilities.

Transmission of data between the United States and Canada on nonswitched or switched facilities is supported. (For nonswitched operation, the channel in Canada must be schedule 4, type 4.

Attachment to Facilities: Attachment of a 3863 mdl 1 to a private line (nonswitched) channel is by a cable supplied with the 3863. The cable termination is a 4-prong plug (WE 283B or equivalent). The plug mates with a receptacle (WE 404B or 549A surface mount or 493A flush mount or equivalent) which is connected to the channel. The receptacle is a conventional item of communications equipment. Upon customer request at the time the channel is ordered it will ordinarily be furnished by the telecommunications service supplier.

In those situations where it is not possible to have the aforementioned receptacle installed by the telecommunications service supplier prior to the installation of the modem a cable termination adapter can be ordered. Two adapters, a 4-spade lug and a 50-pin connector (commonly used for telephone company modems), are available. See "Accessories" for description .

Attachment of a 3863 mdl 2 to the public switched network is by a cable, supplied with the 3863, which is terminated with a miniature 8-position keyed plug for connection to a data jack provided by the telecommunications service supplier. Two of these cables are supplied to attach a 3863 mdl 1 with 4-Wire Switched Network Backup (#7953) to the public switched network and two data jacks are required. The data jack must be a programmed data jack (USOC RJ45S or equivalent) or a universal data jack (USOC RJ41S or equivalent) set in the programmed mode of operation. The RJ45S data jack is recommended. The modem adjusts its output power in accordance with the programming resistor in the data jack to ensure that the transmit signal level is optimum. When the telecommunications service supplier installs a data jack, special design rules are applied to the characteristics of the local loop connection to the central exchange. The special design rules minimize those local loop line impairments that have the most adverse effect on data transmission.

The telecommunications service supplier will install a data jack only on a line specified as a data line. Only lines that terminate at a telephone company central exchange can be specified as data lines. Extensions from a customer-owned or a telecommunications company-owned PBX (Private Branch Exchange) or a KTS (Key Telephone System) are not data lines. The FCC (Federal Communications Commission) Rules and Regulations, Part 68, prohibit the installation of a data jack on such extensions and allow only voice jacks (also called "permissive" jacks when used for data transmission) behind a PBX or KTS.

When a customer decides to connect the modem to a voice, or permissive, jack, an adapter is required to convert the plug on the end of the modem cable to a plug compatible with the voice jack (USOC RJ11C or equivalent) and to limit the transmit signal to the permissive (-9 dBm) level. Adapters for this purpose (Armiger AA330B or AA330C or equivalent) are available from distributors of telecommunications products.

The satisfactory transmission of data through a voice jack is not as predictable as when using a data jack. The most practical method of determining the success of transmitting date through a particular voice jack is by actual usage. In those situations where the transmission of data using a voice jack is unsatisfactory, the customer can initiate action to resolve the impairments in the PBX/KTS and/or the telecommunications service local loop or have the telecommunications service supplier install a data line that bypasses the PBX or KTS.

The protective circuitry required by the FCC for direct connection to the public switched network is contained in the modem. The FCC registration numbers are:

3863 mdl 2	ANO9SA-67992-DP-N
3863 mdl 1, SNBU (#7953)	ANO9SA-67935-DP-N

For both mdls the REN (Ringer Equivalence Number) is 0.8B.

An exclusion key telephone set is required with switched facilities at locations where calls will be originated. Two telephone sets are required with 4-Wire Switched Network Backup (#7953). Answer only locations are not required to have a telephone set. However, for optimum problem determination capability, a telephone set is recommended.

Related Equipment: The 3863 Modem operates with IBM communication products capable of 2400 bps operation. See M2700 pages. The 3863 Modem must communicate with another appropriately configured 3863 Modem or with a 3868 mdl 1 Rack-Mounted Modem. The interconnecting cable between the business machine and the modem must be supplied by the business machine.

Customer Responsibilities: Customers must be informed of their responsibilities as detailed in the M2700 pages, and in the site preparation section of the *Introduction and Site Preparation Guide* (GA27-3200).

The customer is also responsible for:

(1) Arrangements for price quotations, installation, and all costs of common carrier equipment and services.

(2) Private line (nonswitched) channel -- arranging for the telecommunications service supplier to provide a voice-grade data channel. Also, arranging for the installation of the appropriate receptacle described in "Attachment to Facilities".

(3) Switched Telecommunications Network -- arranging for the telecommunications service supplier to install the appropriate communication service equipped with the required connecting device as described in "Attachment to Facilities" and for attaching the IBM-provided cable to the connecting device. When ordering the telecommunications service the customer must be prepared to identify the line to which the modem will be connected, the modem manufacturer, the modem type and mdl number, the type of data jack required, the FCC registration number and the REN of the modem. The customer must also inform the telecommunications service supplier that the rate of data transmission will be faster than 1200 bps.

(4) Ensuring the availability of the interconnecting cable between the business machine and the modem because it must be supplied by the business machine.

(5) Unpacking and placing of the 3863. Physical setup, and connection of cables at setup time. During the physical setup, the position of the two configuration switches located at the bottom of the rear panel must be reviewed to ensure compatibility with the actual application. (Example: Point-to-point primary or secondary; multipoint control or tributary.) Details are in the *IBM 3863/3864 Setup Instructions and User's Guide,* GA27-3216.

(6) Notifying IBM of intent to relocate the unit, and following IBM instructions for relocation.

(7) Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be supplied by IBM.

(8) All three of the following program products must be installed for LPDA to function:
NCCF ... NPDA ... and ACF/NCP. See section "Standard Features" above for required release levels.

Bibliography: See *KWIC Index,* G320-1621, or specific systems bibliography.

SPECIFY

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): 3.0 meter (10 ft.) power cable, non-locking plug (no specify code required). If a 1.8 meter (6 ft.) power cable is required, specify **#9986**.

- Telecommunications Cable (modem to telecommunications line connection): 7.5 meter (25 ft.) (no specify code required).

SPECIAL FEATURES

Fan-Out (#3901): This feature allows attachment of up to three telecommunicating machines to one modem. See M2700 pages for applicable machines. Only one of the attached machines may transmit at a time. This feature may be used at a tributary station in a centralized multipoint network. In this configuration, multipoint programming discipline will provide the selection/control of the specified terminals without any additional user involvement. This feature may also be used to allow up to three multiplexers, or communications controllers, at a central site to share the same 3863 Modem for backup purposes. In this case, although all of the machines attached to the 3863 will receive the incoming data simultaneously, the user switchover procedure must ensure that only one machine is sending. **Limitations:** Mdl 1 only. Cannot be used with DTE external clocking. Cannot be installed with LPDA Functions on Tailed Links (#4791) or with Tail Circuit Attachment accessory. **Field Installation:** Yes.

LPDA Functions on Tailed Links (#4791): This feature enables the 3863 mdl 1 that is attached by the Tailed Circuit Attachment accessory to a channel of a 3865 Modem with Data Multiplexer (#3260) and 3863 mdl 1 that are at the other end of the line to respond to LPDA commands. Required only on the 3863 attached to the 3865. **Limitations:** Mdl 1 only. Cannot be installed with Fan-Out feature (#3901). Operates only with data line procedures SDLC (NRZ or NRZI) and BSC (EBDIC or ASCII or Transparent). **Field Installation:** Yes.

3863 Modem (cont'd)

Prerequisites: Tail Circuit Attachment accessory. See Modem Diagnostic Functions in section "Standard Features" for required program products.

Extended Diagnostic Card (#7930): This feature enhances the diagnostic capabilities of nonswitched modems when it is installed in both the local and remote modem. It provides an additional test that enables NPDA to differentiate between modem failures, line failures and remote modem power loss. **Limitation:** This feature is for the mdl 1 only, and must be in both the local and remote modems. **Field Installation:** Yes. **Prerequisite:** See LPDA in "Highlights" for required program products on S/370 and 4300 processors.

4-Wire Switched Network Backup (4W-SNBU) (#7953): Available for all 3863 Modem mdl 1s (nonswitched line). Provides backup for the nonswitched telecommunications facility. Data rate in 4W-SNBU mode is the same as in normal nonswitched line mode. 4W-SNBU allows restoration of the 4-wire service between two point-to-point or multipoint 3863 Modems. For point-to-point configurations, except for the requirement to establish the switched connections, 4W-SNBU allows continuation of service with no operational or programming impact. For multipoint configurations, operational (and possibly programming) modifications are required. 4W-SNBU can be configured in two ways:

- The 4W-SNBU feature is installed on the normal multipoint control station modem and on any tributary modems that require backup. To establish a backup path to any tributary, the control station modem must go to SNBU mode. In doing so, communication is broken to all other tributaries.
- A spare control station modem equipped with the 4W-SNBU feature is installed on a spare port at the control station location. The spare control station can then establish a 4W-SNBU connection to any 3863 tributary modem equipped with the 4W-SNBU feature. This tributary is deactivated from its normal polling list and assigned to the spare port. The normal control station continues to provide service to other tributaries still reachable over the nonswitched line.

This feature requires two 2-wire "switched" telephone lines, and two telephones at the host site. Attachment to the switched lines is made as described in the "Attachment to Facilities" section. This feature is designed to automatically answer when a call is received. Calls must be placed manually. When one call is placed and the connection completed, a four minute timer is started. The second line must be established within the time-out, otherwise the first line is automatically dropped. **Limitation:** Not available on 3863 mdl 2. **Field Installation:** Yes.

MODEL CONVERSIONS (None)

ACCESSORIES

These items are purchase-only and must be ordered separately from the modem.

Shelf Adapter (P/N 8547412): A shelf adapter that fastens inside a standard 19" EIA rack. The shelf, which fits racks that have an inside depth of 60cm (23.6 in.) to 76cm (30 in.) and an inside opening of 45cm (17.7 in.) will hold two modems side-by-side.

Tail Circuit Attachment (P/N 8547438): Allows the 3863 mdl 1 or 3864 mdl 1 to attach to a 3865 Modem mdl 1 equipped with Data Multiplexing (#3260). Permits an extension of a network via a separate set of modems and a separate communications channel. **Limitations:** To have the 3863's on a tailed circuit responding to LPDA commands, LPDA Functions on Tailed Links (#4791) must be installed on 3863 that is attached to the 3865. Cannot be used simultaneously with Fan-Out (#3901).

Telecommunications Cable Adapters: Convert the 4-prong plug (WE283B or equivalent) supplied on the telecommunications cable to a 4-spade lug or a 50-pin connector termination. For 4-spade lugs, order **P/N 7838805** ... for 50-pin connectors, order **P/N 1992900.** (The 50-pin connector is commonly used for telephone company modems.) See "Attachment to Facilities".

SUPPLIES (None)

3864 MODEM

PURPOSE

A 4800 bps modem used to provide communication products with a means for transmitting data over telecommunications channels (normally telephone lines). These advanced microprocessor-based modems significantly enhance communication network management and network problem determination. The modem diagnostic functions operate with Network Problem Determination Application (NPDA), providing probable cause of of network errors ... alert messages on error threshold ... formatted modem test results.

MODELS

Model 1	001	Operates in half-duplex or duplex mode over 4-wire nonswitched duplex facilities. Operates in point-to-point, multipoint control, or multipoint tributary mode.
Model 2	002	Operates in half-duplex mode over 2-wire switched telecommunications networks. Operating mode is point-to-point.

Customer Setup: The 3864 is designated for Customer Setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance. Customer accessible setup switches are provided on the rear panel to enhance adaptability of the modem. For example, the mdl 1 modem may be configured for point-to-point, multipoint control or multipoint tributary operation with the setup switches. Note: Some changes of the setup switches may require SYSGEN changes in the program support.

HIGHLIGHTS

Sales Highlights:

- Volume purchase price reductions are available for quantity purchases.
- Modems ordered with no special features, or with only Extended Diagnostic feature (#7930), are considered standard configurations and are generally available in a short delivery time.
- Telecommunications cable adapters are available to connect the modem to an unusual circuit termination. See "Attachment to Facilities".
- A high density rack-mounted version of the 3864 mdl 1 is available for central teleprocessing installations. See section "Related Equipment" below and M3868 pages.

Standard Features:

- Data Rate: 4800 bps with backup of 2400 bps.
- A microprocessor for signal processing.
- Auto Answer - Automatic Answering of Switched Network calls - mdl 2 ... SNBU - mdl 1.
- Automatic Remote Speed Selection: The transmission speed of the remote modem follows the transmission speed (4800/2400 bps) of the local modem.
- Anti-Streaming: A multipoint tributary modem can automatically cut off transmission if a terminal holds "Request to Send" up longer than 40 seconds (an abnormal condition in IBM communication protocol). Customer switch option.
- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt in data mode.
- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- The modem diagnostic functions referred to as Link Problem Determination Aid (LPDA), operate with Systems Network Architecture (SNA) and associated program products. Under control of these programs, the modems accept commands and initiate tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provide the network operator with the most probable cause of network problems. These program products are:
  1. Network Communication Control Facility (NCCF) Version 1 Release 2 (PP 5735-XX6).
  2. Network Problem Determination Application (NPDA) Version 2 (PP 5668-983). If either "Receive Signal Level Reporting" or "LPDA Functions on Tailed Links" is needed, Version 3 (PP 5668-920) is required.
  3. ACF/NCP Version 2 (PP 5735-XX1). Note: The functions "Receive Signal Level Reporting", and "LPDA Functions on Tailed Links" are not supported by this level.
- Modem provides its own clocking or will accept DTE (external) clocking.
- Line conditioning is not required for the 3864.
- The protective circuitry required by the FCC (Federal Communications Commission) for direct attachment to the public switched network is contained in the modem.
- Extended Length Cable: The interconnecting cable between the business machine and the modem can be up to 100 meters (328 ft.) long when the modem is attached to an 3705, 3725, or 3726 Communications Controller or equivalent. See M3705, 3725, 3726 for details.

Optional Features:

See "Special Features" for detailed description.

- Extended Diagnostic Card: Enables NPDA to differentiate between modem failures, line failures and remote modem power loss.
- 4-wire Switched Network Backup: Provides backup for nonswitched telecommunications facilities.
- Fan-Out: Provides for the attachment of up to three telecommunicating machines to one modem.
- LPDA Functions on Tailed Links: Allows tailed 3864 mdl 1 to respond to LPDA diagnostic commands.

Diagnostics: Built in diagnostics: All modems will respond to diagnostic commands from the system that help provide status of any modem in the link, its attached terminal, and the quality of the received signal over the communication facility. Test requests and responses utilize the same data path and controls that are used by S/370 or 4300 processor or System/36 for data transmission. Thus diagnostic status/test requests can be interspersed with data requests without interrupting terminal sessions.

To report Receive Signal Level, a 3864 mdl 1 must have serial number suffix code of **MG** or later. If the serial number suffix code is earlier, **RPQ 8Q0318** must be installed.

To respond to LPDA commands, a 3864 tailed to a 3865 with Data Multiplexer (#3620) must have LPDA Function on Tailed Links (#4791) installed.

The Network Problem Determination Application (NPDA) program product is an example of an IBM program product offering the capability to utilize the modem diagnostic functions for the collection, storage and retrieval of network error/management data. NPDA implemented under the Network Communication Control Facility (NCCF) program product has both summary and detailed level information for determining probable cause of network errors. Probable cause differentiates between errors in the communications controller, line, modem, modem interface or terminals.

NPDA will also utilize the new modem facilities to provide alert messages on error threshold and display formatted modem test results.

The System/36 Support Program (5727-SS1) includes an online problem determination facility that uses the 3864 built-in diagnostics. Using online problem determination, the system operator can invoke diagnostic tests from the System/36 operator console. These tests help the system operator locate the failing component (line, System/36, local modem, remote modem or remote workstation controller) when a remote workstation experiences data transmission problems.

In addition, tests can also be executed from the the modem operator panel. These manual tests include:

- Modem self-test -- this includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Modem/line transmit and receive tests -- allow testing of modem and line for a switched network.
- Local loop-back test -- provides a "wrap" or loop-back at the line interface to allow terminal wrap tests through the modem.
- Remote loop-back test -- provides a wrap or loop-back at the remote modem to allow a DTE wrap test back through the local modem for nonswitched modems. This test does not require remote operator assistance.
- Loop test -- allows an end-to-end test to any modem on the link without remote operator assistance. This test is only available when operating over 4-wire telecommunications facilities.
- Lamp test -- tests all indicator lights on the operator panel.

COMMUNICATIONS FACILITIES MDL 1

Common Carrier Facilities: Voiceband private line (nonswitched) channel, type 3002 (or equivalent) as described in the Bell System Technical Reference PUB 41004, dated October 1973.

Privately-owned Communication Facilities: Equivalent to above.

3864 Modem (cont'd)

COMMUNICATION FACILITIES MDL 2 AND MDL 1 WITH SWITCHED NETWORK BACKUP (#7953)

Public Switched Network: Two wire switched line with an exclusion key telephone. The customer must be informed that satisfactory transmission of data depends upon the characteristics of the particular switched network connection being used. Refer to the M2700 pages for further details.

International Facilities: Request IBMto contact IBM coordinators of the other countries involved to determine the availability of such facilities.

Transmission of data between the United States and Canada on nonswitched or switched facilities is supported. (For nonswitched operation, the channel in Canada must be schedule 4, type 4.

Attachment to Facilities: Attachment of a 3864 mdl 1 to a private line (nonswitched) channel is by a cable supplied with the 3864. The cable termination is a 4-prong plug (WE 283B or equivalent). The plug mates with a receptacle (WE 404B or 549A surface mount or 493A flush mount or equivalent) which is connected to the channel. The receptacle is a conventional item of communications equipment. Upon customer request at the time the channel is ordered it will ordinarily be furnished by the telecommunications service supplier.

In those situations where it is not possible to have the aforementioned receptacle installed by the telecommunications service supplier prior to the installation of the modem a cable termination adapter can be ordered. Two adapters, a 4-spade lug and a 50-pin connector (commonly used for telephone company modems), are available. See "Accessories" for description.

Attachment of a 3864 mdl 2 to the public switched network is by a cable, supplied with the 3864, which is terminated with a miniature 8-position keyed plug for connection to a data jack provided by the telecommunications service supplier. Two of these cables are supplied to attach a 3864 mdl 1 with 4-Wire Switched Network Backup (#7953) to the public switched network and two data jacks are required. The data jack must be a programmed data jack (USOC RJ45S or equivalent) or a universal data jack (USOC RJ41S or equivalent) set in the programmed mode of operation. The RJ45S data jack is recommended. The modem adjusts its output power in accordance with the programming resistor in the data jack to ensure that the transmit signal level is optimum. When the telecommunications service supplier installs a data jack, special design rules are applied to the characteristics of the local loop connection to the central exchange. The special design rules minimize those local loop line impairments that have the most adverse effect on data transmission.

The telecommunications service supplier will install a data jack only on a line specified as a data line. Only lines that terminate at a telephone company central exchange can be specified as data lines. Extensions from a customer-owned or a telecommunications company-owned PBX (Private Branch Exchange) or a KTS (Key Telephone System) are not data lines. The FCC (Federal Communications Commission) Rules and Regulations, Part 68, prohibit the installation of a data jack on such extensions and allow only voice jacks (also called "permissive" jacks when used for data transmission) behind a PBX or KTS.

When a customer decides to connect the modem to a voice, or permissive, jack, an adapter is required to convert the plug on the end of the modem cable to a plug compatible with the voice jack (USOC RJ11C or equivalent) and to limit the transmit signal to the permissive (-9 dBm) level. Adapters for this purpose (Armiger AA330B or AA330C or equivalent) are available from distributors of telecommunications products.

The satisfactory transmission of data through a voice jack is not as predictable as when using a data jack. The most practical method of determining the success of transmitting date through a particular voice jack is by actual usage. In those situations where the transmission of data using a voice jack is unsatisfactory, the customer can initiate action to resolve the impairments in the PBX/KTS and/or the telecommunications service local loop or have the telecommunications service supplier install a data line that bypasses the PBX or KTS.

The protective circuitry required by the FCC for direct connection to the public switched network is contained in the modem. The FCC registration numbers are:

3864 mdl 2	ANO9SA-67992-DP-N
3864 mdl 1, SNBU (#7953)	ANO9SA-67935-DP-N

For both mdls the REN (Ringer Equivalence Number) is 0.8B.

An exclusion key telephone set is required with switched facilities at locations where calls will be originated. Two telephone sets are required with 4-wire Switched Network Backup (#7953). Answer-only locations are not required to have a telephone set. However, for optimum problem determination capability, a telephone set is recommended.

Related Equipment: The 3864 operates with IBM communication products capable of 4800 bps operation. See M2700 pages. The 3864 must communicate with another appropriately configured 3864 or with a 3868 mdl 2 Rack-Mounted Modem. The interconnecting cable between the business machine and the modem must be supplied by the business machine.

Customer Responsibilities: Customers must be informed of their responsibilities as detailed in the M2700 pages, and in the site preparation section of the *Introduction and Site Preparation Guide,* GA27-3200.

The customer is also responsible for:

(1) Arrangements for price quotations, installation, and all costs of common carrier equipment and services.

(2) Private line (nonswitched) channel -- arranging for the telecommunications service supplier to provide a voice-grade data channel. Also, arranging for the installation of the appropriate receptacle described in "Attachment to Facilities".

(3) Switched Telecommunications Network -- arranging for the telecommunications service supplier to install the appropriate communication service equipped with the required connecting device as described in "Attachment to Facilities" and for attaching the IBM-provided cable to the connecting device.

When ordering the telecommunications service the customer must be prepared to identify the line to which the modem will be connected, the modem manufacturer, the modem type and mdl number, the type of data jack required, the FCC registration number and the REN of the modem. The customer must also inform the telecommunications service supplier that the rate of data transmission will be faster than 1200 bps.

(4) Ensuring the availability of the interconnecting cable between the business machine and the modem because it must be supplied by the business machine.

(5) Unpacking and placing of the 3864. Physical setup, and connection of cables at setup time. During the physical setup, the position of the two configuration switches located at the bottom of the rear panel must be reviewed to ensure compatibility with the actual application. (Example: Point-to-point primary or secondary; multipoint control or tributary.) Details are in the *IBM 3863/3864 Setup Instructions and User's Guide,* GA27-3216.

(6) Notifying IBM of intent to relocate the unit, and following IBM instructions for relocation.

(7) Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be supplied by IBM.

(8) All three of the following program products must be installed for LPDA to function:

NCCF ... NPDA ... and ACF/NCP. See section "Standard Features" for required release levels.

Bibliography: See *KWIC Index,* G320-1621, or specific systems bibliography.

SPECIFY

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): 3.0 meter (10 ft.) power cable, non-locking plug (no specify code required). If a 1.8 meter (6 ft.) power cable is required, specify **#9986**

- Telecommunications Cable (modem to telecommunications line connection): 7.5 meter (25 ft.) (no specify code required).

SPECIAL FEATURES

Fan-Out (#3901): Mdl 1 only. This feature allows attachment of up to three telecommunicating machines to one modem. See M2700 pages for applicable machines. Only one of the attached machines may transmit at a time. This feature may be used at a tributary station in a centralized multipoint network. In this configuration, multipoint programming discipline will provide the selection/control of the specified terminals without any additional user involvement. This feature may also be used to allow up to three Multiplexers, or Communications Controllers, at a central site to share the same 3864 mdl 1 for backup purposes. In this case, although all of the machines attached to the 3864 will receive the incoming data simultaneously, the user switchover procedure must ensure that only one machine is sending. **Limitations:** Mdl 1 only. Cannot be used with DTE external clocking. Cannot be installed with LPDA Functions on Tailed Links (#4791) or with Tail Circuit Attachment accessory. **Field Installation:** Yes.

LPDA Functions on Tailed Links (#4791): This feature enables the 3864 mdl 1 that is attached by the Tailed Circuit Attachment accessory to a channel of a 3865 modem with Data Multiplexer (#3260) and 3864 mdl 1 that are at the other end of the line to respond to LPDA commands. Required only on the 3864 attached to the 3865. **Limitations:** Mdl 1 only. Cannot be installed with Fan-Out (#3901).

3864 Modem (cont'd)

Operates only with data line procedures SDLC (NRZ or NRZI) and BSC (EBDIC or ASCII or Transparent). **Field Installation:** Yes. **Prerequisites:** Tail Circuit Attachment accessory. See Modem Diagnostic Functions in section "Standard Features" for required program products.

Extended Diagnostic Card (#7930): Mdl 1 only. This feature enhances the diagnostic capabilities of nonswitched modems when it is installed in both the local and remote modem. It provides an additional test that enables NPDA to differentiate between modem failures, line failures and remote modem power loss. **Limitation:** This feature is for the mdl 1 only, and must be in both the local and remote modems. **Field Installation:** Yes. **Prerequisite:** See LPDA in "Highlights" for required program product support.

4-Wire Switched Network Backup (4W-SNBU) (#7953): Available for all 3864 mdl 1s (nonswitched line). Provides backup for the nonswitched telecommunications facility. Data rate in 4W-SNBU mode is the same as in normal nonswitched line mode. 4W-SNBU allows restoration of the 4-wire service between two point-to-point or multipoint 3864s. For point-to-point configurations, except for the requirement to establish the switched connections, 4W-SNBU allows continuation of service with no operational or programming impact. For multipoint configurations, operational (and possibly programming) modifications are required. 4W-SNBU can be configured in two ways:

- The 4W-SNBU feature is installed on the normal multipoint control station modem and on any tributary modems that require backup. To establish a backup path to any tributary, the control station modem must go to SNBU mode. In doing so, communication is broken to all other tributaries.
- A spare control station modem equipped with the 4W-SNBU feature is installed on a spare port at the control station location. The spare control station can then establish a 4W-SNBU connection to any 3864 tributary modem equipped with the 4W-SNBU feature. This tributary is deactivated from its normal polling list and assigned to the spare port. The normal control station continues to provide service to other tributaries still reachable over the nonswitched line.

This feature requires two 2-wire "switched" telephone lines, and two telephones at the host site. Attachment to the switched lines is made as described in the "Attachment to Facilities". This feature is designed to automatically answer when a call is received. Calls must be placed manually. When one call is placed and the connection completed, a four minute timer is started. The second line must be established within the time-out, otherwise the first line is automatically dropped. **Limitation:** Not available on 3864 mdl 2. **Field Installation:** Yes.

MODEL CONVERSIONS (None)

ACCESSORIES

These items are purchase-only and must be ordered separately from the modem.

Shelf Adapter (P/N 8547412): A shelf adapter that fastens inside a standard 19" EIA rack. The shelf, which fits racks that have an inside depth of 60cm (23.6 in.) to 76cm (30 in.) and an inside opening of 45cm (17.7 in.) will hold two modems side-by-side.

Tail Circuit Attachment (P/N 8547438): Allows the 3863 mdl 1 or 3864 mdl 1 to attach to a 3865 Modem mdl 1 equipped with Data Multiplexing (#3260). Permits an extension of a network via a separate set of modems and a separate communications channel. **Limitations:** To have the 3864's on a tailed circuit responding to LPDA commands, LPDA Functions on Tailed Links (#4791) must be installed on 3864 that is attached to the 3865. Cannot be used simultaneously with Fan-Out (#3901).

Telecommunications Cable Adapters: Convert the 4-prong plug (WE283B or equivalent) supplied on the telecommunications cable to a 4-spade lug or a 50-pin connector termination. For 4-spade lugs, order **P/N 7838805** ... for 50-pin connectors, order **P/N 1992900.** (The 50-pin connector is commonly used for telephone company modems.) See "Attachment to Facilities".

SUPPLIES (None)

3865 MODEM

PURPOSE

A 9600 bps modem used to provide communication products with a means for transmitting data over telecommunications channels (normally telephone lines). These advanced microprocessor-based modems significantly enhance communication network management and network problem determination. The modem diagnostic functions operate with Network Problem Determination Application (NPDA), providing probable cause of network errors ... alert messages on error threshold ... formatted modem test results.

MODELS

Model 001 Operatesin half-duplex or duplex mode over 4-wire nonswitched duplex facilities. Operates in point-to-point mode.

Model 002 Operatesin half-duplex or duplex mode over 4-wire nonswitched duplex facilities. Operates in multipoint mode and can be configured as a multipoint control or as a multipoint tributary station.

Limitations: The 3865 mdl 002 can be used only in a multipoint network. A multipoint network can be implemented with only one tributary. Additional stations can be added as the network expands. The 3865 mdl 002 cannot be used in a point-to-point mode, like a 3865 mdl 001. Neither can a 3865 mdl 001 be used in a multipoint network, like a 3865 mdl 002. Model conversion is not possible. See "Network Configuration" in *IBM 3863, 3864 and 3865 Modems Introduction and Site Preparation Guide*, GA27-3200.

Customer Setup: The 3865 is designated for Customer Setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance. Customer accessible setup switches are provided on the rear panel to enhance adaptability of the modem. For example, the mdl 002 modem may be configured for multipoint control or multipoint tributary operation with the setup switches. **Note:** Some changes of the setup switches may require SYSGEN changes in the program support.

HIGHLIGHTS

Sales Highlights:

- Volume purchase price reductions are available for quantity purchases. See Z125-3260 and Z120-3257 for details.
- Modems ordered with no special features, or with only Extended Diagnostic feature (#7930), are considered standard configurations and are generally available in a short delivery time. Refer to the Delivery Schedule and Availability Card or Advanced Administrative System (AAS) for current delivery schedules.
- Telecommunications cable adapters are available to connect the modem to an unusual circuit termination. See "Attachment to Facilities".
- A high density rack-mounted version of the 3865 mdl 001 and 002 is available for central teleprocessing installations. See section "Related Equipment" below and M3868 pages.

Standard Features:

- Data Rate: 9600 bps with backup of 4800 bps.
- Auto Answer: Automatic answering of switched network calls with Switched Network Backup.
- A microprocessor for signal processing.
- Automatic Remote Speed Selection: The transmission speed of the remote modem follows the transmission speed (9600/4800 bps) of the local modem (primary status). The network configuration of the remote modem must be secondary.
- Anti-Streaming: A multipoint tributary modem (mdl 002) can automatically cut off transmission if a terminal holds "Request to Send" up longer than 40 seconds (an abnormal condition in IBM communication protocol). Customer switch option.
- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt in data mode.
- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- The modem diagnostic functions referred to as Link Problem Determination Aid (LPDA), operate with Systems Network Architecture (SNA) and associated program products. Under control of these programs, the modems accept commands and initiate tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provide the network operator with the most probable cause of network problems. These program products are:
  1. Network Communication Control Facility (NCCF) Version 1 Release 2 (PP 5735-XX6).
  2. Network Problem Determination Application (NPDA) Version 2 (PP 5668-983). If either Receive Signal Level Reporting or LPDA Functions on multiplexed links is needed, Version 3 (PP 5668-920) is required.
  3. ACF/NCP Version 2 (PP 5735-XX1). **Note:** The functions Receive Signal Level Reporting, and LPDA Functions on multiplexed links" are not supported by this level.
- Modem provides its own clocking or will accept DTE (external) clocking.
- Fast RFS: 24 millisecond Ready for Sending (RFS) Delay available for 3865 multipoint tributary modems. Customer switch option (24ms or 60ms).
- Both point-to-point and multipoint can operate over 3002 Basic (unconditioned) channels.
- The protective circuitry required by the FCC (Federal Communications Commission) for direct attachment to the public switched network is contained in the 4-wire Switched Network Backup feature (#7953).
- Extended Length Cable: The interconnecting cable between the business machine and the modem can be up to 100 meters (328 ft.) long when the modem is attached to an 3705, 3725, or 3726 Communications Controller or equivalent. See M3705, 3725, 3726 pages for details.

Optional Features:

See "Special Features" for detailed description.

- Extended Diagnostic Card: Enables NPDA to differentiate between modem failures, line failures and remote modem power loss.
- 4-wire Switched Network Backup: Provides backup for non-switched telecommunications facilities.
- Fan-Out: Provides for the attachment of up to three telecommunicating machines to one modem.

Diagnostics: Built in diagnostics: All modems will respond to diagnostic commands from the system that help provide status of any modem in the link, its attached terminal, and the quality of the received signal over the communication facility. Test requests and responses utilize the same data path and controls that are used by S/370 or 4300 processor or System/36 for data transmission. Thus diagnostic status/test requests can be interspersed with data requests without interrupting terminal sessions.

To report Receive Signal Level, a 3865 must have serial number suffix code of **MG** or later. If the serial number suffix code is earlier, **RPQ 8Q0319** must be installed.

The Network Problem Determination Application (NPDA) program product is an example of an IBM program product offering the capability to utilize the modem diagnostic functions for the collection, storage and retrieval of network error/management data. NPDA implemented under the Network Communication Control Facility (NCCF) program product has both summary and detailed level information for determining probable cause of network errors. Probable cause differentiates between errors in the communications controller, line, modem, modem interface or terminals.

NPDA will also utilize the new modem facilities to provide alert messages on error threshold and display formatted modem test results.

The System/36 Support Program (5727-SS1) includes an online problem determination facility that uses the 3865 built-in diagnostics. Using online problem determination, the system operator can invoke diagnostic tests from the System/36 operator console. These tests help the system operator locate the failing component (line, System/36, local modem, remote modem or remote workstation controller) when a remote workstation experiences data transmission problems.

In addition, tests can also be executed from the the modem operator panel. These manual tests include:

- Modem self-test -- this includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Modem/line transmit and receive tests -- allow testing of modem and line for switched network.
- Local loop-back test -- provides a "wrap" or loop-back at the line interface to allow terminal wrap tests through the modem.
- Remote loop-back test -- provides a wrap or loop-back at the remote modem to allow a DTE wrap test back through the local modem for nonswitched modems. This test does not require remote operator assistance.
- Loop test -- allows an end-to-end test to any modem on the link without remote operator assistance. This test is only available when operating over 4-wire telecommunications facilities.

3865 Modem (cont'd)

- Lamp test -- tests all indicator lights on the operator panel.

COMMUNICATIONS FACILITIES

Common Carrier Facilities: Voiceband private line (nonswitched) channel, type 3002 (or equivalent) as described in the Bell System Technical Reference PUB 41004, dated October 1973.

Mdl 001 (point-to-point), and mdl 002 (multipoint) use basic channels.

The 3865 operates on unconditioned lines. In some unusual situations, it may be beneficial to activate a longer (60ms) RFS delay (by a switch on the back panel) on tributary modems. Mdl 002 modems can operate on links with a mix of 24ms and 60ms RFS delay.

Privately-owned Communication Facilities: Equivalent to above.

MDL 001 OR MDL 002 WITH SWITCHED NETWORK BACKUP (#7953)

Public Switched Networks: 2-wire switched line with an exclusion key telephone set. The customer must be informed that satisfactory transmission of data depends upon the characteristics of the particular switched network connection being used. Refer to the M2700 pages for further details.

International Facilities: Request IBM to contact IBM coordinators of the other countries involved to determine the availability of such facilities.

Transmission of data between the United States and Canada on nonswitched or switched facilities is supported. (For nonswitched operation, the channel in Canada must be schedule 4, type 4.

Attachment to Facilities: Attachment of a 3865 to a private line (nonswitched) channel is by a cable supplied with the 3865. The cable termination is a 4-prong plug (WE 283B or equivalent). The plug mates with a receptacle (WE 404B or 549A surface mount or 493A flush mount or equivalent) which is connected to the channel. The receptacle is a conventional item of communications equipment. Upon customer request at the time the channel is ordered, it will ordinarily be furnished by the telecommunications service supplier.

In those situations where it is not possible to have the aforementioned receptacle installed by the telecommunications service supplier prior to the installation of the modem a cable termination adapter can be ordered. Two adapters. a 4-spade lug and a 50-pin connector (commonly used for telephone company modems), are available. See "Accessories" for description and ordering instructions.

Attachment of a 3865 with 4-wire Switched Network Backup (#7953) to the public switched network is by two cables, supplied with the feature, which are terminated with a miniature 8-position keyed plug for connection to the two data jacks provided by the telecommunications service supplier. The data jacks must be programmed data jacks (USOC RJ45S or equivalent) or universal data jacks (USOC RJ41S or equivalent) set in the programmed mode of operation. RJ45S data jacks are recommended. The modem adjusts its output power in accordance with the programming resistor in the data jack to ensure that the transmit signal level is optimum. When the telecommunications service supplier installs a data jack, special design rules are applied to the characteristics of the local loop connection to the central exchange. The special design rules minimize those local loop line impairments that have the most adverse effect on data transmission.

The telecommunications service supplier will install a data jack only on a line specified as a data line. Only lines that terminate at a telephone company central exchange can be specified as data lines. Extensions from a customer-owned or a telecommunications company-owned PBX (Private Branch Exchange) or a KTS (Key Telephone System) are not data lines. The FCC (Federal Communications Commission) Rules and Regulations, Part 68, prohibit the installation of a data jack on such extensions and allow only voice jacks (also called "permissive" jacks when used for data transmission) behind a PBX or KTS.

When a customer decides to connect the modem to a voice, or permissive, jack, an adapter is required to convert the plug on the end of the modem cable to a plug compatible with the voice jack (USOC RJ11C or equivalent) and to limit the transmit signal to the permissive (-9 dBm) level. Adapters for this purpose (Armiger AA330B or AA330C or equivalent) are available from distributors of telecommunications products.

The satisfactory transmission of data through a voice jack is not as predictable as when using a data jack. The most practical method of determining the success of transmitting data through a particular voice jack is by actual usage. In those situations where the transmission of data using a voice jack is unsatisfactory, the customer can initiate action to resolve the impairments in the PBX/KTS and/or the telecommunications service local loop or have the telecommunications service supplier install a data line that bypasses the PBX or KTS.

The protective circuitry required by the FCC for direct connection to the public switched network is contained in the 4-wire Switched Network Backup feature. The FCC registration number is AN09SA-67935-DP-N. The REN (Ringer Equivalent Number) is 0.8B.

An exclusion key telephone set is required with switched facilities at locations where calls will be originated. (Two telephone sets are required with 4-wire Switched Network Backup (#7953).) Answer-only locations are not required to have a telephone set. However, for optimum problem determination capability, a telephone set is recommended.

Related Equipment: The 3865 operates with IBM communication products capable of 9600 bps operation. See M2700 pages. The 3865 must communicate with another appropriately configured 3865 or with a 3868 mdl 003 or 004 Rack-Mounted Modem unless multiplexing is used. The interconnecting cable between the business machine and the modem must be supplied by the business machine.

Customer Responsibilities: Customers must be informed of their responsibilities as detailed in the M2700 pages, and in the site preparation section of the *Introduction and Site Preparation Guide* (GA27-3200).

The customer is also responsible for:

(1) Arrangements for price quotations, installation, and all costs of common carrier equipment and services.

(2) Private line (nonswitched) channel -- arranging for the telecommunications service supplier to provide a voice-grade data channel. Also, arranging for the installation of the appropriate receptacle described in "Attachment to Facilities".

(3) Switched Telecommunications Network -- arranging for the telecommunications service supplier to install the appropriate communication service equipped with the required connecting device as described in "Attachment to Facilities" and for attaching the IBM-provided cable to the connecting device. When ordering the telecommunications service, the customer must be prepared to identify the line to which the modem will be connected, the modem manufacturer, the modem type and mdl number, the type of data jack required, the FCC registration number and the REN of the modem. The customer must also inform the telecommunications service supplier that the rate of data transmission will be faster than 1200 bps.

(4) Ensuring the availability of the interconnecting cable between the business machine and the modem because it must be supplied by the business machine.

(5) Unpacking and placing of the 3865. Physical setup, and connection of cables at setup time. During the physical setup, the position of the two configuration switches located at the bottom of the rear panel must be reviewed to ensure compatibility with the actual application. (Example: Point-to-point primary or secondary; multipoint control or tributary.) Details are in the *IBM 3865 Setup Instructions and User's Guide,* GA27-3218.

(6) Notifying IBM of intent to relocate the unit, and following IBM instructions for relocation.

(7) Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be supplied by IBM.

(8) All three of the following program products must be installed for LPDA to function.
NCCF ... NPDA ... and ACF/NCP. See section "Standard Features" above for required release levels.

Bibliography: See *KWIC Index,* G320-1621, or specific systems bibliography.

SPECIFY

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): 3.0 meter (10 ft.) power cable, non-locking plug (no specify code required). If a 1.8 meter (6 ft.) power cable is required, specify **#9986**.

- Telecommunications Cable (modem to telecommunications line connection): 7.5 meter (25 ft.) (no specify code required)

SPECIAL FEATURES

Data Multiplexer (#3260): This feature allows selection of a 4800 bps and 2400 bps subchannel. The modem multiplexes subchannel data into a single aggregate data stream ... this feature offers four channel configurations. When the 3865 is placed in half-speed mode, the aggregate data stream is transmitted at half speed and as a result the channel configurations will be automatically altered because of lower speed. Channel configurations are:

Channels				Half-Speed Operation			
A	B	C	D	A	B	C	D
9600	–	–	–	4800	–	–	–
4800	4800	–	–	4800	–	–	–
4800	2400	2400	–	4800	–	–	–
2400	2400	2400	2400	2400	2400	–	–

3865 Modem (cont'd)

All data sources are connected to the 3865 mdl 001 by separate EIA/CCITT interfaces. Multiplexer channels will permit attachment to co-located terminals or tailed circuit extensions for network flexibility and cost savings. Tail circuit extensions allow co-located 3863 or 3864 modems equipped with the Tailed Circuit Attachment accessory to be attached to a 3865 channel. Modems so attached can extend the channel data path by its attached communications line and a second (remotely attached) modem. Each multiplexer channel is equipped with buffers to compensate for timing variations between tailed modems and the 3865 clocks. **Limitations:** Mdl 001 only. Cannot be installed with Fan-Out feature (#3901). Tailed 3863 or 3864 modems must be mdl 001 only, multipoint control mode only, set for external clocking. LPDA diagnostic commands to a Data Multiplexed Link are received only on Channel A of the 3865 with Data Multiplexer feature attached to the host DTE. In order for this 3865 to respond to LPDA commands, it must have serial number suffix code of **DG** or later. If the serial number suffix code is earlier, MES **#323406** must be installed.

Field Installation: Yes.

Fan-Out (#3901): This feature allows attachment of up to three telecommunicating machines to one modem. See M2700 pages for applicable machines. Only one of the attached machines may transmit at a time. This feature may be used as a tributary station in a centralized multipoint network. In this configuration, multipoint programming discipline will provide the selection/control of the specified terminals without any additional user involvement. this feature may also be used to allow up to three Multiplexers, or Communications Controllers, at a central site to share the same 3865 for backup purposes. In this case, although all of the machines attached to the 3865 will receive the incoming data simultaneously, the user switchover procedure must ensure that only one machine is sending. **Limitations:** Cannot be installed with DTE external) clock, or Data Multiplexer (#3260).

Field Installation: Yes.

Extended Diagnostic Card (#7930): This feature enhances the diagnostic capabilities of nonswitched modems when it is installed in both the local and remote modem. It provides an additional test that enables NPDA to differentiate between modem failures, line failures and remote modem power loss. **Limitation:** This feature must be in both the local and remote modems. **Field Installation:** Yes. **Prerequisite:** See LPDA in "Highlights" for required program product support.

4-Wire Switched Network Backup (4W-SNBU) (#7953): Provides backup for the nonswitched telecommunications facility. Data rate in 4W-SNBU mode is the same as in normal nonswitched line mode. 4W-SNBU allows restoration of the 4-wire service between two point-to-point or multipoint 3865s. For point-to-point configurations, except for the requirement to establish the switched connections, 4W-SNBU allows continuation of service with no operational or programming impact. For multipoint configurations, operational (and possibly programming) modifications are required. 4W-SNBU can be configured in two ways:

- The 4W-SNBU feature is installed on the normal multipoint control station modem and on any tributary modems that require backup. To establish a backup path to any tributary, the control station modem must go to SNBU mode. In doing so, communication is broken to all other tributaries.
- A spare control station modem equipped with the 4W-SNBU feature is installed on a spare port at the control station location. The spare control station can then establish a 4W-SNBU connection to any 3865 tributary modem equipped with the 4W-SNBU feature. This tributary is deactivated from its normal polling list and assigned to the spare port. The normal control station continues to provide service to other tributaries still reachable over the nonswitched line.

This feature requires two 2-wire switched telephone lines, and two telephones at the host site. Attachment to the switched lines is made as described in the "Attachment to Facilities" section. This feature is designed to automatically answer when a call is received. Calls must be placed manually. When one call is placed and the connection completed, a four minute timer is started. The second line must be established within the time-out; otherwise the first line is automatically dropped. **Limitations:** It may be necessary to re-dial or change to half speed to maintain acceptable performance in SNBU mode. See "Customer Responsibilities" in the M2700 pages for details. **Field Installation:** Yes.

MODEL CONVERSIONS (None)

ACCESSORIES

These items are purchase-only and must be ordered separately from the modem.

Shelf Adapter (P/N 8547412): A shelf adapter that fastens inside a standard 19" EIA rack. The shelf, which fits racks that have an inside depth of 60cm (23.6 in.) to 76cm (30 in.) and an inside opening of 45cm (17.7 in.) will hold two modems side-by-side.

Telecommunications Cable Adapters: Convert the 4-prong plug (WE283B or equivalent) supplied on the telecommunications cable to a 4-spade lug or a 50-pin connector termination. For 4-spade lugs, order **P/N 7838805** ... for 50-pin connectors, order **P/N 1992900**. (The 50-pin connector is commonly used for telephone company modems.) See "Attachment to Facilities". Request price and order from IBM Direct, Dayton, NJ, using telephone number (800) 631-5582; in New Jersey use (800) 352-4960; in Hawaii or Alaska use (800) 526-2484. Specify P/N, quantity, ship date, bill-to name, bill-to address, ship-to name, and ship-to address.

SUPPLIES (None)

3866 MULTIMODEM ENCLOSURE

PURPOSE

The 3866 models 1 and 2 are multimodem enclosure. Model 1 can be mounted in a standard commerically available 19-inch rack cabinet and model 2 comes mounted in a mini cabinet for one enclosure only. These enclosures provide housing, cooling and power for the 3868 models 1 to 4 rack-mounted modems.

MODELS

Model 1	001	Multimodem Enclosure for installation in commercial standard 19-inch rack cabinet.
Model 2	002	Multimodem Enclosure with single enclosure cabinet.

HIGHLIGHTS

The 3866 mdl 1 and 2 are multimodem enclosures providing housing, powering and cooling for 3868 mdls 1 to 4 modem packs. Up to 12 single-width modem packs (3868 mdl 1) or up to six double-width modem packs (3868 mdl 2, 3 and 4) can be housed in an enclosure.

The 3866 mdl 1 multimodem enclosure must be installed in a standard 19-inch wide by 24-inch deep rack cabinet to be provided by the customer. Standard cabinets are available to accommodate several enclosures and mandatory fan units. Up to six enclosures and three mandatory fan units can be housed in a six foot high cabinet.

The 3866 mdl 2 multimodem enclosure is already mounted in an IBM provided mini cabinet.

For both mdls, a power unit and a fan unit must be ordered with each enclosure. In cabinet for multi enclosures only one fan unit is necessary per two enclosures (see "Special Features"). The customer may wish to replace a failing power unit with a spare and should be advised to order sufficient spare units.

Optional Features: See "Special Features" for detailed description.

Customer Set-Up (CSU): The 3866 multimodem enclosures and associated power and fan units are designated to be set up by the user thereby offering the customer availability and relocation flexibility.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all Federal, State and local laws, regulations and ordinances.
- Adequate hardware ordering including Commercial Cabinet, where required, site preparation and setting up. For more information, refer to the *Planning and Site Preparation Guide* (GA33-2023).
- Receipt at the customer's receiving dock, unpacking and setting up the cabinet, enclosure, power and fan units.
- Performing 3866 check-out in accordance with supplied procedures for initial set up and relocation.
- Using customer problem determination procedures provided with the 3866 to determine the failing unit and filling out the appropriate 3866 problem report prior to taking action to get the failing unit exchanged . (See "Maintenance" below).
- Procuring any required spares.

Warranty Service: The warranty period is three years . Warranty service is provided under the terms and conditions of the Agreement for Purchase of IBM Machines and the Amendment for IBM Service/Exchange Center Services. The service offering during warranty is Customer On-Site Exchange (COE) as described below.

Customer On-Site Exchange (COE): It is the customer's responsibility to set up the equipment and to determine when maintenance is required. The customer may wish to replace a failing element with a spare element and should be advised to purchase sufficient spare elements.

It is the customer's responsibility to disconnect the element(s) and call a designated number to have a replacement element(s) delivered to the customer site where they will be exchanged (without testing) for the customer's defective unit(s). The defective elements become the property of IBM.

The 3866 will be eligible for IBM Maintenance Agreement coverage immediately following expiration of the warranty for an annual charge. The service offering after warranty will be Customer On-Site Exchange (COE).

Maintenance: The level of maintenance service on a rental (MRC) machine is Customer On-Site Exchange (COE). Maintenance service is provided under the Amendment for IBM Service/Exchange Center services.

On-Site Assistance: If the customer desires assistance to perform Customer Problem Analysis and Resolution (CPAR), he may call for assistance on a toll free number. IBM will respond to the customer site to aid the customer in performing CPAR procedures using the same documentation available to the customer. IBM assistance is billable at the application rates and terms.

RPQs: RPQs will not be accepted.

SPECIFY

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): Specify **#9891** for 3.0 meter (10 ft.) power cable, or **#9986** for 1.8 meter (6 ft.) power cable or **#9491** for 0.75 meter (2.5 ft.) special rack-installation power cable. If one of the above is not specified, **#9891** will be assigned.

SPECIAL FEATURES

Fan Unit (#3950): Provides cooling for modem enclosure. The Fan Unit is installed in the rack cabinet above the modem enclosures. **Minimum:** One Fan Unit is required for a single 3866 mdl 1 modem enclosure or for a 3866 mdl 2 modem enclosure. Only one Fan Unit is required for two 3866 mdl 1 modem enclosures installed one above the other. **Field Installation:** Yes.

Power Unit (#5210): Provides power for the modem packs installed in the modem enclosure. **Minimum:** One per modem enclosure 3866 mdl 1 or 3866 mdl 2. **Field Installation:** Yes.

Field Installation: Yes.

MODEL CONVERSIONS (None)

ACCESSORIES (None)

SUPPLIES (None)

3867 LINK DIAGNOSTIC UNIT

PURPOSE

The 3867 is a microprocessor-based Link Diagnostic Unit designed to complement the IBM family of microprocessor-based modems (3863, 3864 and 3865). The problem determination and diagnostic functions built into the microprocessor-based Link Diagnostic Unit provide the capability to offer the customer an integrated IBM system solution to network management for both digital and analog links.

MODELS

Model 001

Customer Setup: The 3867 is designed for Customer Setup (CSU). This provides the customer with early availability. This also allows relocation of the unit without requiring IBM service personnel assistance. Customer accessible "Setup Switches" are provided on the rear panel to allow reconfiguration of the unit where application needs change.

HIGHLIGHTS

The microprocessor-based diagnostic unit is designed to operate from 2400 to 9600 bps on nonswitched lines. It is designed to be used either with analog modems attaching to both DTE and carrier modem connections, or on digital/analog links, attaching to the DTE interface connections only, where interpositioning is prohibited.

The function of the Link Diagnostic Unit is to provide a level of the Link Problem Determination Aids (LPDA) problem determination facilities of the 3863, 3864 and 3865 for non-intelligent signal processors.

The 3867 operates in either point-to-point or multipoint mode.

Customer Responsibilities:

1. Arrangements for price quotations, installation, and all costs of common carrier equipment and services.
2. Completion of the site preparation requirements as stated in the *IBM 3867 Link Diagnostic Unit Site Preparation Guide,* GA27-3261. This includes modification of the attaching modem connection and the interface to the telecommunications facility for the 3867 that is installed as an interpositioned analog unit.
3. Unpacking of the 3867, placement, set up, connection of cables and operational checkout during installation.
4. Determine when remedial maintenance is required.
5. Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be provided by IBM.
6. Packing of the malfunctioning 3867 in the designated shipping container with a completed Repair Authorization form and shipping prepaid to the designated IBM Repair Center.
7. Retaining a supply of original shipping containers for use when packing for shipment to the IBM Repair Center.
8. Machines designated as "spares" should be unpacked and checked for proper operation prior to shelving.

Communication Facilities: Attachment to facilities:

Where interpositioning is permitted, attachment to a private line (nonswitched) channel is by a cable, supplied with the 3867, which is terminated with a 4-prong plug (WE 283B or equivalent). The plug mates with a receptacle (WE 404B or 549A surface mount or 493A flush mount or equivalent), which is connected to the channel. For those situations in which the 3867 Link Diagnostic Unit will be attached to a telecommunication receptacle that does not accept the 4-prong plug, adaptors for 4-spade lugs or a 50-pin connector should be ordered. See "Telecommunication Cable" under "Specify".

Maintenance

Spares: The customer may wish to replace a failing 3867 with a spare and must be advised to purchase spares for such use. The number of spare devices needed is dependent upon the number of devices the customer has installed, his application requirements and physical locations.

When a 3867 is removed for maintenance and not replaced with a spare device, a customer must re-cable his modem connections which may be an inconvenience. Unless the customer re-sysgens his NCP, he may obtain unpredictable results from LPDA tests or misleading probable cause indications from NPDA. For these reasons, it is highly recommended that the customer be informed of the value of purchasing spares.

IBM Service: Maintenance of the 3867 will be at a designated IBM Location. All maintenance, parts replacement, adjustments, and repair shall be performed at the designated IBM Location. It shall be the customer's responsibility to determine when remedial maintenance is required. When remedial maintenance is required, it shall be the customer's responsibility to determine the failing device, pack the device in the designated shipping container and ship it prepaid to the designated IBM Location. There is no regularly scheduled preventive maintenance recommended by IBM on these devices.

Purchased Machines under Warranty: All purchased new machines are covered by three months service and parts warranty. If a malfunction occurs within this 90-day period, the machine will be repaired at the designated IBM Repair Center at no cost to the customer other than normal shipping charges.

Purchased Machines - Post Warranty: At the completion of the 90-day warranty period, service is available under a *Maintenance Agreement with the IBM Repair Center Maintenance Supplement* (Z120-2240-5).

Customers may obtain IBM maintenance agreement service after expiration of the warranty period by:

- Shipping the machine to the designated IBM repair center for inspection.
  - If, on the basis of the inspection, the center concludes that a machine is not repairable, no further work will be performed and the machine will be returned to the customer without charge.
  - In all other cases, a minimum charge per machine to cover handling, inspection, cleaning, lubrication, adjustments and testing will be applied. In addition, all parts used will be billed at IBM's prevailing parts prices, and additional time required to make repairs will be billed at IBM's prevailing hourly service rates. The machine will then be qualified for maintenance agreement coverage.
- Having the machine inspected on the customer's site.
  - This inspection will be performed by a local customer engineer to verify that the machine is fully operational.
  - Machines which are not fully operational must be sent to the designated IBM repair center for an IBM inspection and repair and will be subject to the terms and conditions of repair center inspections as stated above.
  - This inspection service is available on a firm price basis under an IBM contract support service agreement or on an hourly service basis.
  - For machines with non-IBM alterations, IBM will furnish maintenance service on the unaltered portion of the IBM machine under the applicable IBM agreement and in accordance with the maintenance plan described in the IBM Multiple Supplier Systems Bulletin.

All customer inquiries regarding IBM maintenance agreement acceptability inspections for purchased repair center machines are to be handled by the branch office. Customers should be advised that if they have non-operational machines for which they desire IBM repair center maintenance agreement service, these machines should be inspected at the repair center rather than on the customer's site.

Leased Machines: The cost of Repair Center maintenance other than the customer-prepaid shipping charges is included in the lease price.

Publications: *IBM 3867 Link Diagnostic Unit Setup Instructions and Users Guide* (GA27-3260) ... *IBM 3867 Link Diagnostic Unit Site Preparation Guide* (GA27-3261)

SPECIFY

- Voltage (120V AC, 1-phase, 3-wire, 60 Hz): Specify **#9891** for non-locking plug or **#9890** for locking plug. If standard 4.5 meter (15 foot) power cable is not required, specify **#9986** for 1.8 meter (6 foot) cable.
- Telecommunication Cable (Link Diagnostic Unit to telecommunication line): Specify only when interpositioning between modem and telecommunication line is permissible. For 4.5 meters (15 feet), specify **#9711**; 18 meters (60 feet), specify **#9712**.

  Cable Termination: See "Attachment to Facilities". For 4-spade lugs, specify **#5332**; 50-pin connector, specify **#5333**.
- 3867 Link Diagnostic Unit to Modem Cable: For 4.5 meters (15 feet), specify **#9940**; 13.5 meters (45 feet), specify **#9941**.

3868 RACK-MOUNTED MODEM

PURPOSE

The 3868 modem packs are rack-mounted versions of the 3863, 3864 and 3865 modem family to be inserted in a 3866 multimodem enclosure. Offering in a minimum volume, the maximum density of modems housing facility, they enhance the user capability for easy installation, maintenance and expansion of a user telecommunication network.

MODELS

Model 1 001 — 2400 bps modem pack operating in half- or full-duplex data mode over 4-wire, nonswitched duplex telecommunication facility at speeds of 2400/1200 bps. It operates in point-to-point or multipoint mode.

Model 2 002 — 4800 bps modem pack operating in half- or full-duplex data mode over 4-wire nonswitched duplex telecommunication facility at speeds of 4800/2400 bps. It operates in point-to-point or multipoint mode.

Model 3 003 — 9600 bps modem pack operating in half- or full-duplex data mode over 4-wire nonswitched duplex telecommunication facility at speeds of 9600/4800 bps. It operates in point-to-point mode.

Model 4 004 — 9600 bps modem pack operating in half- or full-duplex data mode over 4-wire nonswitched duplex telecommunication facility at speeds of 9600/4800 bps. It operates in multipoint mode and can be configured as a multipoint control or as a multipoint tributary station.

Prerequisites: A 3866 model 1 or 2 with available modem pack slots.

HIGHLIGHTS

The 3868 modem packs have the same functional characteristics as the equivalent 3863, 3864 and 3865 stand-alone modems. The following table gives the list of modem packs and equivalent stand-alone modems:

Modem Pack	Description	Equivalent Stand-alone Modem
3868-1	2400 bps leased	3863-1 with extended diagnostic feature
3868-2	4800 bps leased	3864-1 with extended diagnostic feature
3868-3	9600 bps pt-to-pt	3865-1 with extended diagnostic feature
3868-4	9600 bps multipt	3865-2 with extended diagnostic feature

The following list of functions already available with the 3863, 3864 and 3865 stand-alone modems are included in the 3868 mdls 1 to 4 modem packs:

- Data rate:
  - 2400 bps with back-up of 1200 bps on mdl 1
  - 4800 bps with back-up of 2400 bps on mdl 2
  - 9600 bps with back-up of 4800 bps on mdls 3 and 4
- Operation on 4-wire nonswitched duplex communication facility.
- A microprocessor for signal processing.
- Automatic Remote Speed Selection: The transmission speed of the remote modem follows the transmission speed of the local modem (primary status). The network configuration of the remote modem must be secondary.
- Anti-Streaming: A multipoint tributary modem can automatically cut off transmission if a terminal holds "Request to Send" up longer than 40 seconds (an abnormal condition in IBM communication protocol). Customer switch option.
- Automatic and Adaptive Equalization: Equalization is automatically performed by the modem and continues to adapt in data mode.
- Operator Panel with operational status indicators and data quality (Good/Poor) indications.
- The modem diagnostic function referred to as Link Problem Determination Aid (LPDA), operates with Systems Network Architecture (SNA) and associated program products . Under control of these programs, the modem accepts commands and initiates status retrieval and tests that help isolate problems to the line, local or remote modem, or elsewhere in the network and provide the network operator with the most probable cause of a network problem. These program products are:

  Network Communication Control Facility (NCCF) Version 1 Release 2 (PP 5735-XX6).

  Network Problem Determination Application (NPDA) Version 2 (PP 5668-983) or Version 3 (PP 5668-920 MVS/370, MVS/VA) (PP 5666-925 DOS/VSE, SSX/VSE).

  ACF/NCP Version 1 Release 2.1 or Release 3 (PP 5735-XX1) or ACF/NCP Version 2 (PP 5735-XX9). Receive Signal Level Reporting is not supported by these versions.
- Modem pack provides its own clocking or will accept DTE (external) clocking.
- Fast (RFS) Ready for sending delay available for multipoint tributary modem (customer switch option).
- Both point-to-point or multipoint can operate over 3002 Basic (unconditioned) channels.

Note: If a function is not listed herein, it is not available on the 3868 modem packs.

Diagnostics:

Built-in diagnostics: All modems will respond to diagnostic commands from the system. Test requests and responses utilize the same data path and controls that are used by the S/370, System/36, S/8100, (DPPX/SP) or 4300 processor for data transmission. Thus, diagnostic status/test requests can be interspersed with data requests without interrupting terminal sessions.

NPDA implemented under the Network Communication Control Facility (NCCF) program product has both summary and detailed level information for determining probable cause of network errors. Probable cause differentiates between errors in the communications controller, line, modem, modem interfaces or terminals.

NPDA will also utilize the new modem facilities to provide alert messages on error threshold and display formatted modem test results and status data including receive signal level.

In addition, tests can also be executed from the modem operator panel. These manual tests include:

- Modem self-test -- this includes an extensive test of modem microcode, plus a data wrap with reduced thresholds for received data.
- Local loop-back test -- provides a "wrap" or loop-back at the line interface to allow terminal wrap tests through the modem.
- Remote loop-back test -- provides a "wrap" or loop-back at the remote modem to allow a DTE wrap test back through the local modem for nonswitched modems. This test does not require remote operator assistance.
- Loop test -- allows an end-to-end test to any modem on the link without remote operator assistance.
- Lamp test -- tests all indicator lights on the operator panel.

Customer Set Up (CSU): The 3868 Rack-Mounted modems are designated to be set up by the user thereby offering the customer availability and relocation flexibility.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all Federal, State and local laws, regulations and ordinances.
- Adequate hardware ordering including Commercial Cabinet, Site preparation and setting up. For more information, refer to the *Planning and Site Preparation Guide* (GA33-2023).
- Arrangements for the price quotations, installation, and all costs of common carrier equipment and service.
- Private line (nonswitched) channel -- arranging for the telecommunications service supplier to provide a voice-grade data channel.
- Ensuring the availability of the interconnecting cable between the business machine and the modem because it is not supplied by the modem.
- Receipt at the customer's receiving dock, unpacking and setting up the packs.
- Performing 3868 check-out in accordance with supplied procedures for initial set up and relocation.
- Using customer problem determination procedures provided with the 3866 to determine the failing unit and filling out the appropriate 3868 problem report prior to taking action to get the failing unit repaired or exchanged. (See "Maintenance" below.)
- Procuring any required spare packs. The customer may wish to replace a failing 3868 with a spare and must be informed to retain sufficient spare units for such use. The number of spare units recommended is dependent upon the number units the customer has installed, the operational requirements, physical locations, and layouts. However, the minimum number of spare units recommended is shown in the following table:

3868 Rack-Mounted Modem (cont'd)

Number of 3868s Installed	Minimum Number of Spares Recommended
001-100	3
101-200	4
201-300	6
301-500	8
501-1000	14
1001-1500	19
1500-2000	24

- Notifying IBM of intent to relocate the unit, and following IBM instructions for relocation.
- Disconnecting, packing and movement to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be supplied by IBM.
- All three of the following program products must be installed for LPDA to function:
  - NCCF Version 1 Release 2 (PP 5735-XX6)
  - NPDA Version 2 (PP 5668-983) or Version 3 (PP 5668-920, PP 5666-925)
  - ACF/NCP Version 1 Release 2.1 or Release 3 (PP 5735-XX1) or ACF/NCP Version 2 (PP 5735-XX9)

Warranty Service: The warranty period is three years . Warranty Service is provided under the terms and conditions of the Agreement for Purchase of IBM Machines and the Amendment for IBM Service/Exchange Center Services. The service offering during warranty is Customer On-Site Exchange (COE) as described below.

Customer On-Site Exchange (COE): It is the customer's responsibility to set up the equipment and to determine when maintenance is required. The customer may wish to replace a failing element with a spare element and should be advised to purchase sufficient spare elements.

It is the customer's responsibility to disconnect the element(s) and call a designated number to have a replacement element(s) delivered to the customer site where they will be exchanged (without testing) for the customer's defective unit(s). The defective elements become the property of IBM.

The 3868 will be eligible for IBM Maintenance Agreement coverage immediately following expiration of the warranty for an annual charge. The maintenance offering will be Customer On-Site Exchange (COE).

Maintenance: The level of maintenance service on rental (MRC) machines is Customer On-Site Exchange (COE). Maintenance service is provided under the Amendment for IBM Service/Exchange Center services.

On-Site Assistance: If the customer desires assistance to perform Customer Problem Analysis and Resolution (CPAR), he may call for assistance on a toll free number. IBM will respond to the customer site to aid the customer in performing CPAR procedures using the same documentation available to the customer. IBM assistance is billable at the application rates and terms.

Communications Facilities - Mdls 1 and 2

Common Carrier Facilities: Common carrier-provided voiceband private line (nonswitched) channel, type 3002 (or equivalent) as described in the *Bell System Technical Reference,* PUB 41004, dated October 1973.

Privately-owned Communication Facilities: Equivalent to above.

Communications Facilities - Mdls 3 and 4

Common Carrier Facilities: Voiceband private line (nonswitched) channel, type 3002 (or equivalent) as described in the *Bell System Technical Reference,* PUB 41004, dated October 1973.

Mdl 3 (point-to-point), and mdl 4 (multipoint) use basic channels.

Privately-owned Communication Facilities: Equivalent to above.

Extended Diagnostic Functions: Provided with 3868 mdls 1 to 4, these functions enhance the diagnostic capabilities of non-switched modems when it is installed in both the local and remote modems. It provides and additional test that enables NPDA to differentiate between modem failure, line failure and remote modem power loss.

Related Equipment: The 3868 operates with IBM communication products capable of 2400 bps operation for mdl 1, 4800 bps operation for mdl 2 and mdl 2 and 9600 bps operation for mdls 3 and 4. See M2700 pages. The 3868 communicates with another appropriately configured 3868 or 3863/3864/3865 stand-alone modem. The interconnecting cable between the business machine and the modem must be supplied by the business machine.

Bibliography: See specific systems bibliography.

RPQs: RPQs will not be accepted.

SPECIFY

- Telecommunication cable (modem to telecommunications line connection):

  7.5m (25 ft.) **#9713**
  0.7m (2.5 ft.) **#9719**

  If one of the above is not specified, **#9713** will be assigned.

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES

Telecommunications Cable Adapters (P/N 7838805, P/N 1992900): Convert the 4-prong plug (WE238B or equivalent) supplied on the telecommunications cable to a 4-spade lug or a 50-pin connector termination. For 4-spade lugs, order P/N **7838805** ... for 50-pin connectors, order P/N **1992900**. (The 50-pin connector is commonly used for telephone company modems.) See "Attachment Facilities" in the M3863, 3864 or 3865 pages.

SUPPLIES (None)

3872 MODEM

PURPOSE

A 2400 bps modem, with half-speed capability, used to provide communications products with the means for transmitting data over common carrier-provided voice band private line (nonswitched) channels, equivalent privately-owned channels or switched telecommunications networks.

MODELS

Model 1 001

Prerequisites: See "Teleprocessing Systems" in GI section.

HIGHLIGHTS

Modem operation is possible in half-duplex mode over 2- or 4-wire half-duplex facilities, half-duplex or duplex mode over 4-wire duplex facilities, or half-duplex mode over switched telecommunication networks.

Data Rates: 2400 bps with backup half-speed.

Equalization: Manually adjustable by operator on private line (nonswitched) channels and automatic on switched networks .

Operation: Switched network or multipoint control, multipoint tributary, point-to-point on a private line (nonswitched) channel. See "Special Features".

Built-In Diagnostics: Included in each modem are the following diagnostic features accessible to the operator: (1) The modem may be *wrap tested* independently of the using machine and telecommunication channel ... (2) It may be *line tested* with a remote modem and telecommunication channel, independently of the attached business machine. The test may be one-way or remotely wrapped to the local modem.

Communication Facilities

Communication common carrier-provided voice band private line (nonswitched) channel, type 3002 (or equivalent) as described in the *Bell System Technical Reference PUB 41004,* dated October, 1973. **Note:** Machines with a serial number prior to 13100 and a suffix prior to HZ with Multipoint Tributary (#5101, #5102) or Point-to-point (#6101, #6102) feature require the installation of an RPQ to operate on a basic (not conditioned) 3002 channel. Machines shipped from the plant after June 1, 1976, do not require the RPQ. Conditioned lines may be used but are not required. Contact IBM for RPQ ordering information.

Privately Owned Communications Facilities: Equivalent to above.

Public Switched Networks: The customer must be advised that satisfactory data transmission depends upon the characteristics of the particular switched network connection being used. Refer to M2700 pages for further details.

International Facilities: Transmission of data between the U.S. and Canada on nonswitched or switched facilities is supported. (For nonswitched operation, the channel in Canada must be a schedule 4, type 4.)

Attachment to Facilities: Attachment to a private line (nonswitched) channel is by a cable, supplied with the 3872, which is terminated with a 4-prong plug (WE 283B or equivalent). The plug mates with a receptacle (WE 404B or 549A surface mount or 493A flush mount, or equivalent) which is connected to the channel. (The receptacle is a conventional item of communications equipment and is, upon customer request, ordinarily furnished by the telecommunication service supplier.)

If the 3872 is equipped with Switched Network Backup (#7951), another cable is supplied with the feature. This cable is also terminated with a 4-prong plug and requires the aforementioned type of receptacle which is connected to the FCC registered protective circuitry of the CDT type (or equivalent) provided by the user.

If the 3872 is equipped with Switched Network (#7941, #7942) or Switched Network Backup with Automatic Answer (#7952) a cable is supplied with the feature which is terminated with spade lugs for connection to FCC registered protective circuitry of the CBS type (or equivalent) provided by the user.

Related Equipment: The 3872 operates with IBM communications products capable of 2400 bps operation ... see "Related Equipment" under "Specify". Modem clocking must be used. The 3872 Modem must communicate with another appropriately equipped 3872, or with an appropriately equipped IBM 2400 bps Integrated Modem. The interconnecting cable between the business machine and the modem must be supplied by the business machine. If the 3872 is equipped with the Automatic Call Originate (#1091) feature, the interconnecting Auto-Call cable between the business machine and the modem must be supplied by the business machine.

Customer Responsibilities: The customer must be informed of his responsibilities as detailed in the M2700 pages and in the Installation Planning section of the *3872 User's Guide,* GA27-3058. The customer is responsible for:

1. Private line (nonswitched) channel -- arranging for the telecommunication service supplier to provide a type 3002 voice grade data channel (or equivalent) as described under "Communications Channel Specifications" in the *3872 User's Guide.* Also arranging for the installation of the appropriate receptacle described in "Attachment to Facilities".
2. Switched Telecommunication Network -- arranging for the telecommunication service supplier to install the appropriate communication service.

   Also arranging for the FCC registered protective circuitry as described in "Attachment to Facilities" and for attaching the IBM-provided cable to the protective circuitry.

   Also inform the telecommunication service supplier that the speed of data transmission will be 2400 bps and that appropriate conditioning of the local loop is required. The customer must be made aware that the use of local loops not properly conditioned for the speed of data transmission or the use of special switched facilities may result in unsatisfactory data transmission.
3. Providing voice communication between modems to coordinate tests or re-equalization. The voice facility can be provided by the 3872 Alternate Voice feature. Information concerning the handset for the Alternate Voice feature is described in the *3872 Modem User's Guide.* The voice facility must be located such that an operator can use it while operating the controls on the front of the modem.
4. If the 3872 is to be attached to a non-IBM product, the interconnecting cable between the business machine and the modem must be supplied by the business machine.
5. If the 3872 is equipped with the Automatic Call Originate feature (#1091), the interconnecting Auto-Call cable between the business machine and the modem must be supplied by the business machine.

Publications: See *KWIC Index,* G320-1621, or specific system bibliography ... *IBM 3872 User's Guide,* GA27-3058

SPECIFY

- Voltage (AC, 1-phase, 3-wire, 60 Hz): Locking plug -- **#9880** for 115V, **#9884** for 208V, **#9886** for 230V ... non-locking plug -- **#9881** for 115V, **#9885** for 208V, **#9887** for 230V.
- Telecommunication Cord (modem to telecommunication facility): Specify one of the following for each telecommunication channel or network connection:

  #9750 -- Telecommunication cord to connect a basic (control station) 3872 Modem or one equipped with Multipoint Tributary (#5101), or Point-to-Point (#6101) feature, to a private line (nonswitched) channel.

  #9751 -- Telecommunication cord to connect a basic (control station) 3872 Second Modem (#6302) or second modem equipped with Multipoint Tributary (#5102), or Point-to-Point (#6102) feature, to a private line (nonswitched) channel.

  #9752 -- Telecommunication cord to connect a 3872 Modem equipped with Switched Network (#7941) to a switched telecommunication network.

  #9753 -- Telecommunication cord to connect a 3872 Second Modem (#6302) equipped with Switched Network (#7942) to a switched telecommunication network.

  #9754 -- Telecommunication cord to connect a 3872 Modem equipped with Switched Network Backup (#7951) or Switched Network Backup with Automatic Answer (#7952) to a switched telecommunication network.

  A 10-foot cable will be supplied. If a longer cable is required, indicate 15, 20 or 25 feet as the quantity of the feature number specified. **Note:** MES orders to add the Switched Network Backup feature(s) (#7951 or #7952), to convert a private line (nonswitched) channel modem to Switched Network, or to convert a Switched Network modem to private line (nonswitched) channel must include the telecommunication cord specify number(s) compatible with the resultant modem configuration.
- Related Equipment: For record purposes, one 3872 Attachment Feature Code from the table below must be specified for each 3872, depending upon the unit to which it is attached.

The Following Table Has Been Revised:

3872 Modem (cont'd)

Machine	3872 Attach #	Machine	3872 Attach #
2701	**#9505**	4952	**#9573**
3115	**#9527**	4953	**#9573**
3125	**#9525**	4954	**#9573**
3135	**#9512**	4955	**#9573**
3135-3	**#9525**	4987	**#9574**
3138	**#9550**	5010	**#9531**
3232-1	**#9585**	5110	**#9564**
3271	**#9513**	5231	**#9547**
3274	**#9558**	5251	**#9565**
3275	**#9514**	5265	**#9566**
3276	**#9557**	5285	**#9604**
3601	**#9532**	5288	**#9605**

3725	**#9515**	6640	**#9556**
3735	**#9517**	6670	**#9563**
3741	**#9526**	8101	**#9569**
3747	**#9526**	8130	**#9567**
3767	**#9537**	8140	**#9568**
3771	**#9540**	6/420	**#9575**
3774	**#9542**	6/430	**#9552**
3775	**#9543**	6/440	**#9553**
3776	**#9544**	6/442	**#9576**
3777	**#9528**	6/450	**#9554**
3780	**#9521**	6/452	**#9577**
3791	**#9535**	MC II	**#9555**
3845	**#9579**	RPQ	**#9524**
3846	**#9579**	Non-IBM	**#9520**

SPECIAL FEATURES

The basic 3872 Modem, with no additional features required, is used at the control station in a centralized multipoint network. Additional capabilities/configurations are provided by the following features:

Alternate Voice (#1051, #1052): Provides signalling capability and a socket on the operator panel into which a customer-provided handset may be plugged, permitting voice communications with the distant 3872 Modem(s). Data cannot be simultaneously transmitted with voice. A handset is not provided. See *3872 User's Guide* for description of handset. #1051 -- for basic modem ... #1052 -- for Second Modem (#6302). **Limitations:** #1051 cannot be installed with Switched Network (#7941) ... #1052 cannot be installed with Switched Network (#7942). **Maximum:** One of each. **Field Installation:** Yes. **Prerequisites:** #1052 requires #6302.

Automatic Call Originate (#1091): Permits automatic origination of a call by the using machine equipped with an IBM autocall feature. Provides control to FCC registered protective circuitry of the CBS type (or equivalent) provided by the user to dial telephone numbers and to provide on-hook/off-hook control. **Note:** Can only be used with Rotary Dial System. **Limitations:** Cannot be installed with Second Modem (#6302) or Switched Network Backup (#7951, #7952). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #7941 on 3872 and an IBM Auto Call feature on the using machine.

Fan-Out (#3901): This feature allows attachment, to the 3872, of up to three IBM Teleprocessing machines at one location ... see "Related Equipment" under "Specify" for applicable machines. Only one of the attached machines may transmit at a time. This feature may be used at a tributary station in a centralized multipoint network. In this configuration, multipoint programming discipline will provide the selection/control of the specified IBM terminals without any additional user involvement. This feature may also be used to allow up to three of the specified IBM multiplexers, communications controllers, integrated communications adapters or communications adapters on 4331, at a central site, to share the same 3872 Modem for backup purposes. In this case, although all of the machines attached to the 3872 will receive the incoming data simultaneously, the user switchover procedure must ensure that only one machine is sending. **Limitations:** Cannot be installed with Second Modem (#6302) or Switched Network (#7941) . **Maximum:** One. **Field Installation:** Yes.

Multipoint Tributary (#5101, #5102): Used on each modem attached to tributary stations in a centralized multipoint network to compensate for line distortion between the control and tributary station. Operator adjustment on front panel. #5101 -- for basic modem ... #5102 -- for Second Modem (#6302). **Limitations:** #5101 cannot be installed with Point-to-Point (#6101) or Switched Network (#7941) ... #5102 cannot be installed with Point-to-Point (#6102) or Switched Network (#7942). **Maximum:** One of each. **Field Installation:** Yes. **Prerequisites:** #5102 requires #6302. **Specify:** Telecommunication cord **#9750** for feature #5101 ... Telecommunication cord **#9751** for feature #5102.

Point-to-Point (#6101, #6102): Used on modems at each end of a point-to-point private line (nonswitched) channel to compensate for line distortion. #6101 -- for basic modem ... #6102 -- for Second Modem (#6302). **Limitations:** #6101 cannot be installed with Multipoint Tributary (#5101) or Switched Network (#7941) ... #6102 cannot be installed with Multipoint Tributary (#5102) or Switched Network (#7942). **Maximum:** One of each. **Field Installation:** Yes. **Prerequisites:** #6102 requires #6302. **Specify:** Telecommunication cord **#9750** for feature #6101 ... Telecommunication cord **#9751** for feature #6102.

Second Modem (#6302): Permits two modems, each to operate on a separate line, to be housed in the same stand-alone cabinet. The two modems share the same power supply. **Limitations:** Only the following features are allowed on either or both modems -- Alternate Voice (#1051, #1052), Point-to-Point (#6101, #6102), Multipoint Tributary (#5101, #5102), or Switched Network (#7941, #7942). **Maximum:** One. **Field Installation:** No.

Switched Network (#7941, #7942): Used for operation over the public switched network via the FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. Automatic answering of incoming calls will be performed by the modem. Automatic equalization is effected at the beginning of each call. #7941 -- for basic modem ... #7942 -- for Second Modem (#6302). Conditioning of the telecommunication service local loop for transmission of data faster than 300 bps is required. It can communicate with another 3872 equipped with Switched Network (#7941 or #7942), with Switched Network Backup (#7951) or with Switched Network Backup with Automatic Answer (#7952). **Limitations:** #7941 cannot be installed with Alternate Voice (#1051), Fan-Out (#3901), Multipoint Tributary (#5101) or Point-to-Point (#6101) ... #7942 cannot be installed with Alternate Voice (#1052), Multipoint Tributary (#5102) or Point-to-Point (#6102). **Maximum:** One of each. **Field Installation:** Yes. **Prerequisites:** #7942 requires #6302. **Specify:** Telecommunication cord **#9752** for feature #7941 ... telecommunication cord **#9753** for feature #7942.

Switched Network Backup (#7951): Provides the capability of attaching the 3872 to the public switched network as a backup to the private line (nonswitched) channel. It can communicate with another 3872 equipped with Switched Network (#7941 or #7942), with Switched Network Backup (#7951) or with Switched Network Backup with Automatic Answer (#7952). A fixed compromise equalizer is provided for the backup operation. A front panel switch permits operator selection of either the prime or the backup facility. Both facilities cannot be used simultaneously. Attachment to the switched network is made via the FCC registered protective circuitry of the CDT type (or equivalent) provided by the user. Calls must be established and answered manually. **Note:** To use this feature, operator intervention at the modem is required. Operator intervention, program modification, or both may be required on the using system/terminal. This feature can be used with BTAM programs for DOS, DOS/VS, OS, OS/VS1 and OS/VS2 in certain configurations. Programming support for the 2020, 5231, 5285, 5288, 5320, 5340, 5381, 5404, 5406, 5408, 5410, 5412, and 5415 is still applicable when these devices are used as remote terminals. Additional customer program routines will be required, in existing BTAM programming, to fully utilize the capabilities of the Switched Network Backup feature. For additional information, see the *3872 User's Guide.* Conditioning of the telecommunication service local loop for transmission of data faster than 300 bps is required. **Limitations:** Cannot be installed with Second Modem (#6302), or Switched Network features (#7941, #7942 or #7952). **Maximum:** One. **Field Installation:** Yes. **Specify:** Telecommunication cord **#9754.**

Switched Network Backup with Automatic Answer (#7952): Same as Switched Network Backup (#7951) plus the added capability of automatically answering incoming calls when attached to FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. **Note:** To use this feature, operator intervention at the modem is required. Operator intervention, program modification, or both may be required on the using system/terminal. This feature can be used with BTAM programs for DOS, DOS/VS, OS, OS/VS1 and OS/VS2 in certain configurations. Programming support for the 2020, 5231, 5285, 5288, 5320, 5340, 5381, 5404, 5406, 5408, 5410, 5412, and 5415 is still applicable when these devices are used as remote terminals. Additional customer program routines will be required, in existing BTAM programming, to fully utilize the capabilities of the Switched Network Backup feature. Conditioning of the telecommunication service local loop for the transmission of data faster than 300 bps is required. For additional information, see the *3872 User's Guide.* **Limitations:** Cannot be installed with Second Modem (#6302) or Switched Network features (#7941, #7942 or #7951). **Maximum:** One. **Field Installation:** Yes. **Specify:** Telecommunication cord **#9754.**

3872 Modem (cont'd)

CONFIGURATOR

The HONE Configurator, CFMODEM, is available for assistance in configuring the 3872 Modem.

Feature Code Configuration Flowchart

ACCESSORIES (None)

SUPPLIES (None)

3880 STORAGE CONTROL MDLS 1,2,3

PURPOSE

Provides two independent control unit paths, called storage directors, for 3330/3333, 3340/3344, 3350, 3370, 3375 and 3380 direct access storage.

MODELS

Model 1 001 — Each of the two storage directors provides for attachment of either up to four 3340 model A2s, or up to four 3370 model A1s and/or A2s in any combination, or up to four 3375 model A1s and/or D1s, or up to four 3333s (any model) and 3350 A2/A2Fs and C2/C2Fs in any combination (see DASD Attachment Configuration under "Specify" and M3330, 3333, 3340, 3344, 3350, 3370, and 3375 pages).

Model 2 002 — One of the two storage directors provides for DASD attachment as described for both storage directors of the model 1 above. The other storage director provides for attachment of either up to two 3380 model A4s or two 3380 model AA4s (see M3380 pages).

Model 3 003 — Each of the two storage directors provides for attachment of either up to two 3380 model A4s or up to two 3380 model AA4s (see M3380 pages).

Limitations:

1) See M3330, 3333, 3340, 3344, 3350, 3370, 3375, 3380 pages for system support limitations.
2) 3350 DASD attached to the 3880 must be in Native Mode format; 3330 mdls 1 and 11 Compatibility Mode are **not** supported.
3) In S/370 Mdl 135, 135-3, 138, when a 3880 is attached to a block multiplexer channel, only 16 logical devices will operate in this mode, even if more than 16 logical devices are attached.
4) Mdls of 3380 DASD with dynamic path selection (mdl AA4) may not be attached to the same storage director as mdls of 3380 without dynamic path selection (mdl A4).

Maximum: For configurations attaching 3340/3344 DASD, the storage director uses 64 contiguous addresses irrespective of the number of drives attached. The 3340 mdl A2s on the first and third strings may attach up to three 3340 mdl B1s/B2s and/or 3344s in any combination. The 3340 mdl A2 on the second string may attach up to three 3340 mdl B1s/B2s. The 3340 mdl A2 in the fourth string may attach one 3340 mdl B1/B2.

For a storage director attaching 3370 DASD, a maximum of four 3370 mdls A1 and A2 in any combination, each with up to three 3370 mdl B1s may be attached.

For a storage director attaching 3330/3333/3350 DASD, a maximum of four 3333 mdl 1s, 3333 mdl 11s, and/or 3350 mdls A2s/A2Fs in any combinations. Each string with a 3333 mdl 1 or 11 may attach up to three 3330 mdls 1s/2s or 11s. Each string with a 3350 mdl A2/A2F may attach up to three 3350 mdls B2s/B2Fs or up to two 3350 mdls B2s/B2Fs and a 3350 mdl C2/C2F.

For a storage director attaching 3380 DASD, a maximum of either two 3380 mdl A4s or two AA4s. Each string with a 3380 mdl A4/AA4 may attach up to three 3380 mdl B4s.

For a storage director attaching 3375 DASD, a maximum of four 3375 model A1s and/or D1s.

Prerequisites: An available control unit position for each storage director on a block multiplexer channel. One unshared subchannel for each logical address attached to a block multiplexer channel.

On 3880 mdls 2 and/or 3, storage directors attaching 3380 DASD must be attached to either a 3.0MB/sec. block multiplexer channel which can operate in data streaming mode or must have the Speed Matching Buffer for 3380 feature (#6550). On 3880 Models 1 and/or 2, storage director attaching 3375 DASD must be attached to either a block multiplexer channel which can operate at 1.859MB/sec. or more or must have the Speed Matching Buffer for 3375 feature (#6560). Attachment of either the 3380 without use of the Speed Matching Buffer for 3380 feature or the 3375 without use of the Speed Matching Buffer for 3375 feature, through the 3880 to 3031, 3032, 3033 or 3042 mdl 2 requires the Data Streaming feature (#4850) installed on the processor. Attaches to a 3081, 3083, or 3084 Processor via any block multiplexer channel.

On a 4341 Processor, storage directors on 3880 mdls 2 or 3 attaching 3380 DASD must either be attached to a 3.0MB/sec. block multiplexer channel or have the Speed Matching Buffer feature (#6550) and be attached to a 2.0 or 3.0MB/sec. block multiplexer channel. On a 4381 Processor, storage directors on a 3880 mdl 2 or 3 attaching 3380 DASD must be attached to a 3.0MB/sec. block multiplexer channel. Attachment of the 3380 to 4381 Processors in shared DASD environments via speed matching buffer (#6550) is supported only on 4381 3.0MB/sec. channels. Storage directors on 3880 Models 1 and 2 attaching 3350, 3370 or 3375 DASD must be attached to a 2.0 or 3.0MB/sec. block multiplexer channel; storage directors on 3880 Models 1 or 2 attaching 3330/3333 or 3340/3344 DASD may be attached to either a 1.0 (Mdl Group 1), 2.0 or 3.0MB/sec. block multiplexer channel.

On a 4331 Mdl Group 2, or 4361, a 3880 mdl 1 or 2 is supported only on the optional High-Speed Block Multiplexer Channel (#1431).

On a 4361, the 3880 must be attached to optional High-Speed Block Multiplexer Channels (HS BMPX) (#143X). Storage directors attaching 3380 must be attached to HS BMPX 1 or 2 (#1413, #1432).

On a S/370 mdl 165-II and 168, attachment is to the 2880 Block Multiplexer Channel. On S/370 mdl 158, 158-3, 168 and 168-3, the S/370 Extended feature (#7730) is required in order to attach 3380 or 3375 through a 3880 mdl 2 or 3 when the programming support used is one of the MVS/System Program Products.

HIGHLIGHTS

File organization and format are under program control, allowing random or sequential processing of files. Two independent storage directors allow orderly conversion to newer 3370, 3375 or 3380 DAS. Multiple requesting allows multiple overlapped operations on DAS drives attached to each storage director. Data Integrity is provided through extensive error detection and correction capabilities. Advanced logic and improved fault detection capability provide high availability.

System Attachments: Each storage director attaches to a processor channel. The second of the two storage directors can attach to either the same channel as the first, or a different channel on the same processor, or a channel on a different processor. The following DASD and processor attachments are supported:

Processor(s)	DASD
4341/4361/4381	3330, 3333, 3340, 3344, 3350, 3370, 3375, 3380
4331 mdl Group 2	3330, 3333, 3340, 3344, 3350, 3370, 3375
S/370 mdls 135, 135-3, 138, 145, 145-3, 148, 155-II, 165-II, 3330, 3333, 3344, 3340, 3350, 3375	3330, 3333, 3340, 3344, 3350
S/370 mdls 158, 158-3, 168, 168-3	3330, 3333, 3340, 3344, 3350, 3375, 3380
3031, 3032, 3033, 3081, 3083, 3084	3330, 3333, 3340, 3344, 3350, 3375, 3380

Bibliography: GA26-1661.

SPECIFY

- Voltage (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V, **#9915** for 240V.
- Color: **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, **#9065** for pebble gray.
- DASD Attachment Configuration: Two of the following must be specified; one for each storage director. The same attachment specify code may be specified twice:

Attachment	Specify
3330/3333/3350	**#9192**
3340/3344	**#9190**
3370	**#9191**
3380 without (#6550)	**#9193**
3380 with (#6550)	**#9194**
3375 without (#6560)	**#9195**
3375 with #6560	**#9198**

Note 1: Diskette-only specify feature. A fee for purchased machines when DASD Attachment Configuration features are changed via MES.

Note 2: On MES orders where one of the two DASD Attachment Configuration specify codes is changed, you must also specify removal and addition of the other code, even though the code does not change. This will assure that the latest EC level of code is shipped for both storage directors.

3880 Storage Control Mdls 1,2,3 (cont'd)

SPECIAL FEATURES

Remote Switch Attachment (#6148): Removes the enable/disable switches from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. This feature allows relocation of up to four switches, accommodating the single channel connection to each storage director, or two channel connections to each storage director (using #8170). **Maximum:** One. **Field Installation:** Yes.

Remote Switch Attachment, Add'l (#6149): Removes the four additional enable/disable switches provided by the Two Channel Switch Pair, Additional (#8171) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #8170, #8171, #6148.

Remote Switch Attachment For Eight-Channel Switch (#6150): Removes the eight additional enable/disable switches provided by the Eight-Channel Switch (#8172) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #8170, #8171, #8172, #6148, #6149.

Speed Matching Buffer For 3380 (#6550): Supports attachment of 3380 DASD to 1.5MB/sec. block multiplexer channels on S/370 mdls 158, 158-3, 168 and 168-3, 3031, 3032, 3033 and 3042 mdl 2, and 2.0MB/sec. block multiplexer channels on the 4341 Processor. Also supports attachment of 3380 to 3.0MB/sec. block multiplexer channels on 3031, 3032, 3033 and 3042 mdl 2 that have the Data Streaming feature (#4850) with data transfer at 3.0MB/sec., or a 3.0MB/sec. block multiplexer channel on a 4341 or 4381 Processor. The feature is for a storage director that attaches 3380. **Limitations:** On a 3031, 3032, 3033 or 3042 mdl 2 channel group with Data Streaming (#4850), first three block multiplexer channels of the group can attach 3880 storage directors with this feature installed. When both paths of the 3380 with the dynamic path selection function are attached to a single processor, both storage directors must have the Speed Matching Buffer feature or neither may have it.

On 3031, 3032, 3033 or 3042 mdl 2 channel group without Data Streaming, first two block multiplexer channels of the group can attach 3880 storage directors with this feature installed. See the publication *IBM 3031, 3032, 3033 Processor Complex Channel Configuration Guidelines,* GC22-9020, for more information.

On a S/370 mdl 158 or 158-3, two block multiplexer channels can attach 3880 storage directors with this feature installed. See the publication *Guide to the System/370 Model 158,* GG20-1754, for more information.

On a S/370 mdl 168 or 168-3, six block multiplexer channels can attach 3880 storage directors with this feature installed. See the publication *System/370 Model 168 Functional Characteristics,* GA22-7010, for more information. **Maximum:** One on a 3880 mdl 2; two on a 3880 mdl 3. **Field Installation:** Not available on machines with serial numbers of 10444 and below. Not recommended on machines with serial numbers between 10445 and 20119. Field installable on machines with serial numbers of 20200 and above. **Prerequisites: #9194** ... 3380 with #6550.

Speed Matching Buffer For 3775 (#6560): Supports attachment of 3375 DASD to 1.5MB/sec. block multiplexer channels on S/370 Models 145, 148, 155-II, 158, 158-3, 165-II, 168, 168-3, 3031, 3032, 3033, and 3042 Model 2 Processors. Also supports attachment of 3375 to 3.0MB/sec. block multiplexer channels on 3031, 3032, 3033 and 3042 Model 2 that have the Data Streaming Feature (#4850) with data transfer at 3.0MB/sec. per second, or a 2.0 or 3.0MB/sec. block multiplexer channel on a 4341 or 4381 Processor, or the 3.0MB/sec. block multiplexer channel on the 3081 Processor, or the optional High-Speed Channel on the 4331 Model Group 2. If channels of speeds different from 1.859 megabytes per second are switched to a storage director with Speed Matching Buffer Feature, the 3.0 and 2.0MB/sec. block multiplexer channels are supported at the 3375 data rate (1.859MB/sec) and the 1.5MB/sec. block multiplexer channels are supported at the channel data rate (1.5MB/sec). The feature is for a storage director that attaches 3375. **Limitations:** On a 3031, 3032, 3033 or 3042 Mdl 2 channel group with Data Streaming (#4850), first three block multiplexer channels of the group can attach 3880 storage directors with this feature installed.

On 3031, 3032, 3033 or 3042 Model 2 channel group without Data Streaming, the first two block multiplexer channels of the group can attach 3880 storage directors with this feature installed.

On a S/370 Model 155-II, the first or second block multiplexer channel can attach 3880 Storage Directors with this feature installed. On a S/370 Model 158 or 158-3, the first two block multiplexer channels can attach 3880 Storage Directors with this feature installed.

On a S/370 Model 165-II, four block multiplexer channels can attach 3880 Storage Directors with this feature installed. On a S/370 Model 168, 168-3, six block multiplexer channels can attach 3880 Storage Directors with this feature installed.

On a S/370 Model 145 or 148, the first block multiplexer, only, can attach 3880 Storage Directors with this feature installed. Word Buffer Feature (#8810) is required on S/370 Model 145. **Maximum:** Two on a 3880 Model 1; one on a 3880 Model 2. **Field Installation:** Field installable on 3880 Model 1 or 2 machines with serial numbers 20200 through 29999, 30200 through 39999, and 40200 through 99999. RPQ MM2865 is required for machines with serial number 10445 through 20000 . Not available for any other machines.

Two-Channel Switch Pair (#8170): To attach each storage director to a second channel. Four unique channels may be switched, two to each storage director or the same two channels may be switched to both storage directors. The channels to be switched may be on the same or on different processors. An available control unit position is required on each channel ... see "Prerequisites". Switching is under program control. Each storage director can be dedicated to a single channel by means of an enable/disable switch. **Maximum:** One. **Field Installation:** Yes.

Two-Channel Switch Pair, Add'l (#8171): Adds switching for two additional channels per storage director on a 3880 with the Two-Channel Switch Pair (#8170) feature, providing four channel switch capability for both storage directors. Up to eight unique channels may be switched, four to each storage director. Each storage director can be dedicated to a subset of the four attached channels by means of an enable/disable switch. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #8170.

Eight-Channel Switch (#8172): For 3330/3333/3350 and/or 3380 DASD, adds switching for four additional channels per storage director on a 3880 with the Two-Channel Switch Pair and Two-Channel Switch Pair, Add'l features (#8170, #8171), providing eight channel switch capability for both storage directors. The same eight channels must be switched to both storage directors. Each storage director can be dedicated to a subset of the eight attached channels by means of an enable/disable switch. **Maximum:** One. **Field Installation:** Available at time of manufacture only. **Prerequisites:** #8170, #8171. Only supported for 3330/3333/3350 (**#9192**) and/or 3380 (**#9193** or **#9194**).

MODEL CONVERSIONS

Model upgrades are field installable. MES orders for model upgrades must include removal of old DASD Attachment Configuration specify codes and addition of new specify codes.

ACCESSORIES (None)

SUPPLIES (None)

3880 STORAGE CONTROL MDL 4

PURPOSE

Provides a single control unit path, called a Storage Director, for 3370 and 3375 Direct Access Storage. The model 4 contains one Storage Director that provides for attachment of up to four 3370 models A1 and A2 in any combination, or up to four 3375 model A1s. See DASD Attachment Configuration under "Specify" and M3370 and 3375 pages.

MODELS

Model 4 004

Prerequisites: An available control unit position on a block multiplexer channel for the storage director. One unshared subchannel is required for each logical address attached to a block multiplexer channel.

On the 4331-2 or 4361, the Storage Director must be attached to a High-Speed Block Multiplexer Channel (#143X).

On the 4341, the Storage Director must be attached to a 2.0MB/sec. Block Multiplex Channel.

On the 4381, the Storage Director must be attached to either a 3.0MB/sec. Block Multiplexer channel or to a 2.0MB/sec. Block Multiplexer Channel.

Maximum: A maximum of four 3370 mdls A1 and A2 in any combination, or four 3375 mdl A1s can be attached ... See M3370 and 3375 pages.

Limitations:

1. See M3370 and 3375 pages for system limitations.
2. 3370s & 3375s cannot both be attached to the storage director at the same time.
3. No RPQs will be accepted.

HIGHLIGHTS

File organization and format are under program control, allowing random or sequential processing of files; data integrity is provided through extensive error detection and correction capabilities; advanced logic and improved fault detection capability provide high availability.

Systems attachment: The single storage director attaches to a processor channel. The following DASD and processor attachment is supported:

Processor	DASD
4331-2	3370, 3375
4341	3370, 3375
4381	3370, 3375

Bibliography: GC20-0001

SPECIFY

- Voltage: (AC, 3-Phase, 4-wire, 60 Hz): **#9903** for 208V, or **#9915** for 240V **Note:** 240V AC is compatible with 230V AC systems.
- DASD Attachment Configuration: Only one of the following may be specified:

Attachment	Specify
3370	**#9201**
3375	**#9202**

  Diskette-only specify feature. No fee when ordered at time of manufacture. A fee on purchased machines when attachment specify features are changed via MES.

- Color: **#9060** for willow green **#9061** for garnet rose, **9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, or **#9065** for pebble gray.

SPECIAL FEATURES

Two-Channel Switch (#8160): To attach the storage director to a second channel. The channels to be switched may be on the same or different processors. An available control unit position is required on each channel ... see "Prerequisites" above. Switching is under program control. The storage director can be dedicated to a single channel by means of an enable/disable switch. **Maximum:** One. **Field Installation** Yes. **Available:** December 30, 1983.

MODEL CONVERSIONS (None)

ACCESSORIES (None)

SUPPLIES (None)

3880 STORAGE CONTROL MDL 11

PURPOSE

The 3880 Storage Control mdl 11 modifies the first Storage Director, called the Paging Storage Director, to manage dynamically an 8MB solid-state storage unit, for page and swap data. The storage unit is divided into a directory and a cache. Up to eight actuators of 3350 disk storage provide backing storage for the cache. The second Storage Director operates in a conventional manner, as a 3880 Model 1 Storage Director, for 3330/3333 and 3350 direct access storage only.

MODELS

Model 11 D11 — Provides 8,388,608 bytes of Subsystem Storage.

Prerequisites: An available control unit position on a block multiplexer channel for each Storage Director. Four unshared subchannels are required for each 3350 device attached to the Paging Storage Director. One unshared subchannel is required for each 3350 or 3333/3330 device attached to the other Storage Director. The channel must be able to provide either a 1.5 or 3.0MB/sec. capability.

Attaches to a 3081 or 3083 Processor Unit via a block multiplexer channel.

Attaches to a 303X or 3042 Attached Processor mdl 2 via either a 1.5 or 3.0MB/sec. channel. In order to operate at 3.0MB/sec., the Data Streaming Feature (#4850) is required.

On a S/370 mdl 168 or 168-3, attachment is to a 2880 Block Multiplexer Channel capable of 1.5MB/sec.

On a S/370 mdl 158 or 158-3, attachment is to any block multiplexer channel capable of 1.5MB/sec.

On a 4341 and 4381, Storage Directors attaching 3350 DASD must be attached to a 2.0 or 3.0 MB/sec. block multiplexer channel. Data rate will be up to 1.5 or 3.0 MB/sec. respectively for the Paging Storage Director. See M4341 and 4381 pages for information.

Maximum: The Paging Storage Director is limited to attaching one 3350 mdl A2/A2F and three mdl B2/B2Fs, or one 3350 mdl A2/A2F, two mdl B2/B2Fs and one C2/C2F.

The other Storage Director attaches 3330/3333/3350 DASD; a maximum of four 3333 mdl 1s, 3333 mdl 11s, and/or 3350 mdl A2s/A2Fs in any combination. Each string with a 3333 mdl 1 or 11 may attach up to three 3330 mdl 1/2s or 11s. Each string with a 3350 mdl A2/A2F may attach up to three 3350 mdl B2/B2Fs or up to two 3350 mdl B2/B2Fs and a 3350 mdl C2/C2F.

Limitations:

1. The 3350 mdl A2/A2F or C2/C2F attached to the Paging Storage Director may not be actively string switched to another Storage Director (i.e., String Switch Special Feature (#8150) on the 3350 is not supported). The switch may be installed but it is recommended that the switch should be manually positioned to the Paging Storage Director.

2. See M3330, 3333, 3350 for system support limitations.

3. 3350 DASD attached to either 3880 mdl 11 Storage Director must be in native mode format; 3330 mdls 1 and 11 Compatibility Mode are not supported.

4. All 3880 mdl 11 conversions require a 3880 mdl 1 as the converted-from machine.

US manufactured 60 Hz machines: Eligible 3880 machines that can be field model converted are 3880 models with serial numbers between 20200 and 29999, 30200 and 39999, and 40200 and 99999.

5. While the Paging Storage Director may be attached to more than one host system for backup reasons, true dynamic sharing of the paging devices is not supported.

6. The 3880 special feature Eight Channel Switch (#8172) is not supported.

HIGHLIGHTS

- Access to page and swap data in the cache at electronic speeds and transfer at channel speeds of up to 1.5 or 3.0 MB/sec. Up to 3.0MB/sec. data rates are provided on data streaming channels only.
- Attaches to 1.5, 2.0 or 3.0MB/sec. channels (Data rate on a 2.0MB/sec. channel is up to 1.5MB/sec).
- Multiple exposures for 3350s attached to the Paging Storage Director in a similar manner to that provided by the 2305 Fixed Head Storage.
- Easy migration.
- Dynamically managed cache.
- Subsystem Storage size of 8MB.
- The 3880 mdl 11 will attach to a 1.5, 2.0 or 3.0MB/sec. block multiplexer channel on S/370 mdls 158 or 168, 303X, 3042 Attached Processor mdl 2, 4341, 4381, 3081, 3083, or 3084 Processors. On a 303X or 3042 Attached Processor mdl 2, the Data Streaming Feature (#4850) is required for operation in data steaming mode at 3.0MB/sec.
- MVS/SP Release 3 and MVS DFDS Support.
- VM/SP High-Performance Option Release 3 Support.

System Attachments: Each Storage Director attaches to a processor block multiplexer channel whose speed may be 1.5, 2.0 or 3.0MB/sec. (Data rate on a 2.0MB/sec. channel is up to 1.5MB/sec.) The second of the two Storage Directors can attach to either the same channel as the first, or a different channel on the same processor, or a channel of a different processor. These channels need not be the same speed. Only the following DASD and Processor attachments are supported (note the Paging Storage Director attaches to 3350 devices only):

Processor(s)	DASD
4341 mdl Groups 1 and 2	3330, 3333, 3350
4381	3330, 3333, 3350
S/370 mdls 158, 158-3, 168, 168-3	3330, 3333, 3350
3031, 3032, 3033, 3042 mdl 2, 3081, 3083, 3084	3330, 3333, 3350

Bibliography: GC20-0001

SPECIFY

- Voltage (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V, **#9915** for 240V.
  Note: 240V AC is compatible with 230V AC systems.
- DASD Attachment Configuration: Specify one each of the following;
  one for each Storage Director:

Attachment	Specify
3330/3333/3350	**#9192** *
3350/Paging	**#9196** *

* Diskette-only specify feature. No fee when ordered at time of manufacture. A fee on purchased machines when attachment specify features are changed via MES. **Note:** The specify features must be changed when field model conversions of 3880 mdl 1 to mdl 11 occur. See "Model Conversions".

- Color: **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, **#9065** for pebble grey.

SPECIAL FEATURES

Remote Switch Attachment (#6148): Removes the enable/disable switches from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. This feature allows relocation of up to four switches, accommodating the single channel connection to each Storage Director, or two channel connections to each Storage Director when using the Two-Channel Switch - Pair (#8170). **Maximum:** One. **Field Installation:** Yes.

Remote Switch Attachment, Additional (#6149): Removes the four additional enable/disable switches provided by the Two-Channel Switch - Pair, Add'l (#8171) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. **Prerequisites:** #8170, #8171 and #6148. **Maximum:** One. **Field Installation:** Yes.

Two-Channel Switch - Pair (#8170): To attach each Storage Director to a second channel. Four unique channels may be switched, two to each Storage Director or the same two channels may be switched to both Storage Directors. The channels to be switched may be on the same or different processors. An available control unit position is required on each channel (see "Prerequisites" above). Switching is under program control. Each Storage Director can be dedicated to a single channel by means of an enable/disable switch. **Maximum:** One. **Field Installation:** Yes.

Two-Channel Switch - Pair, Additional (#8171): Adds switching for two additional channels per Storage Director on a 3880 equipped with a Two-channel Switch - Pair (#8170), providing four-channel switch capability for both Storage Directors. Up to eight unique channels may be switched, four to each Storage Director. Each Storage Director can be dedicated to a subset of the four attached channels by means of an enable/disable switch. **Maximum:** One. **Prerequisites:** #8170. **Field Installation:** Yes.

3880 Storage Control Mdl 11 (cont'd)

MODEL CONVERSIONS

MES orders for field model conversion of the 3880 model 1 to model 11 must include removal of both the old DASD Attachment Configuration specify codes from the 3880 model 1 and the addition of the new specify codes **#9196** and **#9192** for the model 11. All 3880 model 11 field model conversions require a 3880 model 1 as the converted from machine. Field installation on purchased machines involves removal of parts that become the property of IBM. Note machine serial number restrictions outlined in point 4 of the Limitations section.

ACCESSORIES (None)

SUPPLIES (None)

3880 STORAGE CONTROL MDL 13

PURPOSE

Provides two independent control unit paths, called cache storage directors, for 3380 Direct Access Storage devices. Each cache storage director shares access to an electronic storage unit, called subsystem storage, to two cache storage directors, to the subsystem storage and attached 3380 DASD forming a caching subsystem. The two cache storage directors and subsystem storage are contained in a single caching subsystem. For improved data availability, two 3880's may be attached in a Dual Frame Configuration. In this configuration, one cache storage director from each frame is part of each subsystem. The cache retains frequently used application data for fast access by the host, and the directory contains entries to locate data in the cache.

MODELS

Model B13	4,194,304 bytes of Subsystem Storage
Model D13	8,388,608 bytes of Subsystem Storage

Prerequisites: An available control unit position on a 3.0MB/sec. data streaming channel for each cache storage director. One unshared subchannel is required for each logical address attached to a block multiplexer channel. Dynamic Path Selection (3880 mdl AA4) is required for attached DASD.

Attaches to a 3081, 3083, or 3084 Processor Unit via any block multiplexer channel.

Attachment to a 3031, 3032, 3033 or 3042 Attached Processor mdl 2 requires data streaming (#4850) on the processor's channel group.

4341 mdls manufactured before March, 1981, require an engineering change to achieve data streaming on their 3.0MB/sec. channels.

Maximum: A 3880 mdl 13 may attach one or two 3380 mdl AA4s. Each string with a 3380 mdl AA4 may attach up to three 3380 mdl B4s. Each 3380 AA4 must be attached to both cache storage directors on the same caching system.

Limitations:

1. See M3380 pages for system support limitations.

2. In a single frame configuration, 3380 units that are attached to a 3880 mdl 13 cache storage director must also attach to the other cache storage director in the *same* 3880 mdl 13. In a Dual Frame Configuration, each 3380 must attach to a cache storage director in each frame. The two cache storage directors that share the 3380's must also share a subsystem storage.

3. Speed Matching Buffer for 3380 (#6550) cannot be installed.

4. A single channel *cannot* attach to both cache storage directors in a caching subsystem.

5. All 3880 mdls with serial numbers between 20200 and 29999, 30200 and 39999, and 40200 and 99999 can be field mdl converted to mdl 13s after conversion to 3880 mdl 3.

All 3880 mdls with serial numbers between 975004 through 975999 can be field mdl converted to mdl 13s after conversion to 3880 mdl 3.

HIGHLIGHTS

Provides fast access to disk application data records in the cache storage. Helps reduce the effect of DASD skew. Cache contents are dynamically managed by a modified Lease Recently Used (LRU) algorithm. Requires no more floor space than other 3880 mdls. Data integrity is provided through extensive error detection and correction capabilities and the architecture of the cache implementation.

Systems Attachments: Each cache storage director attaches to a 3.0MB/sec. data streaming channel. The second of the two cache storage directors can attach to a different channel on the same processor, or a channel on a different processor. The following Processor attachments are supported:

Processor(s)	DASD
3081, 3083, 3084, 3033, 3032, 3031 and 3042 mdl 2	3380
4341, 4381	3380

Bibliography: GC20-0001

SPECIFY

- Voltage (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V, **#9915** for 240V. **Note:** 240V AC is compatible with 230V AC systems.
- DASD Attachment Configuration: Specify two (2); one (1) for each cache storage director - **#9197***.

  * Diskette-only specify feature. No fee when ordered at time of manufacture. A fee on purchased machines when attachment specify features are changed via MES. **Note:** The specify feature for each storage director must be changed when field model converting 3880 mdls to the mdl 13. See point 5 under "Limitations" section for field mdl conversion information.
- Color: **#9060** for willow green, **#9061** for garnet rose **#9062** for sunrise yellow, **#9063** for classic blue **#9064** for charcoal brown, **#9065** for pebble gray.

SPECIAL FEATURES

Remote Switch Attachment (#6148): Removes the enable/disable switches from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. This feature allows relocation of up to four switches, accommodating the single channel connection to each cache storage director, or two channel connections to each cache storage director when using the Two-Channel Switch - Pair (#8170). **Maximum:** One. **Field Installation:** Yes.

Remote Switch Attachment, Add'l (#6149): Removes the four additional enable/disable switches provided by the Two-Channel Switch - Pair, Add'l (#8171) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. **Maximum:** One. **Prerequisites:** #8170, #8171, #6148. **Field Installation:** Yes.

Two-Channel Switch - Pair (#8170): To attach each cache storage director to a second channel. Four unique channels may be switched, two to each cache storage director. The channels to be switched may be on the same or different processors. An available control unit position is required on each channel (see "Prerequisites" above). Switching is under program control. Each cache storage director can be dedicated to a single channel by means of an enable/disable switch. **Maximum:** One. **Field Installation:** Yes.

Two-Channel Switch - Pair, Add'l (#8171): Adds switching for two additional channels per cache storage director on a 3880 equipped with a Two-Channel Switch - Pair (#8170), providing four-channel switch capability for both cache storage directors. Up to eight unique channels may be switched. Each cache storage director can be dedicated to a subset of the four attached channels by means of an enable/disable switch. **Maximum:** One. **Prerequisites:** #8170. **Field Installation:** Yes.

Eight-Channel Switch (#8172): The Eight-Channel Switch Feature allows up to eight host systems to access either storage director in a 3880 storage control. The same eight channels must attach to both storage directors in that storage control. The Eight-Channel Switch Feature then combines with the Dual Frame Configuration option to allow up to 16 attaching channels to access each attached DASD. **Note:** The Eight-Channel Switch Feature can be fully utilized only in the Dual Frame Configuration (see Limitation Item 4). **Maximum:** One. **Prerequisites:** #8170, #8171. **Field Installation:** No.

Remote Switch Attachment For Eight-Channel Switch (#6150): Removes the eight additional enable/disable switches provided by the Eight-Channel Switch (#8172) from the 3880 operator panel and allows them to be relocated to a remote configuration control panel. **Maximum:** One. **Prerequisites:** #8170, #8171, #6148, #6149, #8172. **Field Installation:** Yes.

MODEL CONVERSIONS

Field installable. MES orders for field model conversions must include removal of both old DASD Attachment Configuration specify codes and the addition of the new specify code (**#9197**) for each cache storage director on the model 13. All 3880 model 13 field model conversions assume a 3880 model 3 as the converted from machine. Note the machine serial number restrictions outlined in point 6 of the "Limitations" section. See M3880 pages for information about field model converting 3880 models 1 and 2 to a 3880 model 3.

Parts removed or replaced when upgrading from other 3880 models to a 3880 model 13 become the property of IBM.

ACCESSORIES (None)

SUPPLIES (None)

3881 OPTICAL MARK READER

PURPOSE

Reads machine printed and/or handmarked data online into S/370 models 115, 125, 135, 135-3, 138, 145, 145-3, 148, 155II and 158, a 3031 or 3032 processor, System/3 models 8, 10, 12, and 15, and 4300 processor, or offline to either of two magnetic media: diskette or compatible 9-track magnetic tape via a 3410 Magnetic Tape Unit model 1.

MODELS

Model 1	001	For use with a S/370 models 115, 125, 135, 135-3, 138, 145, 145-3, 148, 155II, or 158, a 3031 or 3032 Processor, System/3 models 8, 10, 12, and 15, 4321,, or 4300 processor.
Model 2	002	Magnetic tape output via a 3410 Magnetic Tape Unit model 1.
Model 3	003	Output data written on diskette.

Prerequisites:

Model 1: For S/370 mdls 115 and 125, an available control unit position on the Multiplexer Channel (#5248) ... see M3115 and 3125 pages.

For S/370 mdls 135, 135-3, 138, 145, 145-3, 148, 155II, 158, or a 3031 or 3032 Processor, an available position on a byte multiplexer channel ... see M3135, 3135-3, 3138, 3145, 3145-3, 3148, 3155, 3158, 3031, or 3032 pages.

For 4321, 4331, or 4341 Processor, an available position on a byte multiplexer channel ... see Machines pages.

For System/3 mdls 8, 10, 12, and 15, a Serial I/O Channel (#7081) on the5408, 5410, 5412, or 5415. **Limitations:** The IBM programming support for the 3881 requires a disk-oriented System/3 mdl 8, 10, 12, or 15 with a minimum of 12,288 bytes of storage and the Serial I/O Channel (#7081). **Maximum:** One 3881 can be attached.

Model 2: A 3410 Magnetic Tape Unit mdl 1 equipped with either Single Density (#3211) or Dual Density (#3221) ... see M3410 pages.

Model 3: None.

HIGHLIGHTS

The 3881 is a high-speed optical mark reader. Data sheets are fed from a hopper with a 600-sheet capacity, through the reading area and directed to one of two output stackers. The main stacker has a capacity of 600 sheets. Sheets with detected errors are directed to a separate stacker with a 100-sheet capacity. Documents are stacked in the same sequence as they were entered in the hopper. Data to be read can be placed on data sheets with ordinary #2 pencils, or by a 1403 Printer, a 1443 Printer mdl 1 or 2 with a 52- or 63-character type bar with arrangement A, H or K, a 1443 mdl N1 or 2203 Printer with 52- or 63-character type bar, a 3203 Printer, a 3211 Printer, or a 5203 Printer. The 1403/5203 print chains or trains, the 1443/2203 type bar, or the 3216 Interchangeable Train Cartridge must be equipped with an enlarged dash which replaces the standard dash ... see "Type Catalog".

Data Sheets: 3 inches x 3 inches to 9 inches x 12 inches. Up to 2,480 mark positions printed on a side. Preprinted mark positions are printed in rows of 40 positions on 0.2-inch centers for printer compatibility. Vertical spacing is up to six per inch for printer compatibility. Rows and columns can be grouped into various combinations to form fields for the recording of source data.

Format Control Sheet: Used to load format control information into the 3881. Format control defines:

- The area of the input data sheet which is to be read.
- The marks allowed or discrimination required within each area.
- The sequence of the marking positions which make up the marking matrices.
- The output desired (numeric, alpha, alphameric or multiple mark format).
- The timing mark count which is expected on the sheets to be processed.
- BCD Read (optional feature) requirements.

From one to six formats, each consisting of one or more Format Control Sheets, are read by the 3881 at the beginning of a job. After reading the last Format Control Sheet, the data sheets of the job to be processed are loaded in the 3881.

Processors: Documents are read under computer program control with varying speeds up to 6,000 documents/hour (4,000 pages/hour, 8-1/2 inches x 11 inches). Data is transferred to the CPU one page at a time on a fully-buffered interrupt basis.

3410 Magnetic Tape Unit: Documents are read under control of the 3881 at varying speeds up to 5,400 documents/hour (3,700 pages/hour, 8-1/2 inches x 11 inches). The 3881 reads and fully-buffers a document, after which the data from the document is written as one record on tape. Data is recorded at 1600 bits/inch, phase-encoded. An optional feature, Dual Density (#3221), permits output at either 1600 bpi PE or 800 bpi NRZI.

Diskette: Documents are read under control of the 3881 at varying speeds up to 5,700 documents/hour (3 inches x 3 inches), and 3,800 pages/hour (8-1/2 inches x 11 inches). The diskette drive and its control function are installed within the 3881 mdl 3. Each magnetic diskette has a storage capacity of up to 1,898 data records (128 characters each) with as many as 19 data sets per diskette. The contents of each document read by the 3881 are written within one data record (a maximum of up to 128 characters). The diskette media written by the 3881 is compatible with such devices as the 3741, 3742, 3747 and the 3540.

Publications: *IBM 3881 Reference Manual* (GA21-9143), *IBM 3881 Systems Design Guide* (GC20-1751).

SPECIFY

- Voltage (AC, 1-phase, 3-wire, 60 Hz): **#9902** for 208V or **#9904** for 230V ... must be consistent with system or 3410 voltage. **Field Installation:** Yes.
- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, **#9046** for white. **Field Installation:** Yes.
- S/370 Adapter: **#9551**. Required when a 3881 mdl 1 is to be attached to a S/370 or any 4300 Processor. **Field Installation:** Yes.
- System/3 Adapter: **#9552**. Required when a 3881 mdl 1 is to be attached to a System/3 mdl 8, 10, 12, or 15. **Field Installation:** Yes.
- Invalid Marking Condition Code: **#9301** for Hex 3F (unprintable), or **#9302** for Hex 7C (printable). **Field Installation:** Yes.
- Kickstrips: **#9431** ... if desired.

SPECIAL FEATURES

BCD Read (#1471): Provides, in addition to the basic read head, a second 12-position read head which allows the reading of high-density, preprinted binary coding. These heads will read as marks (digit "ones"), the character "I", or a vertical bar (special character). Each BCD (Binary Coded Decimal) character read will be translated into its equivalent numeric EBCDIC code and transmitted to the CPU, the magnetic tape unit, or diskette at one byte per character. Five of the 12 positions may contain BCD information which is weighted 1-2-4-8 parity from the reference (aligned) edge. The first row of BCD data following the start BCD Field Mark must indicate which 5 of the 12 positions will contain BCD data for that field. If an invalid BCD character is read or an even-parity error is detected, an invalid-marking condition code is sent to the CPU, diskette, or magnetic tape unit. **Field Installation:** Yes.

Document Counters (#3450): Provides two 5-position counters to be incremented by one for documents processed by the 3881. Counters can be manually reset to zero. Counter 1 increments by 1 for each accepted document ... Counter 2 increments by 1 for each selected document. **Field Installation:** Yes.

Dual Density (#3550): [Mdl 2] Permits the 3881 to write on the 3410 Magnetic Tape Unit in either 800 bpi NRZI or 1600 bpi phase-encoded modes. **Field Installation:** Yes. **Prerequisites:** #3221 on 3410 mdl 1.

Expanded Storage (#3801): Provides for an additional 512 bytes of memory which may be required in those situations where the number of formats, fields and characters processed exceed the maximum number of positions available within the basic data store. The formula for the determination of this condition is as follows:

$$5(F + n) + \text{BCD Bytes} + \text{Normal Bytes} + S + I = E$$

Where: F = Number of instruction fields used on all Format Control Sheets loaded.

n = Number of different formats used with the alternate format capability (from 1 to 6).

S = 7 if Serial Numbering (#6451) is installed and is being used ... otherwise, S = 0.

I = Total number of bytes required to store image format data.

E = 435 (or less) for 3881 mdls 1 and 2, or 307 (or less) for 3881 mdl 3.

Maximum: One. **Field Installation:** Yes.

Serial Numbering (#6451): A device for printing consecutive serial numbers on the form being processed. Will print a 7-digit number (2-digit batch and 5-digit serial number) which can be manually set to zero or any desired setting. A reading of the counter may be obtained

3881 Optical Mark Reader (cont'd)

and entered into the 3881 logic via a marked Serial Number Card. Various options exist for the printing of the number. A control switch provides either selective serial numbering based on stacker selection, or a 7-digit batch number without unit advancing. Concurrent with printing, the number will be transmitted to the CPU, the output tape unit or the diskette. See "Supplies". **Field Installation:** Yes.

MODEL CONVERSIONS

Field installable. Must be serial number 20001 or above for field upgrade to model 3.

ACCESSORIES

Document Inspection Guage (P/N 2450145): One is furnished with each 3881 as a customer engineering tool. Used for checking printing alignment on data sheets. Additional gauges can be ordered from Rochester MN plant.

SUPPLIES

Diskettes: Additional diskettes can be ordered from IBM.

Format Control Sheets: 100 are provided with each 3881. Additional pads of 50 may be ordered.

Ribbons:

- For printing on the Serial Numbering (#6451) device use IBM purple ribbon P/N 1136844, or equivalent.
- For printing marks, use IBM ribbon or equivalent as follows:

  1403 - P/N 1136940 or P/N 1136430, on all mdls
  1443 - P/N 422536
  2203 - P/N 422536
  3203 - P/N 1136430
  3211 - P/N 1136964
  5203 - P/N 1136990

- For non-readable background printing, use P/N 419101, or equivalent.

Serial Numbering Card: Packets of 100 may be ordered.

3886 OPTICAL CHARACTER READER

PURPOSE

Optically reads OCR-A font and OCR-B font machine-printed numeric digits, alphabetic characters, and handprinted numeric digits from a wide variety of forms. Attaches online to any virtual storage S/370 processor or any 4300 Processor, offline to the 3410 model 1 Magnetic Tape Unit which provides compatible 9-track magnetic tape.

MODELS

Model 1	001	For use with any virtual storage S/370 or 4300 processor.
Model 2	002	For use offline with a 3410 Magnetic Tape Unit model 1

Prerequisites:

Model 1: An available control unit position on the 5248 of a S/370 mdl 115 or 125, or a byte multiplexer, block multiplexer or selector channel of a S/370 model 135, 135-3, 138, 145, 145-3, 148, 155II, 158,

165II, 168, or a byte multiplexer or block multiplexer channel on a 3031, 3032, 3033, or 4300 processor.

Model 2: A 3410 mdl 1 Magnetic Tape Unit. If Single-Density (#3211) is on the 3410, #6490 is required on the 3886 ... if Dual-Density (#3221) is on the 3410, a #6485 is required on the 3886. See "Special Features".

HIGHLIGHTS

The 3886 is a general purpose optical character recognition reader designed to meet a broad range of data entry requirements. It will read multiple lines of print from forms ranging in size from three to nine inches wide (direction of printing) and from three to 12 inches long. Allowable weights range from 16 pounds to card stock ... see "Documents and Printing". Forms enter the 3886 from the input hopper, which has a capacity of one inch of forms. The forms are advanced line by line (maximum three lines per inch) past a read station, which incorporates a total solid state scanning system to collect character images. These images are analyzed by recognition programs within the 3886 recognition and control processor. After a complete line has been recognized, certain user-specified editing and output formatting functions take place. The line output is then transmitted to the S/370, any 4300 Processor or to a 3410 mdl 1 Magnetic Tape Unit. After the complete form has been read, it is directed to one of two output stackers, each having a capacity of one inch of forms.

The recognition, machine control, and CE diagnostic microprograms for the 3886 are supplied on an internal direct access storage device. The use of these programs, singly or in combination, is dependent on the configuration of the 3886 ... see "Configurator". Input from several different sources can be read on the 3886. The tables of "Acceptable Characters and Printing Devices" below show the characters that are acceptable from typewriters, high-speed printers, lithograph, or, in the case of numeric handprinting, a pencil.

Mdl 1: The online 3886 mdl 1 provides buffered time-independent attachment to S/370 mdl 115 and 125 via an optional multiplexer channel, or to S/370 mdl 135, 135-3, 138, 145, 145-3, 148, 155II, 158, 165II, and 168 via byte multiplexer, block multiplexer or selector channels, or to a 3031, 3032, 3033, or 4300 processor via byte multiplexer or block multiplexer channels. Forms are read and other 3886 functions are performed under S/370 or 4300 Processor program control. The basic 3886 mdl 1 contains 24K bytes of instruction storage for machine control and recognition microprogram storage.

Mdl 2: The offline 3886 mdl 2 operates independently of any processor. It produces compatible 9-track magnetic tape output via the attachment of a 3410 mdl 1 Magnetic Tape Unit. The user indicates form characteristics and processing requirements with Line/Field and Job Specification sheets. These are translated on a special 3886 run into the necessary format control information, and then stored on the internal DASD for subsequent use. Up to eight different form layouts (all one size) can be intermixed within a batch (run). Certain editing and validation functions normally performed by the host processor are also provided. These include self-check digit (Modulus 10) calculation, column or crossfoot-total verification, and field-to-field comparison. The results of these functions can be specified to control stacker selection, Serial Numbering (#6450), and Line Marking (#4720), if they are installed ... see "Special Features". The basic 3886 mdl 2 contains 32K bytes of instruction storage for machine control and recognition microprogram storage.

Speed: Document throughput depends upon the 3886 mdl, document length, number and type of characters read, the amount of output editing and formatting specified, and the user S/370 or 4300 Processor program (mdl 1).

On the mdl 1, speeds range from approximately 5,800 (3-inches long, single-line, 8-character, machine-printed) turnaround documents per hour, to approximately 300 typewritten (8-1/2 inches x 11 inches) pages with 2,262 characters (29 lines of 78 characters).

On the mdl 2, speeds for the same forms range from approximately 5,200 documents to approximately 300 pages per hour. *Input Document Design Guide and Specifications* (GA21-9148), contains formulas which should be used to determine throughput for specific forms.

Documents and Printing: The input forms and printing to be read by the 3886 must conform to the established specifications described in *Input Document Design Guide and Specifications* (GA21-9148). Only those ribbons (see "Supplies") and background inks specifically meeting the outlined spectral criteria will give satisfactory performance. Certain restrictions apply to document sizes, weights, and combinations thereof. These are discussed in *Input Document Design Guide and Specifications* (GA21-9148).

Code: [Mdl 2 only] ID = E30

SPECIFY

- Voltage (AC, 3-phase, 4 wire, 60 Hz): **#9903** for 208V, **#9905** for 230V ... must be consistent with system voltage. **Field Installation:** Yes.
- Color: **#9041** for red, **#9042** for yellow, **#9043** for blue, **#9045** for gray, **#9046** for white.
- Upending Kit: **#9840**, if required ... loan-only basis on initial machine order only, remains property of IBM. Dimensions are 29-1/2 inches wide, 60 inches long, and 76 inches high.
- 3211/5211 B-Font Compatibility: **(#9701)** if required ... only if predominately reading 3211/5211 generated documents.

SPECIAL FEATURES

Data Storage, Add'l (#3210): OCR-B Font and Numeric Handprinting recognition require this feature to handle the more complex character shapes which appear in these fonts. **Maximum:** One. **Field Installation:** Yes.

Hopper and Stacker Capacity, Add'l (#4520): The standard hopper and two stackers on the 3886 each have a capacity of one inch of forms. This feature adds the motors, sensors, etc., to increase that capacity to approximately four inches in each. **Field Installation:** Yes.

Instruction Storage, Add'l (#4610): The recognition microprograms for alphameric machine printed fonts and Numeric Handprinting require storage capacity greater than the basic models of the 3886, as do combinations of fonts. This feature provides the necessary additional storage increments of 8K bytes. Up to nine of these features may be added ... see "Configurator". **Field Installation:** Yes.

Line Marking (#4720): Provides a four-position fixed-slug printer (1, 2, 4 and 8) which prints 15 different codes to be used as an aid to error correction procedures. It is used to indicate field location or error type information in the margin of lines requiring corrective action. It will also provide page marking capability to indicate user-controlled post-processing document handling information. Line marking is under program control on the mdl 1 and is controlled by coding on the specification sheets on mdl 2. Line marking may be done with a purple ribbon if marked documents are to be re-processed through the 3886. Otherwise a black ribbon may be used. See "Supplies". **Field Installation:** Yes. **Prerequisites:** #5340.

Numbering/Marking Adapter (#5340): Provides a group of common parts necessary for the installation of Serial Numbering (#6450) and/or Line Marking (#4720). **Maximum:** One. **Field Installation:** Yes.

Numeric Handprinting (NHP) (#5360): Provides the additional machine circuits to read the handprinted numbers 0-9 and the letter X. For optimum operation, character shapes and spacing should conform to the basic rules of handprinting as outlined in *Input Document Design Guide and Specifications* (GA21-9148). Handprinting should be performed with ordinary #2 pencils or grade HB fine line lead for mechanical pencils. The NHP feature includes the ability to read supplier-preprinted Gothic (3/16-inch) font digits 0-9. Blanks are not recognized. The feature provides two modes of operation, normal and verify. The appropriate mode can be selected on a field-by-field basis depending on the critical nature of the data, the circumstances of form preparation, and the level of other available control techniques. **Field Installation:** Yes. **Prerequisites:** #3210 and sufficient #4610 ... see "Configurator".

Serial Numbering (#6450): Permits the sequential numbering of forms as they are processed. A 10-position numbering head is provided, of which five are unit-advanced and five are stationary. Selection of documents to be printed works in conjunction with stacker selection.

3886 Optical Character Reader (cont'd)

Serial Numbering may be done with a purple ribbon if numbered documents are to be re-processed through the 3886. Otherwise a black ribbon may be used. See "Supplies". **Field Installation:** Yes. **Prerequisites:** #5340.

Tape Adapter, Dual-Density (#6485): [Mdl 2] Provides the appropriate adapter, within the 3886, to attach a 3410 mdl 1 Magnetic Tape Unit for writing at 1600 bpi PE or 800 bpi NRZI (#3221 on 3410). **Field Installation:** Yes.

Tape Adapter, Single-Density (#6490): [Mdl 2] Provides the appropriate adapter, within the 3886, to attach a 3410 mdl 1 Magnetic Tape Unit for writing at 1600 bpi PE (#3211 on the 3410). **Field Installation:** Yes.

Video Collect Features (#8701, #8702, #8703):

Video Collect (#8701): [Mdl 2] Provides for direct attachment of a 3277 Display Station mdl 1 with RPQ 8K0438 to a 3886 mdl 2 (a 3272 Control Unit is not required). Entries on Line/Field and Job Specification sheets allow the 3886 to collect video image data of reject characters in specified fields and/or the collection of the video image of an entire field at either 0.006 inch or 0.012 inch resolution. Video image data will be displayed on the cable-attached 3277 (with RPQ 8K0438) for visual recognition. The display operator will key-enter the correct data. The data record will be updated with the keyed information before being written to tape.

Video Collect (#8702): [Mdl 2] Entries on Line/Field and Job Specification sheets cause collection of video image data of reject characters in specified fields and/or the collection of the video image of an entire field at either 0.006 inch or 0.012 inch resolution. Video image data is written to tape in record lengths that match the user-selected data record length. The tape can be processed on a system and have the video image displayed on a 3277 mdl 1 or 2 Display Station equipped with RPQ 8K0438 and attached to the CPU via a 3272 mdl 2 Control Unit.

Video Collect (#8703): [Mdl 1] Provides the ability to collect video image data of reject characters in specified fields and/or the collection of the video image of an entire field at either 0.006 inch or 0.012 inch resolution. The video image data can be transferred from the 3886 to the CPU by user-written routines coded with present 3886 Type 1 programming support. The display of video image data will require a 3277 mdl 1 or 2 Display Station equipped with RPQ 8K0438 and attached to the CPU via a 3272 mdl 2 Control Unit.

Limitations: The required 3277 mdl 1 or 2 (as described above) cannot be equipped with any of the following: Operator Identification Card Reader (#4600), Selector Light-Pen (#6350), ASCII Character Set (#9091 or #9092), or ASCII Keyboard (#4634 or #4635). For #8703, if a 3277 mdl 1, with the RPQ listed, is to be attached to the required 3272 mdl 2 Control Unit, at least one 3277 mdl 2 (with or without the RPQ) must also be attached to the same 3272 Control Unit for diagnostic purposes. **Field Installation:** Yes. **Prerequisites:** Each of the Video Collect Features requires (#3210) plus two increments of (#4610), in addition to the increments required to hold the font recognition programs as described in *IBM 3886 OCR Model 1 Component Reference Manual* (GA21-9147), and *IBM 3886 Model 2 Component Reference Manual* (GA21-9154), (Figure 10). See the "Configurator" below.

MODEL CONVERSIONS

Conversion from model 1 to model 2 is field installable.

CONFIGURATOR

All 3886 Optical Character Readers will be shipped containing an internal DASD. That device will contain all of the recognition microprograms for OCR-A font, OCR-B font and NHP. See "Acceptable Characters and Printing Devices". This configurator shows which features are necessary in order to utilize all valid combinations of those recognition programs.

From the following table, find the combination of fonts which will appear within any one batch (run) of input forms. The features shown on that line are required. If any other batch (run) of input forms will contain another font, a greater quantity of #4610 may be required to cover the maximum combination of fonts for all batches to be run in various applications.

					Quantity of Features Which Must be Ordered		
Num OCR-A	Num OCR-B	Alpha-meric OCR-A	Alpha-meric OCR-B	Numeric Hand-printing	Instruction Storage, Add'l * (#4610)	Numeric Hand-printing (#5360)	Data Storage, Add'l (#3210)
Single Machine Font Configurations

X	-	-	X	X	9	1	1

* Equal or smaller size combinations of fonts will operate on machines with the required features (#5360 and #3210).

Example: User batch to be processed will contain Alphameric OCR-A font and Numeric Handprinting. This requires the following features: Quantity of 5 of #4610 plus 1 of #5360 and 1 of #3210.

Other batches this user will be able to run can include the following fonts or combinations of fonts:

Numeric-A	Numeric-A and Numeric-B
Numeric-B	Numeric-B and Alphameric-A
Numeric-A and NHP	Numeric-A and Numeric-B and NHP
Numeric-B and NHP	Numeric-A and Alphameric-B
Alphameric-B	

ACCEPTABLE CHARACTERS AND PRINTING DEVICES

OCR-A Font, Size 1: (1)

5211 mdl 2 (2)	Characters from IBM Selectric® Typewriter Only (or equivalent)
Numeric	**Additional** (3)
0	{
1	+
2	}
3	:
4	%
5	?
6	;
7	'
8	=
9	"
Y	ABC (Group Erase)
S	■ ⌶ (Char. Erase)
H	| (4)

Notes:

(1) The division of characters into sets above refers to 3886 recognition capability. The appropriate type catalog arrangements should be referenced for high-speed printer output character sets.

(2) With the 5211, use of Reread-On-Reject, and 75-90 g/sq.m (20-24 pound) single-part forms are required.

(3) All of these characters are recognized on mode 2 alphameric set except Group Erase, ■, and ⌶ which are recognized in the numeric set also. **

(4) The LVM (long vertical mark) is recognized in all OCR-A character sets. The LVL (preprinted long vertical line) is also recognized. **

1403 mdls 2, 3, 7, N1 (or equivalent), 3203 all mdls (or equivalent), 3800 (1), and IBM Selectric® Typewriter (or equivalent). Numeric set only from 3211 (2).

Numeric		**Alphameric** (3) (4)		
0	.	A	N	&
1	$	B	O	
2	*	C	P	
3	-	D	Q	
4	/	E	R	
5	¬	F	S	
6	blank	G	T	(Plus all
7		H	U	Characters
8		I	V	to left
9		J	W	except Y)
Y		K	X	
S		L	Y	
H		M	Z	

Notes:

(1) Minimum paper weight for documents produced on the 3800 is 75 g/sq.m (20 pound).

3886 Optical Character Reader (cont'd)

(2) The OCR Print Package (#5450), on the 3211 is a prerequisite for OCR applications. Use of Reread-On-Reject capability and 75-90 g/sq.m (20-24 pound) Bond is recommended for optimum performance. When other papers are used, customer testing should be performed to assure adequate reading performance.

(3) These characters are recognized in mode 1 alphameric set. **

(4) The timing mark dash (–) can be substituted for a non OCR-A font graphic (#) for the purpose of printing timing marks. See "Type Catalog" for details.

** See *IBM 3886 OCR Model 1 Component Reference Manual* (GA21-9147), and *IBM 3886 Model 2 Component Reference Manual* (GA21-9154).

OCR-B Font, Size 1: (1, 2)

5211 mdl 2 (3)	Characters from IBM Selectric® Typewriter Only (or equivalent)
Numeric	**Additional** (4)

Notes:
(1) Minimum paper weight for documents produced on the 3800 is 75 g/sq.m (20 pound).

(2) The OCR Print Package (#5450), on the 3211 is a prerequisite for OCR applications. Use of Reread-On-Reject capability and 75-90 g/sq.m (20-24 pound) Bond is recommended for optimum performance. When other papers are used, customer testing should be performed to assure adequate reading performance.

(3) The timing mark dash (–) can be substituted for the greater-than symbol (>) for the purpose of printing timing marks. See "Type Catalog" for details.

** See *IBM 3886 OCR Model 1 Component Reference Manual* (GA21-9147), and *BM 3886 Model 2 Component Reference Manual* (GA21-9154).

ACCESSORIES

Document Inspection Gauge (P/N 2448299): One is furnished with each 3886 as a customer engineering tool. It is used for checking printing alignment on data sheets. Additional gauges can be ordered from IBM.

SUPPLIES

Ribbons:

- Input Printing: Providing maximum flexibility in background ink color and intensities requires that ribbons used for printing 3886 input be carefully selected. The following, or their equivalents, should be used:

Film Ribbon Selectric	**P/N 1136310** or **P/N 1136391**
Fabric Ribbon Selectric	**P/N 1136138**
1403 (all mdls)	**P/N 1136430**
3203 (all mdls)	**P/N 1136430**
3211	**P/N 1136627** for 75-90 g/sq.m (20-24 pound) Bond OCR forms, or **P/N 1136626** for all heavier paper.
5211 mdl 2	**P/N 1299243**.

Ribbons not having similar characteristics may result in reduced recognition performance and/or reduced ribbon life.

- Line Printing:

Purple	**P/N 414499**
Black	**P/N 414491**

- Serial Numbering:

Purple	**P/N 1136844**
Black	**P/N 1136843**

3890 DOCUMENT PROCESSOR

PURPOSE

Reads magnetically inscribed data from card and paper documents into any virtual storage S/370, except 3115 and 3125, or to a 4300 processor via the byte multiplexer or block multiplexer channel. Can be used offline for document sorting.

MODELS

The 3890 is available in 20 models as follows:

Model A1	A01	6 stackers	13,312 bytes of
Model A2	A02	12 stackers	storage (10,240 bytes
Model A3	A03	18 stackers	if image processing)
Model A4	A04	24 stackers	for stacker select
Model A5	A05	30 stackers	programs and
Model A6	A06	36 stackers	initialization data
Model B1	B01	6 stackers	29,696 bytes of
Model B2	B02	12 stackers	storage (26,624 bytes
Model B3	B03	18 stackers	of image processing)
Model B4	B04	24 stackers	for stacker select
Model B5	B05	30 stackers	program and
Model B6	B06	36 stackers	initialization data
Model E3	E03	18 stackers	13,312 bytes of
Model E4	E04	24 stackers	storage (10,240 bytes
Model E5	E05	30 stackers	if image processing)
Model E6	E06	36 stackers	for stacker select programs and initialization data.
Model F3	F03	18 stackers	29,696 bytes of
Model F4	F04	24 stackers	storage (26,624 bytes
Model F5	F05	30 stackers	if image processing)
Model F6	F06	36 stackers	for stacker select programs and initialization data.

HIGHLIGHTS

The 3890 is a buffered, modular, pocket reader-sorter which is time-independent. The 3890 mdls A and B are available with 6 to 36 stackers in increments of 6. The 3890 mdls E and F are available with a minimum of 18 stackers expandable to 36 in increments of 6. Also, the 3890 mdls E and F include as standard: Microfilming and System/370 and 4300 Attachment. These features are optional on the 3890 mdls A and B.

Documents are read at a minimum rate of 2,400 6-inch documents per minute for the 3890 mdls A1 through B6. The 3890 mdls E3 through F6 read at a minimum of 1680 6-inch documents per minute Actual throughput depends upon length of document. The formula for determining the approximate average rated throughput per minute is: The percentage of non-card stock checks x [19,200/(average document length, which is 6" or greater plus 2")] + the percentage of card stock checks x 1,907. For the 3890 mdls E and Fthe results of this calculation should be multiplied by 1.7. The primary component of the 3890 is the feed module, which contains the input hopper, recognition circuits, logic to determine stacker selection, merge feed, options when installed, and operator setup and run panels.

Input Hopper, 3890 Mdls A and B: Holds approximately 4,800 documents and permits convenient, continuous loading. A jogger is built into the hopper to eliminate joggering as a separate operation.

Input Hopper, 3890 Mdls E and F: Holds approximately 3,800 documents and permits convenient, continuous loading. Do not include a built-in jogger. Joggering must be performed as a separate operation. About 2,200 additional documents, previously joggered, may be placed in a separate staging area adjacent to the input hopper.

Merge Feed: Permits the merging of documents into the normal input stream from a separate hopper. Document capacity is 600. Document merging is controlled by the user program. For example, as part of job initialization, the user can specify the approximate number of documents to be stacked in each pocket before a document is fed from the merge hopper to that pocket. The 3890 maintains a document count for each pocket. The merge function eliminates the need for programmed pocket lights. **Limitations:** Does not permit the 3890 to function as a collator.

Logic and Control Section: Is initialized by the processor when online and by a removable disk when offline. Initialization determines the fields to be read, length of the fields, starting number for the item numbering feature, merge feed controls, whether image processing is to be performed, the stacker control instruction algorithm to be used, endorser requirements, and whether the symbol error correction option is to be used. With the symbol error correction option, the 3890 performs extensive logical analysis to determine whether unreadable symbols can be replaced by internally generated field-defining symbols. The 3890 performs all stacker select determinations independent of processor control and transfers blocked data records to the processor. Due to the logical capability, the following functions are standard "programmable": split field, self-check number verification, multiple column control, base number conversion for fine sorting.

Stackers: Each pocket holds approximately 800 to 1,000 documents. The operator can unload all but the last 200-300 documents without stopping the 3890. Pocket warning lights alert the operator when a specific pocket is becoming full. The reject stacker is the first stacker -- the stacker closest to the input hopper. Racks for output trays are above each stacker.

Documents: E13B magnetic characters, print quality and codeline arrangement on the documents must meet the specifications recommended by the American Bankers Association. Intermixed paper and card documents within the following specifications can be processed.

Length: 123 to 223mm (4.85 to 8.75 inches).
Width: 70 to 106mm (2.75 to 4.17 inches).
Thickness: .064 to .178mm (.0025 to .007 inches). Carrier documents containing mutilated documents with a total thickness up to .356mm (.014 inches) will also be transported.
Basis Weights: 60 to 165 grams per square meter, 16 to 44 pounds (basis weight is the weight of 500 sheets of 17" x 22" paper)
Grain: grain long or grain short, except for 16 pound paper, which must be grain long.

IBM 3890 Document Processor, Machine and Programming Description, GA24-3612

Code: ID=E80 (applies to stand-alone machines only)

SPECIFY

- Power (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V, **#9905** for 230V ... must be consistent with system voltage.
- Color: **#9041** for red, **#9042** for yellow **#9043** for blue, **#9046** for white.
- Upending Kit **#9840**, if required.
  Note: Loan basis; remains property of IBM.
- Cabling: **#9181** for on the floor.
- SS2 Transmission Option: **#9666**. Codeline SS2s are not treated as field-defining symbols. Requirement for this option is limited. Before specifying, refer to: *IBM 3890 Document Processor, Machine and Programming Description Manual,* GA24-3612. *IBM 3890 Document Processor Mdls E and F Machine and Programming Description Manual,* GC31-0507. **Field Installation:** Yes.
- Tool Kits: Required for CE maintenance. For Rental Customer: Specify on first 3890 order for a customer. If required for a multiple machine installation, additional Tool Kits are available via a no-charge MES. For Purchase Customers: Specify on each 3890 machine order. When installed rental 3890s are purchased, a Tool Kit is to be ordered on a no-charge MES for each machine. **Specify: #9766** for base machine, **#9767** for Microfilming (#5111), **#9768** for Item Numbering/Endorsing (#4666).

SPECIAL FEATURES

Item Numbering/Endorsing (#4666): Mdls A and B only. **Item Numbering/Endorsing (#4667):** Mdls E and F only. Provides the capability of printing an eight-digit number and/or a full endorsement on the back of each document. The starting item number and one of three print locations is determined by the user program at initialization. The number can be incremented on any document cycle based on the user-provided Stacker Control Instruction parameters for the run. The number can be configured by the user at installation to be a combination of batch and serial numbers, or serial number only. Vertical location of the item number is specified by the customer and is normally set at the plant.

During run initialization, the user specifies whether endorsing is active, and one of three horizontal print positions. Vertical location of endorsement is specified by the customer and is normally set at the plant. The design of the endorser facilitates operator changing of endorser legends for users who have a requirement to print different endorsements. The date portion of the endorser is set by the operator. **Specify: #9167** for endorsement at top or **#9168** for center; **#9379** for item number at bottom or **#9378** for center. (For the purpose of minimizing overprinting of item numbers and endorsements, 3890s ordered for Federal Reserve Banks should specify **#9167** for endorsement at top and **#9378** for item number at center. All other machines should specify **#9168** for endorsement at center and **#9378** for item number at bottom.) Color of endorser ink to be used: **#9145** for black, **#9149** for blue, **#9147** for purple, **#9148** for red. **Field Installation:** Yes.

Microfilming (#5111): Standard on mdls E and F. Optional feature on 3890 mdls A and B. Provides the capability of microfilming items, either front and back (duplex) or front only (duo), being processed on the 3890. Items are selectively filmed under program control at 3890

3890 Document Processor (cont'd)

document speeds. An 8-digit number can be exposed on the film for every other document image filmed. The 8 digit positions can be split into two number fields, which can be incremented or reset on any document cycle under stacker control instruction parameters for the run. During run initialization, the user specifies whether microfilming is active, the mode of filming, and the starting 8-digit number. A frame mark is recorded on film for each document image for image counting during retrieval. The camera provides a reduction ratio of 50 to 1 and a resolution of 120 lines per millimeter. The film is advanced by a capstan drive system based upon the document width to maximize the use of film. The film cassette, a purchase-only item (see "Accessories"), provides space for take-up of the film as well as the film supply. Capacity of the cassette is 2,000 feet of .0027" polyester thin base film. Loading and unloading of film from the cassette into the film transport are automatic under operator control. Approximately 380,000 front and back images of an average intermix of documents can be recorded on 2,000 feet of film. The film is spaced six inches every 215 feet to facilitate splicing; if a 49-inch space is required, specify **#9177**. The film to be used is 16mm unperforated thin base microfilm which must be ordered on cores. Disclosure specifications covering the film, cassette, and core on which the film must be wound, are available from: Manager, Industry Relations/Product Information, Dept. 767, IBM, Old Orchard Road, Armonk, N.Y. 10504. Film must be ordered on cores (P/N 2648096 or equivalent) with an 1/8 inch diameter hole center punched approximately seven feet from each end of the film. . **Field Installation:** Yes.

S/370 and 4300 Attachment (#6370): Standard on 3890 mdls E and F. Optional feature on 3890 mdls A and B. Permits attachment to any virtual storage S/370 processor (except 3115 and 3125) or a 4300 processor via the byte multiplexer or block multiplexer channel. This feature is required on each 3890 attached to a S/370 or a 4300 processor. **Maximum:** One per 3890. **Field Installation:** Yes.

MODEL CONVERSIONS

Field installable.

ACCESSORIES

MICROFILM CASSETTE (P/N 2647900): The film cassette provides space for film take-up as well as supply. Capacity is 2000 feet of 0.0027-inch polyester thin base film. The cassette must be loaded in a dark room. Disclosure specifications covering the film, cassette and core on which the film must be wound are available from Manager Industry Relations, Product Information, Dept. 767, CHQ, Old Orchard Road, Armonk, N. Y. 10504.

SUPPLIES (None)

4245 LINE PRINTER

PURPOSE

Printer Output unit for all Virtual Storage S/370's (except 155 II, and 65 II) 303X, 308X and all 4300 Processors. Print speed is 2000 lines per minute (lpm) based on a standard 48-character set.

MODELS

Model 1 001 Print speed 2000 lpm.

Limitations:

1. Only marginally punched, pinfeed, continuous forms may be used. For multiple part forms it is recommended that both sides be securely fastened. However, when only one side is fastened it must be the right side.
2. For full flexibility of column locations for margins, 451mm (17.8 inches) maximum width forms is recommended. If forms greater than 356mm (14 inches) in length are used, the rear stacker enclosure must be opened. If forms greater than 432mm (17 inches) in length are used, the front forms compartment door must be left open. For additional information, see *Forms Design Reference Guide for Printers*, GA24-3488.
3. No staples are permitted in the area exposed to the print band.
4. Both edges of the form must be engaged by the pinfeed forms tractors.
5. Use for OCR applications is not supported.
6. Print quality and printer operation (such as forms feeding and stacking) varies with paper specifications, number of copies, ribbons, and environmental conditions (temperature and humidity).

Forms of more than 4 parts or forms with a first part heavier than 13 pounds (49 grams/sq. meter) should be tested under operating conditions to verify that results are satisfactory for the user applications. The maximum forms thickness is 0.51mm (.020 inches).

Prerequisites: One operator changeable print band for each 4245 printer (see Specify section). One control unit position on a system byte multiplexor, selector, or block multiplexor channel for each printer.

HIGHLIGHTS

Print speed is 2000 lpm using a 48-character interchangeable print band. A variety of other character sets are available. Print speeds vary according to the size of the character set. The following table shows character sizes offered and expected speed ratings:

Character Set	Print Speed (lpm)
48	2000 (max.)
52	1820
50, 63	1620
94	1130
124	820

Print speed depends on frequency of use of various characters. Most 4245 print bands have been optimized to add greater frequency of commonly used characters. This enables most print jobs to run faster than if the frequency of all characters was equal.

132 print positions is standard. Horizontal spacing is 10 characters per inch. Vertical spacing is 6 or 8 lines per inch under program control. Forms skipping and spacing are controlled by a 255 byte forms control buffer. The carriage is a dual speed unit with normal skipping up to .61m (24 inches) per second and high speed skipping up to 1.4m (55 inches) per second after 6 lines have passed. The output forms stacker is power assisted.

Continuous marginally punched forms are fed by a pair of forms tractors. Maximum forms dimensions are: width - 559mm (22 inches); length - 610mm (24 inches). Minimum forms dimensions are: width - 89mm (3.5 inches); length 76mm (3.0 inches). **Note:** In the stacker, the minimum fold-to-fold length is 152mm (6.0 inches).

Customer Responsibilities: The customer is responsible for:

- Adequate site, system, and other vendor preparations
- Replacement of the following items as necessary:
  - Ribbons
  - Print bands
  - Plastic ribbon shields
  - Vacuum bags

All of the above replacement items except vacuum bags can be purchased through SSD . Vacuum bags will be supplied at no charge by Field Engineering for IBM maintained machines. See the supplies section for further information. If the customer desires to have Field Engineering replace or install any of these items, the FE time involved will be billed to the customer.

Bibliography: S/370 - GC20-0001.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (AC, 3 phase, 4 wire, 60 Hz):

  208V **#9903**
  220V **#2800**
  240V **#9915**

- Color: Machine is available in Cloud White only.
- MES: There will be no MES orders with this machine.
- Print Band Character Set: Select one band only by specifying one number from Group A, one number from Group B, and one number for character set height. When printing 8 lines per inch, 2.0mm (.079 inches) character height is recommended. One print band will be shipped at no charge with the printer. Replacement or additional print bands may be obtained by the customer for a charge. See Supplies section.

Group A

Specify	Character Set Size
#9520	48-Character EBCDIC
#9521	50-Character Scientific
#9526	52-Character FORTRAN/COBOL**
#9524	63-Character ASCII**
#9522	63-Character EBCDIC
#9525	94-Character Commercial*
#9527	124-Character Scientific*

Group B

Specify	Language
#2950	International
#2956	English US
#2961	Spanish Speaking

Specify	Character Height
#9950	2.4mm (.095 in.)
#9951	2.0mm (.079 in.)

* Available only with the 2.4mm (.095 in.) character height.

** A selection from Group B is not required.

SPECIAL FEATURES None

MODEL CONVERSIONS None.

ACCESSORIES

See "Customer Responsibilities" under "Highlights".

SUPPLIES

Ribbons: **P/N 7034437** or equivalent is required for forms up to and including four parts. **P/N 4012828** or equivalent is required for five and six part forms.

Print Bands: Replacement or additional bands are available. see the SSD Sales Manual for P/Ns.

Plastic Ribbon Shields: P/N 6092766, or equivalent is required.

For all of the above supplies, see the SSD Sales Manual .

4250 PRINTER

PURPOSE

The 4250 is a high-resolution non-impact printer. It is all-points-addressable (APA) with an addressing resolution of 600 dots per inch in both horizontal and vertical direction and can print a wide variety of text in various styles and sizes, graphics objects with various complexity. As an all-points-addressable device the 4250 can print host system-supplied dot patterns. A blackness ratio of 50% per page should not be exceeded. In case of simulated halftones customers should evaluate these against their application requirements. The 4250, together with associated software such as Document Composition Facility (DCF) Release 3 and Graphical Data Display Manager (GDDM) Release 3, provide a new level of print quality, function, and ease-of-use for a variety of customer applications such as documentation, production of manuals, brochures, reports, newsletters, presentations, etc. Based on electro-erosion technology, the 4250 produces type-set quality camera-ready master-pages directly from an IBM host computer system without photo-sensitive processes and costly darkroom facilities. Unlike traditional photo typesetters, the 4250 output is dry and immediately visible and usable. The output can be reproduced by using the conventional reproduction methods used in the reproduction industry. If the output is reproduced via copiers, the customer should evaluate the results of the copying process on the specific copier.

MODELS

Model 1 001

Prerequisites:

3274 Mdl 1A Attachment:
- **#9112** Configuration Support C at release level 46 or higher.
- Enough control storage to customize for SCS printer support (SCS), structured field and Attribute processing (SFAP) and one extended attribute terminal (EAT) for each 4250 attached.

3274 Mdl 1D Attachment:
- **#9112** Configuration Support C at release level 46 or higher.
- Enough storage to customize for SFAP and one EAT for each 4250 attached.

3274 Mdl 31A or 31D Attachment:
- **#9112** Configuration Support C level 46 or higher. Storage features are not required, but enough control storage must be available to customize for SFAP. SCS support is required for the 31A.

  or
- **#9124** Configuration Support D, and #3650 Extended Function Store Type C1, and #3101 Integrated Diskette Drive Enhancement.

3274 Mdl 41A or 41D Attachment:
- No features or special considerations required.

4321 or 4331 Mdl 1, 2, or 11 Attachment:
- Specify code **#9260** for DPA.

Customer Setup: The 4250 is a Customer Setup (CSU) machine, thereby offering the customer early availability and relocation flexibility. Setup procedures are shipped with each machine. The Customer Setup allowance is four days for each 4250 (regardless of quantity) starting from the day of the arrival at the customer's shipping dock.

HIGHLIGHTS

- Provides high-quality (typeset-level) master pages at an addressing resolution of 600 dots per inch in horizontal and vertical direction.
- Provides immediately usable dry output and requires no chemical processes with costly darkroom facilities or special environmental considerations.
- Provides the capability of printing and merging of a wide variety of text, graphics and host generated dot patterns.
- The output of the 4250 is immediately visible.
- Uses aluminum-coated paper which is inexpensive compared to conventional photographic paper.
- Provides end-user convenience, small size, and silent operation suitable for an office environment.
- The output is easily reproducible and of archival quality.

System Attachment: The 4250 attaches to the 3274 Control Unit, mdls 1A, 1D, 31A, 31D, 41A and 41D. Using these Control Units, the 4250 can be attached to any S/370 mdl 138 and up or 43XX and 30XX. In addition, the 4250 attaches directly to the 4331 mdls 1, 2 and, 11 and to the 4321 via the Integrated Display/Printer Adapter.

Human Factors: The 4250 uses electro-erosion printing technology resulting in a quiet operating unit suitable for installation in an end-user environment. In conjunction with the programming support, the user can initiate re-transmission of a page, if for example, the paper roll is empty prior to reaching the end of the page. The output of the 4250 is immediately visible and no chemicals are involved in obtaining the high quality, camera-ready master-page.

Problem Determination Procedures: The microcode checks and monitors the status of the printer and provides status information on the two-digit display in case of malfunction. The *Reference Card* (GX33-1504) in the rear of the machine provides the problem determination steps. At initial power-on, an automatic sequence of tests checks the circuitry and measures the width of paper mounted in the machine. A subset of these tests is conducted whenever the reset key is depressed. Offline tests may be initiated via the Operator Control Keys to check the function of the electrode driver circuitry.

Indicator Lights: The 4250 has six function-indicators and a 2-digit display which provide status and error code information. A power indicator light is also provided.

Operator Control Keys: The keyboard contains 16 keys. Those of prime importance to the operator such as Start, Stop, Paper Advance, and Reset, are brightly colored for positive recognition. The remaining keys, for application interface and problem determination, are used primarily by the CE.

Performance Considerations: The 4250 is an all-points-addressable printer and performance measures such as lines per minute or characters per second are not meaningful. The physical speed of the print head is one meter per second (approximately 40 inches per second). The actual time to print one page is dependent upon:

- Complexity and size of the page
- Content of a page, e.g., number of skips, line length, etc.

For planning purposes, the printing time for an average A4 size page ranges between 1.5 and 2.5 minutes provided the 4250 operates at maximum printing speed.

IBM Aids: The FIVE/3270 configurator will be enhanced to provide support for 4250 attached to the 3274 control unit.

Customer Responsibilities: The customer is responsible for:

- Adequate site, system, and other vendor preparation.
- Receipt at the customer's receiving dock, unpacking and placement of the 4250 at initial setup.
- Physical setup, connections of cables in customers access areas and check-out.
- Contacting IBM FieldEngineering to make cable connections of IBM CSU units to non-CSU units where customer access areas are not provided.
- Procurement, installation, and maintenance of coaxial communication cables. See "Accessories".
- Disconnection and removal to the customer's shipping dock at the time of discontinuance. Appropriate instructions will be provided by IBM.

Shipping Materials: All shipments are from the plant of manufacture. Packaging material need not to be returned.

Programming Support:

System Support: The 4250 is supported for operation under the following operating systems:

- VM/CMS -- The 4250 is running under VM/SP Release 1 and 2 specifying the 4250 as an unsupported device. VM/SP Release 3 provides standard support as a dedicated device.
- MVS -- MVS/SP Version 1 Release 3.0 and MVS/XA with either ACF/VTAM Release 3 or ACF/VTAM Version 2.
- VSE/Advanced Functions -- VSE/Advanced Function Release 3 with either ACF/VTAM Release 3 or ACF/VTAM Version 2 or ACF/VTAME.

Application Support: The 4250 will be supported by the following strategic IBM Application Packages:

- Document Composition Facility Release 3 (5748-XX9).
- Document Library Facility Rel. 3.
- Graphical Data Display Manager Rel. 3 (5748-XXH) on MVS/TSO and VM/SP CMS only.
- Composed Document Printing Facility (CDPF).
- IBM Typographic Fonts for the IBM 4250.

Basic Configuration: The basic machine is shipped with a non-locking power cable plug and a 4.3 meter (14 foot) power cable. See "Specify".

Publications: *Planning and Site Preparation Guide* (GA33-1552), *Component Description and Programming Information Manual* (GA33-1554), *Operator's Guide* (GA33-1551), *Customer Setup Instructions* (GA33-1553), *Reference Card* (GX33-1504), *Trouble Report Form* (GX33-1503), *IBM 4250 Printer: Type Styles Portfolio* (G520-0004).

SPECIFY

- Color: Pearl White is the only available color. No specify required.

4250 Printer (cont'd)

- Communication Cable: Communication cable is not shipped with the machine. The customer is responsible for procurement, installation, and maintenance of coaxial cable. See "Accessories".

SPECIAL FEATURES (None)

MODEL CONVERSIONS (None)

ACCESSORIES

Cables: Cables, connectors, and adapters may be purchased from IBM or a customer-selected source. The customer is responsible for installation and maintenance of these cables. Assembled cables may be ordered from IBM. When cabling is ordered from IBM, specify a shipping date at least four weeks in advance of receiving the 4250.

Twinax Connector Kit (**P/N 7362268**): Includes two connectors. Twinax Wire and one Twinax Connector Kit are required for each attachment cable. Individual connectors (**P/N 7362229**) are available for replacements.

Twinax Wire (**P/N 7362211**): Order must specify the desired length. Twinax Wire and one Twinax Connector Kit are required for each attachment cable. This is an indoor/outdoor cable.

Twinax Cable Assembly (**P/N 7362267**): Includes a Connector Kit (two connectors) attached to bulk wire. The required length of wire must be specified on the order. The cost of the wire must be added to the fixed assembly price to obtain the total price of the cable assembly.

Twinax Adapter (**P/N 7362230**): Permits two Twinax Cable Assemblies to be joined together.

Twinax Station Protector Kit (**P/N 7361807**): Includes two protectors. One is required at each end of attachment cable installed outdoors (either above or below ground level).

SUPPLIES

Electro-erosion paper is available from IBM. The paper is on rolls and supplied in cartons (10 rolls per carton). Four widths are available:

210mm x 100m (8.26 inches x 300 feet) **P/N 7034360**
215.9mm x 100m (8.5 inches x 300 feet) **P/N 7034361**
265mm x 100m (10.43 inches x 300 feet) **P/N 7034362**
330mm x 100m (12.99 inches x 300 feet) **P/N 7034363**

The electro-erosion paper is a sensitive part of the machine. Use of paper that does not meet IBM specifications may result in unsatisfactory print quality or damage to the print head.

4321 PROCESSOR

PURPOSE

Provides the power, control, logic and memory circuitry necessary for the arithmetic, logic and processor storage functions of the 4321 Processor.

MODELS

Model J11 1,048,576 (bytes) Processor Storage

Prerequisites: Each system requires an operator's display, keyboard and control panel to allow Initial Microcode Load (IML) and interaction with the hardware/software system. A 3278 Display Console mdl 2A or a 3279 Color Display Console mdl 2C with keyboard and control panel is required for this purpose.

Maximum Configuration: The channel load of the attached I/O devices has to be checked against the load limitations of the processor. Refer to *IBM 4321, 4331 Processor Channel Characteristics,* GA33-1527, or use the HONE aid ANCHLOAD.

HIGHLIGHTS

The 4321 is a featured processor with one megabyte of processor storage and contains the following standard hardware features:

	Equivalent feature number on 4331 MG1
–128K bytes of control storage	#1901
–One DASD adapter base	#3201
–One 8809 adapter	#4910
–Display/Printer Adapter Expansion (16 ports)	#2001
–Communication Adapter Base	#1601
–ECPS:VM/370 (VM assist microcode)	#8701

These features are not ordered separately. Features and their specify codes not standard on the 4321 must be ordered individually for the 4321.

The processor contains 1,048,576 bytes of monolithic processor storage. Data flow is four bytes parallel. Storage fetch cycle is 900 nanoseconds for four bytes and the store cycle is 1,300 nanoseconds for four bytes. The processor is microcode controlled.

> **Note:** The microcode which controls system operations resides in Processor Storage and Reloadable Control Storage. 4321 includes 131,072 bytes of Control Storage. In addition to the microcode contained in this storage, a minimum of 136,000 bytes of Processor Storage are occupied by microcode, RAS workspace and system data for the featured 4321 Processor.

Standard Functions:

- Processor storage ... 1,048,576 bytes. The 4321 Processor configurations require a portion of processor storage to be allocated for system microcode use. See Table 1 below for details.
- ECPS:VSE Mode or S/370 Mode: The 4321 operates in either S/370 Mode or in ECPS:VSE mode. The system mode is selectable at Initial Program Load (IPL) time. S/370 mode is required for operation with VM/SP, ECPS:VSE mode for operation with SSX/VSE and DOS/VSE Release 3.
- Display/Printer Adapter allows attachment of:
  - 3178 Display Station
  - 3262 Line Printer mdl 1 (650 lpm system printer)
  - 3262 Line Printer mdl 11 (325 lpm system printer)
  - 3268 Printer mdl 2 and 2C (340 cps)
  - 3230 Printer mdl 2 (350/450 cps burst speed)
  - 3289 Line Printer mdl 4 (400 lpm system printer)
  - 3278 Display Station mdl 2, and keyboards
  - 3270 Personal Computer (control unit terminal mode only)
  - 3279 Color Display Station mdl 2A , S2A and 02X and keyboards
  - 3278 Display Console mdl 2A, keyboard and control panel
  - 3279 Color Display Console mdl 2C, keyboard and control panel
  - 3287 Printer mdls 1, 2, 1C and 2C.
  - 4250 Printer
  - 6580 Displaywriter System mdl A4, A6 A8, A10 (25-line display)

  > **Note:** SSX/VSE supports the 3279 Color Display Console mdl 2C as a 3278-2A with no specific color support, i.e. color is determined via the default attribute byte only.
- The System Diskette Facility is the microcode loading system for the 4321 Processor. The diskettes shipped with the 4321 Processor will supply the required microcode including diagnostics. The System Diskette Facility also allows storage of failure data from 4321 Processor errors which can subsequently be analyzed by the CE for maintenance purposes.
- Reloadable Control Storage is provided in addition to processor storage. This provides storage space for a portion of system microcode of the 4321 Processor. The Reloadable Control Storage is not available to the user. 4321 includes 131,072 bytes of Reloadable Control Storage.
- Remote Support Facility (RSF) is an IBM CE tool permitting IBM Field Technical Support Center specialists to remotely monitor and/or perform problem diagnosis on the 4321 Processor. This includes remotely-initiated execution of diagnostic programs, remote examination of all or selected logout records from the System Diskette Facility, and (with proper customer authorization), remote exercise of the Customer Manual Operations.
- Remote Operator Console Facility (ROCF) provides the ability to IML/IPL and execute manual control functions on a remote 4321 via a 3275 (real or emulated) terminal at a host location. ROCF is an extension of the Remote Support Facility (RSF) and may be ordered as a no-charge specify feature.
- One Level addressing facility for improved virtual storage control by DOS/VSE and SSX/VSE (ECPS:VSE mode)
- Channels with virtual storage addressing (ECPS:VSE mode)
- Channel Indirect Data Addressing (in S/370 Mode)

Other Standard Functions are:

- Virtual Storage capability by Dynamic Address Translation
- Control by VSE (ECPS:VSE mode)
- S/370 Universal Instruction Set
- Extended Precision Floating Point
- Conditional Swapping
- CE maintenance support functions
- Storage Protection (Store and Fetch)
- Byte Oriented Operands
- Clock Comparator and CPU timer
- Time-of-Day Clock
- Interval Timer
- PSW Key Handling
- Control Registers
- Machine Check Handling
- Program Event Recording
- Clear I/O
- Move inverse instruction (not used by IBM programs)
- Monitoring

Programming Note: The system mode will be invoked at IPL time and supports operation of an appropriately installed Control Program. In S/370 mode operation with VM/SP is supported. Operation in a CMS-only environment is recommended. In ECPS:VSE mode, operation of SSX/VSE and DOS/VSE Release 3 is supported.

Console Function: An operator's display, keyboard and control panel is a prerequisite for use of the system by the customer. A 3278 Display Console mdl 2A or a 3279 color Display Console mdl 2C is required for this purpose. The Operator Control Panel allows additional operator communication with the system. Depending on the mode of console operation, a maximum of 20 of the 25 lines on the display may be used for system communication, four are reserved for messages from the 4321 Processor hardware system, and one displays messages unique to the 3278 Display Console mdl 2A or the 3279 Color Display Console mdl 2C.

Another function of the console is the Remote Operator Console Facility (ROCF) which provides the ability to IPL and execute manual control functions on a remote 4321 via a real or emulated 3275 terminal at a host location. ROCF is an extension of Remote Support Facility (RSF).

ECPS:VM/370: The 4321 Processor provides ECPS:VM/370 support at Level 19. This support is compatible with VM/SP corresponding levels of the System Extension Program Products. The functional areas assisted include: Virtual Machine I/O, SVC Handler, Privileged Instruction emulation and Virtual Interval Time. **Limitations:** May only operate when S/370 mode has been invoked by IPL.

Byte Multiplexer Channel (Optional): Functionally equivalent to the byte multiplexer channel on S/360 and S/370 and provides eight control unit positions. When certain control units/devices are to be connected, the optional Power Interface (#5531, #5532) for power control must be installed on the processor. See "Special Features" and Table 4 below for details. The channel permits simultaneous operations of low speed devices. Operates at up to 18K bytes per second in single-byte mode. Up to 500K bytes per second in burst mode. See *IBM Channel Characteristics,* GA33-1527 for devices which may attach and the data rates achievable for certain configurations. The Byte Multiplexer Channel is always addressed as channel 0.

Subchannels: The 4321 Byte Multiplexer Channel (#5248) provides up to 31 subchannels, 4 of which are shared subchannels with up to 16 devices each. The maximum number of 31 subchannels is reduced by 5 for the standard DASD Adapter Base (2), 8809 Magnetic Tape Unit Adapter (2) and the Communications Adapter Base (1). The remaining 26 subchannels are reduced by one for the Block Multiplexer Channel

4321 Processor (cont'd)

(#1421) and one for each telecommunication line on the Communications Adapter Base.

Block Multiplexer Channel (Optional): Provides eight control unit positions. When certain control units/devices are to be connected, the optional Power Interface (#5531, #5532) for power control must be installed on the processor. See "Special Features" and Table 4 below for details. Devices attached to these channels which cannot utilize block multiplexing will function as if attached to selector channels. The 231X and 33XX devices (and the 3830 or 3880 storage control units) do not attach.

- Data rate is up to 0.5 million bytes per second ... see *IBM 4321/4331 Mdl Group 1 Channel Characteristics*, GA33-1527, for details. Standard channel address is 1, a different address may be selected at installation time from the range of 1 to 6.

Subchannels: The following subchannel combinations can be configured at installation time:

– up to 128 non-shared subchannels
and
– up to 16 shared subchannels, each with devices in multiples of 8, up to a total of 128 devices

Integrated I/O Adapters: The following I/O adapters control the designated I/O devices:

DASD Adapter Base (standard)
5424 Adapter
Loop Adapter
8809 Magnetic Tape Unit Adapter (standard)
Display/Printer Adapter (16 ports, standard)
Communications Adapter Base (standard)

Note: All data passing through the system for any I/O device interfaces with the data flow for other devices, producing I/O limitations. The limitations take two forms:

(1) Hardware exclusivities

(2) I/O attachments which individually or in combination can produce frequent overruns. Considerations in this category are:
- The aggregate data rate on the Block Multiplexer Channel and the DASD Adapter.
- The number and speed of lines attached to the Communications Adapter.
- The number and class of overrunnable devices on the Byte Multiplexer Channel.
- The number and traffic on 3270 Personal Computer (control unit terminal mode only), 3278 mdl 2 or 3279 mdl 2A, S2A or 02X attached to the Display/Printer Adapter.

It is necessary to consult *IBM 4321/4331 Channel Characteristics*, GA33-1527, to properly configure a 4321 with an I/O configuration that has not previously been analyzed.

DASD Adapter Base (Standard): One DASD Adapter is standard on the 4321 and provides direct attachment of 3310 **#9202**, 3370 **#9201** and/or 3340/3344 **#7851** Direct Access Storage Devices without the necessity of a control unit. The 3310 and the 3370 operate in fixed block mode. The 3340/3344 operates in Count-Key-Data (CKD) mode. When using 3340/3344 exclusively system throughput can be degraded by a factor of more than two compared with use of fixed block mode devices.

Note: One of the above features must be specified at minimum.

Up to four strings of devices may be attached to the adapter. The attachable device types may be intermixed on the adapter but not within a string. The maximum number of strings of each type of device on the DASD Adapter is:

a) Up to four 3310 mdl A1s or A2s with 3310 mdl B units attached, up to a maximum of 4 drives per string.

b) Up to four 3370 mdl A1s with 3370 mdl B1 units attached, up to a maximum of 4 devices (8 actuators) per string.

c) Up to two 3340 mdl A2s with 3340/3344 mdl B units attached, up to a maximum of eight drives per string. (3340/3344 Direct Attach feature #7851 is required.) Attachment of 3340/3344 is limited to two strings on the system.

As a transition aid and to allow the use of operating systems and programs which require Count-Key-Data (CKD) direct access storage, the 3340/3344 Direct Attachment and Direct Access Storage (DAS) Compatibility for emulation of 231X on 3310 or 3370 and 3330/3340 on 3370 are available. Operation with DAS Compatibility or the 3340/3344 Direct Attachment features in general will not achieve the same performance as the equivalent devices when attached to S/370 or 4300 processor channels. See performance notes included with the feature descriptions.

The String Switch Capability allows sharing of 3340/3344 or 3370 DASD with another IBM processor or control unit that supports the DASD and string switching. String switch support for the 3340/3344 is limited to the static assignment of a shared string to one processor at a time.

3340/3344 devices attaching to the DASD Adapter have logical unit/device addresses as follows:

X00	01	02	03	04	05	06	07
		2A	2B	2C	2D	2E	2F
		4A	4B	4C	4D	4E	4F
		6A	6B	6C	6D	6E	6F

and

X10	11	12	13	14	15	16	17
		3A	3B	3C	3D	3E	3F
		5A	5B	5C	5D	5E	5F
		7A	7B	7C	7D	7E	7F

With a directly-attached 3340 the DASD Adapter can read data from a 3348 Data Module which was recorded on a 3340 attached to a S/3 mdl 12 or 15 ... this is a read-only mode and is available as a conversion aid for users converting to the 4321 Processors from a System/3.

The Direct Access Storage Compatibility feature provides emulation of 231X, 3330 (100MB/volume) or 3340 data formats on the 3370 Direct Access Storage and the emulation of 231X data formats on the 3310 Direct Access Storage. For address assignment of emulated volumes, refer to *IBM 4321/4331 Processor Compatibility Features*, GA33-1528.

Addresses for up to four strings of 3310 and 3370 can be configured at installation time in the range from X0X to X7X. The channel address may be from 1 to 6.

Display/Printer Adapter (Standard): This adapter allows for attachment of the prerequisite 3278 Display Console mdl 2A or a 3279 Color Display Console mdl 2C and up or fifteen additional devices chosen from the list below:

3178 Display Station
3230 Terminal Printer mdl 2 (350/45 cps burst mode
3262 Line Printer mdl 1 and 11 (650 and 325 lpm)
3268 Printer mdl 2 and 2C (340 cps)
3278 Display Station mdl 2
3270 Personal Computer (control unit terminal mode) *
3279 Color Display Station mdl 2A, S2A or 02X
3287 Printer mdls 1, 2, 1C and 2C (80 and 120 cps)
3289 Printer mdl 4 (400 lpm)
4250 Printer
6850 Displaywriter System mdls A4, A6, A8, A10 (25-line display)

* Specify **#9843** on 4321 and 4331 must be ordered for attachment of the 3270 Personal Computer.

These machines may be installed in any combination, provided that [1] only fifteen devices are installed and [2] no more than two System Printers (3262 and/or 3289) are included. A maximum of two 4250 Printer may be installed. The 6580 Displaywriter System can connect to 1 or 2 device ports (display station, or display station and printer).

The 3262 or the 3289 Line Printer may be used as system printers dependent upon control program or program product support. One 3287/3230/3268 Printer may be used as a console hardcopy device; one or more 3287 /3230/3268 Printers may be used as hardcopy workstation devices. The 3178 Display Station 3278 Display Station mdl 2, or 3279 Color Display Station mdl 2A, S2A or 02X may be used as workstations for user-written applications. The 6580 Displaywriter System emulates a 3278-2 Display Station, and optionally, a 3287-1/2 Printer. The 6580 may be used as a workstation for user-written applications and for hard copy, as a 3278-2 and 3287-1/2. Display/Printer Adapter support includes all standard functions of the 3274 mdl X1B with the 3178, 3270 Personal Computer (control unit terminal mode), 3278 mdl 2 or 3279 mdl 2A, S2A or 02X attached. In addition, the following 3278 mdl 2, 3270 Personal Computer (control unit terminal mode), or 3279 mdl 2A, S2A or 02X special features are supported: Keyboard Numeric Lock (Standard on the 3178), Audible Alarm, (standard on the 3178 or 3279) Security Keylock and Switched Control Unit. Other 3278 mdl 2 or 3279 mdl 2A, S2A or 02X special features are not supported. When used as workstations, 3278 or 3279 Display Station keyboard feature codes #4621, #4622, #4623, #4627, #4624, or #4628 may be selected. If two different keyboards are required for a workstation, one must be #4621. Addresses for these devices are selected at installation time from the range 009 through 01F.

The 6580 Displaywriter System prerequisites for attachment include the 3270 Attached Workstation licensed program (5608-SR9) and the 3274/3276 Attached Workstation adapter (**#8332**) and Specify **#9842** 4321 must be ordered for attachment of Displaywriter.

Diskette Drive (Optional): A single drive diskette reader/recorder providing the ability to read or write Diskettes Type I on the 4321 Processor. This diskette has a data capacity of 242,944 bytes

4321 Processor (cont'd)

organized in 1,898 sectors of 128 bytes each (for use in exchanging data with the several products listed below) or a data capacity of 246,272 bytes organized in 1,924 sectors of 128 bytes each (for use in exchanging data with another 4321 Processor). Each Diskette Drive is supported by the control program as a 3540 Diskette Input/Output Unit. When used with DOS/VSE refer to VSE/POWER documentation. Data recorded on a Diskette Type I can be interchanged with IBM devices and systems which have a diskette drive. Examples are the 3740, 3770, 3790, 5230 and 8100 and Series/1 and Systems/ 3, 32, 34, and 38. One diskette is shipped with the feature. Device address is selected at installation time from the range 009 through 01F.

5424 Adapter (Optional): Provides native attachment of 5424 Multi-Function Card Unit mdls A1 or A2 for 96-column card operations ... Device address is 04C.

Loop Adapter (Optional): The Loop Adapter on the 4321 is a native attachment method for the 3640 Plant Data Communications Terminals ... 3104 Display Terminal mdls B1, B2 ... 8775 Display Terminal mdls 1 and 2 ... 3232 Keyboard Printer ... 3287 Printer ... 3274 Control Unit mdl 51C and 61C ... 3276 Control Unit Display Station with their associated terminals. Communications is based on SDLC loop protocols. The Loop Adapter provides the user with a native interface to these terminals and increased configuration flexibility.

A maximum of two direct attached loops and two data link adapters are supported. Each of the direct attached loops consists of two lobes (loop cables), for a total of four lobes on the system. Both lobes must operate at the same bit rate. Each lobe is functionally a loop however, all data on one lobe passes serially through the second lobe and can be as long as the loop, and a fault in one lobe will not affect the terminals on the second lobe, when the disrupted lobe is bypassed at the system. Therefore lobes can cover a greater distance and improve availability.

Each of the data link adapters can attach one IBM 3843 Loop Control Unit as point-to-point or up to 4 Loop Control Units as multipoint configuration. Details on programming information are provided in the *IBM 4321/4331 Loop Adapter Programming Guide*, SC31-0500-0.

User-written programs for loop-attached terminals reside in the 4321 Processor storage and are controlled by VSE and ACF/VTAME or ACF/VTAM and CICS/DOS/VS. The 3644 Automatic Data Unit and 8775 Display Terminal with Downstream Loadable Functions are supported by ACF/VTAME and DSLU with VSE. In order to personalize the 3644, the GEN3644 program product is required in addition to DSLU.

In addition IBM offers a PRPQ to CICS/VS This PRPQ Loop Adapter CICS/VS Extension for 3640 terminals is a series of programs and exit routines that enhance the support of the 3641, 3642, 3644, 3646 and 3647 when attached to the 4321 Processor by Loop Adapter Feature. The following four functions are addressed by this PRPQ:

- Terminal initialization
- Terminal re-initialization
- 3642 encode check handling
- Transaction selection

Communications network management problem determination support for 4321 loop-attached 3104 Display Terminals, 8775 Display Terminals, 3232 Keyboard Printer mdl 11, 3276 Display Control Stations and 3274 mdl 51C and 61C Display Controllers and their/associated terminals, is provided via NCCF/NPDA.

The following terminals/controllers are supported: 3641 Reporting Terminal mdls 1, 2 ... 3642 Encoder Printer mdls 1, 2 ... 3643 Keyboard Display mdl 2, 3, 4 including #4920 Badge and Document Encoder ... 3644 Automatic Data Unit ... 3645 Printer ... 3646 Scanner Control Unit ... 3647 Time and Attendance Terminal ... 3104 Display Terminal mdls B1, B2 ... 8775 Display Terminal mdls 1,2 ... 3232 Keyboard Printer mdl 11 ... 3287 Printer mdls 11, 12 ... 3274 Control Unit mdl 51C and 61C ... 3276 Control Unit Display Station mdls 11-14 with their associated terminals ... 3843 Loop Control Unit. Device addresses are 040 through 07E.

8809 Magnetic Tape Unit Adapter (Standard): Provides native attachment of 8809 mdl 1A and up to five additional 8809 tape units (consisting of a mix of 8809 mdl 2s and 3s) ... allows the 8809 Magnetic Tape Unit to operate in streaming mode (data rate is up to 160K bytes per second) for loading or offloading DASD devices or in start/stop mode (data rate is up to 20K bytes per second) for other data processing operations. Although physical Read Backward commands are not supported, the Read Backward operation is simulated in the Logical IOCS (MTMOD) of DOS/VSE. Standard channel address is 3. Channel and device addresses may be assigned at system installation time from the range of X00 to X7F, where X is 1 to 6.

Communications Adapter Base (Standard): The 4321 Communications Adapter can serve up to eight communication lines. Synchronous Data Link Control (SDLC), Binary Synchronous Communications (BSC) and Start/Stop (asynchronous) transmission modes are provided (Start/Stop and BSC operate in 2703 compatibility mode). The Communications Adapter can handle a variety of terminals (Data Terminal Equipments, DTEs), at different speeds.

The Communications Adapter has the following overall structure: The Communications Adapter Base contains common circuits and control. Each of the up to eight telecommunication lines attachable requires one Line Attachment Base (two different types) and one line attachment feature. Another feature serves for autocall unit interface and two may be installed.

The interface with the external communication facilities is through a modem (also called signal converter or Data Circuit Terminating Equipment). It may be a stand-alone unit or a 1200 bps integrated modem. For Communications Adapter Base details, see "Communications and Loops" below.

IBM Stand-Alone Modems

Switched

3863	2400 bps
3864	4800 bps
3872	1200/2400 bps
3874	2400/4800 bps

Nonswitched

The following modems are supported with the Switched Network Backup feature ... see M3863, 3864, 3865, 3872 pages for details:

3863	2400 bps
3864	4800 bps
3865	9600 bps
3872	1200/2400 bps
3874	2400/4800 bps
3875	3600/7200 bps

IBM Integrated Modem (V.23, 1200 bps): The following integrated modem configurations are available:

- Switched network with auto answer
- Nonswitched line, 2- or 4-wire.
- Nonswitched line with switched network backup and auto answer.
- Nonswitched line with switched network backup with manual answer.

Non-IBM Modems: Non-IBM modems that comply with EIA RS 232-C, CCITT V.24/V.28, or CCITT V.35 recommendations may be connected to the Communications Adapter. Attachment is under the provisions of the Multiple Supplier Systems Policy.

Digital Data Service Adapter: The Digital Data Service Adapter allows attachment to the AT&T Private Line Dataphone* Digital Service Network by way of an internal Digital Data Service (DDS*) adapter.

* Dataphone and DDS are registered trademarks of the American Telephone and Telegraph Company. Other usage of Dataphone and DDS in this text also refers to the registered trademarks of AT & T.

X.21 Adapter for Nonswitched Networks: The X.21 interface allows attachment to the X.21 facilities by way of an internal X.21 adapter.

Automatic Calling Equipment: The following Automatic Calling Equipment, maximum two, can be attached to the Communications Adapter:

- 3872 with Automatic Call Originate feature
- 3874 with Automatic Call Originate feature
- Other Automatic Calling Equipment which complies with EIA RS 366 or CCITT V.25 may be connected to the Autocall Unit Interface (#1020) under the provisions of the IBM Multiple Supplier Systems Bulletin.

SPECIFY

Unless otherwise indicated, these specify features are only available at time of manufacture.

- Voltage (1-phase, 3 wire, 60 Hz): **#9902** for 208V, **#9914** for 240V.
- Color: **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, **#9065** for pebble gray.
- 4250 Printer Attachment: Specify **#9260** for 4250 attachment.
- 6580 Displaywriter Attachment: Specify **#9842** for 6580 attachment.
- Specify **#9841** on 4321 must be ordered for attachment of 3230 mdl 2 or 3268 to the 4321. Provides microcode and/or maintenance documentation if machine is below EC 366585 (microcode for 4321) and/or below EC 366584 (maintenance documentation) for all mdls.
- Remote Support Facility: The Remote Support Facility (RSF) is a customer option. It is recommended to enhance the hardware maintenance of the 4321 Processor. It provides service personnel the capability of remotely controlling the 4321 from any RETAIN terminal and allows the CE to access the RETAIN Data Bank for the latest service aids and information from the customer site. When RSF is selected, the customer must provide the telephone lines required for the RSF modem. The customer must also arrange for

4321 Processor (cont'd)

the connection of the telephone interface cable provided by IBM to the telephone network. For details on customer responsibilities, see *IBM 4300 Processors Installation Manual-Physical Planning,* GA24-3667.

RSF is available in two versions:

Specify **#9510** for integrated modem, 1200 bps, switched network, manual answer. A telephone with FCC registered Data Access Arrangement (DAA) compatible with CDT Coupler Series 1000A interface and operation, with a 4-prong jack, is required.

Specify **#9511** for EIA RS 232-C Interface, 1200 bps, switched network, manual answer. An FCC registered external cable modem compatible with the WE 202S modem, interface and operation, or equivalent, is required.

- Remote Operator Console Facility (ROCF): This feature is an extension of RSF. It provides to an operator at a host location the ability to IML, IPL and execute other 4321 manual control functions for a remote 4321 via a real* or emulated 3275 terminal (Remote Console). After IML and IPL is complete the Remote Operator console should be disconnected and the remote 4321 should be operated in stand-alone mode or control should be turned over to existing networking facilities. ROCF is not designed to be used for interactive applications because operation of all devices attached to the Display/Printer Adapter of the 4321 are suppressed when ROCF is in use. **Field Installation:** Yes.

  * 3275 mdl 2 can only be obtained on an "as available" basis.

  Specify ROCF feature **#9511**. The requisite customer supplied non-clocked external modem attached to feature **#9511** must include auto answer. Line discipline is BSC, 600 or 1200 bps.

- Loop-Attached Terminals: The following specify codes must be selected one time when 3640 and/or 8775 and/or 3287 Terminals and/or 3274 (mdl 51C or 61C) and/or 3276 Control Units are attached to the system via Loop Adapter 1 and/or 2 (#4830, #4831) and/or Data Link Adapters (#4840).

Specify	Selected Terminals
#9251	3641 Reporting Terminal/3647 Time and Attendance Terminal
#9252	3642 Encoder Printer
#9253	3643 Keyboard Display
#9254	3644 Automatic Data Unit (ADU)
#9256	3646 Scanner Control Unit
#9257	8775 Display Terminal 3287/3645 Printer 3274 (mdl 51C or 61C) and 3276Control Unit and 3104 Display Terminal
#9258	3643 Keyboard Display with #4920

- Keyboard/Character Set Language: When 3178 Display Station, 3278 Display Stations mdl 2 and/or 3287 or 3268 mdl 2 Printers are attached to the Display/Printer Adapter, specify on the 4321 Processor:

  #9441: For ASCII Keyboard/Character Set Language (#4624, #4628, on 3278 mdl 2 or 3279 mdl 2A or S2A and/or 3287 with **#9084**), when used as a workstation, or

  #9442: For EBCDIC Data Entry Keyboards (3178 mdl C1, 3278 mdl 2 or 3279 mdl 2A or S2A with #4622, #4623). In addition, specify on the 4321 Processor either **#9301** for Data Entry Keyboard or **#9302** for Data Entry Keyboard, keypunch layout.

  No specify codes on the 4321 are required for EBCDIC Typewriter Keyboards (3178 mdl C2 or #4621, #4627 on 3278 mdl 2 or 3279 mdl 2A S2A or 3270 Personal Computer in control unit terminal mode). The 6580 Displaywriter System supports the EBCDIC Typewriter Keyboard.

  Note: The keyboard/character set language selected must correspond with the mdl of 3178 or the specifications on the 3278 mdl 2 or 3279 mdl 2A or S2A and 3287s. ASCII keyboards are supported as indicated, but the internal binary codes are EBCDIC.

- Console Table: A console table is available ... see #1550 or the 4331-1 Accessories Section for details. Book Rack and Cable Holder ... see #1480 or the 4331-1 "Accessories".

- See 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C for console cabling.

- System Environment: For record purposes specify, one of the following codes (reference only, no parts required):

  #9701 - This processor is planned to be host/peer connected to a system within the same branch office territory (at installation or at a future time).

  #9702 - This processor is planned to be host/peer connected to a system in a different branch office territory (at installation or at a future time).

  #9703 - This processor is planned to be stand-alone (no host/peer connect).

SPECIAL FEATURES

Notes:

%z System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. For a fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

%x Feature supplies diskette for System Diskette facility.

%y System Diskette-only special feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. For a fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

Adapter Power Prerequisite (#1001): Provides power and control circuitry necessary for the Communications Adapter, (when more than three line features are attached), and the Adapter Logic. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1002 or for the Loop Adapter (#4830) and/or Communication Adapter with more than three line attachments #4695 and/or #4696.

Adapter Logic Prerequisite (#1002): Provides logic and control function necessary for the 5424 Adapter (#3901). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1001.

Block Multiplexer Channel (#1421): Provides means of attaching I/O devices. Up to 8 control units may attach to each channel. Disconnect during command chaining allows multiple I/O devices to operate concurrently. 231X as well as 3830 and 3880 Control Units with associated DASD do not attach. See DASD Adapter for attachment of 3340/3344/ 3310/3370 devices. Data transfer rates up to 0.5 million bytes per second. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** For certain control units/devices the processor requires Power Interface (#5531, #5532). See Table 4.

Microcode Storage Requirements: The System microcode resides in the Reloadable Control Storage and Processor Storage, and is loaded from the standard System Diskette facility at IML-time. None of the Reloadable Control Storage is available for user programming and the systems configuration selected will determine the Processor Storage available for user programming and operating system residence.

To calculate the amount of Processor Storage which is available for customer purposes and operating system residence, use the following procedure.

Note: An interactive HONE aid is available dependent on the control program or program product device support to facilitate this procedure.

1) Consulting Table 2, determine the microcode groups required to support the features and I/O to be installed.

2) On Table 3, place a checkmark in the appropriate rows. Note that each microcode group is required only once, even if it supports multiple functions of the 4321 Processor. The only exception to this is microcode group 2 where 2,048 bytes of Processor Storage are required per megabyte of virtual storage as defined in the Table 3 notes.

3) Find the sum of each of the two columns for the required microcode groups.

4) The total from Column A must pass the test: When the total from Column A exceeds 262,144 bytes, an invalid configuration has been selected. See the Note below.

5) Add the total of column A to the total from Column B, subtract control storage of 131,072 bytes and round up to the next multiple of 4,096 bytes.

The results of Step 5 determine the amount of Processor Storage occupied by microcode and should be subtracted from the Processor Storage size ordered to determine the amount available for the user. The storage for Group 7 specified in Column B (DAS Compatibility #7901) is only occupied if the feature is activated at IPL time.

Note: Too many features/options have been selected. Inspect Tables 2 and 3 and determine which feature(s) of lower priority should be deleted from the configuration.

4321 Processor (cont'd)

!

TABLE 2	
Function/Feature Installed	**Microcode Group**
4321 Processor	1
Processor Storage	2

10	9216	1024	

DASD Adapter (Standard): Allows attachment of the 3310, 3370 and 3340/3344 DASD to the 4321 Processor. Up to four strings of devices may be attached to each adapter. The attachable device types may be intermixed on each adapter but not within a string. The maximum number of strings of each type of device on each DASD Adapter is:

a) Up to four 3310 mdl A1s or A2s with 3310 mdl B units attached, up to a maximum of 4 drives per string.

b) Up to four 3370 mdl A1s with 3370 mdl B1 units attached, up to a maximum of 4 devices (8 actuators) per string.

c) Up to two 3340 mdl A2s with 3340/3344 mdl B units attached, up to a maximum of eight drives per string - (3340/3344 Direct Attach feature #7851 is required). Attachment of 3340/3344 is limited to two strings on the system.

String Switch Capability allows sharing of 3340 mdl A2 and/or 3370 mdl A1 and associated drives with another IBM processor or control unit that supports the DASD and string switching. It provides the ability for strings of 3340/3344 or 3370 to be accessed from DASD adapters or control units on the same or two different processors. The 3340 mdl A2 or 3370 mdl A1 must have the String Switch feature #8150 installed. String switch support for 3340/3344 is limited to the static assignment of a shared string to one processor at a time. For data rate and attachment limitations for other devices and communications lines refer to *IBM 4321/4331 Processor Channel Characteristics,* GA33-1527, which contains tables of pre-analyzed configurations.

Prerequisites: 3340/3344 requires #7851 ... see Table 2 for microcode storage requirements. **Specify: #9202**%z if 3310 and/or **#9201**%z if 3370 attaches to the DASD Adapter. **#9316** if String Switch Capability is required with 3370.

Diskette Drive (#3401): A single drive diskette reader/recorder providing the ability to read or write IBM Diskettes Type 1. The Diskette Drive is supported by the control program as a 3540 Diskette Input/Output unit. **Limitations:** Not supported by VM/SP. **Maximum:** One. **Field Installation:** Yes.

External Signals (#3898): Provides six distinct external interrupt lines to request and identify an external interrupt response from the processing unit. **Maximum:** One. **Cable Order:** Required. **Field Installation:** Yes. **Prerequisites:** External Devices must meet the interface specifications outlined in *S/360 Direct Control Feature OEMI,* GA22-6845.

5424 Adapter (#3901%x): Allows attachment of one 5424 Multi-Function Card Unit mdl A1 or A2. **Limitations:** The 5424 is supported by DOS/VSE only. The 5424 must be physically attached, otherwise the system is inoperative. Cannot be installed with the Loop Adapter (#4830). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1001 and #1002.

Byte Multiplexer Channel (#5248): The byte multiplexer channel attaches S/370 byte multiplex devices. The data rate of the channel is up to 18K bytes per second in single byte interleaved mode and up to 500K bytes per second in burst mode. For data rates achievable for specific configurations, see *IBM 4321/4331 Channel Characteristics* GA33-1527. Up to eight control units may be attached. See Input/Output Attachments section above for details on subchannels. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** For certain control units/devices, the processor requires Power Interface (#5531, #5532). See Table 4.

Power Interface (#5531), ADD'L (#5532): Provides power control to the 4321 Processor for control units attaching to the 4321 Byte Multiplexer Channel and Block Multiplexer Channel. Table 4 below lists the control units/devices for which this feature must be installed in the 4321 Processor ... Power Interface (#5531) allows attachment of up to eight of these control units; Power Interface, Add'l (#5532) allows attachment of eight additional control units for a maximum of 16 per processor. **Maximum:** One of #5531; one of #5532. **Field Installation:** Yes. **Prerequisites:** #5532 requires #5531.

TABLE 4

Control Units/Devices Requiring Power Interface Features

1 - Mandatory:
- 1255 Magnetic Character Reader
- 1287 Optical Reader
- 1288 Optical Reader
- 1419 Magnetic Character Reader
- 1442 Card Read Punch mdl N1
- 1442 Card Punch mdl N2
- 1443 Printer mdl N1
- 2415 Magnetic Tape Unit and Control
- 2501 Card Reader mdl B1 and B2
- 2520 Card Read Punch mdl B1, B2 and B3
- 2701 Data Adapter Unit
- 2702 Transmission Control*
- 2703 Transmission Control*
- 2803 Tape Control
- 2821 Control Unit mdls 1, 2, 3, 5 and 6
- 2822 Paper Tape Reader Control*
- 2840 Display Control*
- 3272 Control Unit
- 3411 Magnetic Tape Unit and Control
- 3505 Card Reader
- 3540 Diskette Input/Output Unit

- 3895 Document Reader/Inscriber

2 - Not Mandatory, but can utilize Power Interface features:
- 3274 Control Unit
- 3340 Direct Access Storage Facility
- 3370 Direct Access Storage
- 3203 Printer mdl 5

* No longer available

3340/3344 Direct Attachment (#7851%y): A feature allowing 3340 mdl A2s to attach to a DASD Adapter. Up to two 3340 mdl A2s per system may attach to either adapter. Up to three 3340/3344 mdl B

4321 Processor (cont'd)

units may attach to each 3340 mdl A2. **System/3 Data Import:** With the VSE/IBM System/3-3340 Data Import utility program (5746-AM3), 3348 Data Modules which have been written on a 3340 attached to a S/3 can be read on any directly-attached 3340 drive. The String Switch Capability allows sharing of 3340 mdl A2 drives (with #8150 installed) and associated drives, with another IBM processor or control unit that supports the DASD and string switching. String switch support is limited to the static assignment of a shared string to one processor at a time. **Limitations:** [1] Attachment of 3340/3344 and/or use of the DAS Compatibility is limited to two strings on the system. [2] If one string of 3340/3344s is attached to a DASD Adapter (#3201), only one string of 3310/3370s can perform DASD emulation. If two strings of 3340/3344s are attached, no 3310/3370s can perform DASD emulation. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** 3340 mdl A2. See Table 2 for microcode storage requirements. **Specify: #9315** if String Switch Capability for 3340 required, **#9317** if 3344 is installed.

Note: Use of this feature introduces additional processor and channel demands, and can have a significant effect on system performance, particularly in batch environments with heavy I/O load and/or if multi-track operations are used. Performance considerations should be carefully reviewed before proposing use of the 3340/3344.

Direct Access Storage Compatibility (#7901%y): Designed to be used primarily as a conversion aid, this feature provides emulation of 2311/2314 data formats on 3310 or 3370 Direct Access Storage and emulation of 3330 (100MB/volume) or 3340 data formats on 3370 Direct Access Storage. This allows programs written for use of 2311/2314, 3330 or 3340/3344 DASD to be executed with only Job Control modifications using the 3310 or 3370 Direct Access Storage.

DAS Compatibility can be used on 3310 or 3370 devices which are installed on one DASD adapter on up to two consecutively addressed strings. The DAS Compatibility feature includes all of the compatibility types available for 3310 and 3370. Any one type can be activated at IPL time. Operates in S/370 mode under VM/SP, in ECPS:VSE mode under DOS/VSE. Under DOS/VSE data sets in fixed block format and in emulated format can co-reside on the same 3310/3370 volume. With DOS/VSE, a variable number of full or partial CKD volumes can be stored on the 3310 or 3370 up to the capacity of the host device. Each emulated volume regardless of whether stored with full or partial capacity, begins on a predefined full-volume boundary. With VM/SP partial emulated volumes are not supported.

Mapping of emulated volumes onto 3310/3370 volumes is as follows:

Compatibility Type	Max Number of Emulated Full Volumes		
	Per Host Volume	Per String	Per System
2311 on 3310	7	28	56
2314 on 3310	2	8	16
2311 on 3370	34	68	68
2314 on 3370	9	63	63
3330 on 3370	2	16	28
3340 on 3370	3	24	42

For device address assignment refer to *IBM 4321/4331 Compatibility Features,* GA33-1528.

Performance Note: Use of DAS Compatibility introduces additional processor and channel demands and can have a significant effect on system performance, particularly in environments with high I/O load using emulated DASD. Batch job execution elapsed times may increase by a factor of more than two. The results of measurements on a typical commercial jobstream show an increase in elapsed time by a factor of 1.7, compared to execution with the 3370 in fixed block mode. The performance impact is less severe when DASD is used in mixed fixed block and emulation mode, which is possible in operation with DOS/VSE. Also less critical are online workloads with generally lighter I/O loads. Exclusive use of DASD emulation for batch operation is not recommended in any SCP environment.

Limitations: [1] Operates on up to two strings of 3310 or 3370 attached to the DASD adapter. [2] Operation of emulation and directly-attached 3340/3344 is limited to two strings on the system. [3] One type of emulation can be activated at IPL time. [4] 3330 mdl 11 cannot be emulated. [5] Emulation cannot be used on 3370 drives which are shared via a string switch. [6] VM/SP supports 3310 or 3370 volumes containing emulated data which are dedicated to a guest operating system, other than VM/SP or CMS. Emulated 2311 is not supported by VM/SP. **Program Order:** The required utility programs 3310 for initialization and surface analysis of the 3370 DASD as well as the formatting of the emulator extent are included in the DOS/VSE SCP, 5745-030 or combined with VSE/Advanced Functions and VM/SP (5749-010) contain the Device Support Facilities for initialization and surface analysis of CKD DASD. In addition, for the required formatting of the emulator extent, order 5747-SA1. The stand-alone Device Support Facilities are also separately orderable with program order number 5747-DS1. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** 3370 (**#9201**) and/or 3310 (**#9202**) specification. See Tables 1 and 2 for microcode storage requirements.

Communications And Loops

Communications Adapter Base (Standard): Provides the basic control and common circuits for the direct attachment of up to eight synchronous (BSC), asynchronous (Start/Stop) or Synchronous Data Link Control (SDLC) communication lines in any combination, provided that the aggregate data rate capability of up to 64,000 bps is not exceeded. For data rates achievable, see GA33-1527. The maximum speed of each of the eight lines is 9600 bps except that line position one may be a synchronous high-speed line (BSC or SDLC) up to 56,000 bps and may operate concurrently with other lines provided the data rate limitation is not exceeded. SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, native or as a guest under VM/SP.

Base Characteristics are:

- Auto Answer
- Autopoll operation
- Multipoint central station functions
- Multipoint tributary station functions for BSC only
- EBCDIC transparent mode for BSC only
- EBCDIC and ASCII code for BSC only

The Communications Adapter attaches up to eight lines via the following optional features:

- Up to eight line features without business clock for attachment to X.21 Nonswitched Data Network.
- Up to 8 line features without internal clock for attachment to external modems (Data Circuit Terminating Equipment, DCE) with clock.
- Up to 8 line features with internal clock for attachment to external modems (Data Circuit Terminating Equipment, DCE) without clock.
- Up to 1 synchronous high-speed line feature.
- Up to 8 line features with integrated modems.
- Up to 8 line features with local attachments.
- Up to eight line features with Digital Data Service Adapters.
- Autocall Unit interfaces for up to two of the installed lines.

From the Operator's Console-Keyboard the user may specify some configuration parameters for each separate telecommunications line for each individual connection:

- Select stand-by.
- Half-speed operation for synchronous lines only (for both clocked and non-clocked modems which have this capability).
- NRZI mode in SDLC mode.
- Write interrupt (S/S only).
- Read interrupt (S/S only).
- Unit exception suppression (S/S only).
- Error index byte mode (BSC only).
- ASCII code instead of EBCDIC (BSC only).
- Tributary station addresses (BSC only).

Other configuration parameters can be selected at installation time and set by the CE:

- Duplex instead of half-duplex connection (2-way alternate data flow transmission).
- Switched network facility instead of nonswitched lines (for external modems).
- New sync (for BSC or SDLC in multipoint primary station function only).
- High-speed operation for one line (BSC or SDLC only).
- Connect Data Set to Line or Data Terminal Ready procedure.
- Selection of WE 202 or V.23 answer tone frequencies for 1200 bps integrated modems with automatic answering.

Limitations: [1] SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, or ACF/VTAME operating under VM/SP with DOS/VSE running as a guest. [2] Each line attached reduces the number of available subchannels on the Byte Multiplexer Channel. See "System Subchannels" above for details. [3] The aggregate data rate of lines in operation on the Communications Adapter is 64,000 bps. With the exception of a synchronous line installed in position one capable of higher speed, the line speed is limited to 9600 bps. For data rate and attachment limitations for other devices and communications lines refer to *IBM 4321/4331 Processor Channel Characteristics,* GA33-1527, which contains tables of pre-analyzed configurations. **Prerequisites:** #1001 is required when more than three telecommunications line features are attached. See Table 2 for microcode storage requirements. **Specify:** See Table 5 "Communications Adapter Configuration Features and Position Codes", for required specify codes for each line feature attached.

Customer Responsibilities: See M2700 pages for customer responsibilities regarding communications facilities and services.

Communication Facilities: See M2700 pages for communications facility requirements with this feature.

4321 Processor (cont'd)

Terminals Supported

The Data Communications Equipment and remotely attachable Data Terminal Equipment (abbreviated "terminals") supported by the Communications Adapter are shown in the table below:

SDLC Terminals Supported:

Type	Speed in K bps								
	+1.2/.6	+2.4	+2.4/1.2	+4.8	+4.8/2.4	+7.2	+7.2/3.6	+9.6	+19.2-56
Terminals:									
3271-11,-12 (3)	X	X	X	X	X	X	X	X

8100	X	X	X	X	X	X	X	X	X

Notes:

(1) 3705 supported as a primary station in a network using ACF/VTAM Release 1 or ACF/VTAM Release 2.
(2) Participant as a primary or a secondary station in a network using ACF/VTAM Release 1 or ACF/VTAM Release 2.
(3) Not supported by ACF/VTAME.
(5) Supported as a 3770.
(6) Supported as a 3770 or 3791.
(7) With SDLC/BSC Switch in SDLC mode.
(8) The maximum speed supported is 56K bps.
(9) Supported as a 3274 mdl 1C or 3770
(10) DSLU (5668-006) is required for 7426 or 8775-11, -12 with downstream loadable functions).

BSC Terminals Supported

8100 (4)	X	X	X	X	X	X	X	X	
Series/1 (8)	X	X	X	X	X	X	X	X	X

Notes:

(1) By RPQ.
(2) Equivalent to 2770/2772.
(3) Equivalent to 2770/3780.
(4) Supported as a 3276 mdl 1, 2, 3, 4, nonswitched connection only.
(5) With Communications Adapter.
(6) 19,200 - 56,000 bps in line position 1.
(7) See M3631 and/or 3632 pages for 3631/3632 features required and software requirements for host connection.
(8) Equivalent to 54XX (S/3).
(9) Equivalent to 3741 mdl 2, 4.
(10) Equivalent to 3275 mdl 1, 2.
(11) Equivalent to 3271 mdl 1, 2.
(12) Supported as a 2772.
(13) Supported as 3280
(14) Supported as a 3271 mdl 2.

Start/Stop Terminals Supported

Only terminals using IBM Terminal Control - Type 1 are supported.

Type	IBM I Line Control Speed in bps				
	75	134.5	300	600	1200
2740-1		X			
2740-2	X	X		X	
2741		X			
3232-51		X	X	X	
3767-1 (1)		X	X	X	X
3767-2 (1)		X	X	X	X
3767-3 (1)		X	X	X	X
5100 (2)		X	X		
5110		X	X		
CMCST (1)		X	X		

(1) Equivalent to 2740 and/or 2741: Speed 134.5 bps needs 3767 RPQ 853129.
(2) Equivalent to 2741.

4321 Processor (cont'd)

Autocall Unit Interface (#1020%x): Provides an interface to customer-supplied Automatic Calling Equipment allowing data links with remote stations to be automatically established on the switched telephone network. Automatic Calling Equipment complying with EIA RS 366 or CCITT V.25 procedures may be attached. For the appropriate Automatic Calling Equipment, refer to M2700 pages. **Limitations:** Does not operate with High-Speed Modem Adapter (#4720), any features with 1200 bps Integrated Modem or with any nonswitched lines. **Maximum:** Two. **Cable Order:** Required, for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** #3701 (in switched operation) for each Autocall Unit Interface installed. **Specify:** Line position, see Table 5 below.

EIA/CCITT Interface (#3701%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one external modem having EIA RS 232-C, CCITT V.24/V.28 or X.21bis interface for attachment to one switched or one nonswitched line.

When this feature is installed in conjunction with Line Attachment Base for Clocked Modem (#4695), a BSC or SDLC line is supported. Nonswitched lines with switched network backup may be used where maximum line speed on nonswitched lines is 9600 bps, the maximum line speed on switched network backup or switched networks is 4800 bps.

When this feature is installed in conjunction with Line Attachment Base for Nonclocked Modems (#4696), then a BSC, Start/Stop or SDLC line is supported. Transmission speeds supported are listed with feature #4696 below. **Maximum:** Eight. **Cable Order:** Required, for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** One #4695 or #4696 is required for each feature #3701 installed. **Specify:** Start/Stop, SDLC and/or BSC operations are possible. See Table 5 for Line Position Code and Transmission Mode Codes.

Loop Adapter: Provides the capability to attach directly or via a data link the 3640 Plant Data Communication Terminals and/or General Purpose Terminals 3104 mdls B1, B2 and 8775 mdls 1, 2 , 3232 Keyboard Printer mdl 11 and 3287 mdls 11, 12 and/or Control Units 3274 mdl 51C and 3276 mdls 11-14 with the associated terminals to the 4321 Processors. Loop Adapter 1 and 2 (#4830, #4831) provide for direct attachment. A maximum of two Data Link Adapters (#4840) provide for remote attachment capabilities for 3843 Loop Control Units. Each Data Link Adapter (#4840) can be used as point-to-point or multipoint connection to attach up to four 3843 Loop Control Units.

Devices that can be attached to direct attached loops at 9600 bps or data link attached loops at 2400, 4800 or 9600 bps are the following:

Device Attachments

- 3104 Display Terminal mdls B1, B2
- 3232 Keyboard Printer mdl 11
- 3641 Reporting Terminal mdls 1, 2
- 3642 Encoder Printer mdls 1, 2
- 3643 Keyboard Display mdls 2, 3, 4
  - including #4920 Badge and Document Encoder
- 3644 Automatic Data Unit
- 3645 Printer
- 3646 Scanner Control Unit
- 3647 Time and Attendance Terminal
- 8775 Display Terminal mdls 1, 2
- 3287 Printer mdls 11, 12
- 3274 Control Unit mdls 51C, 61C with the associated terminals
- 3276 Control Unit Display Station mdl 11-14 with the associated terminals

Control Units and Associated Terminals

- 3274 Control Unit mdl 51C, 61C
  - 3178 Display Station
  - 3278 Display Station
  - 3270 Personal Computer (control unit terminal mode only)
  - 3279 Color Display Station
  - 3262 Line Printer
  - 3268 Printer mdl 2, 2C
  - 3287 Printer
  - 3289 Line Printer
- 6580 Displaywriter System, mdl A4, A6, A8, A10 (25-line display)
- 6580 Displaywriter System, mdl B4, B6, B8, B10 (66-line display)
- 3276 Control Unit Display Station mdl 11-14
  - 3178 Display Station
  - 3278 Display Station
  - 3279 Color Display Station
  - 3262 Line Printer
  - 3268 Printer mdl 2, 2C
  - 3287 Printer
  - 3289 Line Printer
- 6580 Displaywriter System, mdl A4, A6, A8, A10 (25-line display)
- 6580 Displaywriter System, mdl B4, B6, B8, B10 (66-line display)

In addition the following devices can be attached at 38,400 bps:

- 3104 Display Terminal mdls B1, B2
- 8775 Display Terminal mdls 1, 2
- 3232 Keyboard Printer mdl 11
- 3287 Printer mdls 11, 12
- 3274 Control Unit mdl 51C with the associated terminals

For the attachment of 3640 terminals it is recommended to use a 3643 Keyboard Display or a 3641 Reporting Terminal on each Loop Control Unit for diagnostics and testing. These units do not need to be dedicated to this purpose.

Cable length for direct attached loops can be up to 2,000m (1.25 miles) when operating at 38,400 bps, or 3,200m (2 miles) when operating at up to 9600 bps.

For data link attached loops see 3843 Loop Control Unit. For details refer to GA23-0038, *IBM Multi-use Communications Loop Planning Guide.*

Loop Installation: For the required information to plan and install the Loop Adapter feature, the loop cables and accessories see the *IBM Multi-use Communications Loop Planning Guide*, GA23-0038, and *Installation Guide*, GA23-0039. The loop cables and accessories should be installed and checked out prior to attaching processors or devices.

The customer is responsible to enter the loop configuration and terminal addresses into the system using the loop adapter configuration tool invocable via a manual operation. Refer to *IBM 4321/4331 Processor Loop Adapter Feature, Operating Procedures*, GA33-1538, and *Problem Determination Procedures*, GA33-1540.

Note:
(1) Loop Accessories are required to properly install the customer-owned loop. The customer is responsible to provide (purchase, install, test and maintain, problem determination) the loop cable and accessories for terminal attachment. See M4331-1 "Accessories" section for details and ordering information.

(2) An unused lobe has to be terminated by a Loop Station Connector (wrap-type), P/N 1657320.

Communications Facilities: See M2700 pages for communications facility requirements.

Loop Adapter 1 (#4830): Provides for direct attachment of a Loop with one or two Lobes (A lobe is the actual physical Loop cable). Transmission speed can be 9.6K bps for 3640 and/or 3104 and/or 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals and/or 3274 (mdl 51C or 61C) and/or 3276 Control Units or 38.4K bps for 3104 and/or 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals and/or 3274 (mdl 51C or 61C) Control Unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. **Limitations:** Can not be installed with 5424 adapter (#3901). **Maximum:** One. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** Adapter power prerequisite (#1001).

Loop Adapter 2 (#4831): Provides for direct attachment of a Loop with one or two Lobes (A lobe is the actual physical Loop cable). Transmission speed can be 9.6K bps for 3640 and/or 3104 and or 3104 and/or 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals, and/or 3274 (mdl 51C or 61C) and/or 3276 Control Units, or 38.4K bps for 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals and/or 3274 (mdl 51C or 61C) control unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or

4321 Processor (cont'd)

maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. **Limitations:** Can not be installed with 5424 adapter (#3901). **Maximum:** One. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** #4830.

Data Link Adapter (#4840): Allows connection of one or more 3843 loop control units to the 4321 processor. The feature provides for the attachment of one external modem complying with EIA/ CCITT . EIA RS 232, RS 334 support will be provided for nonswitched lines only . Transmission speed can be 2400, 4800, or 9600 bps, with half-speed option dependent on the attached modem. The modem can be connected to either a point-to-point or multipoint telecommunications line for connection of up to four 3843 loop control units which directly control the data link attached loops. Support will be provided for the same terminals as on the direct attached loop. **Limitations:** Can not be installed with 5424 adapter (#3901). **Maximum:** Two. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** #4830.

Loop Adapter Logic Storage Requirements: The microcode storage required for attaching terminals to the Loop Adapter 1 and 2 (#4830, #4831) or Data Link Adapters (#4840) has to be calculated from the table shown below. If Total 1 exceeds 65,536, an invalid configuration has been selected. If the sum of Total 1 plus Total 2 exceeds 98,304 an invalid configuration has been selected.

	Microcode Program Space Bytes	System Control Space Bytes
Microcode Base	42836	7880
One or multiple 3641 and/or 3647	7800	1060
One or multiple 3642	5900	580
One or multiple 3643 w/o #4920	8800	3450
One or multiple 3643 w/#4920	9400	3450
One or multiple 3644	4900	-
One or multiple 3646	2900	256
One or multiple 3104 and/or 8775 and/or 3287, 3274, 3276, 3645	2600	-
		Terminal* Control Space
Each 3641, 3647	-	156
Each 3642	-	194
Each 3643	-	156
Each 3644	-	228
Each 3646	-	72
Each port on 3646	-	84
Each 3274, 3276, 3287, 3645, 3104, 8775	-	186
Each 3843	-	68
Each Loop Adapter (#4830, #4831)	-	1272
Each Data Link Adapter (#4840)	-	1204
	Total 1	Total 2

*For additional information on buffer space refer to the *IBM 4321/4331 Loop Adapter Characteristics*, GA33-1534.

The storage requirements need to be validated by DP because the number of devices of each type attached by the customer is not known to manufacturing. Manufacturing can only validate storage requirements with respect to device types but not with respect to the number of devices of each type.

System Diskette Space Requirements: When attaching the Loop Adapter feature with 364X terminals to the 4321 the diskette space requirements must be verified. See the following table for the space calculation. If the total number of records exceeds 3,876, an invalid configuration has been selected. A trade-off between features must be considered.

4321 Processor Feature/Facility	System Diskette Records
4321 Basic	2854
3310 Att. **(#9202)**	66
3370 Att. **(#9201)**	70
3340/3344 Direct Att. **(#7851)**	120
3340 Att. or DAS Compatibility **(#7851 or #7901)**	24
DAS Compatibility **(#7901)**	170
Start/Stop Transmission Mode **(#968X)**	20
BSC Transmission Mode **(#967X)**	24
SDLC Transmission Mode **(#969X)**	52
364X Terminal Att. **(#9251, #9252, #9253, #9254, #9256)**	665

The maximum number of system diskette records may not exceed 3876.

Maximum Number of Terminal Attachment Via Loop Adapters/Data Link Adapter: The maximum number of terminals that can be attached to the 4321 processor via Loop Adapters/Data Link Adapters is 80, of which 62 can be any mix of 3644, 3645, 3287, 3104, 8775 , 3232 mdl 11 terminals or 3274 (mdl 51C or 61C) or 3276 Control Units.

Multiple terminals on a 3274 or 3276 control unit count as a single terminal in determining the maximum number of terminals.

A maximum of 64 terminals out of the total of 80 terminals may be attached to either Loop Adapter 1 or 2, or to one of the Data Link Adapters. For details see *IBM Multi-use Communications Loop Planning Guide*, GA23-0038.

Line Attachment Base For Clocked Modems (#4695%x): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit Terminating Equipment) which provide clocking and comply with EIA RS 232-C CCITT V.35, X.21 or X.21bis recommendations and it is a prerequisite for attachment to X.21 nonswitched data network . See the various line features below to determine when it is required. **Limitations:** A maximum of eight Line Attachment Bases may be installed on 4321 Communications Adapter. Each feature #4695 installed reduces by one the number of feature #4696 allowable. **Maximum:** Eight, one per line installed. **Field Installation:** Yes. **Prerequisites:** #1001 is required if more than three line attachments #4695 and/or #4696 are installed.

Line Attachment Base For Nonclocked Modems (#4696%x): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit Terminating Equipment) which do not provide clocking. See the various features below to determine when it is required.

The clock speed internal to the feature is wired by default to 134.5 bps for Start/Stop operation and 1200 bps for BSC and SDLC operation. Otherwise, the clock speed can be wired at installation to one of the following:

- Start/Stop: 75, 300, 600 or 1200 bps.
- BSC: 600 bps.
- SDLC: 600 bps.

For BSC or SDLC operations, if 1200 bps is wired, then full-speed operation (1200 bps) or half-speed operation (600 bps) may be selected from the operator console keyboard. **Limitations:** A maximum of eight Line Attachment Bases may be installed on 4321 Communications Adapter. Each feature #4696 installed reduces by one the number of feature #4695s allowable. **Maximum:** Eight, one per line installed. **Field Installation:** Yes. **Prerequisites:** Feature #1001 is required if more than three line attachments #4695 and/or #4696 are installed.

High-Speed Modem Adapter (#4720%x): Provides for the attachment of an external modem with clock having a CCITT V.35 or X.21bis interface. One nonswitched point-to-point BSC or SDLC line may be operated with speeds from 19,200 to 56,000 bps. **Limitations:** For speed limitations refer to the Communication Adapter Base feature description. For channel rates achievable, see *IBM 4321/4331 Channel Characteristics*, GA33-1527. Cannot be installed with X.21 Adapter for Nonswitched Networks (#5655) if its speed is 48,000 bps **#9831**. Cannot be installed with Digital Data Service Adapter (#5650) if the Digital Data Service Adapter operates at 56,000 bps **(#9444)**. **Maximum:** One. **Cable Order:** Required for attachment to the external modem. **Field Installation:** Yes. **Prerequisites:** #4695. **Specify:** BSC and/or SDLC operations are possible ... see Table 5 for Line Position Code and Transmission Mode Codes.

1200 bps Integrated Modem, Nonswitched (#4781%X): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched BSC, Start/Stop or SDLC line via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps. Selection of 2- or 4-wire operation is made at installation time. **Cable Orders:** Required for attachment to external equipment. **Maximum:** Eight. **Field Installation:** Yes. **Prerequisites:** #4696. **Specify:** SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

1200 bps Integrated Modem, Switched With Auto Answer (#4782%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one switched network Start/Stop line via an integrated modem at speeds up to 300 bps and for BSC and SDLC at 600 and 1200 bps. Attachment to the switched network is via an IBM-provided cable to FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. **Maximum:** Eight. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** #4696. **Specify:** SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

1200 bps Integrated Modem, Nonswitched With Switched Network Backup And Manual Answer (#4787%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched line with Switched Network Backup (SNBU) and manual answer, allowing BSC, Start/Stop or SDLC operations via an integrated 1200 bps modem. The transmission speed can be strapped by the customer engineer for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps.

4321 Processor (cont'd)

Attachment to the nonswitched line is via an IBM-provided cable. Selection of 2- or 4-wire line operation is made at installation time. The cable group which is ordered also provides for attachment to a Data Access Arrangement type CDT or FCC registered equivalent for manual answer. **Maximum**: Eight. **Cable Order**: Required for one cable group which connects to nonswitched line and to the switched network. **Field Installation**: Yes. **Prerequisites**: #4696. **Specify**: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

1200 bps Integrated Modem, Nonswitched With Switched Network Backup And Auto Answer (#4788%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched line with Switched Network Backup (SNBU) and auto answer, allowing BSC, Start/Stop or SDLC operations via an integrated 1200 bps modem. The transmission speed can be strapped by the customer engineer for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps.

Attachment to the nonswitched line is via an IBM-provided cable. The same cable group provides for attachment to the switched network to a Data Access Arrangement type CBS or FCC registered equivalent for auto answer. **Maximum**: Eight. **Cable Order**: Required for one cable group which connects to the nonswitched line and to the switched network. **Field Installation**: Yes. **Prerequisites**: #4696. **Specify**: SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

Local Attachment Interface (#4801%x): Provides circuits and controls for the local attachment of one BSC or SDLC remote station to the Communications Adapter without the use of modems at either device. Transmission speed can be strapped at installation time by the Customer Engineer at 1200, 2400, 4800 and 9600 bps. The feature provides clocking for both the Communications Adapter and the terminal. The attached terminal must be equipped with an EIA RS 232-C or CCITT V.24/V.28 interface, have no Business Machine Clocking and have an external modem cable. The distance to the terminal may be extended via a customer-provided cable to allow a maximum distance between Communications Adapter and terminal of:

800 meters at 1200 bps
400 meters at 2400 bps
200 meters at 4800 bps
100 meters at 9600 bps

The feature includes cables to attach the Communications Adapter to a customer-supplied terminal plate and from the terminal plate to the DTE external modem cable. **Cable Order**: Required for attachment to terminal plate. Customer-supplied cable for in-door use. **Maximum**: Eight. **Field Installation**: Yes. **Prerequisites**: #4695. **Specify**: SDLC and/or BSC operations are possible, see Table 5.

Digital Data Service Adapter (#5650%x): Provides circuits and controls for attachment of one BSC or SDLC line and includes an internal Dataphone Digital Service Adapter. The adapter allows interface to AT&T and Private Line DDS Network via the AT&T Channel Service Unit. The Digital Data Service Adapter will operate at synchronous speeds of 2400, 4800, 9600 and 56,000 bps. The speed must be set to the speed specified in the customer's order for service to the common carrier at installation time. These line features can be associated with each line position if the line speed does not exceed 9600 bps. **Limitations**: If feature #5650 is installed with a speed of 56,000 bps (**#9444**), then: [1] High-Speed Modem Adapter (#4720) cannot be installed. [2] For speed limitations refer to the Communications Adapter Base feature description. **Maximum**: Eight. **Cable Order**: Required for attachment to external equipment. **Field Installation**: Yes. **Prerequisites**: #4695. **Specify**: **#9444**%z for operation at 56,000 bps ... See Table 5 for Line Position Code, Transmission Mode Code, and line speed selection codes.

X.21 Adapter For Nonswitched Networks (#5655): Provides controls and circuits for attachment of one X.21 Point-to-point or multipoint nonswitched communication line via a DCE complying with CCITT recommendation X.21. Transmission may be at speeds of 2400, 4800, 9600 or 48,000 bps for point-to-point operations and 2400, 4800 and 9600 for multipoint operations. **Limitations**: If feature #5655 operates at 48,000 bps (specify **#9831**), then the following limitations apply: [1] High-Speed Modem Adapter (#4720) cannot be installed ... [2] For speed limitations, refer to the Communications Adapter Base feature description. **Maximum**: Up to eight may be installed, subject to the overall data rate limitations of the Communications Adapter. **Field Installation**: Yes. **Prerequisites**: One #4695 is required for each #5655 installed. **Specify**: SDLC operation must be specified for this feature ... see Table 5 for line position, transmission mode and transmission speed codes. **Note**: **#9831**%x is required for 48,000 bps operation. **Cable Order**: Required for attachment to external equipment.

Table 5
Communications Adapter Configuration Feature And Position Codes

	Feature Number %x	Req'd Line Att Base %x	Line Pos. with Line Pos. Codes 1 %z	2 %z	3 %z	4 %z	5 %z	6 %z	7 %z	8 %z
EIA/CCITT Interface (for Clocked Modems)	3701	4695	9531	9532	9533	9534	9535	9536	9537	9538
EIA/CCITT Interface (for Non-Clocked Modems)	3701	4696	9521	9522	9523	9524	9525	9526	9527	9528
High-Speed Modem Adapter	4720	4695	9501

56,000 bps (6)			9444							
X.21 Adapter for Nonswitched Networks for 2400-9600 bps	5655	4695	9711	9712	9713	9714	9715	9716	9717	9718
for 48,000 bps			9831							
Local Attachment Interface	4801	4695	9451	9452	9453	9454	9455	9456	9457	9458
Autocall Unit Interface (3)	1020									
First			9541	9542	9543	9544	9545	9546	9547	9548
Second			9551	9552	9553	9554	9555	9556	9557	9558
Transmission Mode (5)										
BSC (1)			9671	9672	9673	9674	9675	9676	9677	9678
Start/Stop (2)			9681	9682	9683	9684	9685	9686	9687	9688
SDLC (1)			9691	9692	9693	9694	9695	9696	9697	9698

Notes:

(1) BSC or SDLC transmission mode with any line attachment feature.

(2) Start/Stop transmission mode only with EIA/CCITT Interface (for non-clocked modem, #3701 and prerequisite #4696) or with any other features offering 1200 bps Integrated Modems (with prerequisite #4696).

(3) Must be associated with EIA/CCITT Interface (#3701 and prerequisite #4695 or #4696). Maximum of two #1020s may be installed.

(5) The aggregate data rate of the Communications Adapter is 64,000 bps ... Line Features exceeding this aggregate may be installed, but not operated concurrently. To allow the aggregate of 64,000 bps to be achieved, the highest speed line must be installed in line position one, the next highest in line position two, etc. Each transmission mode installed has different requirements for microcode storage ... see Table 2 for microcode storage requirements.

(6) When changing **#9444** to/from **#9471**, no new hardware or diskette is required.

%z System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

%x Feature supplies diskette for System Diskette facility.

%y System Diskette-only special feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

4321 Processor (cont'd)

MODEL CONVERSIONS

Customer price quotations and customer order acknowledgement letters for purchase machine conversion must state: "Installation of this machine model conversion involves the removal of parts which become the property of IBM".

Field upgrade from 4321 to 4331 Mdl Group 2 is possible. After the upgrade the machine type of the 4321 is changed to 4331 Mdl Group 2 by the CE. Downgrades to 4321 from 4331 is not recommended for field installation.

For administrative instructions concerning the field upgrade from 4321 to 4331 Mdl Group 2 contact IBM.

Machine Upgrade Purchase Prices: There are no additional charges.

The 4321 type conversion to a 4331 Mdl Group 2 has a one year service and parts warranty on those components provided by IBM with the type conversion.

ACCESSORIES

See M4331-1 "Accessories" for additional information and field installation of Console Table (#1550), Book Rack and Cable Holder (#1480) and Loop Accessories and Loop Cables.

SUPPLIES (None)

4331 PROCESSOR

The 4331 Mdl Group 1 is no longer available, replaced by 4331 Mdl Group 11.

PURPOSE

Provides the power, control, logic and storage circuitry necessary for the arithmetic, logic and processor storage functions of the 4331 Processor models.

MODELS

Group–Model		Processor Storage (bytes)	Buffer Storage (bytes)
4331-MG 1			
Model I1	I01	524,288	None
Model J1	J01	1,048,576	None
4331-MG 2			
Model J2	J02	1,048,576	8,192
Model K2	K02	2,097,152	8,192
Model KJ2	KJ2	3,145,728	8,192
Model L2	L02	4,194,304	8,192
4331-MG 11			
Model J11	J11	1,048,576	4,096
Model K11	K11	2,097,152	4,096
Model L11	L11	4,194,304	4,096

For clarity of description, separate machine pages are provided for Mdl Group 11. Tables of supported communications equipment included in this page set are common for all 4331 mdls.

Maximum Configuration: The maximum number of DASD/8809 Adapters and Byte and/or Block Multiplexer Channels which are available are shown below:

4331 Mdl Group 1	Maximum
DASD Adapter	1
8809 Adapter	1
Byte Multiplexer Channel	1
Block Multiplexer Channel	1

4331 Mdl Group 2	Options (select one column)		
DASD Adapter	1	1	1
DASD Adapter, Add'l	1	1	–
8809 Adapter	1	–	–
Byte Multiplexer Channel	1	1	1
Block Multiplexer Channel	1	1	1
Block Multiplexer Channel, Add'l	–	1	1
High-Speed Block Multiplexer Channel	–	–	1

The channel load of the attached I/O devices has to be checked against the load limitations of the processor. Refer to *IBM 4331 Processor Channel Characteristics,* GA33-1527 (Mdl Group 1) or GA33-1535 (Mdl Group 2) which contains comprehensive tables of pre-analyzed configurations.

Prerequisites: Each system requires an operator's display, keyboard and control panel to allow Initial Microcode Load (IML) and interaction with the hardware/software system. A 3278 Display Console mdl 2A or a 3279 Color Display Console mdl 2C with keyboard is required for this purpose.

HIGHLIGHTS

Depending on the mdl, the processor can contain up to 4,194,304 bytes of monolithic processor storage. Storage is high density single bit cell design. Data flow is four bytes parallel. Processor storage cycles are mdl dependent. The 4331 Mdl Group 1 storage fetch cycle is 900 nanoseconds for four bytes and the store cycle is 1,300 nanoseconds for four bytes. The 4331 Mdl Group 2 fetch and store cycles for the buffer are each 200 nanoseconds for four bytes. Buffer storage is automatically replenished from processor storage in 64 byte units at a time. The 64 byte fetch cycle requires 2.6 microseconds, the store cycle requires 3.1 microseconds. The processor is microcode controlled.

Note: The microcode which controls system operations resides in both Processor Storage and Reloadable Control Storage, reducing the Processor Storage available for user programming. For 4331 Mdl Group 1 without the optional Control Storage Expansion feature installed, Processor Storage available for the user is reduced from that installed by at least 53,248 bytes. For 4331 Mdl Group 1 with the optional Control Storage Expansion feature installed or 4331 Mdl Group 2, Processor Storage is reduced from that installed by at least 16,348 bytes (4331 Mdl Group 2 includes 131,072 bytes of Control Storage). Table 1 below lists the storage requirements for system microcode.

Standard Functions:

- For 4331 Mdl Group 1 -- 524,288 bytes or 1,048,576 bytes of processor storage. For 4331 Mdl Group 2 -- 1,048,576 bytes to 4,194,304 bytes of processor storage. 4331 Processor configurations require a portion of processor storage to be allocated for system microcode use. See Table 1 for details.
- ECPS:VSE mode or S/370 mode. In S/370 mode, both Extended Control (EC) and Basic Control (BC) are available. The 4331 Processor operates in either S/370 mode or in Extended Control Program Support:VSE mode. The system mode is selectable at Initial Program Load (IPL) time and determines the base operating characteristics of the machine: S/370 mode allows operation of certain releases of OS/VS1, VM/370, DOS/VSE, DOS/VS and DOS. (See Programming Note below for details.) ECPS:VSE mode supports operation of DOS/VSE and SSX/VSE, offering enhanced systems performance.
- Display/Printer Adapter allows attachment of:
  - 3178 Display Station
  - 3262 Line Printer mdl 1 (650 lpm system printer)
  - 3262 Line Printer mdl 11 (325 lpm system printer)
  - 3268 Printer mdl 2 and 2C (340 cps)*
  - 3230 Terminal Printer mdl 2 (350/450 cps burst speed)*
  - 3289 Line Printer mdl 4 (400 lpm system printer)
  - 3278 Display Station mdl 2, and keyboards
  - 3279 Color Display Station mdl 2A, S2A or 02X and keyboards
  - 3278 Display Console mdl 2A, keyboard and control panel
  - 3279 Color Display Console mdl 2C, keyboard and control panel.
  - 3287 Printer mdls 1, 2, 1C and 2C.
  - 4250 Printer
  - 6580 Displaywriter System, mdl A04, A06, A08, A10 (25-line display)

  *Specify **#9841** in 4331 must be ordered for attachment of 3268 or 3230 mdl 2 to the 4331 Mdl Group 1. Provides microcode and/or maintenance documentation if machine is below EC 366585 (microcode for 4331 Mdl Group 1) or below EC 366586 (microcode for 4331 Mdl Group 2, 11) and/or below EC 366584 (maintenance document) for all mdls.
- The 6580 Displaywriter System prerequisites for attachment include the 3270 Attached Workstation licensed program (5608-SR9) and the 3274/3276 Attached Workstation adapter (**#8332**) and Specify **#9842** in 4331 must be ordered for attachment of Displaywriter.
- The System Diskette Facility is the microcode loading system for the 4331 Processor. The diskette facility reads and writes from removable magnetic diskettes that provide all of the microcode for the 4331 Processor. The diskettes shipped with the 4331 Processor will supply the required microcode for diagnostics, standard functions, and the special features ordered. The System Diskette Facility also allows storage of failure data from 4331 Processor errors which can subsequently be analyzed by the CE for maintenance purposes.
- Reloadable Control Storage is provided in addition to processor storage. This provides storage space for a portion of system microcode in support of standard functions and special features of the 4331 Processor. The Reloadable Control Storage is not available to the user. Tables 1 and 2 list the Reloadable Control Storage requirements for system microcode.
  - 4331 Mdl Group 1 includes 65,536 bytes of Reloadable Control Storage. An additional 65,536 bytes is available as an optional feature.
  - 4331 Mdl Group 2 includes 131,072 bytes of Reloadable Control Storage.

  In addition to Reloadable Control Storage, 4331 Mdl Group 2 contains 12,288 bytes of Read-Only Control Storage.
- Remote Support Facility (RSF) is an IBM CE tool permitting IBM Field Technical Support Center

  specialists to remotely monitor and/or perform problem diagnosis on the 4331 Processor. This includes remotely-initiated execution of diagnostic programs, remote examination of all or selected logout records from the System Diskette Facility, and (with proper customer authorization), remote exercise of the Customer Manual Operations.
- Remote Operator Console Facility (ROCF) provides the ability to IML, IPL and execute other 4331 manual control functions for a remote 4331 via a 3275 (real or emulated) terminal at a host location.
- One level addressing facility for improved virtual storage control by DOS/VSE and SSX/VSE (ECPS:VSE mode)
- Channels with virtual storage addressing (ECPS:VSE mode)
- Channel Indirect Data Addressing (in S/370 mode)
- Data Streaming Mode can operate on the High-Speed Block Multiplexer channel (not available on mdl Group 1). The 3380 is not supported on the 4331.
- S/370 Universal Instruction Set

4331 Processor (cont'd)

- Extended Precision Floating Point
- Conditional Swapping
- CE maintenance support functions
- Storage Protection (Store and Fetch)
- Byte Oriented Operands
- Clock Comparator and CPU timer
- Time-of-Day Clock
- Interval Timer
- PSW Key Handling
- Control Registers
- Machine Check Handling
- Program Event Recording
- Monitoring
- Clear I/O
- Move inverse instruction (not used by IBM programs)
- 8,192 bytes of high-speed buffer storage (4331 Mdl Group 2 only)

Programming Note: The ECPS: VSE mode may be invoked at IPL time and supports operation of an appropriately generated DOS/VSE Control Program with VSE/Advanced Functions Release 1 and 2, or the Small Systems Executive/VSE.

In S/370 mode, operation of DOS/VSE with VSE/Advanced Functions Release 1 and 2 (generated for use in S/370 mode), VM/370 Release 6 with or without VM/System Product or VM/BSE Release 2 or VM/SE Release 2, and OS/VS1 Release 7 with or without VS1/BPE are supported. Although not supported, DOS Release 26 and DOS/VS Release 34 will operate on the 4331 Processor when in S/370 mode.

Console Function: An operator's display, keyboard and control panel is a prerequisite for use of the system by the customer ... a 3278 Display Console mdl 2A or a 3279 Color Display Console mdl 2C is required for this purpose ... the display and keyboard function as an operator's I/O console to communicate with the operating system ... the Operator Control Panel allows additional operator communication with the system. Depending on the mode of console operation, a maximum of 20 of the 25 lines on the display may be used for system communication, four are reserved for messages from the 4331 Processor hardware system, and one displays messages unique to the 3278 Display Console mdl 2A or a 3279 Color Display Console mdl 2C. The console address is selected at system installation time from the range 009 through 01F.

The console functions in one of two modes: "Display Mode" or the "Printer-Keyboard Mode". In the "Printer-Keyboard Mode", the Display Console uses the keyboard for input and the display and a 3287 Printer mdl 1 or 2, 3230 Printer mdl 2 and 3268 Printer mdl 2 for output. The CRT, keyboard and printer appear to the system as a 1052 Printer/Keyboard and operate compatibly with S/360 console operations or as a 3210/3215 Console Printer-Keyboard and operate compatibly with S/370 Console operations. The operation of the 3287/3230/3268 printer in this mode is optional, but recommended.

In "Display Mode" the keyboard is used for input and the CRT with 20 lines by 80 characters/line is used for output. The 3287 mdls 1, 2, 1C or 2C, 3230 mdl 2 and 3268 mdl 2 or 2C if attached, has its own address and must be supported by either the 3277 Console Support of DOS/VS Release 34, the 3277 Console Support of DOS/VSE and SSX/VSE, the Multiple Console Support of OS/VS1, the local-attached 3286/3287/3230/3268 Printer support of VM/370, or the equivalent of any of these.

Another function of the console is the Remote Operator Console Facility (ROCF) which provides the ability to IML, IPL and execute other 4331 manual control functions for a remote 4331 via a real or emulated 3275 terminal at a host location. ROCF is an extension of Remote Support Facility (RSF).

Byte Multiplexer Channel (Optional): Functionally equivalent to the byte multiplexer channel on S/360 and S/370 and provides eight control unit positions. When certain control units/devices are to be connected, the optional Power Interface (**#5531**, **#5532**) for power control must be installed on the processor. See special features and Table 3 below for details. The channel permits simultaneous operations of low speed devices. Operates at up to 18K bytes per second (Mdl Group 1) or at up to 36K bytes per second Mdl (Group 2) in single byte mode. Up to 500K bytes per second in burst mode. See *IBM 4331 Channel Characteristics* GA33-1527 for 4331 Mdl Group 1 or GA33-1535 for 4331 Mdl Group 2 for devices which may attach and the data rates achievable for certain configurations. The Byte Multiplexer Channel is always addressed as channel 0.

Subchannels: The 4331 Mdl Group 1 Byte Multiplexer Channel (**#5248**) provides up to 31 subchannels, 4 of which are shared subchannels with up to 16 devices each. The maximum number of subchannels is reduced from 31 with the addition of certain special features:

Feature	Subchannels Unavailable
DASD Adapter (**#3201**)	2
8809 Magnetic Tape Unit Adapter (**#4910**)	2
Block Multiplexer Channel (**#1421**)	1
Communications Adapter (**#1601**)	1
Each telecommunication line on the Communications Adapter (**#1601**)	1

The 4331 Mdl Group 2 byte Multiplexer Channel (#5248) provides up to 36 subchannels, 4 of which are shared subchannels with up to 16 devices each. The maximum number of 36 subchannels is reduced by one if the Communications Adapter (#1601) is installed, and one for each telecommunication line on the Communications Adapter.

Block Multiplexer Channel (Optional): Each provides eight control unit positions. When certain control units/devices are to be connected, the optional Power Interface (**#5531**, **#5532**) for power control must be installed on the processor. See Special Features and Table 3 below for details. The Block Multiplexer Channel permits simultaneous operation of high-speed devices. Ability to "Block Multiplex" and facility for multiple requesting allows several I/O units to operate concurrently with greater channel efficiency. Devices attached to these channels which cannot utilize block multiplexing will function as if attached to selector channels. 33XX devices (and the 3830 or 3880 storage control units) do not attach.

- 4331 Mdl Group 1: One channel is optional. Data rate is up to .5 million bytes per second ... see *IBM 4331 Mdl Group 1 Channel Characteristics*, GA33-1527, for details. Standard channel address is 1, a different address may be selected at installation time from the range of 1 to 6.
- 4331 Mdl Group 2: Two channels are optional. Data rate is up to 1.25 million bytes per second ... see *IBM 4331 Mdl Group 2 Channel Characteristics*, GA33-1535, for details. If installed together with High-Speed Block Multiplexer Channel, the data rate of the Block Multiplexer Channel, Add'l (**#1422**) is up to .6 million bytes per second. Channel addresses may be selected at installation time from the range of 1 to 6.

Subchannels: The following subchannel combinations can be configured at installation time:

– up to 128 non shared subchannels
and
– up to 16 shared subchannels, each with devices in multiples of 8, up to a total of 128 devices

High-Speed Block Multiplexer Channel (Optional): One channel is optional on 4331 Mdl Group 2 only. High data rate (up to 1.86MB/sec) allows attachment of high-speed I/O devices including 2311/2314/2319, 3330/3333/3340/3344, 3350, 3370 via control units. Ability to "Block Multiplex" and facility for Multiple Requesting allows several I/O units to operate concurrently with greater channel efficiency. Can operate in Data Streaming Mode, which allows increased interface cable length and allows attachment of a control unit, e.g., a 3880, operating in Data Streaming Mode. The 3380 is not supported on the 4331. Devices attached which cannot utilize block multiplexing will function as if attached to a Selector Channel. Eight control unit positions are available. When certain control units/devices are to be connected, the optional Power Interface (**#5531**, **#5532**) for power control must be installed on the processor. See "Special Features" and Table 3 for details. The channel address is selected at installation time from the range of 1 to 6.

Subchannels: Same as the Block Multiplexer Channel.

Native I/O Adapters: The following I/O adapters control the designated I/O devices:

DASD Adapter
5424 Adapter
Loop Adapter
8809 Magnetic Tape Unit Adapter
Display/Printer Adapter
Communications Adapter

Note: All data passing through the system for any I/O device interfaces with the data flow for other devices, producing I/O limitations. The limitations take two forms:

(1) Hardware exclusivities listed in the sales manual.

(2) I/O attachments which individually or in combination can produce frequent overruns. Considerations in this category are:
- The aggregate data rate on the Block Multiplexer Channel and the DASD Adapter.
- The number and speed of lines attached to the Communications Adapter.
- The number and class of overrunnable devices on the Byte Multiplexer Channel.
- The number and traffic on 3178, 3278 mdl 2 or 3279 mdl 2A, S2A or 02X attached to the Display/Printer Adapter.

4331 Processor (cont'd)

It is necessary to consult the *IBM 4331 Channel Characteristics Manual,* GA33-1527, for 4331 Mdl Group 1 or GA33-1535, for 4331 Mdl Group 2 to properly configure a 4331 with an I/O configuration that has not previously been analyzed.

DASD Adapter (Optional): One DASD Adapter is optional on the 4331 Mdl Group 1, one or two are available on the 4331 Mdl Group 2. Attaches 3310, 3370 A1 and/or 3340/3344 Direct Access Storage Devices without the necessity of a control unit. The 3310 and the 3370 normally operate in fixed block mode where optimum DASD and system performance is achieved.

As a transition aid and to allow the use of operating systems and programs which require Count-Key-Data (CKD) direct access storage, the 3340/3344 Direct Attachment and Direct Access Storage (DAS) Compatibility for emulation of 231X on 3310 or 3370 and 3330/3340 on 3370 are available. Operation with DAS Compatibility or the 3340/3344 Direct Attachment features in general will not achieve the same performance as the equivalent devices when attached to S/370 or 4300 processor channels. See performance notes included with the feature descriptions.

The String Switch Capability allows sharing of 3340/3344 or 3370 DASD with another IBM processor or control unit that supports the DASD and string switching. String switch support for the 3340/3344 is limited to the static assignment of a shared string to one processor at a time.

3340/3344 devices attaching to the DASD Adapter have logical unit/device addresses as follows:

X00	**01**	**02**	**03**	**04**	**05**	**06**	**07**
		2A	2B	2C	2D	2E	2F
		4A	4B	4C	4D	4E	4F
		6A	6B	6C	6D	6E	6F

and

X10	**11**	**12**	**13**	**14**	**15**	**16**	**17**
		3A	3B	3C	3D	3E	3F
		5A	5B	5C	5D	5E	5F
		7A	7B	7C	7D	7E	7F

With a directly attached 3340 the DASD Adapter can read data from a 3348 Data Module which was recorded on a 3340 attached to a S/3 mdl 12 or 15 ... this is a read-only mode and is available as a conversion aid for users converting to the 4331 Processors from a System/3.

The Direct Access Storage Compatibility feature provides emulation of 231X, 3330 (100MB/volume) or 3340 data formats on the 3370 mdl A1 and B1 Direct Access Storage and the emulation of 231X data formats on the 3310 Direct Access Storage. For address assignment of emulated volumes refer to *IBM 4331 Processor Compatability Features,* GA33-1528.

Addresses for up to four strings of 3310 and 3370 can be configured at installation time in the range from X0X to X7X. The channel address may be from 1 to 6.

Display/Printer Adapter (Standard): This adapter allows for attachment of the prerequisite 3278 Display Console mdl 2A or a 3279 Color Display Console mdl 2C and up to seven (or fifteen with optional feature, see below) additional devices chosen from the list below:

3178 Display Station
3262 Line Printer mdl 1 and 11 (650 and 325 lpm)
3268 Printer mdl 2 and 2C (340 cps)*
3230 Terminal Printer mdl 2 (350/450 cps burst speed)*
3278 Display Station mdl 2
3279 Color Display Station
mdl 2A, S2A or 02X
3287 Printer mdls 1, 2, 1C and 2C (80 and 120 cps)
3289 Printer mdl 4 (400 lpm)
4250 Printer
6580 Displaywriter System, mdl A04, A06,
A08, A10, (25-line display)

*Specify **#9841** in 4331 must be ordered for attachment of 3268 or 3230 mdl 2 to the 4331 Mdl Group 1. Provides microcode and/or the maintenance documentation if machine is below EC 366585 (microcode for 4331 Mdl Group 1) or below EC 366586 (microcode for 4331 Mdl Group 2, 11) and/or below EC 366584 (maintenance document) for all mdls.

These machines may be installed in any combination, provided that [1] only seven (or fifteen with optional feature) devices are installed and [2] no more than two system printers (3262 and/or 3289) are included. Due to the processing power of the 4250, it is not practical to attach more than two on mdl 1 or more than four on mdl 2, see Specify. The 6580 Displaywriter System can connect to 1 or 2 device ports (display station, or display station and printer).

The 3262 or the 3289 Line Printer may be used as system printers dependent upon control program or program product support. One 3287/3230/3268 Printer may be used as a console hardcopy device; one or more 3178, 3287/3230/3268 Printers may be used as hardcopy workstation devices The 3178, 3278 Display Station mdl 2 or 3279 Color Display Station mdl 2A , S2A or 02X may be used as additional operator's consoles with the presence of OS/VS1 Multiple Console Support or equivalent, or as workstations for user-written applications. The 6580 Displaywriter System emulates a 3278-2 Display Station, and, optionally, a 3287-1/2 Printer. The 6580 may be used as a workstation for user-written applications and for hard copy, as a 3278-2 and 3287-1/2. Display/Printer Adapter support includes all standard functions of the 3274 mdl X1B or 3178 with the 3278 mdl 2 or 3279 mdl 2A, S2A or 02X attached. In addition, the following 3278 mdl 2 or 3279 mdl 2A, S2A or 02X special features are supported: (standard on the 3178) Keyboard Numeric Lock, (standard on the 3178) Audible Alarm, (standard on the 3178 or 3279), Security Keylock and Switched Control Unit. Other 3278 mdl 2 or 3279 mdl 2A, S2A or 02X special features are not supported. When used as workstations, 3278 or 3279 Display Station keyboard feature codes **#4621**, **#4622**, **#4623**, **#4627** ,**#4624**, **#4628** may be selected. If two different keyboards are required for a workstation, one must be **#4621**. Addresses for these devices are selected at installation time from the range 009 through 01F.

The 6580 Displaywriter System prerequisites for attachment include the 3270 Attached Workstation licensed program (5608-SR9) and the 3274/3276 Attached Workstation adapter (**#8332**) and specify **#9842** in 4331 must be ordered for attachment of Displaywriter.

Display/Printer Adapter Expansion (Optional): Expands the capability of the standard Display/Printer Adapter to permit the 3278 Display Console mdl 2A or a 3279 Color Display Console mdl 2C and up to 15 displays and/or printers to directly attach to the 4331 Processor. All other capabilities and limitations are listed under Display/Printer Adapter (Standard) above.

Diskette Drive (Optional): A single drive diskette reader/recorder providing the ability to read or write Diskettes Type I on the 4331 Processor. This diskette has a data capacity of 242,944 bytes organized in 1,898 sectors of 128 bytes each (for use in exchanging data with the several products listed below) or a data capacity of 246,272 bytes organized in 1,924 sectors of 128 bytes each (for use in exchanging data with another 4331 Processor). Each Diskette Drive is supported by the control program as a 3540 Diskette Input/Output Unit. When used with DOS/VSE or DOS/VS POWER refer to VSE/POWER documentation. Data recorded on a Diskette Type I can be interchanged with IBM devices and systems which have a diskette drive. Examples are the 3740, 3770, 3790, 5230 and 8100 and Series/1 and Systems/3, 32, 34, and 38. One diskette is shipped with the feature. Device address is selected at installation time from the range 009 through 01F.

5424 Adapter (Optional): Provides native attachment of 5424 Multi-Function Card Unit mdls A1 or A2 for 96-column card operations ... Device address is 04C.

Loop Adapter (Optional): The Loop Adapter on the 4331 Mdl Groups 1 and 2 is a native attachment method for the 3640 Plant Data Communications Terminals ... 3104 Display Terminal mdls B1, B2 ... 8775 Display Terminal mdls 1 and 2 ... 3232 Keyboard Printer ... 3287 Printer ... 3274 Control Unit mdl 51C, 61C ... 3276 Control Unit Display Station with their associated terminals ... 7426 Terminal Interface Unit mdl 1 with its associated terminals. Communications is based on SDLC loop protocols. The Loop Adapter provides the user with a native interface to these terminals and increased configuration flexibility.

A maximum of two direct attached loops and two data link adapters are supported. Each of the direct attached loops consists of two lobes (loop cables), for a total of four lobes on the system. Both lobes must operate at the same bit rate. Each lobe is functionally a loop however, all data on one lobe passes serially through the second lobe and can be as long as the loop, and a fault in one lobe will not affect the terminals on the second lobe, when the disrupted lobe is bypassed at the system. Therefore lobes can cover a greater distance and improve availability.

Each of the data link adapters can attach one 3843 Loop Control Unit as point-to-point or up to 4 Loop Control Units as multipoint configuration. Details on programming information are provided in the *IBM 4331 Loop Adapter Programming Guide,* SC31-0500-0.

User-written programs for loop-attached terminals reside in the 4331 Processor storage and are controlled by VSE and ACF/VTAME or ACF/VTAM and CICS/DOS/VS. The 3644 Automatic Data Unit and 8775 Display Terminal with Downstream Loadable Functions are supported by ACF/VTAME and DSLU with VSE. In order to personalize the 3644, the GEN3644 program product is required in addition to DSLU.

In addition IBM offers a PRPQ to CICS/VS . This PRPQ Loop Adapter CICS/VS Extension for 3640 terminals is a series of programs and exit routines that enhance the support of the 3641, 3642, 3644, 3646 and 3647 when attached to the 4331 Processor by Loop Adapter Feature. The following four functions are addressed by this PRPQ:

- Terminal initialization
- Terminal re-initialization

4331 Processor (cont'd)

- 3642 encode check handling
- Transaction selection

Communications network management problem determination support for 4331 loop-attached 3104 Display Terminals, 8775 Display Terminals, 3232 Keyboard Printer mdl 11, 3276 Display Control Stations and 3274 mdl 51C, 61C Display Controllers and their/associated terminals, is provided via NCCF/NPDA.

The following terminals/controllers are supported: 3641 Reporting Terminal mdls 1, 2 ... 3642 Encoder Printer mdls 1, 2 ... 3643 Keyboard Display mdl 2, 3, 4 including 4920 Badge and Document Encoder ... 3644 Automatic Data Unit ... 3645 Printer ... 3646 Scanner Control Unit ... 3647 Time and Attendance Terminal ... 3104 Display Terminal mdls B1, B2 ... 8775 Display Terminal mdls 1,2 ... 3232 Keyboard Printer mdl 11 ... 3287 Printer mdls 11, 12 ... 3274 Control Unit mdl 51C, 61C ... 3276 Control Unit Display Station mdls 11-14 with their associated terminals ... 3843 Loop Control Unit ... 7426 Terminal Interface Unit mdl 1 with its associated terminals. Device addresses are 040 through 07E.

8809 Magnetic Tape Unit Adapter (Optional): Provides native attachment of 8809 mdl 1A and up to five additional 8809 tape units (consisting of a mix of 8809 mdl 2s and 3s) ... allows the 8809 Magnetic Tape Unit to operate in streaming mode (data rate is up to 160K bytes per second) for loading or offloading DASD devices or in start/stop mode (data rate is up to 20K bytes per second) for other data processing operations. Although physical Read Backward commands are not supported, the Read Backward operation is simulated in the Logical IOCS (MTMOD) of DOS/VSE. Standard channel address is 3. Channel and device addresses may be assigned at system installation time from the range of X00 to X7F, where X is 1 to 6.

Communications Adapter (Optional): The 4331 Communications Adapter can serve up to eight communication lines. Synchronous Data Link Control (SDLC), Binary Synchronous Communications (BSC) and Start/Stop (asynchronous) transmission modes are provided (Start/Stop and BSC operate in 2703 compatibility mode). The Communications Adapter can handle a variety of terminals (Data Terminal Equipments, DTEs), at different speeds.

The Communications Adapter has the following overall structure: The Communications Adapter Base contains common circuits and control. Each of the up to eight telecommunication lines attachable requires one Line Attachment Base (two different types) and one line attachment feature. Another feature serves for autocall unit interface and two may be installed.

The interface with the external communication facilities is through a modem (also called signal converter or Data Circuit-terminating Equipment). It may be a stand-alone unit or a 1200 bps integrated modem. For further details, refer to "Special Features".

IBM Stand-Alone Modems

Switched

3863	2400 bps
3864	4800 bps
3872	1200/2400 bps
3874	2400/4800 bps

Nonswitched

The following modems are supported with the Switched Network Backup feature ... see M3863, 3864, 3865, 3872, 3874, 3875 pages for details:

3863	2400 bps
3864	4800 bps
3865	9600 bps
3872	1200/2400 bps
3874	2400/4800 bps
3875	3600/7200 bps

IBM Integrated Modem (V.23, 1200 bps): The following integrated modem configurations are available:

- Switched network with auto answer
- Nonswitched line, 2- or 4-wire.
- Nonswitched line with switched network backup and auto answer.
- Nonswitched line with switched network backup with manual answer.

OEM Modems: OEM modems that comply with EIA RS-232-C, CCITT V.24/V.28, or CCITT V.35 recommendations may be connected to the Communications Adapter. Attachment is under the provisions of the Multiple Supplier Systems Policy.

Digital Data Service Adapter: The Digital Data Service Adapter allows attachment to the AT & T Private Line Dataphone* Digital Service Network by way of an internal Digital Data Service (DDS*) adapter.

* Dataphone and DDS are registered trademarks of the American Telephone and Telegraph Company. Other usage of Dataphone and DDS in this text also refers to the registered trademarks of American Telephone and Telegraph.

X.21 Adapter for Nonswitched Networks: The X.21 interface allows attachment to the X.21 facilities by way of an internal X.21 adapter.

Automatic Calling Equipment: The following Automatic Calling Equipment, maximum two, can be attached to the Communications Adapter:

- 3872 with Automatic Call Originate feature
- 3874 with Automatic Call Originate feature
- Other Automatic Calling Equipment which complies with EIA RS-366 or CCITT V.25 may be connected to the Autocall Unit Interface **(#1020)** under the provisions of the IBM Multiple Supplier Systems Bulletin.

SPECIFY

Unless otherwise indicated, these specify features are only available at time of manufacture.

- Voltage (1-phase, 3 wire, 60 Hz): **#9902** for 208V, **#9914** for 240V.
- Color: **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, **#9065** for pebble gray.
- Specify **#9260** for 4250 attachment and **#9841** for 3268 or 3230 Mdl 2 attachment.
- Remote Support Facility: The Remote Support Facility (RSF) is a customer option. It is recommended to enhance the hardware maintenance of the 4331 Processor. It provides service personnel the capability of remotely controlling the 4331 from any RETAIN terminal and allows the CE to access the RETAIN Data Bank for the latest service aids and information from the customer site. When RSF is selected, the customer must provide the telephone lines required for the RSF modem. The customer must also arrange for the connection of the telephone interface cable provided by IBM to the telephone network. For details on customer responsibilities, see *IBM 4300 Processors Installation Manual-Physical Planning,* GA24-3667.

  RSF is available in two versions:

  Specify **#9510** for integrated modem, 1200 bps, switched network, manual answer. A telephone with FCC registered Data Access Arrangement (DAA) compatible with CDT Coupler Series 1000A interface and operation, with a 4-prong jack, is required.

  Specify **#9511** for EIA RS-232-C Interface, 1200 bps, switched network, manual answer. An FCC registered external cable modem compatible with the WE 202S modem, interface and operation, or equivalent, is required.
- Remote Operator Console Facility (ROCF): This feature is an extension of RSF. It provides to an operator at a host location the ability to IML, IPL and execute other 4331 manual control functions for a remote 4331 via a real* or emulated 3275 terminal (Remote Console). After IML and IPL is complete the Remote Operator console should be disconnected and the remote 4331 should be operated in stand-alone mode or control should be turned over to existing networking facilities. ROCF is not designed to be used for interactive applications because operation of all devices attached to the Display/Printer Adapter of the 4331 are suppressed when ROCF is in use.

  * 3275 mdl 2 can only be obtained on an as available basis.

  Specify ROCF feature **#9511**. The requisite customer supplied non-clocked external modem attached to feature **#9511** must include auto answer. Line discipline is BSC, 600 or 1200 bps.
- Loop Attached Terminals: The following specify codes must be selected one time when 3640 and/or 8775 and/or 3287 Terminals and/or 3274-51C, 61C and/or 3276 Control Units are attached to the system via Loop Adapter 1 and/or 2 **(#4830, #4831)** and/or Data Link Adapters **(#4840)**.

Specify	Selected Terminals
#9251	3641 Reporting Terminal/3647 Time and Attendance Terminal
#9252	3642 Encoder Printer
#9253	3643 Keyboard Display
#9254	3644 Automatic Data Unit (ADU)
#9256	3646 Scanner Control Unit
#9257	8775 Display Terminal 3287/3645 Printer 3274-51C, 61C and 3276 Control Unit and 3104 Display Terminal
#9258	3643 Keyboard Display with #4920

4331 Processor (cont'd)

- Keyboard/Character Set Language: When a 3178 Display Station, 3278 Display Station mdl 2 and/or 3268 or 3287 Printers are attached to the Display/Printer Adapter, specify on the 4331 Processor:

  #9441: For ASCII Keyboard/Character Set Language (**#4624**, **#4628**, on 3278 mdl 2 or 3279 mdl 2A or S2A and/or 3287 with **#9084**), when used as a workstation, or

  #9442: For EBCDIC Data Entry Keyboards, 3178 mdl 1C, 3278 mdl 2 or 3279 mdl 2A or S2A with **#4622**, **#4623**. In addition, specify on the 4331 Processor either **#9301** for Data Entry Keyboard or **#9302** for Data Entry Keyboard, keypunch layout.

  No specify codes on the 4331 are required for EBCDIC Typewriter Keyboards 3178 mdl C2 or (**#4621**, **#4627** on 3278 mdl 2 or 3279 mdl 2A S2A). The 6580 Displaywriter System supports the EBCDIC Typewriter Keyboard.

  Note: The keyboard/character set language selected must correspond with the mdl of 3178 or the specifications on the 3278 mdl 2 or 3279 mdl 2A or S2A and 3287s. ASCII keyboards are supported as indicated, but the internal binary codes are EBCDIC.

- Console Table: A console table is available ... see **#1550** or Accessories section for details. Book Rack and Cable Holder ... see **#1480** or Accessories section.

- See 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C for console cabling.

  #9842 - For attachment of 6580 Displaywriter System to the Display/Printer Adapter (ordered on the 4331 only, not on the Displaywriter).

- System Environment: For record purposes specify one of the following codes (reference only, no parts required):

  #9701 - This processor is planned to be host/peer connected to a system within the same branch office territory (at installation or at a future time).

  #9702 - This processor is planned to be host/peer connected to a system in a different branch office territory (at installation or at a future time).

  #9703 - This processor is planned to be stand-alone (no host/peer connect).

SPECIAL FEATURES

Notes:

%z System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

%x Feature supplies diskette for System Diskette facility.

%y System Diskette-only special feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

Adapter Power Prerequisite (#1001): Provides power and control circuitry necessary for the Communications Adapter (**#1601**), (when more than three line features are attached), and the Adapter Logic. **Maximum**: One. **Field Installation**: Yes. **Prerequisite: #1002** or for the Loop Adapter (**#4830**) and/or **#1601** with more than three line attachments **#4695** and/or **#4696**.

Adapter Logic Prerequisite (#1002): Provides logic and control function necessary for the 5424 Adapter (#3901). **Maximum**: One. **Field Installation**: Yes. **Prerequisites**: #1001.

Block Multiplexer Channel (#1421), Add'l [Mdl Group 2] (#1422): Each provides means of attaching I/O devices. Up to 8 control units may attach to each channel. Disconnect during command chaining allows multiple I/O devices to operate concurrently. The 3830 and 3880 Control Units with associated DASD do not attach. See DASD Adapter (**#3201**, **#3202**) for attachment of 3340/3344/3310/3370 devices.

4331 Mdl Group 1: Data transfer rates up to 0.5 million bytes per second.

4331 Mdl Group 2: Data transfer rates up to 1.25 million bytes per second each.

If High-Speed Block Multiplexer Channel is installed, the data rate is up to 0.6 million bytes per second for the Block Multiplexer Channel, Add'l (#1422). See Input/Output Attachment section above for details on subchannels. **Limitations**: [1] 231X can only be installed on Block Multiplexer Channel **#1421**, not on **#1422**. [2] 231X devices cannot operate with any telecommunication line feature on the Communications Adapter which operates at a speed greater than 9600 bps (**#4720**), or **#5650** with **#9444** On 4331 Mdl Group 1 only: [3] Block Multiplexer Channel, Add'l (**#1422**) is not available. [4] 231X devices may not be installed with any of the following: 3370s on the DASD Adapter (**#3201**, **#3202**), 3340/3344 Direct Attachment (#7851), 8809 Magnetic Tape Unit Adapter (**#4910**), Magnetic Tape Units attached to the Byte Multiplexer Channel (**#5248**). On 4331 Mdl Group 2: [5] Block Multiplexer Channel, Add'l (**#1422**) not be installed with 8809 Magnetic Tape Unit Adapter (**#4910**). [6] 231X devices cannot be installed on the Block Multiplexer Channel (#1421) if High-Speed Block Multiplexer Channel (**#1431**) is installed. **Maximum**: **#1421** one, **#1422** one (Mdl Group 2). **Field Installation**: Yes. **Prerequisites**: **#1422** requires **#1421**. For certain control units/devices the processor requires Power Interface feature (**#5531**, **#5532**). See Table 3 above.

High-Speed Block Multiplexer Channel (#1431): [Mdl Group 2] Provides attachment of high-speed I/O devices including 3330/3333, 3340/3344, 3350, 3370 A1 via control units including 3830 mdl 2 and 3880. The control unit can operate in Data Stream Mode. Up to eight control units may attach. Data transfer rate up to 1.86 million bytes per second. (See Input/Output Attachment section above for specifics). **Limitations**: [1] Not available on 4331 Mdl Group 1. [2] For data rate and attachment limitations for other devices and communications lines refer to *IBM 4331 Processor Channel Characteristics,* GA33-1535 (Mdl Group 2), which contains tables of pre-analyzed configurations. [3] Cannot be installed with 8809 Magnetic Tape Unit Adapter (**#4910**). [4] 231X devices must be attached to the High-Speed Block Multiplexer Channel and cannot be used on the Block Multiplexer Channel (**#1421**). [5] Is mutually exclusive with DASD Adapter, Add'l (**#3202**). **Maximum**: One. **Field Installation**: Yes. **Prerequisites**: For certain control units/devices, the processor requires Power Interface feature (**#5531**, **#5532**). See Table 3 above.

Control Storage Expansion (#1901): [Mdl Group 1] Increases the Control Storage capacity of the Mdl Group 1 from 65,536 to 131,072 bytes, providing additional storage area for special features and the basic functions of the 4331 Processor. See Tables 1 and 2 to determine the requirement for this feature. **Limitations**: Not available on 4331 Mdl Group 2 (expanded control storage is standard). If installed on Mdl Group 1, this feature should be deleted with the order entry for conversion to Mdl Group 2. **Maximum**: One. **Field Installation**: Yes.

Note: This is for order entry only. The feature is not physically removed when upgrading to a Mdl Group 2.

Microcode Storage Requirements: The System microcode resides in the Reloadable Control Storage and Processor Storage, and is loaded from the standard System Diskette facility at IML-time. None of the Reloadable Control Storage is available for user programming and the systems configuration selected will determine the Processor Storage available for user programming and operating system residence.

To calculate the amount of Processor Storage which is available for customer purposes and operating system residence, and to determine when Control Storage Expansion (#1901) is required, use the following procedure.

Note: An interactive HONE aid is available dependent on the control program or program product device support to facilitate this procedure.

1) Consulting Table 1, determine the microcode groups required to support the features and I/O to be installed.

2) On the Table 2, place a checkmark in the appropriate rows. Note that each microcode group is required only once, even if it supports multiple functions of the 4331 Processor. The only exception to this is microcode group 2 where 2,048 bytes of Processor Storage are required per megabyte of virtual storage defined in the notes.

3) Find the sum of each of the three columns for the required microcode groups.

4) The total from Column A and B must pass three tests.
   - When the total from Column A exceeds 65,536 bytes, Control Storage Expansion (**#1901**) is required (4331 Mdl Group 1).
   - When the total from Column A exceeds 131,072 bytes for a Mdl Group 1 or 143,360 bytes for a Mdl Group 2, an invalid configuration has been selected (see Note).
   - When the total from Column A plus the total from Column B exceeds 262,144 bytes, an invalid configuration has been selected (see Note).

5) Subtract the total from Column A from either:
   - 131,072 if **#1901** is required (4331 Mdl Group 1), or
   - 65,536 if **#1901** is not required (4331 Mdl Group 1).
   - 143,360 if 4331 Mdl Group 2 is being configured.

6) Subtract the results of Step 5 from the total of Column B.

7) Add the results of Step 6 to the total from Column C and round up to the next multiple of 4,096.

The results of Step 7 determine the amount of Processor Storage occupied by microcode and should be subtracted from the Processor Storage size ordered to determine the amount available for the user.

4331 Processor (cont'd)

The storage for Group 9 (DAS Compatibility **#7901**) is only occupied if the feature is activated at IPL time.

Note: Too many features/options have been selected. Inspect table 1 and 2 and determine which feature(s) of lower priority should be deleted from the configuration.

TABLE 1

Function/Feature Installed	Microcode Group
4331 Processor	1
Processor Storage	2
3310 attached (**#3201** and **#9202**)	3,4,5,6
3370 attached (**#3201** and **#9201**)	3,4,6,17
3340/3344 Direct Attach (**#3201** and **#7851**)	3,6,8,15
Direct Access Storage Compatibility (**#7901**)	9,15
8809 Magnetic Tape Unit attached (**#4910**)	3,4,6,7
Communications Adapter Base (**#1601**)	6,10
BSC lines installed (**#9671-#9678**)	11
S/S lines installed (**#9681-#9688**)	12
SDLC lines installed (**#9691-#9698**)	13
ECPS:VM/370 (**#8701**)	16
1401/1440/1460 Compatibility (**#3950**)	14
High-Speed BMPX Channel (**#1431**)	21

TABLE 2

Micro-code Group	– A – Control Storage (only)	– B – Control Storage – or – Processor Storage	– C – Processor Storage (only)	Notes
1	33792	66816	24576	
2	–	–	2048 or 32768	For each 1 MB of processor storage in S/370 mode or for each 1 MB of virtual storage in ECPS:VSE mode, in steps of 2, 4, 8, 16 MB. For Mdl Group 2 when High-Speed BMPX or ECPS:VM/370 is installed.
3	6144	24320	7168	
4	5120	12288	–	
5	–	4608	11250	
6	–	–	10250	
7	6144	9728	3060	Excl. with Group 14
8	9216	13312	11600 8800 1800	Plus Per 3340 buffer. For a second string of 3340s attached to the DASD adapter.
9	–	27648	1300 4096 7680 13312 8704	Plus Per 2311 buffer. Per 2314 buffer. Per 3330 buffer. Per 3340 buffer.

12	5120	–	–	
13	12288	–	1024	
14	14336	–	1800	Excl. with Group 7 and 16
15	–	5760	200	
16	6656	–	–	Excl. with Group 14
17	–	9316	10000	
21	8448	2880	400	(Mdl Group 2 only)
TOTAL				

Display/Printer Adapter Expansion (#2001): Expands the capability of the standard Display/Printer Adapter to allow the 3278 mdl 2A or the 3279 mdl 2C and up to 15 displays and/or printers to directly attach to the 4331 Processor. The devices attachable are:

Up to 15 3178 Display Stations
Up to 15 3278 Display Station mdl 2s
Up to 15 3279 Color Display Station mdl 2A, S2A or 02X
Up to 15 3230 and 3268 Printers mdl 2
Up to 15 3287 Printer mdls 1, 2, 1C and 2C
Up to 2 3289 Line Printer mdl 4s
Up to 2 3262 Line Printer mdl 1s and 11s.
Up to 2 4250 Printers mdl 1 or four mdl 2.
6580 Displaywriter System mdl A04, A06, A08, A10 (25-line display). Can connect to 1 or 2 device ports (display station or display station and printer).

Other details are the same as given under the description of the Standard Function: Display/Printer Adapter, above. **Limitations:** Only the 3278 mdl 2A or the 3279 mdl 2C and 15 devices (listed above) may attach to the Display/Printer Adapter and the Display/Printer Adapter Expansion. **Maximum:** One. **Cable Order:** See Accessories section for ordering information for the required coaxial cable. **Field Installation:** Yes. **Specify:** See "Specify" for character code/keyboard combinations available. **Prerequisites:** The 6580 Displaywriter System prerequisites for attachment include the 3270 Attached Workstation licensed program (5608-SR9) and the 3274/3276 Attached Workstation adapter (**#8332**) and Specify **#9842** in 4331 must be ordered for attachment of Displaywriter.

4331 Processor (cont'd)

DASD Adapter (#3201%x), ADD'L (4331 Mdl Group 2) (#3202%x): Each allows attachment of the 3310, 3370 A1 and 3340/3344 DASD to the 4331 Processor. Up to four strings of devices may be attached to each adapter. The attachable device types may be intermixed on each adapter but not within a string. The maximum number of strings of each type of device on each DASD Adapter is:

a) Up to four 3310 mdl A1s or A2s with 3310 mdl B units attached, up to a maximum of 4 drives per string.

b) Up to four 3370 mdl A1s with 3370 mdl B1 units attached, up to a maximum of 4 devices (8 actuators) per string.

c) Up to two 3340 mdl A2s with 3340/3344 mdl B units attached, up to a maximum of eight drives per string - (3340/3344 Direct Attach feature **#7851** is required). Attachment of 3340/3344 is limited to two strings on the system.

String Switch Capability allows sharing of 3340 mdl A2 and/or 3370 mdl A1 and associated drives with another IBM processor or control unit that supports the DASD and string switching. It provides the ability for strings of 3340/3344 or 3370 to be accessed from DASD adapters or control units on the same or two different processors. The 3340 mdl A2 or 3370 mdl A1 must have the String Switch feature **#8150** installed. String switch support for 3340/3344 is limited to the static assignment of a shared string to one processor at a time. **Limitations:** [1] DASD Adapter, Add'l **(#3202)** is not available for Mdl Group 1. [2] DASD Adapter, Add'l **(#3202)** is mutually exclusive with High-Speed Block Multiplexer Channel **(#1431)**. [3] 3310 and 3370 are not supported by VS1 in fixed block mode. [4] For data rate and attachment limitations for other devices and communications lines refer to *IBM 4331 Processor Channel Characteristics,* GA33-1527 (Mdl Group 1) or GA33-1535 (Mdl Group 2), which contains tables of pre-analyzed configurations. [5] On 4331 Mdl Group 1 only: 3340 or 3370 may not be attached to the DASD Adapter if 231X DASD is attached to the Block Multiplexer Channel **(#1421)**. **Maximum:** One **#3201** and one **#3202** (on 4331 Mdl Group 2). **Field Installation:** Yes. **Prerequisites:** 3340/3344 requires #7851 ... see Table 1 for microcode storage requirements and possible requirement for **#1901** on Mdl Group 1 ... **#3202** requires **#3201**. **Specify: #9202**%z if 3310 and/or **#9201**%z if 3370 attaches to the DASD Adapter. **#9316** if String Switch Capability is required with 3370.

Diskette Drive (#3401): A single drive diskette reader/recorder providing the ability to read or write IBM Diskettes Type 1. The Diskette Drive is supported by the control program as a 3540 Diskette Input/Output unit. **Limitations:** Not supported by VM/370. **Maximum:** One. **Field Installation:** Yes.

External Signals (#3898): Provides six distinct external interrupt lines to request and identify an external interrupt response from the processing unit. **Maximum:** One. **Cable Order:** Required. **Field Installation:** Yes. **Prerequisites:** External Devices must meet the interface specifications outlined in *S/360 Direct Control Feature OEMI,* GA22-6845.

5424 Adapter (#3901%x): Allows attachment of one 5424 Multi-Function Card Unit mdl A1 or A2. **Limitations:** The 5424 is supported by DOS/VSE only. The 5424 must be physically attached, otherwise the system is inoperative. Cannot be installed with the Loop Adapter **(#4830)**. **Maximum:** One. **Field Installation:** Yes. **Prerequisites: #1001** and **#1002**.

1401/1440/1460 Compatibility (#3950%y): A feature which, in conjunction with special software, permits execution of 1401/1440/1460 instructions. Feature may be used with S/370 mode or with ECPS:VSE mode. See "Software" for details concerning prerequisites. **Limitations:** May not be installed with 8809 Magnetic Tape Unit Adapter **(#4910)**. May not be installed with ECPS:VM/370 **(#8701)** and does not operate under VM/370. Support is available under DOS/VSE/Advanced Function, DOS/VS Release 34 and DOS Release 26. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** IBM Systems 1401/1440/1460 Emulator Program Product. See Programming pages for details. See Table 1 for microcode storage requirements and possible requirement for #1901.

8809 Magnetic Tape Unit Adapter (#4910%x): Provides for attachment of the 8809 Magnetic Tape Unit. One 8809 mdl 1A may attach. Up to five 8809 mdl 2s and 3s may attach to the mdl 1A for a total of six 8809 Magnetic Tape Unit drives. **Limitations:** [1] May not be installed with 1401/1440/1460 Compatibility **(#3950)**. [2] May not be installed with Block Multiplexer Channel, Add'l **(#1422)** on 4331 Mdl Group 2. [3] May not be installed on 4331 Mdl Group 1 if 231X devices are attached to the Block Multiplexer Channel **(#1421)**. [4] May not be installed with High-Speed Block Multiplexer Channel **(#1431)** on 4331 Mdl Group 2. [5] The 8809 is not supported by VS1. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** See Table 1 for microcode storage requirements and possible requirement for #1901 on Mdl Group 1.

Byte Multiplexer Channel (#5248): The byte multiplexer channel attaches S/370 byte multiplex devices. The data rate of the channel is up to 18K bytes per second for Mdl Group 1 or up to 36K bytes per second for Mdl Group 2 in single byte interleaved mode and up to 500K bytes per second in burst mode. For data rates achievable for specific configurations, see *IBM 4331 Channel Characteristics,* GA33-1527 for Mdl Group 1 or GA33-1535 for Mdl Group 2. Up to eight control units may be attached. See Input/Output Attachments section above for details on subchannels. **Limitations:** [4331 Mdl Group 1] Magnetic tape devices may not be attached to the Byte Multiplexer Channel whenever 231X devices are attached to the Block Multiplexer Channel **(#1421)**. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** For certain control units/devices, the processor requires Power Interface **(#5531, #5532)**. See Table 3.

Power Interface (#5531), ADD'L (#5532): Provides power control to the 4331 Processor for control units attaching to the 4331 Byte Multiplexer Channel and Block Multiplexer Channel. Table 3 below lists the control units/devices for which this feature must be installed in the 4331 Processor ... Power Interface **(#5531)** allows attachment of up to eight of these control units; Power Interface, Add'l **(#5532)** allows attachment of eight additional control units for a maximum of 16 per processor. **Maximum:** One of **#5531**; one of **#5532**. **Field Installation:** Yes. **Prerequisites: #5532** requires **#5531**.

Table 3

Control Units/Devices Requiring Power Interface Features

1 - Mandatory:
- 1255 Magnetic Character Reader
- 1287 Optical Reader
- 1288 Optical Reader
- 1419 Magnetic Character Reader
- 1442 Card Read Punch mdl N1
- 1442 Card Punch mdl N2
- 1443 Printer mdl N1
- 2314 Storage Control* mdl A1 and B1
- 2314 Direct Access Storage Facility* mdl 1
- 2415 Magnetic Tape Unit and Control
- 2501 Card Reader mdl B1 and B2
- 2520 Card Read Punch mdl B1, B2 and B3
- 2701 Data Adapter Unit
- 2702 Transmission Control*
- 2703 Transmission Control*
- 2803 Tape Control
- 2821 Control Unit mdls 1, 2, 3, 5 and 6
- 2822 Paper Tape Reader Control*
- 2840 Display Control*
- 2841 Storage Control
- 3272 Control Unit
- 3411 Magnetic Tape Unit and Control
- 3430 Magnetic Tape Unit and Control
- 3505 Card Reader
- 3540 Diskette Input/Output Unit
- 3704 Communications Controller
- 3705 Communications Controller
- 3725 Communication Controller
- 3791 Controller
- 3800 Printing Subsystem
- 3803 Tape Control
- 3811 Printer Control Unit
- 3881 Optical Mark Reader mdl 1
- 3886 Optical Character Reader mdl 1
- 3890 Document Processor
- 3895 Document Reader/Inscriber

2 - Not Mandatory, but can utilize Power Interface features:
- 3274 Control Unit
- 3340 Direct Access Storage Facility
- 3370 Direct Access Storage
- 3203 Printer mdl 5

* No longer available

3340/3344 Direct Attachment (#7851%y): A feature allowing 3340 mdl A2s to attach to a DASD Adapter **(#3201, #3202)**. Up to two 3340 mdl A2s per system may attach to either adapter. Up to three 3340/3344 mdl B units may attach to each 3340 mdl A2. **S/3 Data Import:** With the VSE/IBM System/3-3340 Data Import utility program (5746-AM3), 3348 Data Modules which have been written on a 3340 attached to a System/3 can be read on any directly attached 3340 drive. The String Switch Capability allows sharing of 3340 mdl A2 drives (with **#8150** installed) and associated drives, with another IBM processor or control unit that supports the DASD and string switching. String switch support is limited to the static assignment of a shared string to one processor at a time. **Limitations:** [1] May not be installed if 231X devices attach to the Block Multiplexer Channel **(#1421)**. [2] Attachment of 3340/3344 and/or use of the DAS Compatibility is limited to two strings on the system. [3] If one string of 3340/3344s is attached to a DASD Adapter **(#3201)**, only one string of 3310/3370s can perform DASD emulation. If two strings of 3340/3344s are attached, no 3310/3370s can perform DASD emulation. **Maximum:** One. **Field Installation:** Yes. **Prerequisites: #3201** ... 3340 mdl A2. See Table 1 for microcode storage requirements and possible requirement for **#1901**. **Specify: #9315** if String Switch Capability for 3340 required, **#9317** if 3344 is installed.

4331 Processor (cont'd)

Communications and Loops

Note: Use of this feature introduces additional processor and channel demands, and can have a significant effect on system performance, particularly in batch environments with heavy I/O load and/or if multi-track operations are used. Performance considerations should be carefully reviewed before proposing use of the 3340/3344.

Direct Access Storage Compatibility (#7901%y): Designed to be used primarily as a conversion aid, this feature provides emulation of 2311/2314 data formats on 3310 or 3370 Direct Access Storage and emulation of 3330 (100MB/volume) or 3340 data formats on 3370 Direct Access Storage. This allows programs written for use of 2311/2314, 3330 or 3340/3344 DASD to be executed with only Job Control modifications using the 3310 or 3370 Direct Access Storage.

DAS Compatibility can be used on 3310 or 3370 devices which are installed on one DASD adapter on up to two consecutively addressed strings. The DAS Compatibility feature includes all of the compatibility types available for 3310 and 3370. Any one type can be activated at IPL time. Operates in S/370 mode under DOS, DOS/VS, OS/VS1 or VM/370, in ECPS:VSE mode under DOS/VSE. Under DOS/VSE data sets in fixed block format and in emulated format can coreside on the same 3310/3370 volume. With DOS/VSE a variable number of full or partial CKD volumes can be stored on the 3310 or 3370 up to the capacity of the host device. Each emulated volume regardless of whether stored with full or partial capacity, begins on a predefined full-volume boundary. With OS/VS1 or VM/370 partial emulated volumes are not supported.

Mapping of emulated volumes onto 3310/3370 volumes is as follows:

Compatibility Type	Max number of emulated full volumes		
	Per Host Volume	Per String	Per System
2311 on 3310	7	28	56
2314 on 3310	2	8	16
2311 on 3370	34	68	68
2314 on 3370	9	63	63
3330 on 3370	2	16	28
3340 on 3370	3	24	42

For device address assignment refer to *IBM 4331 Compatibility Features,* GA33-1528.

Performance Note: Use of DAS Compatibility introduces additional processor and channel demands and can have a significant effect on system performance, particularly in environments with high I/O load using emulated DASD. Batch job execution elapsed times may increase by a factor of more than two. The results of measurements on a typical commercial jobstream show an increase in elapsed time by a factor of 1.7, compared to execution with the 3370 in fixed block mode. The performance impact is less severe when DASD is used in mixed fixed block and emulation mode, which is possible in operation with DOS/VSE or VM/370 but not with OS/VS1. Also less critical are online workloads with generally lighter I/O loads. Exclusive use of DASD emulation for batch operation is not recommended in any SCP environment.

Limitations: [1] Operates on up to two strings of 3310 or 3370 attached to the DASD adapter. [2] Operation of emulation and directly attached 3340/3344 is limited to two strings on the system. [3] One type of emulation can be activated at IPL time. [4] 3330 mdl 11 cannot be emulated. [5] Emulation cannot be used on 3370 drives which are shared via a string switch. [6] VM/370 supports 3310 or 3370 volumes containing emulated data which are dedicated to a guest operating system, other than VM/370 or CMS. Emulated 2311 is not supported by VM/370. [7] OS/VS1 does not support 2311, native or emulated. **Program Order:** The required utility programs 3310 for initialization and surface analysis of the 3370 DASD as well as the formatting of the emulator extent are included in the DOS/VSE SCP, 5745-030 or combined with VSE/Advanced Functions, 5746-XE9. OS/VS1 (5741-VS1) and VM/370 (5749-010) contain the Device Support Facilities for initialization and surface analysis of CKD DASD. In addition, for the required formatting of the emulator extent, order 5747-SA1. The stand-alone Device Support Facilities are also separately orderable with program order number 5747-DS1. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** **#3201** with 3370 **(#9201)** and/or 3310 **(#9202)** specification. See Tables 1 and 2 for microcode storage requirements.

ECPS:VM/370 (#8701%y): The 4331 Processor provides ECPS:VM/370 support at Level 19. This support is compatible with VM/370 Release 6 and VM/System Product or VM/BSE Release 2 or VM/SE Release 2. corresponding levels of the System Extension Program Products. The functional areas assisted include: Virtual Machine I/O, SVC Handler, Privileged Instruction Emulation and Virtual Interval Timer. **Limitations:** May only operate when S/370 mode has been invoked by IPL. May not be installed with 1401/1440/1460 Compatibility (#3950). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** See Table 1 for microcode storage requirements and possible requirement for Control Storage Expansion (#1901).

Communications Adapter: Provides the basic control and common circuits for the direct attachment of up to eight synchronous (BSC), asynchronous (Start/Stop) or Synchronous Data Link Control (SDLC) communication lines in any combination, provided that the aggregate data rate capability of up to 64,000 bps is not exceeded. For data rates achievable, see GA33-1527 for Mdl Group 1 or GA33-1535 for Mdl Group 2. The maximum speed of each of the eight lines is 9600 bps except that line position one may be a synchronous high-speed line (BSC or SDLC) up to 56,000 bps and may operate concurrently with other lines provided that its data rate does not exceed 50,000 bps and the data rate limitation is not exceeded. SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, native or as a guest under VM/370.

Base Characteristics are:

- Auto Answer
- Autopoll operation
- Multipoint central station functions
- Multipoint tributary station functions for BSC only
- EBCDIC transparent mode for BSC only
- EBCDIC and ASCII code for BSC only

The Communications Adapter attaches up to eight lines via the following optional features:

- Up to eight line features without business clock for attachment to X.21 Nonswitched Data Network.
- Up to 8 line features without internal clock for attachment to external modems (Data Circuit-Terminating Equipment, DCE) with clock.
- Up to 8 line features with internal clock for attachment to external modems (Data Circuit-Terminating Equipment, DCE) without clock.
- Up to 1 synchronous high-speed line feature.
- Up to 8 line features with integrated modems.
- Up to 8 line features with local attachments.
- Up to eight line features with Digital Data Service Adapters.
- Autocall Unit interfaces for up to two of the installed lines.

From the Operator's Console-Keyboard the user may specify some configuration parameters for each separate telecommunications line for each individual connection:

- Select stand-by.
- Half speed operation for synchronous lines only (for both clocked and nonclocked modems which have this capability).
- NRZI mode in SDLC mode.
- Write interrupt (S/S only).
- Read interrupt (S/S only).
- Unit exception suppression (S/S only).
- Error index byte mode (BSC only).
- ASCII code instead of EBCDIC (BSC only).
- Tributary station addresses (BSC only).

Other configuration parameters can be selected at installation time and set by the customer engineer:

- Duplex instead of half-duplex connection (two-way alternate data flow transmission).
- Switched network facility instead of nonswitched lines (for external modems).
- New sync (for BSC or SDLC in multipoint primary station function only).
- High speed operation for one line (BSC or SDLC only).
- Connect Data Set to Line or Data Terminal Ready procedure.
- Selection of WE 202 or V.23 answer tone frequencies for 1200 bps integrated modems with automatic answering.

Customer Responsibilities: See M2700 pages for customer responsibilities regarding communications facilities and services.

Communication Facilities: See M2700 pages for communications facility requirements with this feature.

4331 Processor (cont'd)

Terminals Supported

The Data Communications Equipment and remotely attachable Data Terminal Equipment (abbreviated "terminals") supported by the Communications Adapter are shown in the table below:

SDLC Terminals Supported:

Type	Speed in K bps								
	+1.2/.6	+2.4	+2.4/1.2	+4.8	+4.8/2.4	+7.2	+7.2/3.6	+9.6	+19.2-56
Terminals:									
3271-11,-12 (3)	X	X	X	X	X	X	X	X	
3274-1 X1C (8)		X	X	X	X	X	X	X	X
3276-1-4 (7)	X	X	X	X	X	X	X	X	
3275-12 (3)	X	X	X	X	X	X	X	X	
3276-11-14	X	X	X	X	X	X	X	X

5380 (5)	X	X	X	X	X	X	X	X	X
8100	X	X	X	X	X	X	X	X	X

Notes:

(1) 3705 or 3725 supported as a primary station in a network using ACF/VTAM Release 1 or ACF/VTAM Release 2.
(2) Participant as a primary or a secondary station in a network using ACF/VTAME.
(3) Not supported by ACF/VTAME.
(5) Supported as a 3770.
(6) Supported as a 3770 or 3791.
(7) With SDLC/BSC Switch in SDLC mode.
(8) The maximum speed supported is 56K bps.
(9) Supported as a 3274 mdl 1C or 3770
(10) DSLU (5668-006) is required for 7426 or 8775-11, -12 with downstream loadable functions.

BSC Terminals Supported

Type	Speed in K bps								
	+1.2/.6	+2.4	+2.4/1.2	+4.8	+4.8/2.4	+7.2	+7.2/3.6	+9.6 (6)	+19.2-56

Series/1 (8)	X	X	X	X	X	X	X	X	X

Notes:

(1) By RPQ.
(2) Equivalent to 2770/2772.
(3) Equivalent to 2770/3780.
(4) Supported as a 3276 mdl 1, 2, 3, 4, nonswitched connection only.
(5) With Communications Adapter.
(6) 19,200 - 56,000 bps in line position 1.
(7) See M3631 and/or 3632 pages for 3631/3632 features required and software requirements for host connection.
(8) Equivalent to 54XX (S/3).
(9) Equivalent to 3741 mdl 2, 4.
(10) Equivalent to 3275 mdl 1, 2.
(11) Equivalent to 3271 mdl 1, 2.
(12) Supported as a 2772.
(13) Supported as 3280
(14) Supported as a 3271 mdl 2.

Start/Stop Terminals Supported

Only terminals using IBM Terminal Control - Type 1 are supported.

Type	IBM I Line Control Speed in bps				
	75	134.5	300	600	1200
2740-1		X			
2740-2	X	X		X	
2741		X			
3232-51 (3)			X	X	X
3767-1 (1)		X	X	X	X
3767-2 (1)		X	X	X	X
3767-3 (1)		X	X	X	X
5100 (2)		X	X		
5110		X	X		
6733 (3)			X		X
CMCST (1)		X	X		

(1) Equivalent to 2740 and/or 2741: Speed 134.5 bps needs 3767 RPQ 853129.

4331 Processor (cont'd)

(2) Equivalent to 2741.

(3) Supported as a CPT-TWX 33/35

Autocall Unit Interface (#1020%x): Provides an interface to customer-supplied Automatic Calling Equipment allowing data links with remote stations to be automatically established on the switched telephone network. Automatic Calling Equipment complying with EIA RS-366 or CCITT V.25 procedures may be attached. For the appropriate Automatic Calling Equipment, refer to M2700 pages. **Limitations:** Does not operate with High-Speed Modem Adapter **(#4720)**, any features with 1200 bps Integrated Modem or with any nonswitched lines. **Maximum:** Two. **Cable Order:** Required, for attachment to external equipment. **Field Installation:** Yes. **Prerequisites: #1601** and **#3701** (in switched operation) for each Autocall Unit Interface installed. **Specify:** Line position, see Table 4 below.

Communications Adapter, Base (#1601%x): Allows attachment of up to eight lines (with up to two transmission modes) plus Autocall Unit Interfaces (#1020) for up to two of the lines. The aggregate data rate capability of the Communications Adapter is 64,000 bps. **Limitations:** [1] SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, or ACF/VTAME operating under VM/370 Release 6 with DOS/VSE running as a guest. [2] Each line attached reduces the number of available subchannels on the Byte Multiplexer Channel. See "System Subchannels" above for details. [3] The aggregate data rate of lines in operation on the Communications Adapter is 64,000 bps. With the exception of a synchronous line installed in position one capable of higher speed, the line speed is limited to 9600 bps. For data rate and attachment limitations for other devices and communications lines refer to *IBM 4331 Processor Channel Characteristics* GA33-1527 (Mdl Group 1) or GA33-1535 (Mdl Group 1) which contains tables of pre-analyzed configurations. **Maximum:** One. **Field Installation:** Yes. **Prerequisites: #1001** is required when more than three telecommunications line features are attached. See Table 1 for microcode storage requirements and possible requirement for **#1901** (4331 Mdl Group 1). **Specify:** See Table 4, "Communications Adapter Configuration Features and Position Codes", for required specify codes for each line feature attached.

EIA/CCITT Interface (#3701%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one external modem having EIA RS-232-C, CCITT V.24/V.28 or X.21bis interface for attachment to one switched or one nonswitched line.

When this feature is installed in conjunction with Line Attachment Base for Clocked Modem **(#4695)**, a BSC or SDLC line is supported. Nonswitched lines with switched network backup may be used where maximum line speed on nonswitched lines is 9600 bps, the maximum line speed on switched network backup or switched networks is 4800 bps.

When this feature is installed in conjunction with Line Attachment Base for Nonclocked Modems **(#4696)**, then a BSC, Start/Stop or SDLC line is supported. Transmission speeds supported are listed with feature **#4696** below. **Maximum:** Eight. **Cable Order:** Required, for attachment to external equipment. **Field Installation:** Yes. **Prerequisites: #1601.** One **#4695** or **#4696** is required for each feature **#3701** installed. **Specify:** Start/Stop, SDLC and/or BSC operations are possible. See Table 4 for Line Position Code and Transmission Mode Codes.

Loop Adapter: Provides the capability to attach directly or via a data link the 3640 Plant Data Communication Terminals and/or General Purpose Terminals 3104 mdls B1, B2 and 8775 mdls 1, 2 , 3232 Keyboard Printer mdl 11 and 3287 mdls 11, 12, 3230 and 3268 Printers mdl 2 and/or Control Units 3274 mdl 51C, 61C7426 Terminal Interface Unit mdl 1 with its associated terminals and 3276 mdls 11-14 with the associated terminals to the 4331 Processors. Loop Adapter 1 and 2 **(#4830, #4831)** provide for direct attachment. A maximum of two Data Link Adapters **(#4840)** provide for remote attachment capabilities for 3843 Loop Control Units. Each Data Link Adapter **(#4840)** can be used as point-to-point or multipoint connection to attach up to four 3843 Loop Control Units.

Devices that can be attached to direct attached loops at 9600 bps or data link attached loops at 2400, 4800 or 9600 bps are the following:

Device Attachments

3104 Display Terminal mdls B1, B2
3232 Keyboard Printer mdl 11
3641 Reporting Terminal mdls 1,2
3642 Encoder Printer mdls 1,2
3643 Keyboard Display mdls 2, 3,4
including #4920 Badge and Document Encoder
3644 Automatic Data Unit
3645 Printer
3646 Scanner Control Unit
3647 Time and Attendance Terminal
8775 Display Terminal mdls 1,2
3287 Printer mdls 11,12
3274 Control Unit mdl 51C, 61C with the
associated terminals
3276 Control Unit Display Station mdl 11-14
with the associated terminals

Control Units and Associated Terminals

3274 Control Unit Mdl 51C, 61C
3178 Display Station
3278 Display Station
3279 Color Display Station
3262 Line Printer
3268 Printer mdl 2 and 2C
3287 Printer
3289 Line Printer
6580 Displaywriter System,
mdl A04, A06, A08, A10 (25-line display)
6580 Displaywriter System,
mdl B04, B06, B08, B10 (66-line display)

3276 Control Unit Display Station Mdl 11-14
3178 Display Station
3278 Display Station
3279 Color Display Station
3262 Line Printer
3268 Printer Mdl 2 and 2C
3287 Printer
3289 Line Printer
with its associated terminals
6580 Displaywriter System,
mdl A04, A06, A08, A10 (25-line display)
6580 Displaywriter System,
mdl B04, B06, B08, B10 (66-line display)
7426 Terminal Interface Unit mdl 1

In addition the following devices can be attached at 38,400 bps:

3104 Display Terminal mdls B1, B2
8775 Display Terminal mdls 1,2
3232 Keyboard Printer mdl 11
3287 Printer mdls 11, 12
3274 Control Unit mdl 51C with the
associated terminals
7426 Terminal Interface Unit mdl 1
with its associated terminals

For the attachment of 3640 terminals it is recommended to use a 3643 Keyboard Display or a 3641 Reporting Terminal on each Loop Control Unit for diagnostics and testing. These units do not need to be dedicated to this purpose.

Cable length for direct attached loops can be up to 2,000m (1.25 miles) when operating at 38,400 bps, or 3,200m (2 miles) when operating at up to 9600 bps.

For data link attached loops see 3843 Loop Control Unit. For details refer to GA23-0038, *IBM Multiuse Communications Loop Planning Guide.*

Loop Installation: For the required information to plan and install the Loop Adapter feature, the loop cables and accessories see the *IBM Multiuse Communications Loop Planning Guide,* GA23-0038, and *Installation Guide,* GA23-0039. The loop cables and accessories should be installed and checked out prior to attaching processors or devices.

The customer is responsible to enter the loop configuration and terminal addresses into the system using the loop adapter configuration tool invocable via a manual operation. Refer to *IBM 4331 Processor Loop Adapter Feature, Operating Procedures,* GA33-1538, and *Problem Determination Procedures,* GA33-1540.

Note: (1) Loop Accessories are required to properly install the customer-owned loop. The customer is responsible to provide (purchase, install, test and maintain, problem determination) the loop cable and accessories for terminal attachment. See Accessories section for details and ordering information.

(2) An unused lobe has to be terminated by a Loop Station Connector (wrap-type), P/N1657320.

Communications Facilities: See M2700 pages for communications facility requirements.

Loop Adapter 1 (#4830): Provides for direct attachment of a Loop with one or two Lobes (The lobe is the actual physical Loop cable). Transmission speed can be 9.6K bps for 3640 and/or 3104 and/or 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals and/or 3274-51C, 61C and/or 3276 Control Units or 38.4K bps for 3104 and/or 7426 Terminal Interface Unit mdl 1 with its associated terminals 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals and/or 3274-51C, 61C Control Unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. **Limitations:** Can not be installed with 5424 adapter **(#3901). Maximum:** One. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites: #1001.**

4331 Processor (cont'd)

Loop Adapter 2 (#4831): Provides for direct attachment of a Loop with one or two Lobes (A lobe is the actual physical Loop cable). Transmission speed can be 9.6K bps for 3640 and/or 3104 and/or 3104 and/or 8775 and/or 7426 Terminal Interface Unit mdl 1 with its associated terminals and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals, and/or 3274-51C, 61C and/or 3276 Control Units, or 38.4K bps for 3104 and/or 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals and/or 3274-51C, 61C control unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. **Limitations:** Can not be installed with 5424 adapter **(#3901)**. **Maximum:** One. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites: #4830.**

Data Link Adapter (#4840): Allows connection of one or more 3843 loop control units to the 4331 processor. The feature provides for the attachment of one external modem complying with EIA/CCITT recommendations. EIA RS-232, RS-334 support will be provided for nonswitched lines only . Transmission speed can be 2400, 4800, or 9600 bps, with half speed option dependent on the attached modem. The modem can be connected to either a point-to-point or multipoint telecommunications line for connection of up to four 3843 loop control units which directly control the data link attached loops. Support will be provided for the same terminals as on the direct attached loop. **Limitations:** Can not be installed with 5424 adapter (#3901). **Maximum:** Two. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** Loop Adapter 1 **(#4830)**.

Loop Adapter Logic Storage Requirements: The microcode storage required for attaching terminals to the Loop Adapter 1 and 2 **(#4830, #4831)** or Data Link Adapters **(#4840)** has to be calculated from the table shown below. If Total 1 exceeds 65,536, an invalid configuration has been selected. If the sum of Total 1 plus Total 2 exceeds 98,304 an invalid configuration has been selected.

	Microcode Program Space Bytes	System Control Space Bytes
Microcode Base	42836	7880
One or multiple 3641 and/or 3647	7800	1060
One or multiple 3642	5900	580
One or multiple 3643 w/o #4920	8800	3450
One or multiple 3643 w/#4920	9400	3450
One or multiple 3644	4900	-
One or multiple 3646	2900	256
One or multiple 3104 and/or 8775 and/or 3287, 3274, 3276, 3645, 7426	2600	-
		Terminal* Control Space
Each 3641, 3647	-	156
Each 3642	-	194
Each 3643	-	156
Each 3644	-	228
Each 3646	-	72
Each port on 3646	-	84
Each 3274, 3276, 3287, 3645, 3104, 8775	-	186
Each 3843	-	68
Each Loop Adapter (#4830, #4831)	-	1272
Each Data Link Adapter (#4840)	-	1204
	Total 1	Total 2

*For additional information on buffer space refer to the *IBM 4331 Loop Adapter Characteristics*, GA33-1534.

The storage requirements need to be validated by DP because the number of devices of each type attached by the customer is not known to manufacturing. Manufacturing can only validate storage requirements with respect to device types but not with respect to the number of devices of each type.

System Diskette Space Requirements: When attaching the Loop Adapter feature with 364X terminals to the IBM 4331 the diskette space requirements must be verified. See the following table for the space calculation. If the total number of records exceeds 3876, an invalid configuration has been selected. A trade-off between features must be considered.

4331 Processor Feature/Facility	System Diskette Records
4331 Basic	2061
DASD Adapter **(#3201, #3202)**	251
3310 or 3370 Common **(#9202, #9201)**	71
3310 Att. **(#9202)**	63
3370 Att. **(#9201)**	61
3340/3344 Direct Att. **(#7851)**	73
3340 Att. or DAS Compatibility **(#7851 or #7901)**	24
DAS Compatibility **(#7901)**	190
8809 Tape Adapter **(#4910)**	87
Communications Adapter **(#1601)**	272
Start/Stop Transmission Mode **(#968x)**	15
BSC Transmission Mode **(#967x)**	18
SDLC Transmission Mode **(#969x)**	52
Inline (System RAS Test Functions, req'd. by CE)	40
1400/1440/1460 Compatibility **(#3950)**	60
ECPS:VM/370 (#8701)	26
High-Speed BMPX Channel **(#1431)**	50
Loop Adapter Common **(#4830, #4831, #4840)**	448
3640 Terminal Att. **(#9251, #9252, #9253, #9254, #9256)**	252

The maximum number of system diskette records may not exceed 3876.

Maximum Number of Terminal Attachment Via Loop Adapters/Data Link Adapter: The maximum number of terminals that can be attached to the 4331 processor via Loop Adapters/Data Link Adapters is 80, of which 62 can be any mix of 3644, 3645, 3287, 3104, 8775 , 3232 mdl 11 terminals or 3274-51C, 61C or 3276 Control Units.

Multiple terminals on a 3274 or 3276 control unit count as a single terminal in determining the maximum number of terminals.

A maximum of 64 terminals out of the total of 80 terminals may be attached to either Loop Adapter 1 or 2, or to one of the Data Link Adapters. For details see *IBM Multiuse Communications Loop Planning Guide*, GA23-0038.

Line Attachment Base For Clocked Modems (#4695%x): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit-terminating Equipment) which provide clocking and comply with EIA RS-232-C CCITT V.35, X.21 or X.21bis recommendations and it is a prerequisite for attachment to X.21 nonswitched data network . See the various line features below to determine when it is required. **Limitations:** A maximum of eight Line Attachment Bases may be installed on 4331 Communications Adapter. Each feature **#4695** installed reduces by one the number of feature **#4696** allowable. **Maximum:** Eight, one per line installed. **Field Installation:** Yes. **Prerequisites: #1601** ... **#1001** is required if more than three line attachments **#4695** and/or **#4696** are installed.

Line Attachment Base For Nonclocked Modems (#4696%x): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit-terminating Equipment) which do not provide clocking. See the various features below to determine when it is required.

The clock speed internal to the feature is wired by default to 134.5 bps for Start/Stop operation and 1200 bps for BSC and SDLC operation. Otherwise, the clock speed can be wired at installation to one of the following:

- Start/Stop: 75, 300, 600 or 1200 bps.
- BSC: 600 bps.
- SDLC: 600 bps.

For BSC or SDLC operations, if 1200 bps is wired, then full speed operation (1200 bps) or half-speed operation (600 bps) may be selected from the operator console keyboard. **Limitations:** A maximum of eight Line Attachment Bases may be installed on 4331 Communications Adapter. Each feature **#4696** installed reduces by one the number of feature **#4695s** allowable. **Maximum:** Eight, one per line installed. **Field Installation:** Yes. **Prerequisites: #1601.** Feature **#1001** is required if more than three line attachments **#4695** and/or **#4696** are installed.

High-Speed Modem Adapter (#4720%x): Provides for the attachment of an external modem with clock having a CCITT V.35 or X.21bis interface. One nonswitched point-to-point BSC or SDLC line may be operated with speeds from 19,200 to 56,000 bps. **Limitations:** For speed limitations refer to the Communication Adapter Base feature description. For channel rates achievable, see *IBM 4331 Channel Characteristics,* GA33-1527 (Mdl Group 1) or GA33-1535 (Mdl Group 2). Cannot be installed with 231X DASD attached to the Block Multiplexer Channel **(#1421)**. Cannot be installed with X.21 Adapter for Nonswitched Networks **(#5655)** if its speed is 48,000 bps **#9831**. Cannot be installed with Digital Data Service Adapter **(#5650)** if the Digital Data Service Adapter operates at 56,000 bps **(#9444)**. **Maximum:** One. **Cable Order:** Required for attachment to the external modem. **Field Installation:** Yes. **Prerequisites:** #1601 and #4695. **Specify:** BSC and/or SDLC operations are possible ... see Table 4 for Line Position Code and Transmission Mode Codes.

1200 bps Integrated Modem, Nonswitched (#4781%X): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched BSC, Start/Stop or SDLC line via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps. Selection of 2- or 4-wire operation is made at installation time. **Cable Orders:** Required for attachment to external equipment. **Maximum:** Eight. **Field Installation:** Yes. **Prerequisites:** #1601 and #4696. **Specify:** SDLC and/or BSC and/or Start/Stop operations are possible, see Table 4.

4331 Processor (cont'd)

1200 bps Integrated Modem, Switched With Auto Answer (#4782%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one switched network Start/Stop line via an integrated modem at speeds up to 300 bps and for BSC and SDLC at 600 and 1200 bps. Attachment to the switched network is via an IBM-provided cable to FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. **Maximum:** Eight. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites: #1601** and **#4696**. **Specify:** SDLC and/or BSC and/or Start/Stop operations are possible, see Table 4.

1200 bps Integrated Modem, Nonswitched With Switched Network Backup And Manual Answer (#4787%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched line with Switched Network Backup (SNBU) and manual answer, allowing BSC, Start/Stop or SDLC operations via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps.

Attachment to the nonswitched line is via an IBM-provided cable. Selection of 2- or 4-wire line operation is made at installation time. The cable group which is ordered also provides for attachment to a Data Access Arrangement type CDT or FCC registered equivalent for manual answer. **Maximum:** Eight. **Cable Order:** Required for one cable group which connects to nonswitched line and to the switched network. **Field Installation:** Yes. **Prerequisites: #1601** and **#4696**. **Specify:** SDLC and/or BSC and/or Start/Stop operations are possible, see Table 4.

1200 bps Integrated Modem, Nonswitched With Switched Network Backup And Auto Answer (#4788%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched line with Switched Network Backup (SNBU) and auto answer, allowing BSC, Start/Stop or SDLC operations via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps.

Attachment to the nonswitched line is via an IBM-provided cable. The same cable group provides for attachment to the switched network to a Data Access Arrangement type CBS or FCC registered equivalent for auto answer. **Maximum:** Eight. **Cable Order:** Required for one cable group which connects to the nonswitched line and to the switched network. **Field Installation:** Yes. **Prerequisites: #1601** and **#4696**. **Specify:** SDLC and/or BSC and/or Start/Stop operations are possible, see Table 4.

Local Attachment Interface (#4801%x): Provides circuits and controls for the local attachment of one BSC or SDLC remote station to the Communications Adapter without the use of modems at either device. Transmission speed can be strapped at installation time by the CE at 1200, 2400, 4800 and 9600 bps. The feature provides clocking for both the Communications Adapter and the terminal. The attached terminal must be equipped with an EIA RS-232-C or CCITT V.24/V.28 interface, have no Business Machine Clocking and have an external modem cable. The distance to the terminal may be extended via a customer-provided cable to allow a maximum distance between Communications Adapter and terminal of:

800 meters at 1200 bps
400 meters at 2400 bps
200 meters at 4800 bps
100 meters at 9600 bps

The feature includes cables to attach the Communications Adapter to a customer-supplied terminal plate and from the terminal plate to the DTE external modem cable. **Cable Order:** Required for attachment to terminal plate. Customer supplied cable for in-door use. **Maximum:** Eight. **Field Installation:** Yes. **Prerequisites: #1601** and **#4695**. **Specify:** SDLC and/or BSC operations are possible, see Table 4.

Digital Data Service Adapter (#5650%x): Provides circuits and controls for attachment of one BSC or SDLC line and includes an internal Dataphone Digital Service Adapter. The adapter allows interface to American Telephone and Private Line DDS Network via the American Telephone and Telegraph Channel Service Unit. The Digital Data Service Adapter will operate at synchronous speeds of 2400, 4800, 9600 and 56,000 bps. The speed must be set to the speed specified in the customer's order for service to the common carrier at installation time. These line features can be associated with each line position if the line speed does not exceed 9600 bps. **Limitations:** If feature **#5650** is installed with a speed of 56,000 bps (**#9444**), then: [1] High-Speed Modem Adapter (**#4720**) cannot be installed. [2] 231X DASD attached to the Block Multiplexer Channel (**#1421**) cannot be installed. [3] For speed limitations refer to the Communications Adapter Base feature description. **Maximum:** Eight. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites: #1601** and **#4695**. **Specify: #9444**%z for operation at 56,000 bps ... See Table 4 for Line Position Code, Transmission Mode Code, and line speed selection codes.

X.21 Adapter For Nonswitched Networks (#5655): Provides controls and circuits for attachment of one X.21 Point-to-point or multipoint nonswitched communication line via a DCE complying with CCITT recommendation X.21. Transmission may be at speeds of 2400, 4800, 9600 or 48,000 bps for point-to-point operations and 2400, 4800 and 9600 for multipoint operations. **Limitations:** If feature **#5655** operates at 48,000 bps (specify **#9831**), then the following limitations apply: [1] High-Speed Modem Adapter (#4720) cannot be installed ... [2] 231X DASD attached to the Block Multiplexer Channel (#1321) cannot be installed ... [3] For speed limitations, refer to the Communications Adapter Base feature description. **Maximum:** Up to eight may be installed, subject to the overall data rate limitations of the Communications Adapter. **Field Installation:** Yes. **Prerequisites: #1601** ... one **#4695** is required for each **#5655** installed. **Specify:** SDLC operation must be specified for this feature ... see Table 4 for line position, transmission mode and transmission speed codes. **Note: #9831**%x is required for 48,000 bps operation. **Cable Order:** Required for attachment to external equipment.

Table 4

Communications Adapter Configuration Feature And Position Codes

	Feature Number %x	Req'd Line Att Base %x	Line Pos. with Line Pos. Codes 1 %z	2 %z	3 %z	4 %z	5 %z	6 %z	7 %z	8 %z
EIA/CCITT Interface (for Clocked Modems)	3701	4695	9531	9532	9533	9534	9535	9536	9537	9538
EIA/CCITT Interface (for Non-clocked Modems)	3701	4696	9521	9522	9523	9524	9525	9526	9527	9528

Autocall Unit Interface (3)	1020									
First			9541	9542	9543	9544	9545	9546	9547	9548
Second			9551	9552	9553	9554	9555	9556	9557	9558
Transmission Mode (5)										
BSC (1)			9671	9672	9673	9674	9675	9676	9677	9678
Start/Stop (2)			9681	9682	9683	9684	9685	9686	9687	9688
SDLC (1)			9691	9692	9693	9694	9695	9696	9697	9698

Notes:

(1) BSC or SCLC transmission mode with any line attachment feature.

(2) Start/Stop transmission mode only with EIA/CCITT Interface (for nonclocked modem, **#3701** and prerequisite **#4696**) or with any other features offering 1200 bps Integrated Modems (with prerequisite **#4696**).

(3) Must be associated with EIA/CCITT Interface (**#3701** and prerequisite **#4695** or **#4696**). Maximum of two **#1020s** may be installed.

4331 Processor (cont'd)

(5) The aggregate data rate of the Communications Adapter is 64,000 bps ... Line Features exceeding this aggregate may be installed, but not operated concurrently. To allow the aggregate of 64,000 bps to be achieved, the highest speed line must be installed in line position one, the next highest in line position two, etc. Each transmission mode installed has different requirements for microcode storage ... see Table 1 for microcode storage requirements and possible requirement for Control Storage Expansion (**#1901**).

(7) May not be installed when 231X DASD is attached to the Block Multiplexer Channel (**#1421**).

(8) When changing **#9444** to/from **#9471**, no new hardware or diskette is required.

%z System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

%x Feature supplies diskette for System Diskette facility.

%y System Diskette-only special feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

MODEL CONVERSIONS

For model upgrade from the 4331 to a 4361 processor, refer to the M4361 pages.

Model Conversions within Model Group: Can be made in the field.

Model Group Conversions: Customer price quotation and customer order acknowledgement letters for purchase model upgrades must State: "Installations of this model upgrade involves the removal of parts which become the property of IBM."

Field upgrade from 4331 Model Group 1 to 4331 Model Group 11 is possible ... refer to M4331-11 pages.

Field upgrade from 4331 Model Group 1 to 4331 Model Group 2 is possible ... see below.

Field downgrade from 4331 Model Group 2 to 4321 or 4331 Model Group 1 is not recommended. Field downgrade from 4331 Model Group 11 to 4331 Model Group 1 is not recommended.

For upgrade from 4321 to 4331 Mdl Group 2, refer to 4321 pages.

Field upgrade from 4331 Model Group 1 to Model Group 2: For upgrade of a purchase 4331 Mdl Group 1 processor to Mdl Group 2, conversion RPQ number 7B0697 is required in addition to the mdl upgrade MES if Control Storage Expansion (**#1901**) is not installed or on order for installation prior to the mdl upgrade installation.

ACCESSORIES

CONSOLE TABLE

An operator workstation with modesty skirt has capabilities for two operators with two 3278 mdl 2A/3279 mdl 2C and room for reference material. Attachable book racks may be ordered for manual storage and also serves as a cable control device for the 3278 mdl 2A/3279 mdl 2C, telephones, etc. Table dimensions are 1590mm x 815mm and is equipped with gliders. For field installation, order feature via MES specify on the 4300:

4300 Processors Console Table Accessory, **#1550**
4300 Processors Bookrack and Cable Holder, **#1480**

Console table will be supplied in the same color as the basic machine. It is available only on a purchase basis.

LOOP - ACCESSORIES

A group of accessory products are offered to permit plant electricians or contract personnel to install the loops. Refer to *IBM Multiuse Communications Loop Planning and Installation Guide,* GA23-3341, for information necessary to plan the layout and for selection of the loop hardware, for Installation and Testing information.

Loop Splice Plate (LSP): The LSP splices together two segments of indoor cable or provides a connecting point for future expansion of the loop. The LSP consists of a single connector strip, to which the incoming loop cable and the outgoing loop cable can be attached; it is installed in a standard outlet box for business office environments, or weatherproof outlet box for industrial environments.

Loop Station Connector (LSC): The LSC is available as two unique types: Wrap and radial. The wrap LSC attaches an I/O unit or controller directly to the main loop cable; the radial LSC attaches an I/O unit only through an LWC to the loop. The wrap LSC attaches an incoming and outgoing loop cable; the radial LSC attaches at the end of one loop cable from the LWC.

The wrap LSC also offers the isolation feature of wrapping, which allows the customer to wrap the loop away from a loop wiring failure or to reconfigure the loop during alterations. Both wrap and radial LSCs contain bypass relays that bypass the I/O unit when the I/O unit is powered-off or disconnected. These accessories are installed in a standard or weatherproof outlet box.

2 X 4 Adapter Plate (2AP): The 2" X 4" Adapter Plate is used with the Loop Station Connector and accommodates the use of standard outlet boxes that have dimensions smaller than the outlet boxes defined in the Loop Installation and Planning Guide. It is not to be used with the environmental boxes.

Loop Wiring Concentrator (LWC): The LWC provides the facility to attach a cluster of I/O units without a large number of drops on the loop cable. It attaches up to eight radial LSCs at the end of loop cables called *radials.* The point where a radial line terminates at the LWC is called an LWC *port.* Not all ports have to be used; unused ports can be reserved for future expansion.

The LWC has the same wrapping capability as the wrap LSC. In addition, the LWC allows the customer to bypass one or more of the radials by setting a corresponding switch located inside the LWC.

The LWC has its own enclosure or can be mounted in a NEMA-4X environmental equipment cabinet, with minimum measurement of 36x30x15cm (14x12x6 in.).

Loop Surge Suppressor (LSS): The LSS allows the loop to be run across an outdoor space to another building. It attaches two outdoor cables and two indoor cables, allowing the proper termination and grounding for each type of cable. In addition, the LSS contains four surge protectors, one for each twisted pair in the two outdoor cables, to protect from voltage surges caused by near strikes of lightning. There is no protection in the LSS from a direct lightning strike.

The LSS has its own enclosure or can be mounted in an electrical equipment cabinet, with minimum measurement of 36x30x15cm (14x12x6 in).

Continuity And Relay Tester: The Continuity and Relay Tester is used with a customer supplied volt-ohm meter, capable of reading 0.5 ohms and rated at least 5000 ohms/volt, to verify the loop installation, including loop cabling and accessories, after completion. By plugging the tester into any loop station connector and connecting the volt-ohm meter to the tester, the condition of the wire segment being tested can be determined as to conductor and shield continuity (opens or shorts), wrap switch operation, and total lobe resistance.

The loop station connector relays are also activated and their operation verified with this tester.

System Loop Accessories	Part Number
Loop Splice Plate (LSP) (indoor)	**1657300**
Loop Station Connector (Radial LSC)	**1657310**
Loop Station Connector (Wrap LSC)	**1657320**
Loop Station Connector Gasket	**1657260**
Loop Wiring Concentrator (LWC)	**1657330**
LWC Circuit Board Assy (order instead of LWC-1657330) *	**1657332**
Loop Surge Suppressor (LSS)	**1657350**
LSS Circuit Board Assy (order instead of LSS-1657350) *	**1657354**
Continuity and Relay Tester	**1657420**
Wrap Switch Access Cover	**1657325**
Loop Accessory Keys (10 spares) **	**1657379**
2 X 4 Adapter Plate (2AP)	**7838771**
Conventional Box (indoor) 5 x 10cm - (2 x 4 inches)	**2102151**
Clamp (for cable to indoor box)	**2100264**
ElectricalBox (outdoor) 7 x 11.5cm - (2.75 x 4.5 inches) (For industrial use)	**1657280**
Clamp - small (for indoor cable to environmental box)	**2114285**
Clamp - large (for outdoor cable to environmental box)	**1657377**

* For use with NEMA-4X enclosure and associated parts (used when installing in harsh environments) or as a replacement part for the LWC or LSS.

** 1 package (10 keys) shipped with each 43XX with Loop Adapter 1 (#4830), 1 key shipped with each LWC and wrap LSC.

Order via MSORDER (Order Category = Supplies/ Accessories; Group Code = DP Supply Order). When ordering, use Machine type 43XX with Loop Adapter 1 (#4830). Allow lead time of 120 days.

Warranty: All loop accessories are warranted free from defects of workmanship and materials for 90 days.

Customer Responsibilities: The customer is responsible to provide (purchase, install, test, and maintain) the loop cables and accessories for terminal attachments.

The customer is also responsible for procuring and stocking spare cable and spare parts for loop accessories.

See *IBM Multiuse Communications Loop Planning and Installation Guide,* (GA27-3341) for a suggested schedule to allow the customer to

4331 Processor (cont'd)

plan, install, and test the loop cable and accessories prior to delivery of the system.

It is recommended that the customer order additional loop components for spares with the initial order, as spares will not be stocked in the Branch Office.

To enable a customer to test his installed loops it is recommended that the customer order a Continuity and Relay Tester. Testing the loop wiring will require the tester or its equivalent.

LOOP - CABLES

Loop Cables may be purchased from IBM or a customer selected source. See *IBM Multiuse Communication Loop Planning and Installation Guide,* GA27-3341, for part numbers, specifications and usage which is necessary for preplanning and ordering.

- **Indoor Cable P/N 1657265**: UL approved (style 2919) for interconnection of low voltage electronic equipment. Maximum allowable cable temperature range is -34°C to +80°C.
- **Indoor Cable P/N 7838694**: UL approved for cable tray installation (NEC Art. 725-40b3). Maximum allowable cable temperature range is -34°C to +90°C.
- **Indoor Cable P/N 7838695**: UL approved for duct and plenum installation (NEC Art. 725-2b). Maximum allowable cable temperature range is -34°C to +105°C.
- **Outdoor Cable P/N 1657267**: For above ground installation. Maximum allowable cable temperature range is -34°C to +80°C.
- **Outdoor Cable P/N 1657268**: For below ground installation. Maximum allowable cable temperature range is -34°C to +80°C.

Ordering Instructions: Interior cable (**P/N 1657265, 7838694** and **7838695**) should be ordered in lengths of 304.8m to 609.6m (1000 to 2,000 feet). Additional lengths up to 609.6m (2,000 ft.) can be ordered by specifying the length wanted. Indoor cable splices can be accomplished via **P/N 1657300**. A minimum order quantity is 304.8M (1,000 feet).

Exterior cable (**P/N's 1657267** and **1657268**) should be ordered in one continuous length, up to a maximum of 914.4m (3,000 feet), by specifying the length wanted.) Outdoor splices with aerial and burial cable should be avoided. Order via MSORDER (Category = Bulk Cable). Specify cable part number and number of feet desired.

Warranty: Loop cable is warranted free from defects of workmanship and materials for 90 days.

SUPPLIES (None)

4331 PROCESSOR MODEL GROUP 11

PURPOSE

Provides the power, control, logic and memory circuitry necessary for the arithmetic, logic and processor storage functions of the 4331 Processor models, including I/O channels and integrated adapters.

MODELS

Group-Model	Processor Storage (bytes)	Buffer Storage (bytes)
Model J11	1,048,576	4,096
Model K11	2,097,152	4,096
Model L11	4,194,304	4,096

Prerequisites: Each system requires an operator's display, keyboard and control panel to allow Initial Microcode Load (IML) and interaction with the hardware/software system. A 3278 Display Console mdl 2A or a 3279 Color Display Console mdl 2C with keyboard and control panel is required for this purpose.

Maximum Configuration: The channel load of the attached I/O devices has to be checked against the load limitations of the processor. Refer to *IBM 4331 Processor Channel Characteristics,* GA33-1550 or use the HONE aid ANCHLOAD.

HIGHLIGHTS

The 4331 Mdl Group 11 is a featured processor with up to four megabytes of processor storage and contains the following standard hardware features:

	Feature Number on Mdl Group 1 and 2
One block multiplexer channel	#1421
Communications Adapter Base	#1601
128K bytes of control storage	#1901*
Display/Printer Adapter Expansion (16 ports)	#2001
One DASD adapter (3310, 3370 A1 attachment)	#3201
One 8809 adapter	#4910
One byte multiplexer channel	#5248
Power Interface	#5531
3340/3344 Direct Attachment	#7851
ECPS: VM/370 (VM assist microcode)	#8701

* Mdl Group 1

These features are not ordered separately. The processor can contain up to 4,194,304 bytes of monolithic processor storage. Data flow is four bytes parallel. Processor fetch and store cycles for the buffer are each 200 nanoseconds for four bytes. Buffer storage is automatically replenished from processor storage in 64 byte units at a time. The 64 byte fetch cycle requires 2.6 microseconds, the store cycle requires 3.1 microseconds. The processor is microcode controlled.

> **Note:** The microcode which controls system operations resides in Processor Storage, Reloadable Control Storage and Read-Only Storage. 4331 Mdl Group 11 includes 131,072 bytes of Control Storage plus 12,288 bytes of Read-only Storage. In addition to the microcode contained in this storage approximately 200,000 bytes of Processor Storage are occupied by microcode, RAS workspace and system data.

Standard Functions:

- Processor storage: 1,048,576, 2,097,152 or 4,194,304 bytes for Model Group 11. Approximately 200,000 bytes of processor storage are allocated for system/microcode use. The 4331 Mdl Group11 configurations require a portion of processor storage to be allocated for system microcode use. See Table 1 for details.
- ECPS:VSE Mode or S/370 Mode: In S/370 mode, both Extended Control (EC) and Basic Control (BC) are available. The 4331 Processor operates in either S/370 Mode or in Extended Control Program Support:VSE Mode. The system mode is selectable at Initial Program Load (IPL) time: S/370 Mode allows operation of VM/370, VSE, DOS/VS and DOS. (See "Programming Note" below for details.) ECPS:VSE mode supports operation of an appropriately generated VSE system, with enhanced systems performance.
- Display/Printer Adapter allows attachment of:
  - 3178 Display Station
  - 3262 Line Printer mdl 1 (650 lpm system printer)
  - 3262 Line Printer mdl 11 (325 lpm system printer)
  - 3268 Printer mdl 2 and 2C (340 cps)
  - 3230 Printer mdl 2 (350/450 cps burst speed)
  - 3289 Line Printer mdl 4 (400 lpm system printer)
  - 3278 Display Station mdl 2, and keyboards
  - 3279 Color Display Station mdl 2A and keyboards
  - 3278 Display Console mdl 2A, keyboard and control panel
  - 3279 Color Display Console mdl 2C, keyboard and control panel
  - 3287 Printer mdls 1,2, 1X and 2C.
  - 4250 Printer
  - 6580 Displaywriter System mdl A4, A6, A8, A10 (25 line display)
- The System Diskette Facility is the microcode loading system for the 4331 Processor. The diskettes shipped with the 4331 Processor will supply the required microcode for diagnostics, Standard Functions, and the special features ordered. The System Diskette Facility also allows storage of failure data from 4331 Processor errors which can subsequently be analyzed by the CE for maintenance purposes.
- Reloadable and Read-Only Control Storage is provided in addition to processor storage. This provides storage space for a portion of system microcode in support of standard functions and special features of the 4331 Processor. The Reloadable Control Storage is not available to the user. 4331 Mdl Group 11 includes 131,072 bytes of Reloadable Control Storage plus 12,288 bytes of ROS.
- Remote Support Facility (RSF) is an IBM CE tool permitting IBM Field Technical Support Center specialists to remotely monitor and/or perform problem diagnosis on the 4331 Processor. This includes remotely-initiated execution of diagnostic programs, remote examination of all or selected logout records from the System Diskette Facility, and (with proper customer authorization) remote exercise of the Customer Manual Operations.
- Remote Operator Console Facility (ROCF) provides the ability to IML/IPL and execute manual control functions on a remote 4331 via a 3275 (real or emulated) terminal at a host location.

Other Standard Functions are:

- Virtual Storage capability by Dynamic Address Translation
- One level addressing facility for improved virtual storage control by VSE (ECPS:VSE mode)
- Channels with virtual storage addressing (ECPS:VSE mode)
- Channel Indirect Data Addressing (in S/370 Mode)
- S/370 Universal Instruction Set
- Extended Precision Floating Point
- Conditional Swapping
- CE maintenance support functions
- Storage Protection (Store and Fetch)
- Byte-Oriented Operands
- Clock Comparator and CPU timer
- Time-of-Day Clock
- Interval Timer
- PSW Key Handling
- Control Registers
- Machine Check Handling
- Program Event Recording
- Monitoring
- Clear I/O
- Move inverse instruction (not used by IBM programs)
- 4,096 bytes of high-speed storage.

Programming Note: The ECPS:VSE mode may be invoked at IPL time and supports operation of an appropriately generated VSE Control Program with VSE/Advanced Functions and the SSX/VSE control program.

In S/370 Mode, operation of VSE with VSE/Advanced Functions (generated for use in S/370 Mode), VM/370 Release 6 with or without VM/System Product or VM/BSE Release 2 or VM/SE Release 2 are supported. Although not supported, DOS Release 26 and DOS/VS Release 34 will operate on the 4331 Processor when in S/370 Mode.

Console Function: An operator's display, keyboard and control panel is a prerequisite for use of the system by the customer. A 3278 Display Console mdl 2A or a 3279 color Display Console mdl 2C is required for this purpose. The Operator Control Panel allows additional operator communication with the system. Depending on the mode of console operation, a maximum of 20 of the 25 lines on the display may be used for system communication, four are reserved for messages from the 4331 Processor hardware system, and one displays messages unique to the 3278 Display Console mdl 2A or the 3279 Color Display Console mdl 2C. The console address is selected at system installation time from the range 009 through 01F.

The console functions in one of two modes: "Display Mode" or the "Printer-Keyboard Mode". In the "Printer-Keyboard Mode", the

4331 Processor Mdl Group 11 (cont'd)

Display Console uses the keyboard for input and the display and a 3287 Printer mdl 1, 2, 1C and 2C or 3268 mdl 2 or 2C for output. The CRT, keyboard and printer appear to the system as a 1052 Printer/Keyboard and operate compatibly with S/360 console operations or as a 3210/3215 Console Printer-Keyboard and operate compatibly with S/370 Console operations. The operation of the 3287 or 3268 mdl 2 or 2C in this mode is optional, but recommended. The "Printer-Keyboard Mode" and the 4250 attachment are mutually exclusive.

In "Display Mode" the keyboard is used for input and the CRT with 20 lines by 80 characters/line is used for output. The 3287 mdls 1, 2, 1C or 2C or 3268 mdl 2 or 2C if attached, has its own address and must be supported by either the 3277 Console Support of DOS/VS Release 34, the 3277 Console Support of VSE, the local-attached 3286/3287 Printer support of VM/370, or the equivalent of any of these.

Another function of the console is the Remote Operator Console Facility (ROCF) which provides the ability to IPL and execute manual control functions on a remote 4331 via a real or emulated 3275 terminal at a host location. ROCF is an extension of Remote Support Facility (RSF).

ECPS:VM/370: The 4331 Processor provides ECPS:VM/370 support at Level 19. This support is compatible with VM/370 Release 6 and VM/System Product or VM/BSE Release 2 or VM/SE Release 2 corresponding levels of the System Extension Program Products. The functional areas assisted include: Virtual Machine I/O, SVC Handler, Privileged Instruction emulation and Virtual Interval Time. **Limitations:** May only operate when S/370 Mode has been invoked by IPL.

Byte Multiplexer Channel (Standard): Functionally equivalent to the byte multiplexer channel on S/360 and S/370 and provides eight control unit positions. The channel permits simultaneous operations of low-speed devices. Operates at up to 36K bytes per second in single byte mode. Up to 500K bytes per second in burst mode. See *IBM 4331 Channel Characteristics,* GA33-1550, for devices which may be attached and the data rates achievable for certain configurations. The Byte Multiplexer Channel is always addressed as channel 0. **Limitation:** Magnetic tape devices may not be attached to the byte MPX channel when 231X devices are attached to the block multiplexer channel.

Subchannels: The 4331 mdl Group 11 byte Multiplexer Channel provides up to 36 subchannels, 4 of which are shared subchannels with up to 16 devices each. The maximum number of 36 subchannels is reduced by one for the Communications Adapter and one for each telecommunication line on the Communications Adapter.

Block Multiplexer Channel (Standard): Provides eight control unit positions. The Block Multiplexer Channel permits simultaneous operation of high-speed devices. Ability to "Block Multiplex" and facility for multiple requesting allows several I/O units to operate concurrently with greater channel efficiency. Devices attached to these channels which cannot utilize block multiplexing will function as if attached to selector channels. 33XX devices (and the 3830 or 3880 storage control units) do not attach.

Data rate is up to 1.25 million bytes per second ... see *IBM 4331 Channel Characteristics,* GA33-1550, for details. Channel addresses may be selected at installation time from the range of 1 to 6.

Subchannels: The following subchannel combinations can be configured at installation time:

- up to 256 non-shared or shared subchannels each with devices in multiples of 8, up to a total of 256 devices.

Integrated I/O Adapters: The following I/O adapters control the designated I/O devices:

DASD Adapter (Standard)
8809 Magnetic Tape Unit Adapter (Standard)
Display/Printer Adapter (16 Ports, Standard)
Communications Adapter Base (Standard)
5424 Adapter
Loop Adapter

Note: All data passing through the system for any I/O device interferes with the data flow for other devices, producing I/O limitations. The limitations take two forms:

(1) Hardware exclusivities listed in the feature descriptions.

(2) I/O attachments which individually or in combination can produce frequent overruns. Considerations in this category are:
- The aggregate data rate on the Block Multiplexer Channel and the DASD Adapter.
- The number and speed of lines attached to the Communications Adapter.
- The number and class of overrunable devices on the Byte Multiplexer Channel.

It is necessary to consult the *IBM 4331 Channel Characteristics Manual,* GA33-1550, to properly configure a 4331 with an I/O configuration that has not previously been analyzed.

DASD Adapter (Standard): One DASD Adapter provides direct attachment of 3310, 3370 A1 and/or 3340/3344 Direct Access Storage Devices without the necessity of a control unit. The 3310 and the 3370 operate in fixed block mode. The 3340/3344 operates in Count-Key-Data (CKD) mode. When using 3340/3344 exclusively system throughput can be degraded by a factor of more than two compared with use of fixed block mode devices.

Up to four strings of devices may be attached to the adapter. The attachable device types may be intermixed on the adapter but not within a string. The maximum number of strings of each type of device on the DASD Adapter is:

a) Up to four 3310 mdl A1s or A2s with 3310 mdl B units attached, up to a maximum of 4 drives per string.

b) Up to four 3370 mdl A1s with 3370 mdl B1 units attached, up to a maximum of 4 devices (8 actuators) per string.

c) Up to two 3340 mdl A2s with 3340/3344 mdl B units attached, up to a maximum of eight drives per string. Attachment of 3340/3344 is limited to two strings on the system.

The String Switch Capability allows sharing of 3340/3344 or 3370 DASD with another IBM processor or control unit that supports the DASD and string switching. String switch support for the 3340/3344 is limited to the static assignment of a shared string to one processor at a time. The 3340-A2 or the 3370-A1 must have the string switch feature #8150 installed.

With a directly attached 3340 the DASD Adapter can read data from a 3348 Data Module which was recorded on a 3340 attached to a System/3 mdl 12 or 15. This function is available as a conversion aid for users converting to the 4331 Processors from a System/3.

3340/3344 devices attaching to the DASD Adapter have logical unit/device addresses as follows:

X00	**01**	**02**	**03**	**04**	**05**	**06**	**07**
		2A	2B	2C	2D	2E	2F
		4A	4B	4C	4D	4E	4F
		6A	6B	6C	6D	6E	6F
				and			
X10	**11**	**12**	**13**	**14**	**15**	**16**	**17**
		3A	3B	3C	3D	3E	3F
		5A	5B	5C	5D	5E	5F
		7A	7B	7C	7D	7E	7F

Addresses for up to four strings of 3310 and 3370 can be configured at installation time in the range from X0X to X7X. The channel address may be from 1 to 6.

Display/Printer Adapter (Standard): This adapter allows for attachment of the prerequisite 3278 Display Console mdl 2A or a 3279 Color Display Console mdl 2C and up to fifteen additional devices chosen from the list below:

3178 Display Station
3230 Printer mdl 2 (350/450 cps burst speed)
3262 Line Printer mdl 1 and 11 (650 and 325 lpm)
3268 Printer mdl 2 and 2C (340 cps)
3278 Display Station mdl 2
3279 Color Display Station mdl 2A
3287 Printer mdls 1, 2, 1C and 2C (80 and 120 cps)
3289 Printer mdl 4 (400 lpm)
4250 Printer
6580 Displaywriter System mdl A4, A6, A8, A10 (25 line display)

These machines may be installed in any combination, provided that (1) only fifteen devices are installed and (2) no more than two System Printers (3262 and/or 3289) are included. Due to the processing power requirements, it is not practical to attach more than four 4250 printers. The 6580 Displaywriter System can connect to 1 or 2 device ports (display station, or display station and printer).

The 3262 or the 3289 Line Printer may be used as system printers dependent upon control program or program product support. One 3287 Printer may be used as a console hardcopy device; one or more 3287 Printers may be used as hardcopy workstation devices. The 3178 Display Station, 3278 Display Station mdl 2 or 3279 Color Display Station mdl 2A may be used as workstations for user-written applications.

The 6580 Displaywriter System emulates a 3278 mdl 2 Display Station, and, optionally, a 3278 mdl 1, 2 Printer. The 6580 may be used as a work station for user-written applications and for hard copy, as a 3278 mdl 2 and 3287 mdl 1, 2. Display/Printer Adapter support includes all standard functions of the 3274 mdl X1B with the 3178, 3278 mdl 2 or 3279 mdl 2A attached. In addition, the following 3278 mdl 2 or 3279 mdl 2A special features are supported: Keyboard Numeric Lock (standard on the 3178), Audible Alarm (standard on the 3178 or 3279), Security Keylock (standard on the 3178) and Switched Control Unit.

4331 Processor Mdl Group 11 (cont'd)

Other 3278 mdl 2 or 3279 mdl 2A special features are not supported. When used as workstations, 3278 or 3279 Display Station keyboard feature codes #4621, #4622, #4623, #4627 , #4624, #4628 or 3178 mdl C1 or C2 may be selected. If two different keyboards are required for a workstation, one must be #4621. Addresses for these devices are selected at installation time from the range 009 through 01F.

The 6580 Displaywriter System prerequisities for attachment include the 3270 Attached Work Station licensed program (5608-SR9) and the 3274/3276 Attached Work Station adapter (#8332) and specify **#9842** in the 4331 must be ordered for attachment of Displaywriter.

Diskette Drive (Optional): A single drive diskette reader/recorder providing the ability to read or write Diskettes Type I on the 4331 Processor. This diskette has a data capacity of 242,944 bytes organized in 1,898 sectors of 128 bytes each (for use in exchanging data with the several products listed below). The Diskette Drive is supported by the control program as a 3540 Diskette Input/Output Unit. When used with VSE, refer to VSE/POWER documentation. Data recorded on a Diskette Type I can be interchanged with IBM devices and systems which have a diskette drive. Examples are the 3740, 3770, 3790, 5230 and 8100 and Series/1 and Systems/3, 32, 34, and 38. One diskette is shipped with the feature. Additional diskettes are available from IBM Information Records Division (SSD). Device address is selected at installation time from the range 009 through 01F. **Limitation:** Support by VM/370 via IUP only.

8809 Magnetic Tape Unit Adapter (Standard): Provides direct attachment of 8809 mdl 1A and up to five additional 8809 tape units (consisting of a mix of 8809 mdl 2s and 3s) ... allows the 8809 Magnetic Tape Unit to operate in streaming mode (date rate is up to 160K bytes per second) for loading or offloading DASD devices or in start/stop mode (data rates is up to 20K bytes per second) for other data processing operations. Although physical Read-Backward commands are not supported, the Read-Backward operation is simulated in the Logical IOCS (MTMOD) of VSE. Channel and device addresses may be assigned at system installation time from the range of X00 to X7F, where X is 1 to 6.

5424 Adapter (Optional): Provides native attachment of 5424 Multi Function Card Unit mdls A1 or A2 for 96-column card operations, device address is 04C.

Loop Adapter (Optional): The Loop Adapter on the 4331 is a native attachment method for the 3640 Plant Data Communications Terminals ... 3104 Display Terminals mdls B1, B2 ... 8775 Display Terminal mdls 1 and 2. 3232 Keyboard Printer ... 3287 Printer ... 3274 Control Unit mdl 51C, 61C ... 3276 Control Unit Display Station with their associated terminals. Communications is based on SDLC loop protocols. The Loop Adapter provides the user with a native interface to these terminals and increased configuration flexiblity.

A maximum of two direct attached loops and two data link adapters are supported. Each of the direct attached loops consists of two lobes (loop cables), for a total of four lobes on the system. Both lobes must operate at the same bit rate. Each lobe is functionally a loop however, all data on one lobe passes serially through the second lobe and can be as long as the loop, and a fault in one lobe will not affect the terminals on the second lobe, when the disrupted lobe is bypassed at the system. Therefore lobes can cover a greater distance and improve availability.

Each of the data link adapters can attach one IBM 3843 Loop Control Unit as point-to-point or up to 4 Loop Control Units as multipoint configuration. Details on programming information are provided in the *IBM 4331 Loop Adapter Programming Guide*, SC31-0500-0.

User-written programs for loop-attached terminals reside in the 4331 Processor storage and are controlled by VSE and ACF/VTAME or ACF/VTAM and CICS/DOS/VS. The 3644 Automatic Data Unit and 8775 Display Terminal with Downstream Loadable Functions are supported by ACF/VTAME and DSLU with VSE. In order to personalize the 3644, the GEN3644 program product is required in addition to DSLU.

In addition IBM offers a PRPQ to CICS/VS announced December 23, 1980 with P80-282. This PRPQ Loop Adapter CICS/VS Extension for 3640 terminals is a series of programs and exit routines that enhance the support of the 3641, 3642, 3644, 3646 and 3647 when attached to the 4331 Processor by Loop Adapter Feature. The following four functions are addressed by this PRPQ:

- Terminal initialization
- Terminal re-initialization
- 3642 encode check handling
- Transaction selection

Communications network management problem determination support for 4331 loop-attached 3104 Display Terminals, 8775 Display Terminals, 3232 Keyboard Printer mdl 11, 3276 Display Control Stations and 3274 mdl 51C, 61C Display Controllers and their/associated terminals, is provided via NCCF/NPDA.

The following terminals/controllers are supported: 3641 Reporting Terminal mdls 1, 2 ... 3642 Encoder Printer mdls 1, 2 ... 3643 Keyboard Display mdl 2, 3, 4 including #4920 Badge and Document Encoder ... 3644 Automatic Data Unit ... 3645 Printer ... 3646 Scanner Control Unit ... 3647 Time and Attendance Terminal ... 3104 Display Terminal mdls B1, B2 ... 8775 Display Terminal mdls 1,2 ... 3232 Keyboard Printer mdl 11 ... 3287 Printer mdls 11, 12 ... 3274 Control Unit mdl 51C, 61C ... 3276 Control Unit Display Station mdls 11-14 with their associated terminals ... 3843 Loop Control Unit. Device addresses are 040 through 07E.

Communications Adapter Base (Standard): The 4331 Communications Adapter can serve up to eight communication lines. Synchronous Data Link Control (SDLC), Binary Synchronous Communications (BSC) and Start/Stop (asynchronous) transmission modes are provided (Start/Stop and BSC operate in 2703 compatibility mode). The Communications Adapter can handle a variety of terminals (Data Terminal Equipments, DTEs), at different speeds.

The Communications Adapter has the following overall structure: The Communications Adapter Base contains common circuits and control. Each of the up to eight telecommunication lines attachable requires one Line Attachment Base (two different types) and one line attachment feature. Another feature serves for autocall unit interface and two may be installed.

The interface with the external communication facilities is through a modem (also called signal converter or Data Circuit Terminating Equipment). It may be a stand-alone unit or a 1200 bps integrated modem. For Communications Adapter Base details, see section "Communications and Loops" below.

IBM Stand- Alone Modems

Switched

3863	2400 bps
3864	4800 bps
3872	1200/2400 bps
3874	2400/4800 bps

Nonswitched

The following modems are supported with the Switched Network Backup feature ... see M3863, 3864, 3865, 3872, 3874, 3875 pages for details:

3863	2400 bps
3864	4800 bps
3865	9600 bps
3872	1200/2400 bps
3874	2400/4800 bps
3875	3600/7200 bps

IBM Integrated Modem (V.23, 1200 bps): The following integrated modem configurations are available:

- Switched network with auto answer
- Nonswitched line, 2- or 4-wire.
- Nonswitched line with switched network backup and auto answer.
- Nonswitched line with switched network backup with manual answer.

OEM Modems: OEM modems that comply with EIA RS-232-C, CCITT V.24/V.28, or CCITT V.35 recommendations may be connected to the Communications Adapter. Attachment is under the provisions of the Multiple Supplier Systems Policy.

Digital Data Service Adapter: The Digital Data Service Adapter allows attachment to the AT&T Private Line Dataphone* Digital Service Network by way of an internal Digital Data Service (DDS*) adapter.

* Dataphone and DDS are registered trademarks of the AT & T Company. Other usage of Dataphone and DDS in this text also refers to the registered trademarks of AT & .

X.21 Adapter for Nonswitched Networks: The X.21 interface allows attachment to the X.21 facilities by way of an internal X.21 adapter.

Automatic Calling Equipment: The following Automatic Calling Equipment, maximum two, can be attached to the Communications Adapter:

- 3872 with Automatic Call Originate feature
- 3874 with Automatic Call Originate feature
- Other Automatic Calling Equipment which complies with EIA RS-366 or CCITT V.25 may be connected to the Autocall Unit Interface (#1020) under the provisions of the IBM Multiple Supplier Systems Bulletin.

SPECIFY

Unless otherwise indicated, these specify features are only available at time of manufacture.

- Voltage (1-phase, 3 wire, 60 Hz): **#9902** for 208V, **#9914** for 240V.
- Color: **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, **#9065** for pebble gray.
- Specify **#9841** in 4331 must be ordered for attachment of 3230 or 3268 to 4331. Provides microcode and/or maintenance documen-

4331 Processor Mdl Group 11 (cont'd)

tation if machine is below EC 366586 (microcode for 4331) and/or below EC 366584 (maintenance document) for all mdls.

- 4250 Printer Attachment: Specify **(#9260)** for 4250 Printer attachment to display adapter.
- 6580 Displaywriter System Attachment: Specify **(#9842)** for 6580 attachment to the Display/Printer Adapter.
- Remote Support Facility: The Remote Support Facility (RSF) is a customer option. It is recommended to enhance the hardware maintenance of the 4331 Processor. It provides service personnel the capability of remotely controlling the 4331 from any RETAIN terminal and allows the CE to access the RETAIN Data Bank for the latest service aids and information from the customer site. When RSF is selected, the customer must provide the telephone lines required for the RSF modem. The customer must also arrange for the connection of the telephone interface cable provided by IBM to the telephone network. For details on customer responsibilities, see *IBM 4300 Processors Installation Manual-Physical Planning,* GA24-3667.

  RSF is available in two versions:

  Specify **#9510** for integrated modem, 1200 bps, switched network, manual answer. A telephone with FCC registered Data Access Arrangement (DAA) compatible with CDT Coupler Series 1000A interface and operation, with a 4-prong jack, is required.

  Specify **#9511** for EIA RS-232-C Interface, 1200 bps, switched network, manual answer. An FCC registered external cable modem compatible with the WE 202S modem, interface and operation, or equivalent, is required.
- Remote Operator Console Facility (ROCF): This feature is an extension of RSF. It provides to an operator at a host location the ability to IML, IPL and execute other 4331 manual control functions for a remote 4331 via a real* or emulated 3275 terminal (Remote Console). After IML and IPL is complete the Remote Operator console should be disconnected and the remote 4331 should be operated in stand-alone mode or control should be turned over to existing networking facilities. ROCF is not designed to be used for interactive applications because operation of all devices attached to the Display/Printer Adapter of the 4331 are suppressed when ROCF is in use. **Field Installation:** Yes.

  * 3275 mdl 2 can only be obtained on an "as available" basis.

  Specify ROCF feature **#9511**. The requisite customer supplied non-clocked external modem attached to feature **#9511** must include auto answer. Line discipline is BSC, 600 or 1200 bps/sec.
- Loop-Attached Terminals: The following specify codes must be selected one time when 3640 and/or 8775 and/or 3287 Terminals and/or 3274-51C, 61C and/or 3276 Control Units are attached to the system via Loop Adapter 1 and/or 2 (#4830, #4831) and/or Data Link Adapters (#4840).

Specify	Selected Terminals
#9251	3641 Reporting Terminal/3647 Time and Attendance Terminal
#9252	3642 Encoder Printer
#9253	3643 Keyboard Display
#9254	3644 Automatic Data Unit (ADU)
#9256	3646 Scanner Control Unit
#9257	8775 Display Terminal 3287/3645 Printer 3274-51C, 61C and 3276 Control Unit and 3104 Display Terminal
#9258	3643 Keyboard Display with #4920

- Keyboard/Character Set Language: When 3178 Display Station, 3278 Display Stations mdl 2 and/or 3287 Printers and/or 3268 Printer mdl 2 are attached to the Display/Printer Adapter, specify on the 4331 Processor:

  #9441: For ASCII Keyboard/Character Set Language (#4624, #4628, on 3278 mdl 2 or 3279 mdl 2A or S2A and/or 3287 with **#9084**), when used as a workstation, or

  #9442: For EBCDIC Data Entry Keyboards (3178 mdl C1, 3278 mdl 2 or 3279 mdl 2A or S2A with #4622, #4623). In addition, specify on the 4331 Processor either **#9301** for Data Entry Keyboard or **#9302** for Data Entry Keyboard, keypunch layout.

  No specify codes on the 4331 are required for EBCDIC Typewriter Keyboards (3178 mdl C2 or #4621, #4627 on 3278 mdl 2 or 3279 mdl 2A S2A). The 6580 Displaywriter System supports the EBCDIC typewriter keyboard.

  Note: The keyboard/character set language selected must correspond with the mdl of 3178 or the specifications on the 3278 mdl 2 or 3279 mdl 2A or S2A and 3287s. ASCII keyboards are supported as indicated, but the internal binary codes are EBCDIC.
- Console Table: A console table is available ... see #1550 or M4331-1 "Accessories" section. Book Rack and Cable Holder ... see #1480 or M4331-1 "Accessories" section.
- See 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C for console cabling.
- System Environment: For record purposes specify one of the following codes (reference only, no parts required):

  #9701 - This processor is planned to be host/peer connected to a system within the same branch office territory (at installation or at a future time).

  #9702 - This processor is planned to be host/peer connected to a system in a different branch office territory (at installation or at a future time).

  #9703 - This processor is planned to be stand-alone (no host/peer connect).

SPECIAL FEATURES

Notes:

%z System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

%x Feature supplies diskette for System Diskette facility.

%y System Diskette-only special feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

Adapter Power Prerequisite (#1001): Provides power and control circuitry necessary for the Communications Adapter, (when more than three line features are attached), and the Adapter Logic. **Maximum:** One. **Field Installation:** Yes. **Prerequisite:** #1002 or for the Loop Adapter (#4830) and/or Communications Adapter Base with more than three line attachments #4695 and/or #4696.

Adapter Logic Prerequisite (#1002): Provides logic and control function necessary for the 5424 Adapter (#3901). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1001.

Microcode Storage Requirements: The System microcode resides in the Reloadable Control Storage and Processor Storage, and is loaded from the standard System Diskette facility at IML-time. None of the Reloadable Control Storage is available for user programming and the systems configuration selected will determine the Processor Storage available for user programming and operating system residence.

To calculate the amount of Processor Storage which is available for customer purposes and operating system residence, use the following procedure.

Note: An interactive HONE aid (ANCHLOAD) is available dependent on the control program or program product device support to facilitate this procedure.

1) Consulting Table 2, determine the microcode groups required to support the features and I/O to be installed.
2) On the Table 3, place a check mark in the appropriate rows.
3) Find the sum of Table 3 for the required microcode groups.
4) Subtract the control storage of 143,360 bytes from the total of Table 3 and round up to the next multiple of 4,096.

The result of step 4 determines the amount of processor storage occupied by microcode and should be subtracted from the processor storage size ordered to determine the amount available for the user. The storage for group 3 specified in Table 2 (DAS Compatibility #7901) is only occupied if the feature is activated at IPL time.

Table 2

Function/Feature Installed	Microcode Group
4331 Mdl Group 11 Processor	1
Direct Access Storage Compatibility (#7901)	2
BSC lines installed (**#9671-#9678**)	3
S/S lines installed (**#9681-#9688**)	4
SDLC lines installed (**#9691-#9698**)	5

Note: The Microcode Group 1 contains 4331 Mdl Group 11 standard hardware features, see M4331-11.1 page.

4331 Processor Mdl Group 11 (cont'd)

Table 3

Micro-code Group	Control Storage – or – Processor Storage	Notes
1	331776 8800 1800	Plus Per 3340 buffer. For a second string of 3340s attached to the DASD adapter.
2	28948 4096 7680 13312 8704	Plus Per 2311 buffer. Per 2314 buffer. Per 3330 buffer. Per 3340 buffer.
3	6144	
4	5120	
5	10240	

Diskette Drive (#3401): A single drive diskette reader/recorder providing the ability to read or write IBM Diskettes Type 1. The Diskette Drive is supported by the control program as a 3540 Diskette Input/Output unit. **Limitations:** Not supported by VM/370. **Maximum:** One. **Field Installation:** Yes.

External Signals (#3898): Provides six distinct external interrupt lines to request and identify an external interrupt response from the processing unit. **Maximum:** One. **Cable Order:** Required. **Field Installation:** Yes. **Prerequisites:** External Devices must meet the interface specifications outlined in *S/360 Direct Control Feature OEMI,* GA22-6845.

5424 Adapter (#3901%x): Allows attachment of one 5424 Multi-Function Card Unit mdl A1 or A2. **Limitations:** The 5424 is supported by DOS/VSE only. The 5424 must be physically attached, otherwise the system is inoperative. Cannot be installed with the Loop Adapter (#4830). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1001 and #1002.

Power Interface, Add'L (#5532): Provides power control to the 4331 Processor for control units attaching to the 4331 Byte Multiplexer Channel and Block Multiplexer Channel. Table 4 below lists the control units/devices for which this feature must be installed in the 4331 Processor. Standard Power Interface allows attachment of up to eight of these control units; Power Interface, Add'l (#5532) allows attachment of eight additional control units for a maximum of 16 per processor. **Maximum:** One. **Field Installation:** Yes.

Table 4

Control Units/Devices Requiring Power Interface Features

1 - Mandatory:
- 1255 Magnetic Character Reader
- 1287 Optical Reader
- 1288 Optical Reader
- 1419 Magnetic Character Reader
- 1442 Card Read Punch mdl N1
- 1442 Card Punch mdl N2
- 1443 Printer mdl N1
- 2314 Storage Control* mdl A1 and B1
- 2314 Direct Access Storage Facility* mdl 1
- 2415 Magnetic Tape Unit and Control
- 2501 Card Reader mdl B1 and B2
- 2520 Card Read Punch mdl B1, B2 and B3
- 2701 Data Adapter Unit
- 2702 Transmission Control*
- 2703 Transmission Control*
- 2803 Tape Control
- 2821 Control Unit mdls 1, 2, 3, 5 and 6
- 2822 Paper Tape Reader Control*
- 2840 Display Control*
- 2841 Storage Control
- 3272 Control Unit
- 3411 Magnetic Tape Unit and Control
- 3505 Card Reader
- 3540 Diskette Input/Output Unit
- 3704 Communications Controller
- 3705 Communications Controller
- 3791 Controller
- 3800 Printing Subsystem
- 3803 Tape Control
- 3811 Printer Control Unit
- 3881 Optical Mark Reader mdl 1
- 3886 Optical Character Reader mdl 1
- 3890 Document Processor
- 3895 Document Reader/Inscriber

2 - Not Mandatory, but can utilize Power Interface features:
- 3274 Control Unit
- 3340 Direct Access Storage Facility
- 3370 Direct Access Storage
- 3203 Printer mdl 5

* No longer available

Direct Access Storage Compatibility (#7901%y): Designed to be used primarily as a conversion aid, this feature provides emulation of 2311/2314 data formats on 3310 or 3370 Direct Access Storage and emulation of 3330 (100MB/volume) or 3340 data formats on 3370 Direct Access Storage. This allows programs written for use of 2311/2314, 3330 or 3340/3344 DASD to be executed with only Job Control modifications using the 3310 or 3370 Direct Access Storage.

DAS Compatibility can be used on 3310 or 3370 devices which are installed on one DASD adapter on up to two consecutively addressed strings. The DAS Compatibility feature includes all of the compatibility types available for 3310 and 3370. Any one type can be activated at IPL time. Operates in S/370 Mode under DOS, DOS/VS, or VM/370, in ECPS:VSE Mode under DOS/VSE. Under DOS/VSE, data sets in fixed block format and in emulated format can coreside on the same 3310/3370 volume. With DOS/VSE a variable number of full or partial CKD volumes can be stored the 3310 or 3370 up to the capacity of the host device. Each emulated volume regardless of whether stored with full or partial capacity, begins on a predefined full-volume boundary. With VM/370 partial emulated volumes are not supported.

Mapping of emulated volumes onto 3310/3370 volumes is as follows:

Compatibility Type	Max Number of Emulated Full Volumes		
	Per Host Volume	Per String	Per System
2311 on 3310	7	28	56
2314 on 3310	2	8	16
2311 on 3370	34	68	68
2314 on 3370	9	63	63
3330 on 3370	2	16	28
3340 on 3370	3	24	42

For device address assignment refer to *IBM 4331 Compatibility Features,* GA33-1528.

Performance Note: Use of DAS Compatibility introduces additional processor and channel demands and can have a significant effect on system performance, particularly in environments with high I/O load using emulated DASD. Batch job execution elapsed times may increase by a factor of more than two. The results of measurements on a typical commercial jobstream show an increase in elapsed time by a factor of 1.7, compared to execution with the 3370 in fixed block mode. The performance impact is less severe when DASD is used in mixed fixed block and emulation mode, which is possible in operation with DOS/VSE or VM/370. Also less critical are online workloads with generally lighter I/O loads. Exclusive use of DASD emulation for batch operation is not recommended in any SCP environment.

Limitations: [1] Operates on up to two strings of 3310 or 3370 attached to the DASD adapter. [2] Operation of emulation and directly attached 3340/3344 is limited to two strings on the system. [3] One type of emulation can be activated at IPL time. [4] 3330 mdl 11 cannot be emulated. [5] Emulation cannot be used on 3370 drives which are shared via a string switch. [6] VM/370 supports 3310 or 3370 volumes containing emulated data which are dedicated to a guest operating system, other than VM/370 or CMS. Emulated 2311 is not supported by VM/370.

Program Order: The required utility programs 3310 for initialization and surface analysis of the 3370 DASD as well as the formatting of the emulator extent are included in the DOS/VSE SCP, (5745-030) or combined with VSE/Advanced Functions, and VM/370 (5749-010) contain the Device Support Facilities for initialization and surface analysis of CKD DASD. In addition, for the required formatting of the emulator extent, order 5747-SA1. The stand-alone Device Support Facilities are also separately orderable with program order number 5747-DS1. **Maximum:** One. **Field Installation:** Yes. See Tables 2 and 3 for microcode storage requirements.

Communications And Loops

Communications Adapter Base (Standard): Provides the basic control and common circuits for the direct attachment of up to eight synchronous (BSC), asynchronous (Start/Stop) or Synchronous Data Link Control (SDLC) communication lines in any combination, provided that the aggregate data rate capability of up to 64,000 bps is not exceeded. For data rates achievable, see GA33-1535. The maximum speed of each of the eight lines is 9600 bps except that line position one may be a synchronous high-speed line (BSC or SDLC) up to 56,000 bps and may operate concurrently with other lines provided the data rate limitation is not exceeded. SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, native or as a guest under VM/370.

4331 Processor Mdl Group 11 (cont'd)

Base Characteristics are:

- Auto Answer
- Autopoll operation
- Multipoint central station functions
- Multipoint tributary station functions for BSC only
- EBCDIC transparent mode for BSC only
- EBCDIC and ASCII code for BSC only

The Communications Adapter attaches up to eight lines via the following optional features:

- Up to eight line features without business clock for attachment to X.21 Nonswitched Data Network.
- Up to 8 line features without internal clock for attachment to external modems (Data Circuit Terminating Equipment, DCE) with clock.
- Up to 8 line features with internal clock for attachment to external modems (Data Circuit Terminating Equipment, DCE) without clock.
- Up to 1 synchronous high-speed line feature.
- Up to 8 line features with integrated modems.
- Up to 8 line features with local attachments.
- Up to eight line features with Digital Data Service Adapters.
- Autocall Unit interfaces for up to two of the installed lines.

From the Operator's Console-Keyboard the user may specify some configuration parameters for each separate telecommunications line for each individual connection:

- Select stand-by.
- Half speed operation for synchronous lines only (for both clocked and non-clocked modems which have this capability).
- NRZI mode in SDLC mode.
- Write interrupt (S/S only).
- Read interrupt (S/S only).
- Unit exception suppression (S/S only).
- Error index byte mode (BSC only).
- ASCII code instead of EBCDIC (BSC only).
- Tributary station addresses (BSC only).

Other configuration parameters can be selected at installation time and set by the CE:

- Duplex instead of half-duplex connection (two-way alternate data flow transmission).
- Switched network facility instead of nonswitched lines (for external modems).
- New sync (for BSC or SDLC in multipoint primary station function only).
- High speed operation for oneline (BSC or SDLC only).
- Connect Data Set to Line or Data Terminal Ready procedure.
- Selection of WE 202 or V.23 answer tone frequencies for 1200 bps integrated modems with automatic answering.

Limitations: (1) SDLC is supported only by ACF/VTAME operating under DOS/VSE or SSX/VSE, or ACF/VTAME operating under VM/370 Release 6 with DOS/VSE running as a guest. (2) Each line attached reduces the number of available subchannels on the Byte Multiplexer Channel. See "System Subchannels" above for details. (3) The aggregate data rate of lines in operation on the Communications Adapter is 64,000 bps. With the exception of a synchronous line installed in position one capable of higher speed, the line speed is limited to 9600 bps. For data rate and attachment limitations for other devices and communications lines, refer to *IBM 4331 Processor Channel Characteristics,* GA33-1535, which contains tables of pre-analyzed configurations. **Prerequisites:** #1001 is required when more than three telecommunications line features are attached. See Table 2 for microcode storage requirements.

Customer Responsibilities: See M2700 pages for customer responsibilities regarding communications facilities and services.

Communication Facilities: See M2700 pages for communications facility requirements with this feature.

Terminals Supported: For supported terminals refer to tables in the communications adapter feature description of 4331 pages for Mdl Group 1 and 2 or for more details to the M2700 pages.

Autocall Unit Interface (#1020%x): Provides an interface to customer-supplied Automatic Calling Equipment allowing data links with remote stations to be automatically established on the switched telephone network. Automatic Calling Equipment complying with EIA RS-366 or CCITT V.25 procedures may be attached. For the appropriate Automatic Calling Equipment, refer to M2700 pages. **Limitations:** Does not operate with High-Speed Modem Adapter (#4720), any features with 1200 bps Integrated Modem or with any nonswitched lines. **Maximum:** Two. **Cable Order:** Required, for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** #3701 (in switched operation) for each Autocall Unit Interface installed. **Specify:** Line position, see Table 5 below.

EIA/CCITT Interface (#3701%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one external modem having EIA RS-232-C, CCITT V.24/V.28 or X.21bis interface for attachment to one switched or one nonswitched line.

When this feature is installed in conjunction with Line Attachment Base for Clocked Modem (#4695), a BSC or SDLC line is supported. Nonswitched lines with switched network backup may be used where maximum line speed on nonswitched lines is 9600 bps, the maximum line speed on switched network backup or switched networks is 4800 bps.

When this feature is installed in conjunction with Line Attachment Base for Nonclocked Modems (#4696), then a BSC, Start/Stop or SDLC line is supported. Transmission speeds supported are listed with feature #4696 below. **Maximum:** Eight. **Cable Order:** Required, for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** One #4695 or #4696 is required for each feature #3701 installed. **Specify:** Start/Stop, SDLC and/or BSC operations are possible. See Table 5 for Line Position Code and Transmission Mode Codes.

Loop Adapter: Provides the capability to attach directly or via a data link the 3640 Plant Data Communication Terminals and/or General Purpose Terminals 3104 mdls B1, B2 and 8775 mdls 1, 2 , 3232 Keyboard Printer mdl 11 and 3287 mdls 11, 12 and/or Control Units 3274 mdl 51C, , 61C and 3276 mdls 11-14 with the associated terminals to the 4331 Processors. Loop Adapter 1 and 2 (#4830, #4831) provide for direct attachment. A maximum of two Data Link Adapters (#4840) provide for remote attachment capabilities for 3843 Loop Control Units. Each Data Link Adapter (#4840) can be used as point-to-point or multipoint connection to attach up to four 3843 Loop Control Units.

Devices that can be attached to direct attached loops at 9600 bps or data link attached loops at 2400, 4800 or 9600 bps are the following:

Device Attachments

3104 Display Terminal mdls B1, B2
3232 Keyboard Printer mdl 11
3641 Reporting Terminal mdls 1, 2
3642 Encoder Printer mdls 1, 2
3643 Keyboard Display mdls 2, 3, 4
  including #4920 Badge and Document Encoder
3644 Automatic Data Unit
3645 Printer
3646 Scanner Control Unit
3647 Time and Attendance Terminal
8775 Display Terminal mdls 1, 2
3287 Printer mdls 11, 12
3274 Control Unit mdl 51C, 61C with the
  associated terminals
3276 Control Unit Display Station mdl 11-14
  with the associated terminals

Control Units and Associated Terminals

3274 Control Unit Mdl 51C, 61C
  3178 Display Station
  3278 Display Station
  3279 Color Display Station
  3262 Line Printer
  3268 Printer mdl 2
  3287 Printer
  3289 Line Printer
6580 Displaywriter System, mdl A4, A6, A8,
  A10 (25-line display)
6580 Displaywriter System mdl B4, B6, B8,
  B10 (66-line display)

3276 Control Unit Display Station Mdl 11-14
  3178 Display Station
  3278 Display Station
  3279 Color Display Station
  3262 Line Printer
  3268 Printer Mdl 2
  3287 Printer
  3289 Line Printer
6580 Displaywriter System, mdl A4, A6, A8,
  A10 (25-line display)
6580 Displaywriter System, mdl B4, B6, B8,
  B10 (66-line display)

In addition the following devices can be attached at 38,400 bps:

3104 Display Terminal mdls B1, B2
8775 Display Terminal mdls 1,2
3232 Keyboard Printer mdl 11
3287 Printer mdls 11, 12
3274 Control Unit mdl 51C , 61C with the
  associated terminals

For the attachment of 3640 terminals it is recommended to use a 3643 Keyboard Display or a 3641 Reporting Terminal on each Loop Control Unit for diagnostics and testing. These units do not need to be dedicated to this purpose.

4331 Processor Mdl Group 11 (cont'd)

Cable length for direct attached loops can be up to 2,000m (1.25 miles) when operating at 38,400 bps, or 3,200m (2 miles) when operating at up to 9600 bps.

For data link attached loops see 3843 Loop Control Unit. For details refer to GA23-0038, *IBM Multiuse Communications Loop Planning Guide*.

Loop Installation: For the required information to plan and install the Loop Adapter feature, the loop cables and accessories see the *IBM Multiuse Communications Loop Planning Guide*, GA23-0038, and *Installation Guide*, GA23-0039. The loop cables and accessories should be installed and checked out prior to attaching processors or devices.

The customer is responsible to enter the loop configuration and terminal addresses into the system using the loop adapter configuration tool invocable via a manual operation. Refer to *IBM 4331 Processor Loop Adapter Feature, Operating Procedures*, GA33-1538, and *Problem Determination Procedures*, GA33-1540.

> **Note:** (1) Loop "Accessories" are required to properly install the customer-owned loop. The customer is responsible to provide (purchase, install, test and maintain, problem determination) the loop cable and accessories for terminal attachment. See 4331-1 "Accessories" section for details and ordering information.
>
> (2) An unused lobe has to be terminated by a Loop Station Connector (wrap-type), P/N 1657320. **Communications Facilities:** See M2700 pages for communications facility requirements.

Loop Adapter 1 (#4830): Provides for direct attachment of a Loop with one or two Lobes (a lobe is the actual physical Loop cable). Transmission speed can be 9.6K bps for 3640 and/or 3104 and/or 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals and/or 3274-51C , 61C and/or 3276 Control Units or 38.4K bps for 3104 and/or 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals and/or 3274-51C , 61C Control Unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. **Limitations:** Can not be installed with 5424 adapter (#3901). **Maximum:** One. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** Adapter power prerequisite (#1001).

Loop Adapter 2 (#4831): Provides for direct attachment of a Loop with one or two Lobes (A lobe is the actual physical Loop cable). Transmission speed can be 9.6K bps for 3640 and/or 3104 and or 3104 and/or 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals, and/or 3274-51C, 61C and/or 3276 Control Units, or 38.4K bps for 8775 and/or 3232 Keyboard Printer mdl 11 and/or 3287 terminals and/or 3274-51C , 61C control unit. Cable length for each lobe can be maximum of 3,200m (2 miles) for up to 9.6K bps, or maximum of 2,000m (1.25 miles) for 38.4K bps transmission speed. **Limitations:** Can not be installed with 5424 adapter (#3901). **Maximum:** One. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** Loop Adapter 1 (#4830).

Data Link Adapter (#4840): Allows connection of one or more 3843 loop control units to the 4331 processor. The feature provides for the attachment of one external modem complying with EIA/CCITT recommendations. EIA RS-232, RS-334 support will be provided for nonswitched lines only . Transmission speed can be 2400, 4800, or 9600 bps, with half-speed option dependent on the attached modem. The modem can be connected to either a point-to-point or multipoint telecommunications line for connection of up to four 3843 loop control units which directly control the data link attached loops. Support will be provided for the same terminals as on the direct attached loop. **Limitations:** Can not be installed with 5424 adapter (#3901). **Maximum:** Two. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** Loop Adapter 1 (#4830).

Loop Adapter Logic Storage Requirements: The microcode storage required for attaching terminals to the Loop Adapter 1 and 2 (#4830, #4831) or Data Link Adapters (#4840) has to be calculated from the table shown below. If Total 1 exceeds 65,536, an invalid configuration has been selected. If the sum of Total 1 plus Total 2 exceeds 98,304 an invalid configuration has been selected.

	Microcode Program Space Bytes	System Control Space Bytes
Microcode Base	42836	7880
One or multiple 3641 and/or 3647	7800	1060
One or multiple 3642	5900	580
One or multiple 3643 w/o #4920	8800	3450
One or multiple 3643 w/#4920	9400	3450
One or multiple 3644	4900	-
One or multiple 3646	2900	256
One or multiple 3104 and/or 8775 and/or 3287, 3274, 3276, 3645	2600	-
		Terminal* Control Space
Each 3641, 3647	-	156
Each 3642	-	194
Each 3643	-	156
Each 3644	-	228
Each 3646	-	72
Each port on 3646	-	84
Each 3274, 3276, 3287, 3645, 3104, 8775	-	186
Each 3843	-	68
Each Loop Adapter (#4830, #4831)	-	1272
Each Data Link Adapter (#4840)	-	1204
	Total 1	Total 2

*For additional information on buffer space refer to the *IBM 4331 Loop Adapter Characteristics*, GA33-1534.

The storage requirements need to be validated because the number of devices of each type attached by the customer is not known to manufacturing. Manufacturing can only validate storage requirements with respect to device types but not with respect to the number of devices of each type.

System Diskette Space Requirements: When attaching the Loop Adapter feature with 364X terminals to the 4331 the diskette space requirements must be verified. See the following table for the space calculation. If the total number of records exceeds 3876, an invalid configuration has been selected. A trade-off between features must be considered.

4331 Mdl Group 11 Processor Feature Facility	System Diskette Records
4331 Basic	3133
DAS Compatibility #7901	170
Start/Stop Transmission Mode **#968X**	20
BSC Transmission Mode **#967X**	24
SDLC Transmission Mode **#969X**	52
364X Terminal Att. **#9251, #9252, #9253, #9254, #9256**	665

The maximum number of system diskette records may not exceed 3876.

Maximum Number of Terminal Attachment Via Loop Adapters/Data Link Adapter: The maximum number of terminals that can be attached to the 4331 processor via Loop Adapters/Data Link Adapters is 80, of which 62 can be any mix of 3644, 3645, 3287, 3104, 8775 , 3232 mdl 11 terminals or 3274-51C , 61C or 3276 Control Units.

Multiple terminals on a 3274 or 3276 control unit count as a single terminal in determining the maximum number of terminals.

A maximum of 64 terminals out of the total of 80 terminals may be attached to either Loop Adapter 1 or 2, or to one of the Data Link Adapters. For details see *IBM Multiuse Communications Loop Planning Guide*, GA23-0038.

Line Attachment Base For Clocked Modems (#4695%x): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit-terminating Equipment) which provide clocking and comply with EIA RS-232-C CCITT V.35, X.21 or X.21bis recommendations and it is a prerequisite for attachment to X.21 nonswitched data network . See the various line features below to determine when it is required. **Limitations:** A maximum of eight Line Attachment Bases may be installed on 4331 Communications Adapter. Each feature #4695 installed reduces by one the number of feature #4696 allowable. **Maximum:** Eight, one per line installed. **Field Installation:** Yes. **Prerequisites:** #1001 is required if more than three line attachments #4695 and/or #4696 are installed.

Line Attachment Base For Nonclocked Modems (#4696%x): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit Terminating Equipment) which do not provide clocking. See the various features below to determine when it is required.

The clock speed internal to the feature is wired by default to 134.5 bps for Start/Stop operation and 1200 bps for BSC and SDLC operation.

4331 Processor Mdl Group 11 (cont'd)

Otherwise, the clock speed can be wired at installation to one of the following:

- Start/Stop: 75, 300, 600 or 1200 bps.
- BSC: 600 bps.
- SDLC: 600 bps.

For BSC or SDLC operations, if 1200 bps is wired, then full-speed operation (1200 bps) or half-speed operation (600 bps) may be selected from the operator console keyboard. **Limitations:** A maximum of eight Line Attachment Bases may be installed on 4331 Communications Adapter. Each feature #4696 installed reduces by one the number of feature #4695s allowable. **Maximum:** Eight, one per line installed. **Field Installation:** Yes. **Prerequisites:** #1001 is required if more than three line attachments #4695 and/or #4696 are installed.

High-Speed Modem Adapter (#4720%x): Provides for the attachment of an external modem with clock having a CCITT V.35 or X.21bis interface. One nonswitched point-to-point BSC or SDLC line may be operated with speeds from 19,200 to 56,000 bps. **Limitations:** For speed limitations refer to the Communication Adapter Base feature description. For channel rates achievable, see *IBM 4331 Channel Characteristics,* GA33-1535. Cannot be installed with 231X DASD attached to the Block Multiplexer Channel. Cannot be installed with X.21 Adapter for Nonswitched Networks (#5655) if its speed is 48,000 bps **#9831**. Cannot be installed with Digital Data Service Adapter (#5650) if the Digital Data Service Adapter operates at 56,000 bps (**#9444**). **Maximum:** One. **Cable Order:** Required for attachment to the external modem. **Field Installation:** Yes. **Prerequisites:** #4695. **Specify:** BSC and/or SDLC operations are possible ... see Table 5 for Line Position Code and Transmission Mode Codes.

1200 bps Integrated Modem, Nonswitched (#4781%X): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched BSC, Start/Stop or SDLC line via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps. Selection of 2- or 4-wire operation is made at installation time. **Cable Orders:** Required for attachment to external equipment. **Maximum:** Eight. **Field Installation:** Yes. **Prerequisites:** #4696. **Specify:** SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

1200 bps Integrated Modem, Switched With Auto Answer (#4782%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one switched network Start/Stop line via an integrated modem at speeds up to 300 bps and for BSC and SDLC at 600 and 1200 bps. Attachment to the switched network is via an IBM-provided cable to FCC registered protective circuitry of the CBS type (or equivalent) provided by the user. **Maximum:** Eight. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** #4696. **Specify:** SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

1200 bps Integrated Modem, Nonswitched With Switched Network Backup And Manual Answer (#4787%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched line with Switched Network Backup (SNBU) and manual answer, allowing BSC, Start/Stop or SDLC operations via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps.

Attachment to the nonswitched line is via an IBM-provided cable. Selection of 2- or 4-wire line operation is made at installation time. The cable group which is ordered also provides for attachment to a Data Access Arrangement type CDT or FCC registered equivalent for manual answer. **Maximum:** Eight. **Cable Order:** Required for one cable group which connects to nonswitched line and to the switched network. **Field Installation:** Yes. **Prerequisites:** #4696. **Specify:** SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

1200 bps Integrated Modem, Nonswitched With Switched Network Backup And Auto Answer (#4788%x): This feature may be intermixed with other line features. Each feature provides for the attachment of one nonswitched line with Switched Network Backup (SNBU) and auto answer, allowing BSC, Start/Stop or SDLC operations via an integrated 1200 bps modem. The transmission speed can be strapped by the CE for Start/Stop operation up to 1200 bps and for BSC or SDLC operation at 600 or 1200 bps.

Attachment to the nonswitched line is via an IBM-provided cable. The same cable group provides for attachment to the switched network to a Data Access Arrangement type CBS or FCC registered equivalent for auto answer. **Maximum:** Eight. **Cable Order:** Required for one cable group which connects to the nonswitched line and to the switched network. **Field Installation:** Yes. **Prerequisites:** #4696. **Specify:** SDLC and/or BSC and/or Start/Stop operations are possible, see Table 5.

Local Attachment Interface (#4801%x): Provides circuits and controls for the local attachment of one BSC or SDLC remote station to the Communications Adapter without the use of modems at either device. Transmission speed can be strapped at installation time by the CE at 1200, 2400, 4800 and 9600 bps. The feature provides clocking for both the Communications Adapter and the terminal. The attached terminal must be equipped with an EIA RS-232-C or CCITT V.24/V.28 interface, have no Business Machine Clocking and have an external modem cable. The distance to the terminal may be extended via a customer-provided cable to allow a maximum distance between Communications Adapter and terminal of:

800 meters at 1200 bps
400 meters at 2400 bps
200 meters at 4800 bps
100 meters at 9600 bps

The feature includes cables to attach the Communications Adapter to a customer-supplied terminal plate and from the terminal plate to the DTE external modem cable. **Cable Order:** Required for attachment to terminal plate. Customer supplied cable for in door use. **Maximum:** Eight. **Field Installation:** Yes. **Prerequisites:** #4695. **Specify:** SDLC and/or BSC operations are possible, see Table 5.

Digital Data Service Adapter (#5650%x): Provides circuits and controls for attachment of one BSC or SDLC line and includes an internal Dataphone Digital Service Adapter. The adapter allows interface to American Telephone and Private Line DDS Network via the AT&T Channel Service Unit. The Digital Data Service Adapter will operate at synchronous speeds of 2400, 4800, 9600 and 56,000 bps. The speed must be set to the speed specified in the customer's order for service to the common carrier at installation time. These line features can be associated with each line position if the line speed does not exceed 9600 bps. **Limitations:** If feature #5650 is installed with a speed of 56,000 bps (**#9444**), then: [1] High-Speed Modem Adapter (#4720) cannot be installed. [2] 231X DASD attached to the Block Multiplexer Channel cannot be installed. [3] For speed limitations refer to the Communications Adapter Base feature description. **Maximum:** Eight. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** #4695. **Specify:** **#9444**%z for operation at 56,000 bps ... See Table 5 for Line Position Code, Transmission Mode Code, and line speed selection codes.

X.21 Adapter For Nonswitched Networks (#5655): Provides controls and circuits for attachment of one X.21 Point-to-point or multipoint nonswitched communication line via a DCE complying with CCITT recommendation X.21. Transmission may be at speeds of 2400, 4800, 9600 or 48,000 bps for point-to-point operations and 2400, 4800 and 9600 for multipoint operations. **Limitations:** If feature #5655 operates at 48,000 bps (specify **#9831**), then the following limitations apply: [1] High-Speed Modem Adapter (#4720) cannot be installed ... [2] 231X DASD attached to the Block Multiplexer Channel (#1321) cannot be installed ... [3] For speed limitations, refer to the Communications Adapter Base feature description. **Maximum:** Up to eight may be installed, subject to the overall data rate limitations of the Communications Adapter. **Field Installation:** Yes. **Prerequisites:** One #4695 is required for each #5655 installed. **Specify:** SDLC operation must be specified for this feature ... see Table 5 for line position, transmission mode and transmission speed codes. **Note:** **#9831**%x is required for 48,000 bps operation. **Cable Order:** Required for attachment to external equipment.

Table 5

Communications Adapter Configuration Feature And Position Codes

	Feat Number %x	Req'd Line Att Base %x	Line Pos. with Line Pos. Codes 1 %z	2 %z	3 %z	4 %z	5 %z	6 %z	7 %z	8 %z

SDLC (1)		9691	9692 9693	9694 9695	9696 9697	9698	

Notes:

(1) BSC or SCLC transmission mode with any line attachment feature.

(2) Start/Stop transmission mode only with EIA/CCITT Interface (for non-clocked modem, #3701 and prerequisite #4696) or with any other features offering 1200 bps Integrated Modems (with prerequisite #4696).

(3) Must be associated with EIA/CCITT Interface (#3701 and prerequisite #4695 or #4696). Maximum of two #1020s may be installed.

(5) The aggregate data rate of the Communications Adapter is 64,000 bps ... Line Features exceeding this aggregate may be installed, but not operated concurrently. To allow the aggregate of 64,000 bps to be achieved, the highest speed line must be installed in line position one, the next highest in line position two, etc. Each transmission mode installed has different requirements for microcode storage ... see Table 2 for microcode storage requirements.

(7) May not be installed when 231X DASD is attached to the block multiplexer channel.

(8) When changing **#9444** to/from **#9471**, no new hardware or diskette is required.

%z System Diskette-only specify feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

%x Feature supplies diskette for System Diskette facility.

%y System Diskette-only special feature. No fee when ordered at time of manufacture or with chargeable feature that supplies diskette. A fee on purchase machines to include any number of diskette-only changes ordered on the same diskette.

MODEL CONVERSIONS

Model Changes within Model Group: Can be made in the field. Customer price quotations and customer order acknowledgement letters for purchase model conversions must state, "Installation of this model upgrade involves the removal of parts which become the property of IBM".

Field upgrade from 4331 Mdl Group 1 or 4321 to 4331 Mdl Group 11 is possible. The 4331 Mdl Group 11 can be field upgraded to 4331 Mdl Group 2.

Downgrades from 4331 Mdl Group 2 to 4331 Mdl Group 11 and from 4331 Mdl Group 11 to 4331 Mdl Group 1 or to the 4321are not recommended for field installation.

Field Upgrade from 4331 Mdl Group 1 to 4331 Mdl Group 2, refer to machine pages for 4331 Mdl Group 1 and 2.

Field Upgrade from 4331 Mdl Group 1 to 4331 Mdl Group 11: When a leased 4331 Mdl Group 1 is upgraded to the 4331 Mdl Group 11, features and specifications installed on the 4331 Mdl Group 1 which are not available on the 4331 Mdl Group 11 should be deleted with the upgrade MES order. Features installed on the 4331 Mdl Group 1 which are standard on the 4331 Mdl Group 11 should be deleted, i.e, changed to standard, for record purposes. Features which are standard on 4331 Mdl Group 11, but are not installed on a leased 4331 Mdl Group 1 being upgraded, are automatically added to the configuration.

For upgrade of a purchased 4331 Mdl Group 1 to 4331 Mdl Group 11 features installed on the 4331 Mdl Group 1 which are not available on the 4331 Mdl Group 11 have to be removed. An RPQ has to be submitted listing each feature to be removed. There will be a charge for this RPQ. The features removed are the customer's property.

Standard features of the 4331 Mdl Group 11 not installed on the 4331 Mdl Group 1 are added to the configurations The 4331 Mdl Group 1 prices of these features are added to the model upgrade prices.

Standard features of the 4331 Mdl Group 11 already installed on a purchased 4331 Mdl Group 1 should be deleted, i.e., changed to standard, for record purposes.

Field Upgrade from 4331 Mdl Group 11 to 4331 Mdl Group 2: Standard features of the 4331 Mdl Group 11 which are to be retained on the 4331 Mdl Group 2 have to be included in the MES order using the individual feature and specify codes of the 4331 Mdl Group 2.

Order for the 4331 Mdl Group 2 Processor:

Block Multiplexer Channel	#1421
Communication Adapter Base	#1601
Display/Printer Add'l Expansion	#2001
DASD Adapter	#3201
8809 Adapter	#4910
Byte Multiplexer Channel	#5248
Power Interface	#5531
3340/3344 Direct Attachment (If required)	#7851
ECPS:VM/370 (VM assist) (if required)	#8701

Other features or specifies on the 4331 Mdl Group 11 are retained unchanged on the 4331 Mdl Group 2.

ACCESSORIES

See M4331-1 "Accessories" for additional information and field installation of Console Table (#1550), Book Rack and Cable Holder (#1480) and "Loop Accessories" and "Loop Cables".

SUPPLIES (None)

4341 PROCESSOR

PURPOSE

Provides power, control, logic and memory circuitry for the arithmetic, logic and processor storage functions of the 4341 Processor.

MODELS

Mdl Grp 9	Mdl Grp 10	Mdl Grp 1	Mdl Grp 11	Mdl Grp 2	Mdl Grp 12	Bytes of Processor Storage
J9						1,048,576
K9	K10	K1	K11	K2	K12	2,097,152
L9	L10	L1	L11	L2	L12	4,194,304
			M11	M2	M12	8,388,808
				N2	N12	12,582,912
				P2	P12	16,777,216

Note: The microcode which controls system operations resides in Reloadable Control Storage and keeps dynamic tables in Processor Storage, thus reducing the amount of Processor Storage available for user programming. See "Microcode Storage Requirements" below for details.

Prerequisites: Each 4341 Processor requires one 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C and Operator Console Keyboard with an operator control panel.

HIGHLIGHTS

From 2,097,152 to 16,777,216 bytes of monolithic processor storage depending upon the mdl ... see "Models" above.

Processor base cycle time in nanoseconds:

Mdl Groups					
Grp 9	Grp 10	Grp 1	Grp 11	Grp 2	Grp 12
150-300	150-300	150-300	120-240	120-240	115-230

8-byte parallel data flow within the processor as well as an 8-byte wide data flow between the processor, storage and channels.

Processor High-Speed Buffer storage in bytes:

Mdl Groups					
Grp 9	Grp 10	Grp 1	Grp 11	Grp 2	Grp 12
2,048	4,096	8,192	8,192	16,384	16,384

Buffer storage is transparent to the program and significantly reduces the effective access time of storage. Buffer storage does not increase the amount of addressable storage. Extensive data checking, error recording by the hardware itself and remote maintenance are coupled with increased availability and serviceability.

Standard Features Include: Virtual Storage Capability by Dynamic Address Translation ... Byte and Block Multiplexer Channels ... Data Streaming Mode ... One-Level Addressing Facility for Improved Virtual Storage Control by DOS/VSE (ECPS:VSE Mode) ... Channels with Virtual Storage Addressing (ECPS:VSE Mode) ... 128-1024 UCWs ... Channel Indirect Addressing in S/370 Mode ... Channel Command Retry ... EC and BC Modes ... Byte Oriented Operands ... Clock Comparator and CPU Timer ... Control Registers ... Error Checking and Correction in Processor Storage ... Extended Control-Program Support for DOS/VSE, VS1, VM/370 and MVS ... Extended Precision Floating Point ... Interval Timer ... Machine Check Handling ... Support Processor ... Instruction Retry ... Program Event Recording ... Reloadable Control Storage ... Storage Protection (Store and Fetch) ... S/370 Universal Instruction Set ... System Diskette Drive ... Time-of-Day Clock ... PSW Key Handling ... Compare and Swap and Compare Double and Swap ... Clear I/O ... External Signal ... Unit Power Off ... Move Inverse Instruction (not software supported) ... Engineering Scientific Assist (Multiply Add facility) on Mdl Group 9, Mdl Group 10, Mdl Group 11, Mdl Group 2 and Mdl Group 12 Processors ... Fast Release for the Start I/O Fast Release Instruction for the Mdl Group 12.

Modes of Operation: Two modes of operation are available. The mode is selected from a common diskette at Initial Microcode Load (IML) time.

- ECPS:VSE Mode – allows operation of an appropriately generated DOS/VSE system, offering potential for enhanced systems performance.
- S/370 Mode – allows operation of any program written for S/370 and S/360 that does not violate the exceptions noted under "Compatibility" below. **Note:** DOS/VSE in S/370 Mode will not operate on 12MB and 16MB models, except under VM/370. See the Programming Support Section for those SCPs which contain 4341 support. In this mode, two performance options and an MVS support option are available. These options are selected at IML time and are mutually exclusive on Mdl Group 9, Mdl Group 10, Mdl Group 1 and Mdl Group 11 processors. On Mdl Group 2 and Mdl Group 12 processors with ECPS Expansion Feature (#1601), ECPS:VM/370 and ECPS:MVS can operate concurrently.
  - ECPS:VS1 – hardware assist that reduces the processor time needed to execute certain frequently used supervisor functions in OS/VS1, Release 7. The functional areas include:

    IOS
    SVC FLIH
    System Trace
    Page Management

    Note: OS/VS1 Release 7 with or without OS/VS1 Basic Programming Extension will operate on 12MB and 16MB mdls, but the SCP will only access up to 8MB. However, when OS/VS1 runs as a guest SCP under VM/370 and the VM Handshaking feature is specified, an OS/VS1 system can utilize up to 16MB.
  - ECPS:MVS – hardware facility that provides 14 privileged instructions necessary to allow the 4341 processor to be supported by the MVS System Product – JES2, 5740-XYS, and MVS/System Product – JES3, 5740-XYN. The instructions involve the following MVS functional areas:

    SVC Interrupt Handling
    Integrity
    Tracing
    Lock Management
    Real Storage Management

    On Mdl Group 2 and Mdl Group 12 processors, the ECPS:MVS hardware facility is extended to include the dual address space facility a function supported by MVS/System Product-JES2 Release 3 and MVS/System Product-JES3 Release 3 and defined in *IBM System/370 Principles of Operation,* GA22-7000-7. This extension facilitates communication among address spaces in an MVS/SP environment. In addition, the extensions include the ADD FRR instruction and the Page Fault Assist function, defined in *IBM System/370 Assists for MVS,* GA22-7079-1.
  - ECPS:VM/370 – hardware assist that reduces the processor time needed to execute certain frequently used supervisor functions in VM/370 Release 6. The functional areas include:

    Virtual Machine I/O
    Storage Management
    SVC Handler
    Privileged Instruction Emulation
    Dispatching
    Virtual Interval Timer

    On Mdl Group 2 and Mdl Group 12 processors, whenever ECPS:VM/370 and ECPS:MVS are both selected at IML time, ECPS:VM/370 is enhanced to include the functions of the Shadow-Table Bypass Assist defined in *Virtual Machine Assist and Shadow-Table-Bypass Assist,* GA22-7074. These functions are defined to enhance the performance of MVS running under VM/370 in a V=R environment with VM System Extensions Release 2 or VM/System Product. (#1601, ECPS Expansion Feature is required.)

The Engineering/Scientific Assist can be used in both modes of operation.

Control Storage Requirements: [Mdl Group 2 and 12] ECPS Expansion Feature (#1601) is required to support concurrent operation of ECPS:VM/370 and ECPS:MVS.

System Diskette Drive: This is the basic microcode loading device for the system. The several removable diskettes that will be supplied with the system will contain all of the required microcode for CE diagnostics, basic systems features, plus the optional features ordered for the system. The System Diskette File also allows recording of system failure data for later CE diagnostics.

In addition, the system diskette file provides automated Problem Analysis for use by console operators and system programmers. Basic data are collected and analyzed. Messages are displayed which describe system problems or status and suggest corrective actions. Options are included for sending service information to IBM via RSF and for running an additional processing unit analysis test when required.

4341 Processor (cont'd)

Console Function: A 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C and Operator Console Keyboard with an operator control panel is required. It is the principal device provided for the operator to communicate with the system. The operator may use the keyboard and the display to control the system operation as well as to display the status of the system. The primary Operator Console Keyboard includes the operator control panel. The 3278 mdl 2A and 3279 mdl 2C has a screen size of 1,920 characters, 24 lines at 80 characters per line. The bottom four lines (lines 21-24) are reserved for system status information and are not accessible to the user. 3278/3279 features other than those basic to the primary console display/keyboard are not supported. Up to three optional (for a total of four) 3278 Operator Display Consoles mdl 2A or 3279 Color Operator Display Console mdl 2C or 3268 Printer mdsl 2 and 2C or 3287 Printers mdl 1, 2, 1C or 2C for hard copy output are also available in any combination.

Two console modes are available -- "Display Mode" and "Printer-Keyboard Mode". In "Display Mode", the keyboard is used for input, the display with 20 lines of 80 characters/line for output, and DOS/VSE, OS/VS1 Release 7 to VM/370 Release 6 or MVS Release 3.8 with the MVS/System Product-JES2 or MVS/System Product-JES3 support is required. The optional 3268 Printer mdls 2 and 2C or 3287 Printer mdl 1 or 2 has a separate address. In "Printer-Keyboard Mode", the 3278 mdl 2A Display Console or 3279 mdl 2C Color Display Console uses the keyboard for input and the display and a recommended 3268 Printer mdls 2 and 2C or 3287 Printer mdl 1 or 2 or 3287 Color Printer mdl 1C or 2C for output. The display/keyboard and 3268 Printer mdls 2 and 2C or 3287 Printer mdl 1 or 2 or 3287 Color Printer mdl 1C or 2C appear to the system as a Console Printer-Keyboard. This allows the 4341 Processor user to run an operating system which has been generated for use on a S/360 with a 1052 typewriter keyboard console or a S/370 with a 3210 or 3215 console.

Channels Mdl Group 9, Mdl Group 10 and Mdl Group 1: Six channels in two groups are available. Group 1 (standard) consists of 1 byte multiplexer channel and 2 block multiplexer channels. Group 2 (optional) consists of 3 block multiplexer channels. One of the 2.0 million byte per second block multiplexer channels in the second group (channel 4) can be optionally selected as an additional byte multiplexer channel.

The following table shows the Block Multiplexer speed in million bytes per second for the following Mdl Groups:

Mdl Group 1, 9, 10

Channel	Group 1			Group 2			Total
	0	1	2	3	4	5	
Option 1	byte	3	3	-	-	-	6
Option 2	byte	3	3	2	2	1	11
Option 3	byte	3	3	2	byte	1	9

Channels Mdl Group 11, Mdl Group 2 and Mdl Group 12: Six channels are standard, consisting of one byte multiplexer channel and five block multiplexer channels. One of the block multiplexer channels can be optionally selected as an additional byte multiplexer channel.

The following table shows the Block Multiplexor speed in million bytes per second for the following Mdl Groups:

Mdl Group 2, 11

Channel	Group 1			Group 2			Total
	0	1	2	3	4	5	
Option 1	byte	3	3	2	2	2	12
Option 2	byte	3	3	2	byte	2	10

Mdl Group 12

Channel	Group 1			Group 2			Total
	0	1	2	3	4	5	
Option 1	byte	3	3	2	3	2	13
Option 2	byte	3	3	2	3	byte	11
Option 3	byte	3	3	2	byte	2	10

Data Streaming Mode can operate on any 4341 block multiplexer channel up to the maximum data rates specified above.

The capability for the attachment and automatic I/O power sequencing of up to 24 separate control units is standard. Optionally, 48 control units can be attached. An optional Channel to Channel Adapter is also available.

Compatibility: Any program written for S/370 will operate on the 4341 Processor in S/370 Mode, provided that it (1) is not time-dependent, (2) does not depend on system facilities (storage size, I/O equipment, optional features, etc.) being present when the facilities are not included in the configuration, (3) does not depend on system facilities (such as operation codes) being absent when the facilities are included in the 4341 Processor, and (4) does not depend on results or functions which are defined in the *Principles of Operation* to be unpredictable or model-dependent.

Any program written for S/360 will operate on the 4341 Processor in S/370 Mode, provided that it follows the above rules and does not depend on functions that differ between S/360 and S/370.

Any program written for the 4331 Processor in ECPS:VSE Mode or S/370 Mode will operate on the 4341 Processor, provided it follows the above rules. **Note:** DOS/VSE and prior DOS releases in S/370 Mode will not operate on the 4341 12MB and 16MB models, except under VM/370.

For more details, see *S/370 Principles of Operation,* GA22-7000, or *4300 Processors Principles of Operations for ECPS:VSE Mode,* GA22-7070.

Microcode Storage Requirements: The microcode which controls system operations resides in Reloadable Control Storage and keeps dynamic tables in Processor Storage, thus reducing the amount of Processor Storage available for user programming. The amount required is the sum of Processor Storage required by two user selectable options: [1] the number of Unit Control Words (UCWs) selected, and [2] the mode of operation.

1. Number of UCWs:

   128 UCWs are basic on the 4341 and require 8,192 bytes of Processor Storage. Additional UCWs are allocated as required in groups of 32, each group requiring an additional 2,048 bytes of Processor Storage. The maximum number of UCWs on 4341 is 1,024.

   UCW assignment is user-dependent. It is the customer's responsibility to designate desired I/O addresses and configurations to service personnel. Channel configurations should be reviewed during pre-installation planning for new systems and when additional I/O devices are attached or existing equipment is reconfigured.

   For specific device requirements, see the appropriate machine pages.

2. Depending on which mode of operation is selected at IML time, processor storage will be required as follows:

	.... Mode of Operation	
	ECPS:VSE Mode	S/370 Mode
4341 J9 K1 K2 K9 K10 K11 K12	49,152 bytes	10,240 bytes
4341 L1 L2 L9 L10 L11 L12	51,200 bytes	10,240 bytes
4341 M2 M11 M12	55,296 bytes	10,240 bytes
4341 N2 N12	59,392 bytes	10,240 bytes
4341 P2 P12	63,488 bytes	10,240 bytes

Bibliography: GC20-0001

4341 Processor (cont'd)

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V, **#9915** for 240V.
- Cabling: For the primary console with Operator Control Panel (OCP) signal and control cables are shipped with the processor. 7.6m (25 feet) is standard. Cables longer than 7.6m (25 feet), up to a maximum length of 45.6m (150 feet) may be obtained by RPQ. Each additional console device (without OCP) requires a cable order. For cable order information, refer to the *4300 Processor Installation Manual - Physical Planning*, #GA24-3667.
- Color: **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, **#9065** for pebble gray. **Note: #9061, #9062, #9063** are slightly different colors from those available on previous machines.
- Dimensions: The normal dimensions of the larger of two 4341 Processor frames are 62-3/4" x 32" x 39-1/2". Dimensions can be reduced to 60" x 29-1/2" x 38-1/2", if required, by local field engineering. No materials need to be ordered.
- Remote Support Facility: The Remote Support Facility utilization (RSF) is a customer option. It is recommended to enhance the hardware maintenance of the 4341 Processor. It provides service personnel the capability of remotely controlling the 4341 from any RETAIN terminal and allows the IBM CE to access the RETAIN Data Bank for the latest service aids and information from the customer site. When RSF is selected, the customer must provide the telephone lines required for the RSF Modem. The customer must also arrange for the connection of the telephone interface cable provided by IBM to the telephone network. For details on customer responsibilities, see *4300 Processors Installation Manual - Physical Planning*, GA24-3667.

  RSF is available in two versions for Mdl Group 1 and three versions for the other mdls:

  Specify **#9510** for integrated modem, 1200 bps, switched network, manual answer. A telephone set with exclusion Key and with FCC registered Data Access Arrangement (DAA), compatible with CDT Type Coupler Series 1000A interface and operation is required.

  Specify **#9511** for EIA-Interface, 1200 bps, switched network, manual answer. An FCC registered external modem compatible with the WE202S modem, interface and operation, or equivalent is required.

  For Mdl Group 2, Mdl Group 9, Mdl Group 10, Mdl Group 11 and Mdl Group 12, specify **#9512** for integrated modem with integrated protective circuits, 1200 bps, switched network, manual answer. (An external protective coupler is not required.) A telephone set with exclusion key and an RJ41S or RJ45S type data jack are required. Protective couplers are FCC registered. The FCC Registration number is AN09SA-67992-DP-N and Ringer Equivalence Number (REN) 0.8B.

  If Remote Support Facility is not desired, no specify code is required.
- Remote Operator Console Facility: The Remote Operator Console Facility (ROCF) is an extension of RSF. It gives personnel at a host site the ability to dial-up and control a remote 4341 by means of a 3275 mdl 2 Display Station or by means of host site programming support.

  Specify RSF feature **#9511**. The customer-supplied external modem attached to feature **#9511** must include auto answer.

SPECIAL FEATURES

ECPS Expansion (#1601): [Mdl Group 2 or 12] Adds 16,384 bytes of control storage. See "Control Storage Requirements" under "Highlights" for details. **Maximum:** One. **Field Installation:** Yes. Field installation of #1601 involves the removal of parts which become the property of IBM. **Prerequisites:** A 4341 Mdl Group 2 or Mdl Group 12 Processor.

Channel-To-Channel Adapter (#1850): One channel to channel feature is optionally available to interconnect two channels (4341 Processor, S/360, S/370) ... one of the processors requires this feature ... requires one control unit position on each of the connected channels. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** [1] #4631 must be specified on the primary 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C. [2] One control unit position on a block multiplexer channel.

Block Multiplexer Channels Add'l (#1870): [Mdl Group 9, 10, 1] An optional group of three block multiplexer channels permits simultaneous operation of high speed devices at a data rate of 2.0MB/second for two channels and 1.0MB/second for one channel. One of the 2.0 million byte per second block multiplexer channels in the second group (Channel 4) can be optionally selected as an additional byte multiplexer channel at installation time. **Limitations:** Not available on 4341 Mdl Group 2, 11, or 12 since five block multiplexer channels are standard. If installed on a 4341 Mdl Group 1, 9, or 10, this feature designation should be deleted with the order entry for conversion to a 4341 Mdl Group 2, 11, or 12. This is for order entry purposes only. The channels are not physically removed when upgrading. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** A 4341 Mdl Group 1, 9, or 10 Processor.

Channel Control Unit Positions, Add'l (#1890): This feature is required for the automatic I/O power sequencing of more than 24 control units from the 4341 Processor. Standard on the 4341 is the capability to attach up to 24 control units, not to exceed eight per channel. With this feature, 25 to 48 Control Units may be attached and automatically powered up, not to exceed eight per channel. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1870 on Mdl Group 9, Mdl Group 10 or Group 1 Processor.

MODEL CONVERSIONS

There are no additional installation charges for allowable upgrades of a purchased 4341 processor. Select the appropriate upgrade MES from the table below. Since six channels are standard on the Model Group 11 and Model Group 2, MES upgrade prices for upgrades to these two models from Model Group 10 or Model Group 1 without Add'l Block Multiplexer Channels #1870 installed will include the price for (#1870). Customer price quotations and customer order acknowledgment letters for purchase MESs must state: "Installation of a model upgrade and special feature additions involves the removal of parts which become the property of IBM." Other mdl changes and storage downgrades are not recommended for field installation.

ACCESSORIES

The following items are available on a purchase-only basis. For shipment with machine, order the P/N indicated below.

Bookrack and Cable Holder (#1480): Provides a storage rack for use with Console Table (#1550) only. Up to four racks can be mounted on one table.

Console Table, 4300 Processors (#1550): Provides a convenient workstation table to support one or two 3278 mdl 2As/3279 mdl 2Cs.

SUPPLIES (None)

4361 PROCESSOR MDL GROUPS 4, 5

PURPOSE

Provides the power, control, logic and memory circuitry necessary for the Processor Central Electronic Complex including I/O channels and integrated device adapters.

Model ML4	Model ML5	12,582,912

HIGHLIGHTS

The 4361 Processors incorporate several design and technology advances to achieve substantial performance gains relative to the 4331 Processors. They are designed as one physical unit including all CEC functions and the service processor. Each is comprised of the following:

- Instruction processing unit with:
  - A High-Accuracy Arithmetic Facility that allows computational procedures with maximum accuracy and automatic verification of results.
  - Floating-point multiply hardware accelerator using high-speed array multiplier logic. It improves floating-point multiply instruction execution times by a factor of 3 to 8 over microcode implementation.
  - Implementation of frequently used instructions in hardware rather than in microcode.
- Channel processor which controls integrated I/O attachments and the I/O interface channels. It operates concurrently with the instruction processing unit for maximum throughput.
- Service processor which controls the operator console, the maintenance and service functions and the locally attached displays, printers, and diskette drive.
- Processor storage from 2 to 12 megabytes.
- High-speed cache buffer storage with 100 nanosecond cycle speed; (8K bytes on Mdl Group 4, 16K bytes on Mdl Group 5).
- High-speed reloadable control storage of 150K bytes.

Data flow is four bytes parallel within the processors and eight bytes parallel between the processors and main storage. Processor fetch cycles from the cache are 100 nanoseconds each for four bytes. The cache is automatically replenished from main storage in 64-byte blocks. The 64-byte fetch cycle requires 1.9 microseconds. The store cycle requires 2.2 microseconds.

Microcode: The microcode which controls systems operations resides in processor storage and reloadable control storage. The 4361 includes 150K bytes of Reloadable Control Storage, which is not available to the user. In addition, approximately 350,000 bytes of processor storage are occupied by microcode, RAS workspace and system data. The approximate processor storage available to the user is obtained by subtracting 350,000 bytes from the nominal storage size of a given mdl. When directly attached 3340 or DAS Compatibility is used, approximately 100K of additional storage is required for I/O buffers.

The system diskette facility is the microcode loading system for the 4361 Processors. The facility includes two diskette drives, and the second is available to the user after initial microcode loading.

The diskettes shipped with the processor supply the microcode for diagnostics, standard functions, and all optional features. The facility is also used for the storage of processor failure data for analysis by IBM customer engineers.

Operational Modes: The 4361 Processor operates in either S/370 mode or in Extended Control Program Support (ECPS):VSE mode. The mode is selectable at Initial Program Load (IPL) time.

ECPS:VSE supports operation of an appropriately generated VSE or SSX/VSE system.

S/370 mode allows operation of VM/370, VSE, OS/VS1, MVS/370 (on Mdl Group 5).

Performance: The 4361 Processors incorporate several design and technology advances to achieve substantial performance gains relative to the 4331 Processors:

- New instruction processing unit and cache buffer storage each with 100 nanosecond cycle speeds.
- A separate channel processor which operates concurrently with the instruction processing unit.
- Additional, frequently used instructions implemented in hardware rather than in microcode.
- Floating-point multiply hardware accelerator using high-speed array multiplier logic.
- Larger storage, higher internal data rates, and additional data paths.
- Support of the Start I/O Fast Release instruction with queuing of I/O requests on the Mdl Group 5.

Instruction execution rates, relative to the 4331-2, are approximately as follows:

	Mdl Group 4	Mdl Group 5
For commercial workloads	2	3
Workloads For Engineering/Scientific		
Single Precision	3	4
Double Precision	6	6

STANDARD FUNCTIONS

High-Accuracy Arithmetic Facility: A high-accuracy arithmetic facility is included. New floating-point instructions in addition to the S/370 floating-point instruction set are implemented in the 4361. They compute the basic arithmetic operations (+, -, x, /) and the scalar (dot) product with maximum accuracy, providing directed rounding (up, down, to nearest, to zero) for the short and long floating-point hexadecimal formats. Maximum accuracy is defined as between the computed floating-point result and the exact result (infinite precision) there is no other floating point number.

A set of subroutines using these instructions have been developed, which allow computations where the existence, uniqueness and validity of the solution and the accuracy of the results are algorithmically verified. If no solution can be achieved in the case of extremely ill-conditioned problems, the user is notified. A new program product, High-Accuracy Arithmetic Subroutine Library, 5664-185, provides these subroutines for use in programs compiled with VS/FORTRAN under VM/SP.

The application areas which should benefit from this facility include: professional personal computing, education in numerical mathematics, research in numerical methods, and mathematical problem solving in such areas as structural analysis, optimization, nuclear energy, power net distribution, forecasting, robotics, and others.

Direct Attachment Capability for Intelligent Workstation: The 3270 Personal Computer - control unit terminal mode only (see Note), and the 6580 Displaywriter System can be attached to the 4361 processors via the Display/Printer Adapter or remotely connected via the Communication Adapter. These attachments provide additional capability for Office applications. Several emulation features on the Displaywriter enable access to S/370 host networks.

The 5150 Personal Computer can be direct-attached to the 4361 via the Communication Adapter. Through the use of 3270 or 3101 emulation features, customers can access host applications. When the Personal Computer is not used for that purpose, it is available for use in native mode.

The IBM 3270 Personal Computer Attachment (PC attached via a 3278) to the Display/Printer Adapter supports concurrent operation of host and Personal Computer programs. The file transfer function from Personal Computer to host and the screen capture function to the PC printer or diskette are not supported. No specify is required on the 4361. For prerequisites on the Personal Computer and the 3278, see the "Machine" pages for these devices.

On the 6580 Displaywriter System and the 3270 Personal Computer Attachment when attached to the DPA, a 'Hot Key' function provides the capability to switch between the native mode and 3270 emulation mode, that is, switching between local operation and network connection.

Console Function: An operator's display console, keyboard, and control panel is a prerequisite for use of the system. The display console can be a 3278 mdl 2A or a 3279 mdl 2C (color), with keyboard feature **#4634**.

The Operator Control Panel allows additional communication with the system. A maximum of 20 of the 25 lines on the display may be used for system communication; four lines are reserved for messages from the 4361 Processor, and one line displays messages unique to the 3278 mdl 2A or the 3279 mdl 2C. The console address is selected at system installation time.

Note: Certain MVS components, such as DCCF, require output to a 24-line display. In these cases, an alternate console must be assigned to a terminal other than the operator console.

The console can operate in "Display Mode" or in "Printer/Keyboard Mode".

4361 Processor Mdl Groups 4, 5 (cont'd)

- In Display Mode, the keyboard is used for input and the CRT, with 20 80-character lines, is used for output. The 3287 or the 3268 Printers, if attached, has its own address and are supported as an independent device.
- In Printer/Keyboard Mode, the console and an optional printer have a single address, and operation is in single-line mode compatible with the 1052/3210/3215 devices of the older S/360 and S/370.

Printer/Keyboard Mode is selected at IPL time and is exclusive with the 4250 Image Printer operation. Remote Operator Console Facility (ROCF) is an extension of the Remote Support Facility (RSF) and provides an operator at a host location the ability to IML, IPL, and execute other manual control functions for a remote 4361 via a 3275 display station, or via a 3275 emulated on a host-attached 3278.

Maintenance Facilities: Remote Support Facility (RSF) is an IBM Customer Engineering tool provided by the Service Processor. Installation of the corequisite IBM modem is a no-charge customer option. RSF permits IBM Field Technical Support Center specialists after customer authorization to remotely monitor and/or perform problem diagnosis from any RETAIN terminal. This includes remotely-initiated execution of diagnostic programs, remote examination of logout records from the system diskette facility, and remote exercise of the Customer Manual Operations. RSF also allows the CE to access the RETAIN Data Bank for the latest service aids and information from the customer site.

Problem Finder Facility: This is a function of the service processor. It provides the customer with detailed information on machine failures. It also contains procedures which enable the customer's operator to diagnose and solve certain problems before calling for service. When CE service is necessary, the customer reported error data allows the CE to identify suspected FRU remotely. This eliminates on-site verification and wait time for required parts, resulting in reduced system outage time.

Other Standard Functions are:

- Multiple Virtual Storage capability by 2-level Dynamic Address Translation in S/370 mode
- Single Virtual Storage by one-level addressing in ECPS:VSE mode
- Channel Indirect Data Addressing in S/370 mode
- Channel Virtual Storage addressing in ECPS:VSE mode
- S/370 Universal Instruction Set
- Extended Precision floating-point arithmetic
- Multiply-and-Add instruction set
- Floating-Point multiply hardware accelerator
- Support of the Start I/O Fast Release instruction with queuing
- Conditional Swapping
- Customer Engineering maintenance support functions
- Storage Protection (Store and Fetch)
- Byte-Oriented Operands
- Clock Comparator and CPU Timer
- Time-of-Day Clock
- Interval Timer
- PSW Key Handling
- Control Registers
- Machine Check Handling including Recovery Extension Feature
- Command retry on block multiplexer channels
- Program Event Recording
- Monitoring
- Clear I/O
- Move inverse instruction (not used by IBM programs)
- High-Speed buffer storage (Cache)

  Mdl Group 4 8KB
  Mdl Group 5 16KB

STANDARD PROCESSOR FEATURES

The 4361 includes many generally required features as standard. Configuring, ordering, and administration are simplified. (In the tables below, 4331 feature numbers are provided for reference.)

Standard Features on Mdl Groups 4 and 5	4331 Feature
Adapter Power Prerequisite	#1001
Block Multiplexer Channel, 1st	#1421
Control Storage Expansion	#1901
Display/Printer Adapter Expansion	#2001
Diskette Drive	#3401
External Signals	#3898
Power Interface	#5531
3340/44 Attachment	#7851
DAS Compatibility	#7901
ECPS: VM/370	#8701
ECPS: VSE	standard

Additional Standard Features on Mdl Group 5	4331 Feature
Block Multiplexer channel, Add'l	#1422
Byte Multiplexer channel	#5248
Power Interface, Add'l	#5532
ECPS: MVS	–

The block multiplexer channel operates at up to 1.25MB/second for the attachment of tape units, system printers, displays and other non-DASD I/O via their control units. The ASCII Device Control Unit 4994 attaches to a block multiplexer channel.

The byte multiplexer channel (standard on MG5, optional on MG4) operates at up to 36K Bytes/second in single byte-mode and 500K Bytes/second in burst mode. It is primarily for the attachment of unbuffered card readers and MICR and OCR devices.

Power Interface provides power on/off control from the 4361 Processor for control units/devices attached to 4361 channel and I/O adapters. The Mdl Group 4 has control for up to eight control units/devices, and the Mdl Group 5 for up to 16.

External Signals provides six external interrupt lines.

The Diskette Drive is compatible with the 3540 as a reader/recorder for Diskettes Type 1. It is required during system start-up for microcode loading and when the Problem Finder Facility is used.

The Display/Printer Adapter attaches the 3278-2A or 3279-2C operator console, and the following displays, printers and other devices:

3178-C1,C2	Display Station
3278-2, 3279-2A,S2A,0SX	Display Station
3270 Personal Computer	Control unit terminal mode only
5150 Attached to a 3278	3270 Personal Computer Attachment
6580-A4,A6,A8,A10	Displaywriter System
3262-1,11	System Line Printer
3289-4	System Line Printer
3268-2,2C	Printer
3287-1,2,1C,2C	Printer
4250-1	Printer
5210-G1,G2	Printer

OPTIONAL FEATURES

Byte Multiplexer Channel: Optional on Mdl Group 4.

DASD/8809 Adapters and High-Speed Channels: The 4361 Processors have integrated DASD/8809 adapters and High-Speed BMPX Channels to attach high-performance DASD, Tape, and other I/O devices.

These adapters and channels are available in several combinations to provide the configurations required to support a range of programming systems' and customers' environments.

4361 Processor	DASD/8809 Adapters (max)		High-Speed BMPX Channels (max)
Mdl Group 4	2	and	1
	1	and	2
Mdl Group 5	4		none
	2	and	1
	1	and	2
	none		3

The DASD/8809 Adapters operate at up to 1.86MB/second for the attachment and control of 3310, 3370 mdls A1/A2, B1/B2 and 3340/44 DASD or the 8809 Magnetic Tape Unit. The 3310 and 3370 operate in fixed-block data format and provide emulation of Count-Key-Data (CKD) data formats. The 3340 operates in CKD data format.

The High-Speed BMPX Channels include two which operate at up to 3MB/second for the attachment of the 3880/3380 DASD, a third operates at up to 1.86MB/second. Any of the three channels support 231X, 333X, 334X, 3350, and 337X DASD, and other higher data rate I/O devices via control units.

The Communications Adapter attaches up to eight communication lines with an aggregate data rate of 64K bps. BSC, SDLC, and Start/Stop transmission modes are supported and can be intermixed. In Start/Stop mode, Type 1 and TWX/TTC2 devices are supported, with connection via the EIA RS-232-C interface.

4361 Processor Mdl Groups 4, 5 (cont'd)

Additional optional features on the 4361 Processors include most of those available on the 4331 Processors. Exceptions are those with low usage, which are the 5424 Adapter, 1400 Compatibility, and integrated modems for the communications adapter.

The Loop Adapter features of the 4331 Processors are available on the 4361 Processors via RPQ.

PROGRAMMING SUPPORT

The 4361 Processors implement new machine and channel checking techniques which significantly increase recovery capabilities, reduce downtime and allow increased deferred maintenance.

The 4361 Mdl Group 5 supports the Start I/O Fast Release instruction with queuing of I/O requests. This can improve performance by up to 20 percent in commercial workloads with high input/output activity.

These new capabilities are supported by the following IBM programming releases:

- VSE/SIPO/E 1.4.0, including VSE/System Package 1.1.0, in ECPS:VSE or S/370 modes, and as a guest under VM.
- VSE/Advanced Functions 1.3.5, in ECPS:VSE or S/370 modes, and as a guest under VM.
- SSX/VSE 1.3.0, in ECPS:VSE mode, and as a guest under VM.
- VM/System Product Release 2 and 3.
- MVS Release 3.8 with MVS/System Product Release 1.3.0 and above installed. JES2 (5740-XYS) and JES3 (5740-XYN) are supported. ECPS:MVS must be activated. Operation as a guest under VM is supported and assisted. **Note:** MVS supports only the 4361 Mdl Group 5. MVS does not support the integrated communication adapter or the DASD/8809 adapter.

OS/VS1 Release 7, with OS/VS1/Basic Programming Extensions Release 4 supports the 4361 Processor. The Start I/O Fast Release instruction and the enhanced recovery capabilities of the 4361 are not supported in OS/VS1.

At start-up of the system (at IPL time), the 4361 Processors can be conditioned to be viewed by the operating system as a 4331-2. Previous releases of VSE, SSX/VSE, and VM, as well as OS/VS1, which do not recognize the 4361 Processors, can then be used.

This additional programming support will ease migration to the 4361 Processors for customers upgrading from a 4331 with a following release installed:

- VSE/SIPO/E 1.2.1 or 1.3.1, and releases with VSE/Advanced Functions 1.2.0 or 1.3.0 as a base, in ECPS:VSE or S/370 mode, including as a guest under VM.
- VSE/Advanced Functions 1.2.0 or 1.3.0, in ECPS:VSE or S/370 mode.
- SSX/VSE Release 1.2.0, in ECPS:VSE mode, including as a guest under VM.
- VM/System Product Release 2 and 3.
- OS/VS1 Release 7, with or without OS/VS1/Basic Programming Extensions, including as a guest SCP under VM.

Customers who install the 4361 processor with a VSE, SSX/VSE, or VM release supporting the 4361 as a 4331 should plan to subsequently migrate to the latest release in order to gain the benefits of improved performance and enhanced recovery. Customers who install with OS/VS1 Release 7 can achieve full benefit from a 4361 Mdl Group 5 by migrating to MVS/SP.

Additional Comments:

- VSE releases in S/370 mode will not operate on the 12MB mdls unless VSE is a guest under VM. When the VM linkage enhancements are generated in the VSE system, it can then fully utilize a 12MB configuration.
- Under VSE basic support for attachment of X.21 switched lines to the Communications Adapter will be available in ACF/VTAM 2.1 during the second half of 1984.
- OS/VS1 will operate on the 12MB mdls, but the SCP will only access up to 8MB. When OS/VS1 is a guest SCP under VM, and the VM handshaking feature is generated, an OS/VS1 system can fully utilize the 12MB storage.
- Support for the 4361 in VM/SP Release 2 and 3 can be installed with an SPE via PUT tape 8308, available December, 1983.
- Support for the 4361 in MVS/SP 1.3.X can be installed with PTF 90274 via SMP.

ECPS: VM/370: The 4361 Processor provides ECPS: VM/370 support at Level 20, compatible with VM/SP Release 2. The functional areas assisted include: Virtual Machine I/O, SVC Handler, Privileged Instruction emulation, and Virtual Interval Timer.

Whenever ECPS:VM/370 and ECPS:MVS are both selected at IPL time, ECPS:VM/370 is enhanced to include the functions of the Shadow-Table Bypass Assist defined in *Virtual Machine Assist and Shadow-Table-Bypass Assist*, GA22-7074. These functions enhance the performance of MVS running under VM/370 in a V=R environment with VM/System Product.

ECPS:MVS: The 4361 Processor Mdl Group 5 provides the privileged instructions required by MVS/System Product - JES2 (5740-XYS) and MVS/System Product - JES3 (5740-XYN). These instructions involve the following MVS functional areas:

- SVC Interrupt Handling
- Integrity
- Tracing
- Lock Management
- Real Storage Management

INPUT/OUTPUT ATTACHMENTS - ADD'L INFORMATION

External Signals: External devices must meet the interface specifications outlined in *S/360 Direct-Control Feature OEMI*, GA22-6845.

Byte Multiplexer Channel: Functionally equivalent to the byte multiplexer channel on S/360 and S/370 and provides eight control unit positions. The channel permits simultaneous operations of low-speed devices. See *IBM 4361 Channel Characteristics*, GA33-1567, for devices which may be attached and the data rates achievable for certain configurations.

Channel Address and Subchannels: The Byte Multiplexer Channel, the Display/Printer Adapter, the Loop Adapter (RPQ) and the Communications Adapter are addressed via channel 0. From the 256 subchannel addresses of channel 0, up to 32 are assigned to the Display/Printer Adapter, up to 64 to the Loop Adapter and one, or two in case of a X.25 line, are required for each communication line installed. The subchannels remaining for the Byte Multiplexer Channel can be configured at installation time as non-shared or shared subchannels, the latter each with devices in multiples of 8, up to a maximum of 224 devices.

Block Multiplexer Channel 1 and 2: Each provides eight control unit positions. The block multiplexer channels permit simultaneous operation of high-speed devices. The ability to "Block Multiplex" and the facility for multiple requesting allows several I/O units to operate concurrently with greater channel efficiency. Devices attached to these channels which cannot utilize block multiplexing will function as if attached to selector channels. See Table 2 and *IBM 4361 Channel Characteristics*, GA33-1567, for details, or use HONE aid ANCHLOAD.

Channel Address and Subchannels: Channel addresses may be selected at installation time from the range of 1 to 6. Subchannels can be configured at installation time with up to 256 non-shared or shared subchannels, the latter each with devices in multiples of eight, up to a total of 256 devices.

DASD/8809 Adapter: DASD/8809 Adapters provide attachment of 3310, 3370 (including mdls A02/B02), 3340/3344 Direct Access Storage Devices or 8809 Magnetic Tape Units without the necessity of a control unit. Attachment of DASD and of 8809 units on one adapter is mutually exclusive. The configuration is selected at system installation time.

DASD Attachment: Up to four strings of devices may be attached to the adapter. The attachable device types may be intermixed on the adapter but not within a string.

The channel address may be from 1 to 6. Addresses for up to four strings of 3310 and 3370 can be configured at installation time in the range from X0X to X7X.

3340/3344 devices attaching to the DASD Adapter have logical unit/device addresses as follows:

X00	**01**	**02**	**03**	**04**	**05**	**06**	**07**
		2A	2B	2C	2D	2E	2F
		4A	4B	4C	4D	4E	4F
		6A	6B	6C	6D	6E	6F
and							
X10	**11**	**12**	**13**	**14**	**15**	**16**	**17**
		3A	3B	3C	3D	3E	3F
		5A	5B	5C	5D	5E	5F
		7A	7B	7C	7D	7E	7F

String Switch Capability allows sharing of 3340-A2 and/or 3370-A1/A2 and associated drives with another IBM processor or control unit that supports the DASD and string switching. It provides the ability for strings of 3340/3344 or 3370 to be accessed from DASD adapters or control units on the same or two different processors. The 3340-A2 or 3370-A1/A2 must have the String Switch feature **#8150** installed. String switch support of 3340/3344 is limited to the static assignment of a shared string to one processor at a time.

4361 Processor Mdl Groups 4, 5 (cont'd)

System/3 Data Import: With the VSE/3340 Data Import utility program product (5746-AM3), 3348 Data modules which have been written on a System/3-3340 can be read on any directly attached 3340 drive.

Direct Access Storage Compatibility: (Standard when a DASD/8809 adapter is installed) Designed primarily as a conversion aid, this feature provides emulation of 231X data formats on 3310 or 3370 Direct Access Storage and emulation of 3330 (100MB volume) or 3340 (70MB volume) formats on 3370 Direct Access Storage. This allows programs written for use with 231X, 3330 or 3340/3344 DASD to be executed with only Job Control modifications.

DAS Compatibility can be used on 3310 or 3370 devices which are installed on one DASD adapter on up to two consecutively addressed strings. Any one compatibility type can be activated at IPL time. Operates under DOS/VSE, OS/VS1 or VM/370, is not supported by MVS.

Data sets in fixed-block format and in emulated format can reside on the same 3310/3370 volume, however, access to one format only can be selected at IPL time. A variable number of full or partial CKD volumes can be stored on the 3310 or 3370 up to the capacity of the host device, in case of 3370 mdls A02 and B02 up to the capacity of 3370 mdls A01/B01. Residual space can be used in fixed-block format. Each full or partial emulated volume begins on a predefined full-volume boundary. With OS/VS1 or VM/370 partial emulated volumes are not supported.

Mapping of emulated volumes onto 3310/3370 volumes is as follows:

Compatibility Type	Maximum number of emulated full volumes		
	Per Host Volume	Per String	Per System
2311 on 3310	7	28	56
2314 on 3310	2	8	16
2311 on 3370	34	68	68
2314 on 3370	9	63	63
3330 on 3370	2	16	28
3340 on 3370	3	24	42

For device address assignment refer to *IBM 4361 Direct Access Storage Compatibility,* GA33-1569.

Performance Note: Use of DAS Compatibility or 3340 direct attachment introduces additional channel demands and can have an effect on system performance, particularly in environments with high I/O load on emulated DASD. Batch job execution elapsed times may increase. Exclusive use of DASD emulation is not recommended in any SCP environment. **Limitations:** [1] Operates on up to two consecutively addressed strings of 3310 or 3370 attached to the DASD adapter. [2] Direct attachment of 3340/3344 is limited to two strings on the system. [3] One type of emulation can be activated at IPL time. [4] 3330-11 cannot be emulated. [5] Emulation cannot be used on 3370 drives which are shared via string switch. [6] VM/370 supports 3310 or 3370 volumes containing emulated data which are dedicated to a guest operating system, other than VM/370 or CMS. Emulated 2311 is not supported by VM/370. [7] OS/VS1 does not support 2311, native or emulated. [8] MVS does not support DAS compatibility.

Program Order: The required utility programs for initialization and surface analysis of the 3310/3370 DASD as well as the formatting of the emulator extent are included in the VSE SCP, 5745-030, or VSE/AF or combined with VSE/SIPO/E products. OS/VS1 (5741-VS1), VM/370 (5749-010) and VM/SP contain the Device Support Facilities for initialization and surface analysis of CKD DASD. In addition, for the required formatting of the emulator extent, order 5747-SA1. The stand-alone Device Support Facilities are also separately orderable with program order number 5747-DS1.

8809 Magnetic Tape Unit Attachment: 8809-1A and up to five additional 8809 tape units (consisting of a mix of 8809-2s and 3s) may be attached. Allows the 8809 Magnetic Tape Unit to operate in streaming mode (data rate is up to 160K bytes per second) for dedicated loading or offloading DASD devices, since streaming mode may not be sustained, the 3340/3344 should not be used with the 8809 in that mode. Can operate in start/stop mode (data rate is up to 20K bytes per second) for other data processing operations. Although physical Read-Backward commands are not supported, the Read-Backward operation is simulated in the Logical IOCS (MTMOD) of VSE. Channel and device addresses may be assigned at system installation time from the range of X00 to X05, where X is 1 to 6.

Display/Printer Adapter: Up to 15 of the devices attachable may be installed in any combination. No more than two 3262 and/or 3289 printers can be included. The 3262 or the 3289 may be used as system printers depending on control program or program product support. One 3287 or 3268 Printer may be used as a console hardcopy device. The remaining ports may be used for attachment of displays, printers and workstations for user-written applications. Display/Printer Adapter support includes all standard functions of the 3274-1B with the respective terminal devices attached. In addition, the following 3278/3279 special features are supported: Keyboard Numeric Lock, Audible Alarm (standard on the 3279), Security Keylock and Switched Control Unit. Other 3278/3279 special features are not supported. 3278 or 3279 Display Station keyboard feature codes **#4621, #4622, #4623, #4627, #4624, #4628,** and the mdl C1 and C2 keyboards of the 3178 are supported. If two different keyboards are required for 3278/3279s, one must be **#4621.**

The 3268 and the 5210 printer are supported as 3287.

The 6580 Displaywriter may be used with its native functions or emulating a 3278-2 and the 3287-1 or 2. The 6580 requires the 3274/3276 Attachment Workstation Adapter (**#8332**) and the 3270 Attached Workstation Licensed Program (5608-SR9) to support normal 3270 screen functions, screen save, deferred print, compressed print, keystroke save and playback alternate task, and document transfer.

The IBM 3270 Personal Computer Attachment (PC attached via a 3278) to the Display/Printer Adapter supports concurrent operation of host and Personal Computer programs. The file transfer function from Personal Computer to host and the screen capture function to the PC printer or diskette are not supported. No specifies are required on the 4361. For prerequisites on the Personal Computer and the 3278, see the "Machine" pages for these devices.

Channel 0 addresses for these devices are assigned at installation time.

Cable Order: See machine pages of the device for ordering information for the required coax cable. **Specify:** See "Specify" for character code /keyboard combinations available.

Diskette Drive: This diskette has a data capacity of 242,944 bytes organized in 1,898 sectors of 128 bytes each (Diskette Type 1). When used with VSE refer to VSE/POWER documentation. Recorded Data can be interchanged with IBM devices and systems which have a diskette drive. Examples are the 3740, 3770, 3790, 5280 and 8100 and Series/1 and System/3, 32, 34, and 38. The diskette drive is temporarily used as input device for Initial Microcode Load (IML) and when the Problem Finder Facility is used. **Limitations:** Support by VM/370 via IUP only. Device address on channel 0 is selected at installation time.

COMMUNICATIONS ADAPTER

Provides the basic control and common circuits for the direct attachment of up to eight communication lines in any combination, operating in the following transmission modes: Synchronous (BSC), asynchronous (Start/Stop), Synchronous Data Link Control (SDLC).

Connection via 2- or 4-wire line is possible. Simultaneous bidirectional (full-duplex) data transmission over one line is not supported . Maximum aggregate data rate is 64,000 bps. The maximum speed of each of the eight lines is 9600 bps except that line position one may be a synchronous high-speed line (BSC or SDLC) up to 56,000 bps. For number and speed of lines allowable, refer to Table 3 above or see *IBM 4361 Channel Characteristics,* GA33-1567.

The Communications Adapter has the following structure: The Communications Adapter Base contains common circuits and control. Each of the telecommunication lines attachable requires one Line Attachment Base (two different types) and one line attachment feature. Another feature serves for autocall unit interface. The following optional line interface features are available:

- Up to eight line features without internal clock for attachment to external modems (Data Circuit terminating Equipment, DCE) with clocking (EIA RS-232-C/CCITT V.24/V.28 or X.21bis).
- Up to eight line features with internal clock for attachment to external modems (Data Circuit-Terminating Equipment, DCE) without clock (EIA RS-232-C/CCITT V.24/V.28 or X.21bis).
- Autocall Unit interfaces (EIA RS-366/CCITT V.25) for up to two of the installed lines with EIA RS-232-C/CCITT V.24/V.28 interface.
- One synchronous high-speed line feature (V.35 interface).
- One synchronous high-speed line feature (WE303 modem interface).
- Up to eight line features without business machine clock for attachment to X.21 Nonswitched Data Network.
- Up to eight line features for synchronous transmission with local attachment without modems.
- Up to eight line features with Digital Data Service Adapters.

Note: IBM Integrated Modems are not available on the 4361 processor.

CONFIGURATIONS

Maximum Configuration: The maximum number of channels and integrated adapters which can be installed are shown below with associated features numbers. Your configuration should correspond to one column or be a subset of it. Either High-Speed BMPX Channel (#1431) or DASD/8809 Adapter (#3201) must be installed.

4361 Processor Mdl Groups 4, 5 (cont'd)

Table 1 - Maximum Configurations

Channel/Adpt Configuration Option	Mdl Group 4 C2D1	C1D2	C	Mdl Group 5 C2D1	C1D2	D
Byte Mpx channel	0	0	S	S	S	S
Block Mpx channel 1st	S	S	S	S	S	S
Block Mpx channel 2nd	–	–	S	S	S	S
High-Speed Block Mpx channel 1	#1431	#1431	#1431	#1431	#1431	–
High-Speed Block Mpx channel 2	#1432	–	#1432	#1432	–	–
High-Speed Block Mpx channel 3	–	–	#1433	–	–	–
DASD/8809 Adpt 1	#3201	#3201	–	#3201	#3201	#3201
DASD/8809 Adpt 2	–	#3202	–	–	#3202	#3202
DASD/8809 Adpt 3	–	–	–	–	–	#3203
DASD/8809 Adpt 4	–	–	–	–	–	#3204

Legend:

S	Standard
O	Optional
-	Not available
C	Channel configuration
D	DASD/8809 adapter configuration
C1D2	One channel, two DASD adapters
C2D1	Two channels, one DASD adapter

Channel/Adapter Load Evaluation: All data passing through the system for any I/O device interferes with the data flow for other devices, producing I/O limitations. The limitations take two forms:

(1) Hardware exclusivities listed in the feature descriptions.

(2) I/O attachments which individually or in combination can produce frequent data overruns. Considerations in this category are:

- The number of and the aggregate data rate of the Block Multiplexer Channels and the DASD/8809 Adapters.
- The number and speed of lines attached to the Communications Adapter.
- The number and class of overrunnable devices on the Byte Multiplexer Channel.

Refer to Tables 2, 3 and 4 below to properly configure a 4361. If your configuration is within the limits of the examples shown no further validation is required. Valid configurations of the 4331-2 including channels, adapters and communications lines, are valid for a 4361. If additional channels/adapters/lines are to be installed, the limitations below should be observed.

Table 2 - Allowable Data Rates

Configuration	Maximum Data Rate (MByte/sec) Block Mpx 1	2	High-Speed BMpx 1	2	3	DASD/8809 Adapter 1	2	3	4
D1	1.25	1.25	–	–	–	1.86	–	–	–
D2	1.25	1.25	–	–	–	1.86	1.86	–	–
D3 (4)	0.50	1.25	–	–	–	1.86	1.86	1.86	–
D4 (4)	0.50	0.50	–	–	–	1.86	1.86	1.86	1.86
C1D2a	Class 3	1.25	3.00	–	–	1.86	1.86	–	–
C1D2b	0.50	1.25	1.86	–	–	1.86	1.86	–	–
C2D1a	Class 3	1.25	3.00	3.00	–	1.86	–	–	–
C2D1b	0.50	1.25	1.86	3.00	–	1.86	–	–	–
C2	1.25	1.25	3.00	3.00	–	–	–	–	–
C3a (4)	Class 3	1.25	3.00	3.00	1.50	–	–	–	–
C3b (4)	0.50	1.25	1.86	3.00	1.86	–	–	–	–

Notes:

(1) See Table 3 below for number and speed of lines concurrently operable on the communications adapter together with devices (example 2501) attached to the Byte Multiplexer Channel.

(2) If multiple Class 1 devices are to be operated concurrently on the byte multiplexer channel, consult *IBM 4361 Channel Characteristics,* GA33-1567, or use HONE aid ANCHLOAD.

(3) For data rates and recommended attachment of commonly used devices, refer to Table 4 below.

(4) Configuration is not applicable to Mdl Group 4.

(5) Second BMPX channel not available on Mdl Group 4.

Table 3 - Medium Speed Communication Lines

Allowable number of medium speed communication lines. Maximum line speed, 9600 bps.

Configuration	Single DeviceVon Byte Mpx channel None	2501	1442	1419
D1	8	8	8	8
D2, D3, C1D1	8	8	8	7
D4, C1D2	8	8	8	6
C2, C2D1	8	8	6	3
C3	8	5	4	1

Note: Lines of different speed may be mixed. Maximum number of lines is 8. Aggregate data rate of 64K bps may not be exceeded. For configurations with line speed higher than 9600 bps refer to, *IBM 4361 Channel Characteristic, GA33-1567,* or use HONE aid ANCHLOAD. Line configurations which exceed the load maximum may be installed, however, should only be operated concurrently within an allowable configuration.

Table 4 - Data Rates and I/O Attachment

Data rates and recommended attachment of selected I/O devices:

Device	Data Rate (MB/sec)	Recommended attachment in sequence of preference		
3310	1.030	da		
3370	1.860	da	hb	
3375	1.860	hb		
3380	3.000	hb12		
3330	0.805	hb		
3340/3344	0.885	hb	da

Legend:

Class 1	unbuffered device, manual recovery from overrun
Class 2	unbuffered device, programmed recovery
Class 3	buffered device, operates at channel speed
da	attach to a DASD/8809 adapter
b	attach to any Block MPX channel
b1	attach to Block MPX channel 1
b2(s)	attach to BMPX channel 2 as single device
hb	attach to any High-Speed BMPX channel
hb12	attach to HS BMPX channel 1 or 2
Bu	attach to Byte MPX channel in burst mode, may not operate concurrent with Class 1 or Class 2 devices
By	attach to Byte MPX channel in byte mode

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage: No specify is required. 1-phase, 3-wire, 60 Hz, 208V, **(#9902)** is standard. 240V **(#9914)** can be wired at installation time (paper MES required).
- Color: **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9063** for classic blue, **#9064** for charcoal brown, **#9065** for pebble gray.
- **Remote Support Facility:** The Remote Support Facility (RSF) is a customer engineering tool provided by the Service Processor. Its use is recommended. It requires installation of a communications interface in the 4361 which is a no-charge customer option. It can be installed in the field. RSF permits IBM Field Technical Support Center specialists, after customer authorization, to manually establish a connection to a remote IBM support location and monitor and/or perform problem diagnosis from any RETAIN terminal.

  When RSF is selected, the customer must provide the telephone line and arrange for the connection of the telephone interface cable provided by IBM to the telephone network. For details on customer responsibilities, see *IBM 4300 Processors Installation Manual-Physical Planning,* GA24-3667.

4361 Processor Mdl Groups 4, 5 (cont'd)

RSF is available in three versions:

For a 4361 upgraded from an installed 4331, retain specify **#9510** for integrated modem, 1200 bps, switched network, manual answer. A telephone with FCC registered Data Access Arrangement (DAA) compatible with CDT Coupler Series 1000A interface and operation, with a 4-prong jack, is required.

Specify **#9512** on new 4361 orders for integrated modem, 1200 bps, switched network, manual answer. An telephone set with exclusion key and a RJ41S or RJ45S type data jack is required. An FCC registered protective coupler is included. Ringer Equivalence Number (REN) is 0.8B.

Specify **#9511** for EIA RS-232-C Interface, 1200 bps, switched network manual answer. An FCC registered external cable modem compatible with the WE202S modem, interface and operation, or equivalent, is required.

- Remote Operator Console Facility (ROCF) is field installable and is an extension of RSF. It provides to an operator at a host location the ability to IML, IPL and execute other manual control functions for a remote 4361 via a 3275 display station, or via a 3275 emulated on a host attached 3278 (Remote Console). After IML and IPL is complete the remote operator console can be disconnected and the remote 4361 can be operated in stand-alone mode, or control can be turned over to existing networking facilities.

  Note: The 3275 Display Terminal can only be obtained on an "as available" basis. The 3275 emulation can be used instead, which is available via microcode on a 4361, or as a facility of the host operating system. In latter case, either program product MVS/OCCF, 5665-288, or VM/Pass-Thru Facility, 5748-RC1, is required. **Prerequisites:** Specify ROCF feature **#9511**. The customer-supplied non-clocked external modem attached to feature **#9511** must include auto answer. Line discipline is BSC, 600/1200 bps.

- Keyboard/Character Set Language: No specification is required on the 4361. The keyboard/character set for devices attached to the Display/Printer Adapter is selected at installation of the machine or the device via a Manual Operation. It must correspond to the keyboard/character set ordered for the device. Support is provided for:

  EBCDIC Typewriter Keyboards **#4621, #4627** on 3278-2 or 3279-2A. The 3178 mdl C2 is compatible with 3278 with **#4621**.

  EBCDIC Data Entry Keyboards: For 3278-2 or 3279-2A either Data Entry (**#4623**) or Data Entry/keypunch-layout (**#4622**). 3178 mdl C1 is compatible with 3278 with **#4623**.

  Support for Data Entry/keypunch-layout keyboard (**#4623**) will be withdrawn in the future because of diminishing usage. Do not plan its use in future applications.

  ASCII Keyboard/Character Set: **#4624, #4628** on 3278-2 or 3279-2A and/or **#9084** on 3287, when used as a workstation. ASCII keyboards are supported as indicated, but the internal binary codes are EBCDIC.

SPECIAL FEATURES

NON-COMMUNICATIONS FEATURES

High-Speed Block Multiplexer Channel 1, 2 and 3 (#1431, #1432, #1433): [HS-BMPX 3 is not available on Mdl Group 4] provides attachment of high-speed I/O devices including 3330/3333, 3340/3344, 3350, 3370, 3375, 3380 via control units including 3830 mdl 2 and 3880. The ability to "Block Multiplex" and the facility for Multiple Requesting allows several I/O units to operate concurrently with greater channel efficiency. Can operate in Data Streaming Mode. Devices attached which cannot utilize block multiplexing will function as if attached to a selector channel. Up to eight control units may attach. Data transfer rate is up to 3.0 million bytes per second. Channel address and subchannels, same as on the block multiplexer channels. **Limitations:** [1] is mutually exclusive with certain DASD/8809 Adapters: Adapter 1 (#3201) is mutually exclusive with HS BMPX 3 (#1433,) Adapter 2 (#3202) is mutually exclusive with HS BMPX 2 and 3 (#1432, #1433), Adapters 3 and 4 (#3203, #3204) are exclusive with any HS BMPX (#1431, #1432, #1433). [2] For data rate and attachment limitations for other devices and communications lines refer to "Maximum Configuration" section above or to *IBM 4361 Processor Channel Characteristics,* GA33-1567, or use HONE aid ANCHLOAD. [3] 231X devices must be attached to a High-Speed Block Multiplexer Channel and cannot be used on a Block Multiplexer Channel. [4] HS BMPX3 is not available on Mdl Group 4. **Maximum:** One each. **Field Installation:** Yes. **Prerequisites:** #1431 for #1432 ... #1431 and #1432 for #1433.

DASD/8809 Adapter 1, 2, 3 and 4 (#3201, #3202, #3203, #3204): [Adapters 3 and 4 are not available on Mdl Group 4] Each allows attachment of the 3310, 3370 and 3340/3344 DASD or of 8809 Magnetic Tape Units to the 4361 Processor.

DASD Attachment: Up to four strings of devices may be attached to each adapter. A string consists of one A-unit and one or several B-units. The attachable device types may be intermixed on each adapter but not within a string. Device strings may be configured on each adapter as follows:

(a) Up to four strings of 3310-A1s or A2s with 3310-B units attached, up to a maximum of 4 drives per string.

(b) Up to four strings of 3370-A1/A2 with 3370-B1/B2 units attached, up to a maximum of four drives (eight actuators/addresses) per string.

(c) Up to two strings of 3340-A2s with 3340/3344-B units attached, up to a maximum of eight drives per string can be attached to one or two DASD/8809 Adapters.

8809 Magnetic Tape Unit Attachment: Provides for attachment of the 8809 Magnetic Tape Unit. One 8809-1A may attach. Up to five 8809-2s and 3s may attach to the mdl 1A for a total of six 8809 Magnetic Tape Unit drives. The 8809 is not supported by VS1 and MVS.

Limitations: [1] Adapters 3 and 4 (#3203, #3204) are not available on Mdl Group 4. [2] DASD and 8809 are mutually exclusive on the same adapter. [3] DASD/8809 Adapters are mutually exclusive with certain High-Speed Block Multiplexer channels. Adapter 1 (#3201) is mutually exclusive with HS BMPX 3 (#1433,) Adapter 2 (#3202) is mutually exclusive with HS BMPX 2 and 3 (#1432, #1433), Adapters 3 and 4 (#3203, #3204) are exclusive with any HS BMPX (#1431, #1432, #1433). [4] 3310 and 3370 are not supported by VS1 or by MVS in fixed block mode. MVS does not support direct-attached 3340/3344. [5] For data rate and attachment limitations for other devices and communications lines, refer to "Maximum Configuration" above or to *IBM 4361 Processor Channel Characteristics,* GA33-1567. [6] Use of direct- attached 3340/3344 introduces additional channel demands, and can have an effect on system performance, particularly in batch environment with heavy I/O load. Performance considerations should be carefully reviewed before proposing use of the 3340/3344. **Maximum:** One #3201, #3202, #3203 or #3204. **Field Installation:** Yes. **Prerequisites:** #3204 requires #3203 ... #3203 requires #3202 ... #3202 requires #3201.

Byte Multiplexer Channel (#5248): Optional on Mdl Group 4, standard on Mdl Group 5. **Limitations:** [1] Available only on Mdl Group 4, is standard on Mdl Group 5. [2] For data rate and attachment limitations for other devices and communications lines, refer to Maximum Configuration section above or to *IBM 4361 Processor Channel Characteristics,* GA33-1567, or use HONE aid ANCHLOAD. **Maximum:** One. **Field Installation:** Yes.

COMMUNICATIONS FEATURES

Customer Responsibilities: See M2700 pages for customer responsibilities regarding communication facilities and services. For supported terminals and communications facilities, refer to the M2700 pages.

Autocall Unit Interface (#1020): Provides an interface to customer-supplied Automatic Calling Equipment allowing data links with remote stations to be automatically established on the switched telephone network. Automatic Calling Equipment complying with EIA RS-366/CCITT V.25 interface may be attached. For the appropriate Automatic Calling Equipment, refer to M2700 pages. **Maximum:** Two. **Cable Order:** Required, for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** #1601 and #3701 (in switched operation) for each Autocall Unit Interface installed.

Communications Adapter Base (#1601): Allows attachment of up to eight lines plus Autocall Unit Interface (#1020) for up to two of the lines. **Limitations:** Each line attached reduces the number of available subchannels on the Byte Multiplexer Channel. See "Subchannels" above for details. **Maximum:** One. **Field Installation:** Yes. **Specify:** See Table 6 for required specify codes for each line feature attached.

EIA/CCITT Interface (#3701): This feature may be intermixed with other line features. Each feature provides for the attachment of one external modem having EIA RS-232-C, CCITT V.24/V.28 or X.21bis interface for attachment to one switched or one nonswitched line. When this feature is installed in conjunction with Line Attachment Base for Clocked Modem (#4695), a BSC, or an SDLC line is supported. Nonswitched lines with switched network backup may be used where maximum line speed on nonswitched lines is 9600 bps, the maximum line speed on switched network backup or switched networks is 4800 bps.

When this feature is installed in conjunction with Line Attachment Base for Non-Clocked Modems (#4696), then a BSC, a Start/Stop (including ASCII/TTC2 line protocol), or an SDLC line is supported. Transmission speeds supported are listed with feature #4696 below. **Maximum:** Eight. **Cable Order:** Required, for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** #1601. One #4695 or #4696 is required for each feature #3701 installed. **Specify:** See Table 6 for line position codes.

4361 Processor Mdl Groups 4, 5 (cont'd)

Line Attachment Base For Clocked Modems (#4695): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit-terminating Equipment) which provide clocking and comply with EIA RS-232-C CCITT V.35, X.21, X.21bis or X.25 recommendations. See the various line features below to determine when it is required. **Limitations:** A maximum of eight Line Attachment Bases #4695 and/or #4696 can be installed. **Field Installation:** Yes. **Prerequisites:** #1601.

Line Attachment Base For Non-Clocked Modems (#4696): This feature is a prerequisite for all line adapters which attach to modems (Data Circuit-terminating Equipment) which do not provide clocking and comply with EIA RS-232-C CCITT recommendation. See the various features below to determine when it is required.

The clock speed can be wired at installation to one of the following:

- Start/Stop (IBM Type I) - 75, 300, 600, 1200 and 2400 bps.
- Start/Stop (ASCII/TTC2) - 75, 300, 600, 1200 and 2400 bps.
- BSC - 600 or 1200 bps.
- SDLC - 600 or 1200 bps.

Limitations: A maximum of eight Line Attachment Bases #4695 and/or #4696 may be installed. **Field Installation:** Yes. **Prerequisites:** #1601.

High-Speed Digital Interface (#4717): Provides for the attachment of an wideband external modem (WE303 interface). One nonswitched point-to-point BSC or SDLC line may be operated with speeds from 19,200 to 56,000 bps. **Limitations:** Is always installed in line position 1. No other line with speed higher than 9600 bps can be installed. **Maximum:** One. **Cable Order:** Required for attachment to the external modem. **Field Installation:** Yes. **Prerequisites:** #1601 and #4695.

High-Speed Modem Adapter (#4720): Provides for the attachment of an external modem with clock having a CCITT V.35 or X.21bis interface. One nonswitched point-to-point BSC or SDLC line may be operated with speeds from 19,200 to 56,000 bps. **Limitations:** Is always installed in line position 1. No other line with speed higher than 9600 bps can be installed. **Maximum:** One. **Cable Order:** Required for attachment to the external modem. **Field Installation:** Yes. **Prerequisites:** #1601 and #4695.

Local Attachment Interface (#4801): Provides circuits and controls for the local attachment of one BSC or SDLC remote station to the Communications Adapter without the use of modems at either device. Transmission speed can be strapped at installation time by the CE at 1200, 2400, 4800 and 9600 bps. The feature provides clocking for both the Communications Adapter and the terminal. The attached terminal must be equipped with an EIA RS-232-C or CCITT V.24/V.28 interface, have no Business Machine Clocking and have an external modem cable. The distance to the terminal may be extended via a customer-provided cable to allow a maximum distance between Communications Adapter and terminal of:

800 meters at 1200 bps	200 meters at 4800 bps
400 meters at 2400 bps	100 meters at 9600 bps

For distances beyond 120 meters, to protect against damage by lightning, shielded cables should be used. For installation details, see *IBM 4300 Installation Manual/Physical Planning,* GA24-3667, Appendix D. The feature includes cables to attach the Communications Adapter to a customer-supplied terminal plate and from the terminal plate to the DTE external modem cable. **Cable Order:** Required for attachment of communications adapter and DTE to customer-supplied terminal blocks. **Maximum:** Eight. **Field Installation:** Yes. **Prerequisites:** #1601 and #4695. **Specify:** See Table 6 for line position codes.

Digital Data Service Adapter (#5650): Provides circuits and controls for attachment of one BSC or SDLC line and includes an internal Dataphone Digital Service Adapter. The adapter allows interface to American Telephone and Private Line DDS Network via the AT&T Channel Service Unit. The Digital Data Service Adapter will operate at synchronous speeds of 2400, 4800, 9600 and 56,000 bps. These line features can be associated with each line position if the line speed does not exceed 9600 bps. **Limitations:** If feature #5650 operates with a speed of 56,000 bps it must be installed in line position 1 (specify **#9471**). No other line with speed higher than 9600 bps can then be installed. **Maximum:** Eight. **Cable Order:** Required for attachment to external equipment. **Field Installation:** Yes. **Prerequisites:** #1601 and #4695. **Specify:** See Table 6 for line position codes. **#9471** is required for operation at 56,000 bps.

X.21 Adapter for Nonswitched Networks (#5655): Provides controls and circuits for attachment of one X.21 point-to-point or multipoint nonswitched communication line via a DCE complying with CCITT recommendation X.21 or X25. In X.21 networks transmission may be at speeds of 2400, 4800, 9600 or 48,000 bps for point-to-point operations and 2400, 4800 and 9600 for multipoint operations. **Limitations:** If feature #5655 operates with a speed of 48,000 bps, it must be installed in line position 1 (specify **#9711**). No other line with speed higher than 9600 bps can then be installed. **Maximum:** Eight. **Field installation:** Yes. **Prerequisites:** #1601 and #4695. **Specify:** See Table 6 for line position codes. **#9711** is required for operation at 56,000 bps. **Cable Order:** Required for attachment to external equipment.

Table 6 - Comm. Adapter and Line Position Features

Communications Adapter Configuration Special Features and Line Position Specify Codes:

Feature	Line	Inter Att face Base		Line Position 1	2	3	4	5	6	7	8
EIA/CCITT interface (for Clocked Modems)		#3701	#4695	#9531	#9532	#9533	#9534	#9535	#9536	#9537	#9538
EIA/CCITT interface (for Non-Clocked Modems)		#3701	#4696	#9521	#9522	#9523	#9524	#9525	#9526	#9527	#9528
Transmission Mode(1)											
Start/Stop(2) incl. ASCII/TTC2				#9681	#9682	#9683	#9684	#9685	#9686	#9687	#9688
Digital Data Service Adapter		#5650	#4695	#9471	#9472	#9473	#9474	#9475	#9476	#9477	#9478
High-Speed Modem Adapter		#4720	#4695	No position code required. Is always installed in line position one.							
High-Speed Digital Interface		#4717	#4695	No position code required. Is always installed in line position one.							
X.21 Adapter for Nonswitched Networks		#5655	#4695	#9711	#9712	#9713	#9714	#9715	#9716	#9717	#9718
X.21 Adapter for Switched Networks		#5656	#4695	#9721	#9722	#9723	#9724	#9725	#9726	#9727	#9728
Local Attachm. Interface		#4801	#4695	#9451	#9452	#9453	#9454	#9455	#9456	#9457	#9458
Autocall Unit Interface (3)		#1020		No position code required. Association with the desired line via manual operation in the field.							

Notes: The aggregate data rate of the Communications Adapter is 64,000 bps. Line Features exceeding this aggregate may be installed, but not operated concurrently. To allow the aggregate of 64,000 bps to be achieved, the highest speed line must be installed in line position one, the next highest in line position two, etc.

(1) BSC or SDLC transmission mode is possible with any line attachment feature. Selection of BSC or SDLC at installation time using configuration tool.

(2) Start/Stop transmission mode requires EIA/CCITT Interface (for non-clocked modem, #3701 and prerequisite #4696). IBM Start/Stop Line Control Type 1 or TWX/TTC Type 2 is selected at installation time.

(3) Is linked to the desired EIA/CCITT Interface (#3701) and prerequisite (#4695 or #4696) by the CE. Maximum of two #1020s may be installed.

MODEL CONVERSIONS

Field installation Downgrades from 4361 to 4331 or from 4361 Model Group 5 to Model Group 4, as well as memory downgrades, are not recommended for field installation.

Customer price quotations and customer order acknowledgment letters for machine/model conversions must state: "Installation of this model upgrade involves the removal of parts which become the property of IBM."

Depending on whether an installed 4331 feature is standard, optional, or not available on the 4361, different ordering actions will be required when an installed 4331 is upgraded to a 4361.

Standard features of the 4361, not installed on the 4331 to be upgraded, are automatically included in the upgrade by the plant. The 4331 prices of these features are added to the model upgrade price. If the 4331 to be upgraded has features installed which are standard on the 4361, those feature codes must be shown as 'chargeable to standard' on the upgrade MES order.

Optional features of the 4361 which are not currently installed on the upgrading 4331 may be ordered with the upgrade MES without restriction. However, conversion time may be extended.

4361 Processor Mdl Groups 4, 5 (cont'd)

Those 4331 feature codes and specify codes which are not available on the 4361 must be deleted with the MES upgrade order. Features installed on the upgrading 4331 which are not available on the 4361 will be removed. The customer has two options: [1] If the parts to be removed are returned to IBM with the gate exchange, the removal is free of charge. [2] If the customer elects to keep removed parts, an RPQ must be submitted listing each feature to be removed from the 4331. There will be a charge for these RPQs. The removal of features must be scheduled prior to the machine conversion. Specify codes on the upgrading 4331 which are not available on the 4361 must be deleted.

Depending on whether a feature is standard, optional, or not available on the 4361, the following actions are required when a 4331-1, 2, or 11 is upgraded to a 4361.

4331 Upgrading to 4361

Feature	Number	Available On 4331 1	2	11	4361 4	5	Action if Feature Is Installed	Action if Feature Is Not Installed

Legend:

No entry in Column	Feature is optional
N	Feature is not available
S	Feature is standard
R	Feature available via RPQ
–	No action

Notes:

1. Delete feature code (chargeable to standard).
2. No action, feature price is added to upgrade purchase price by IBM.
3. No action, feature is carried to 4361.
4. Feature must be cancelled/removed.
5. Feature must be removed from the 4331. Feature can be returned to IBM without charge or feature can be removed from the 4331 via removal RPQ (charge). In latter case, removed parts are the customer's property.
6. For attachment of the 8809, order DASD/8809 Adapter (#3201, #3202, #3203 or #3204). See DASD/8809 feature description for limitations and prerequisites. On a 4331-1 or 2, delete #4910. On the 4331-11, feature #4910 is standard and need not be deleted. If #320X is ordered, this involves hardware swapping of the adapter hardware without charge in the case of a purchased machine.
7. On the 4331-11, feature is standard. To retain the feature on the 4361, add the feature on the MES order. If not ordered, the feature will be removed.
8. 8809 attachment to the 4361 is via any DASD/8809 adapter (#3201, #3202, #3203 or #3204).
9. For installation of these features, the specified RPQ is required. Availability is June, 1984.
10. Feature is equivalent to RPQ ML4707 for 4331 Mdl Grps 1, 2, 11.
11. Cancel the RPQ and add the feature (chargeable to standard).

ACCESSORIES

The following items are available on a purchase-only basis. For shipment with the 4361, order the feature number indicated below:

Console Table (#1550): Provides a convenient table for the operator console and one 3278/3279 Display Station. Color is the same as the machine.

Book Rack and Cable Holder (#1480): Provides a book rack and cable holder.

SUPPLIES (None)

4381 PROCESSOR

PURPOSE

Provides power, control, logic, memory and channels circuitry for the associated functions in a Data Processing System where a model of the 4381 is the Central Electronic Complex.

MODELS

Six models of the 4381 are available, offering two computing power options and three sizes of processor storage.

Model		Processor Storage
L01	L02	4,194,304 Bytes
M01	M02	8,388,608 Bytes
P01	P02	16,777,216 Bytes

Prerequisites: Each 4381 Processor requires one 3278 Display Console Mdl 2A or 3279 Color Display Console Mdl 2C equipped with an operator console keyboard and an operator control panel. A second 3278 or 3279 Console, although not required, will enhance system operations for most customers and help increase system availability.

HIGHLIGHTS

Depending on the 4381 mdl selected, 4,194,304 to 16,777,216 bytes of monolithic processor storage are available. Internal processor cycle time of 68 nanoseconds for both Mdl Groups ... 8,192 bytes of high-speed buffer are available on the Mdl Group 1 when the operating system supports 4K pages ... 4,096 bytes of high-speed buffer on the Mdl Group 1 when the operating system supports 2K pages ... 32,768 bytes of high-speed buffer on the Mdl Group 2 when the operating system supports 4K pages ... 16,384 bytes of high-speed buffer on the Mdl Group 2 when the operating system supports 2K pages ... 8-byte parallel data flow within the processor as well as an 8-byte wide data flow between the processor, high-speed buffer and channels ... 16-byte wide data flow between the high-speed buffer and main storage ... Upright design for optimum floor space utilization.

Standard Features Include: Virtual Storage Capability by Dynamic Address Translation ... 1 byte and 5 block multiplexer channels ... Data Streaming Mode ... 128 to 2,048 UCWs in S/370 Mode ... Channel Indirect Addressing in S/370 Mode ... Channel Command Retry on Block Multiplex Channels ... EC and BC Modes ... Byte-Oriented Operands ... Clock Comparator and CPU Timer ... Control Registers ... Error Checking and Correction in Processor Storage ... Extended Control-Program Support for VM/370 and MVS/370 ... Extended Precision Floating Point ... Interval Timer ... Machine Check Handling ... Support Processor ... Instruction Retry ... Program Event Recording ... Reloadable Control Storage ... Storage Protection (Store and Fetch) ... S/370 Universal Instruction Set ... Two System Diskette Drives ... Time of Day Clock ... PSW Key Handling ... Compare and Swap and Compare Double and Swap ... Clear I/O ... Clear Channel... Recovery Extension Facility ... External Signals ... Unit Power Off ... Move Inverse Instruction (not software supported) ... Fast Release for the Start I/O Fast Release Instruction ... Hardware Reconfiguration in High-Speed Buffer (Cache), Control Storage, Channel Data Buffer and Processor Storage ... Remote Operator Console Facility (ROCF), when a no-charge Remote Support Facility (RSF) Feature is installed .

Modes of Operation: Two modes of operation are available. The mode is selected from a common diskette at Initial Microcode Load (IML) time.

S/370 Mode allows operation of any program written for S/370 and S/360 that does not violate the exceptions noted under "Compatibility" below. When the 4381 Processor is operating in S/370 mode, support is provided by:

- MVS/System Product Version 1 Release 3.
- VM/System Product Release 2 with or without VM/SP High Performance Option Release 3 and VM/SP Release 3 with or without High-Performance Option Release 3.2.
- DOS/VSE with VSE/Advanced Functions Release 3.5 and by VSE/SP Release 1.1.0.
- ACP/TPF1 or ACP/TPF2.
- OS/VS1 Release 7 with OS/VS1 Basic Programming Extensions Release 4 supports 4381 Mdl Groups 1 and 2; with Basic Programming Extensions Release 3 and appropriate PTF, only 4381 Mdl Group 2 is supported.

To improve the performance of the 4381 Processors running in S/370 Mode, the following assists and facilities are standard:

- Extended Control Program Support (ECPS) for MVS/370, and VM/370.
- Elementary Math Library Assist (4381 Mdl Group 2 only).
- Engineering/Scientific Assist.
- Enhancements to ECPS:MVS for MVS/System Product Version 1 Release 3 (MVS/SP) which include cross memory services, the page fault assist function, and the ADDFRR instruction.
- Preferred Machine Assist to improve performance of MVS/370 running as a guest under VM/SP High-Performance Option.

When the 4381 processor is operating in S/370 Extended Architecture (370-XA) Mode, support is provided by:

- MVS/XA Version 2 Release 1.
- VM/XA Migration Aid, Release 1.

To improve the performance of the 4381 Processors running in 370-XA Mode, the Engineering/Scientific Assist and the Elementary Math Library Assist (Mdl Group 2 only) are available.

Compatibility: Any program written for S/370 will operate on the 4381 Processors in S/370 or 370-XA Mode, provided that it (1) is not time-dependent, (2) does not depend on system facilities (storage size, I/O equipment, optional features, etc.) being present when the facilities are not included in the configuration, (3) does not depend on system facilities (such as operation codes) being absent when the facilities are included in the 4381 Processor, and (4) does not depend on results or functions which are defined in the *Principles of Operation* to be unpredictable or model-dependent.

Any program written for S/360 will operate on the 4381 Processor in S/370 Mode, provided that it follows the above rules and does not depend on functions that differ between S/360 and S/370.

For more details, see *System/370 Extended Architecture Principles,* GA22-7000 or the *IBM System/370 Extended Architecture Principles of Operations,* SA22-7085.

Problem Determination Procedures: The Problem Analysis facility will be available on each 4381 Processor. Every user should be encouraged to take advantage of the benefits offered by Problem Analysis by invoking the procedure each time a machine failure occurs. Doing so will cause a set of routines to be executed by the system which will store failure data for later analysis and which will assist in isolating failing components. The benefit for the customer is that in many machine failure situations, it will not be necessary to await arrival of an CE to begin isolation of system problems, with the result of higher system availability for the customer. Use of Problem Analysis is a customer option. The capabilities of Problem Analysis are enhanced with the installation of one of the RSF features listed under "Specify", below.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (AC, 3-phase, 4-wire, 60 Hz): **#9903** for 208V, **#9915** for 240V.
- Power Cord Length: For all machines to be installed in Chicago, Ill., specify **#9986** is required to order 1.83m (6 feet) power cord.
- Cabling: See 3278 mdl 2A Display Console or 3279 Color Display Console mdl 2C for console cabling.
- Color: If no specify is selected, then the color of the 4381 Processor will be classic blue. If another color is required, specify: **#9060** for willow green, **#9061** for garnet rose, **#9062** for sunrise yellow, **#9064** for charcoal brown, **#9065** for pebble gray.
- Remote Support Facility (RSF): The RSF utilization is a customer option. It is recommended to enhance the hardware availability of the 4381 Processor. It provides service personnel the capability of remotely controlling the 4381 from any RETAIN terminal and allows the CE to access the RETAIN data bank for the latest service aids and information from the customer site. When RSF is used, the customer must provide the telephone lines required for the RSF modem.

  To provide RSF, specify one. Customers are urged to select **#9514** to eliminate the need for either external modems or protective couplers. This specify code is the preferred choice of all the RSF features, allowing both RSF and Remote Operator Console Facility (ROCF) capabilities.

  Specify **#9514** for integrated modem with integrated protective circuits, 1200 bps, switched network, auto answer. (An external protective coupler is not required.) A telephone set with exclusion key and an RJ41S or RJ45S type data jack are required. Protective couplers are FCC registered. The FCC Registration number is AN09SA-67992-DP-N and Ringer Equivalence Number (REN) 0.8B. FCC approval is pending.

  Specify **#9511** for EIA Interface, 1200 bps, switched network, manual answer. An FCC registered external modem compatible with the WE 202S modem, interface and operation, or equivalent is required.

  Specify **#9510** for integrated modem, 1200 bps, switched network, manual answer. (This feature should only be selected when the 4381 is directly replacing a 4341 processor which had used **#9510**, and the customer is unwilling to upgrade his installation to accommodate **#9514** on the 4381.) A telephone set

4381 Processor (cont'd)

with exclusion key and with FCC registered Data Access Arrangement (DAA), compatible with CDT Type Coupler Series 1000A interface and operation is required.

If RSF is not desired, no specify code is required.

- Remote Operator Console Facility (ROCF): The ROCF is an extension of RSF. It gives personnel at a host site the ability to dial-up and control a remote 4381 by means of host site programming support.

  The preferred ROCF feature is **#9514**, since it avoids the necessity of external modems or external protective couplers. Details of **#9514** are shown under RSF, above. RSF feature **#9511** may also be specified. The customer-supplied external modem attached to feature **#9511** must include auto answer.

SPECIAL FEATURES

Channel-To-Channel Adapter (#1850): One channel to channel feature is optionally available to interconnect two channels (4381 Processor, 4300 Processor, S/360, S/370, 30XX). One of the processors requires this feature. Requires three control unit positions on each of the connected channels. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** **#4631** must be specified on the primary 3278 Display Console mdl 2A or 3279 Color Display Console mdl 2C. Three control unit positions on a block multiplexer channel.

Block Multiplexer Channels, Add'l (#1870): An optional group of six Block Multiplexer Channels. Permits simultaneous operation of high-speed devices at a data rate of 2.0 MB/second for two channels and 1.0MB/second for four channels. **Maximum:** One.

MODEL CONVERSIONS

4381 Model Group 1 Processors may be upgraded in the field to Model Group 2 Processors, provided that the same or larger Processor Storage is selected. Changes from the 4 Megabyte Models (L01 and L02) to the 8 Megabyte Models (M01 and M02) or to the 16 Megabyte Models (P01 and P02) may be made in the field. In addition, changes from the 8 Megabyte Models (M01 and M02) may be made in the field to the 16 Megabyte Models (P01 and P02). Memory model changes from a larger to a smaller size are not recommended. Installation of a change from one model to another may involve the removal of parts which become the property of IBM.

ACCESSORIES

An operator work station with modesty skirt has capabilities for two operators with two 3278 mdl 2A/3279 mdl 2C and room for reference material. Attachable book racks may be ordered for manual storage and also serves as a cable control device for the 3278 mdl 2A/3279 mdl 2C, telephones, etc. Table dimensions are 1590mm x 815mm and is equipped with gliders. The following items are available on a purchase-only basis. For field installation, order feature via MES. For shipment with machine, order the feature number indicated below.

Bookrack and Cable Holder (#1480): Up to four racks can be mounted on one table.

Console Table (#1550).

SUPPLIES (None)

4701 FINANCE COMMUNICATION CONTROLLER

PURPOSE

A programmable controller for attachment of 4700 Finance Communication System terminals and 3600 Finance Communication System terminals to System/370, 303X, 308X or 4300 Processors, System/34, System/36 or 8100 System.

MODELS

Model 1 001 — A programmable controller with a base configuration of 192K bytes of machine storage, two loops, SDLC communication adapter, and one diskette drive which accommodates 1- or 2- sided removable diskettes (type 1 or 2) to provide up to 0.5 megabytes of diskette storage. May be upgraded to provide a maximum of four loops, 512K bytes of machine storage and one auxiliary diskette storage feature (0.5 or 1.0 megabyte).

Model 2 002 — A programmable controller with a base configuration of 256K bytes of machine storage, two loops, SDLC communication adapter, and one diskette drive which accommodates 1- or 2-sided removable diskettes (type 1, 2, or 2D) to provide up to 1.0 megabytes of diskette storage. May be upgraded to provide a maximum of four loops, 896K bytes of machine storage and one auxiliary diskette storage feature (1.0 megabyte only). May also be upgraded to provide a maximum capacity of 60MB of Disk Storage.

Customer-Setup (CSU): Machine and selected specify features.

Machine Storage: For the mdl 1 controller the base 192K bytes of machine storage and the additional storage increments, when present, are contiguous and are available to provide the storage as required for system control, selected device/feature/function support and user-programmable storage.

For the mdl 2 controller, the base 256K bytes of machine storage and storage increments up to 512K bytes, when present, are contiguous. When total storage capacity exceeds 512K bytes, storage is divided into a user/microcode storage area and a microcode storage area, and addressing is no longer contiguous. The minimum microcode storage area is 256K bytes. Refer to the *IBM 4700 System Configurator*, GC31-2017, for a comprehensive list of storage requirements and details on determining the amount of additional storage, if any, required.

HIGHLIGHTS

Controls all the functions of 4700 Finance Communication System and/or 3600 Finance Communication System terminals. The 4700 Online Terminal Support for System/34 PRPQ (5799-BGB) supports the 4704 mdl 1, 5210 mdls G01, G02 Printers, 4710, 3603, 3610, 3611, 3616 and 3624 (multiline display only).

Controls data transmission between terminals and the central processing site. Host data transmission via SDLC can be at speeds up to 9600 bps or via BSC at speeds up to 4800 bps dependent on the other elements of the host connection facility. The base controller provides a controller maximum aggregate bps rate of 16,800 (mdl 1) or 19,200 (mdl 2) for the loops independent of host SDLC link. When using BSC, the maximum aggregate bps rate is 14,400 (mdl 1) or 16,800 (mdl 2) including the host BSC link. The base controller also offers integrated encryption to provide security of personal identification numbers (PINs), messages and software.

All 4700 system terminals (except 4704-2 and 4704-3) and 4730 are attached by loops which may be selected to operate at speeds of 1200, 2400 or 4800 bps.

The mdl 1 controller contains 192K bytes of machine storage for use as system control, device/ feature/ function support and user-programmable storage. One additional 64K byte storage increment and two 128K byte storage increments are available for a total of 512K bytes. For a 192K, 320K or 448K byte mdl 1 controller already installed, a maximum of one additional 64K byte storage increment and, respectively, two 128K, one 128K or zero 128K byte storage increments are allowed. The mdl 2 controller contains 256K bytes of machine storage. A maximum of five additional 128K byte storage increments are available for a total of 896K bytes. For a 192K, 320K or 448K byte mdl 2 controller already installed, a maximum of one additional 64K byte storage increment and, respectively, five 128K, four 128K, or three 128K byte storage increments are allowed. Refer to the *IBM 4700 System Configurator*, GC31-2017, for detailed storage use information.

Two loops are provided. An optional feature providing two loops (for a total of four) is available. Houses a direct access diskette drive for 1- or 2-sided removable diskettes which provide up to .5 megabytes (mdl 1) or 1 megabytes (mdl 2) of diskette storage for controller data and user programs, plus temporary and permanent storage for user data (sequential logging, random retrieval of data records, etc.). One additional diskette drive may be attached. Alternatively, a maximum capacity of 60MB of disk storage may be attached for temporary and permanent storage of user data (mdl 2).

The 4701 mdl 2 controller with storage sizes of 192K, 320K, or 448K bytes have been designated as 4701 mdl A2 controllers for administrative purposes only. Additional storage increments to the mdl A2 require a mdl conversion via MES. This mdl conversion includes 64K bytes of additional machine storage.

An optional Device Cluster Adapter (DCA) feature is available to provide high-speed workstation attachment locally for 3178 mdl C1, C2, 3278 mdl 2 3279 mdl 2A, S2A, 2B, S2B, 02X, 4704 mdl 2 and 4704 mdl 3 Displays, 5210 mdl G01, G02 Printwheel Printers, 3287 mdl 1, 2 Character Printers, 3262 mdl 3, 13 Line Printers, 6580 Displaywriter System and 5150 or 5160 XT Personal Computer. Optional SDLC Communications Adapter with either EIA/CCITT Interface or Fanout Communications Adapter are available to attach 4730 Personal Banking Machines.

System Attachment:

Note: See Program Product pages for host support programming information.

S/370, 303X, 308X or 4300 Processors: Remote attachment using SDLC or BSC-3 via a 3704, 3705 or 3725 Communications Controller. BSC-3 requires optional BSC Communications feature **(#1422)**.

4321, 4331 Processors: Remote attachment using SDLC or BSC-3 via the Communication Adapter on the 4321 or 4331 BSC-3 requires optional BSC Communications feature (#1422). Local attachment using SDLC or BSC-3 via 4321 or 4331 Local Attachment feature. BSC-3 requires optional BSC Communications feature (#1422).

8100 Units (8101, 8130, 8140): Remote attachment or Direct connection using SDLC via 8100 unit Data Link features.

These attachments are supported by the DPPX/DSC capability.

System/34 or System/36 Processors: Remote attachment or local attachment using SDLC via System/34 or System/36 Communication Adapter feature.

Note: See IBM for a list of applicable PRPQs.

Each 4701 operates in half-duplex mode. When operating in an SNA environment, duplex communication line operations are possible (except System/34 or System/36) with multiple 4701s attached to the line, one 4701 transmitting, while another receives. The 4701 contains a communication adapter without business machine clocking and EIA RS-232-C interface for direct connections or for attaching external modems operating via SDLC at speeds up to 9600 bps or BSC-3 with optional BSC Communications feature at speeds up to 4800 bps. The Data Circuit-terminating Equipment (DCE) must provide its own clocking. Non-IBM modems may be attached subject to the IBM Multiple Supplier Systems Policy. See M2700 pages for further information.

Note: SNA and BSC Communications are mutually exclusive. Conversion in the field from one to the other requires an RPQ.

When using SDLC, the X.21 adapter for nonswitched or switched networks (#1424) is available in place of the standard EIA/CCITT interface.

The 4701 can be programmed to operate independently when the host processor is unavailable. It also is capable of controlling all terminal functions, executing arithmetic and capturing data from the terminals for later transmission to the host processor.

When used either with a non-S/370 compatible host system or without a host system, the Local Configuration Facility (LCF) specify **#9490** may be ordered, see "Controller Data Support".

Transmission: The 4701 operates over common carrier-provided or equivalent customer-owned communication facilities. For information concerning these facilities, see M2700 pages.

Modems: External modems operating at speeds up to 9600 bps for SDLC links, or 4800 bps for BSC-3 links, may be used.

Modem	Speed (bps)	Facility
3863	2400	Switched or nonswitched voice grade lines
3864	4800	Switched or nonswitched voice grade lines
3865	9600	Nonswitched voice grade lines
3868 Mdl 1	2400	Nonswitched voice grade lines
3868 Mdl 2	4800	Nonswitched voice grade lines
3868 Mdl 3/4	9600	Nonswitched voice grade lines
3872	2400	Switched or nonswitched voice grade lines
3874	4800	Switched or nonswitched voice grade lines

Customer-Setup (CSU): The 4701 is designated customer setup, thereby offering the customer early availability and terminal relocation flexibility. For additional information on CSU, see IBM. One copy of the CSU Instructions and diagnostic diskette are shipped with each 4701. The CSU allowance is four days.

4701 Finance Communication Controller (cont'd)

Customer Responsibilities: All customers must be advised that their responsibilities include:

- Assuring that the use of the equipment complies with all Federal, State and local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Price quotations, installation and cost (initial and recurring) of common carrier equipment and service.
- Receipt at the customer's receiving dock, unpacking and placement of the 4701.
- Performing 4701 checkout in accordance with supplied procedures for initial installation or relocation, and updating of controller diskettes (at customer option).
- Physical setup, connection of cables in protected customer access areas including loop cables, cable to host communication lines/modems, and cables for Disk Storage features and Auxiliary Diskette feature.
- Installation of the controller data support and generation of the operational diskettes, at initial controller installation and for any subsequent release distribution.
- Checking communications to the host processor.
- Security for erasure of data from a failing Disk Storage feature being returned to IBM. It is IBM's practice to erase any remaining data on a returned disk before reusing it.
- Using the problem determination procedures provided with the 4701 to determine the failing unit and filling out the appropriate 4700 Problem Report prior to forwarding the failing unit to an IBM designated location or requesting On-Site Service (see "Maintenance" below).
- Determining the need for any required spares.
- Notifying IBM of intent to relocate the 4701 and following IBM instructions regarding relocation.

Maintenance: Maintenance of 4701s is available under IBM Maintenance agreement for either On-Site Service or IBM Service/Exchange Center Service Service/Exchange Center Service is under the Repair option only. The Service/Exchange Center Service is not available for rental machines. Replacement option is not available for the 4701. It is the customer's responsibility to setup the equipment and to determine when maintenance is required. If the customer has selected Service/Exchange Center Service, it is the customer's responsibility to disconnect the unit(s), transport them to the designated IBM location, pick them up when repair is completed and re-setup the unit(s). The customer may wish to replace a failing unit with a spare and should be advised to purchase sufficient spare units if such a practice is planned. On-Site Service is provided during the warranty period. When the 4701 mdl 2 is configured with a Disk Storage feature, only On-Site Service is offered.

Customers with 4701s not covered by IBM Maintenance Agreements may have the unit(s) repaired (if the unit is repairable) on-site or at the designated IBM location for a time and material charge.

If maintenance coverage is not contracted for immediately following expiration of any service and parts warranty and the customer subsequently wants IBM Maintenance Agreement coverage, he must first have the machine(s) inspected so that eligibility for maintenance coverage may be determined. Qualification inspection will be done at the customer's site. There is no charge for this inspection.

If the unit requires repair, and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs are billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage.

Bibliography: For information on 4701 publications, refer to the *4700 System Summary*, GC31-2016.

SPECIFY

Unless indicated otherwise, these specify features are only available at time of manufacture.

- Voltage (120V AC, 1-phase, 60 Hz): **#9890** for locking plug, **#9891** for non-locking plug. A line cord of 1.8 meters (6 feet) will be provided at time of shipment.
- Controller Storage Size: Controller storage size must be specified on all orders and MESs as follows:

  #9616 for 256K, **#9617** for 384K, **#9618** for 512K, **#9619** for 640K, **#9620** for 384K user storage and 384K microcode storage, **#9621** for 512K user storage and 256K microcode storage, and **#9622** for 512K user storage and 384K microcode storage.

  No specify code is required for ordering a base 192K byte mdl 1 controller. Specify codes **#9619**, **#9620**, **#9621**, and **#9622** are for mdl 2 only. Controllers with greater than 192K bytes of machine storage have one specify code **#9612** (320K bytes), **#9614** (448K bytes) or **#9616** to **#9622** to identify the current storage configuration. When a storage increment is ordered via MES or via a mdl A2 to mdl 2 conversion, the old specify code must be deleted and the proper new specify code must be added.
- X.21 Adapter: **#9750** for switched network or **#9751** for non-switched network.

Controller data support is *not* supplied with the shipment of the controller. Subscription order form *GX31-4501* is to be filled out, by the customer, and sent to

IBM Corporation
Department 05Y
Building 101
1001 W. T. Harris Boulevard
Charlotte, NC 28257.

Any 4701 RPQ information with corresponding controller data support requirements should be supplied to the customer for inclusion on form *GX31-4501*.

Receipt of this form by IBM will assure prompt shipment of the required controller data support and notification of any subsequent enhancements.

This subscription form provides capability for the customer to indicate their requirements for:

- Distribution Tape Reel (DTR)
- Installation Diskette
- Local Configuration Facility (LCF)
- Pre-operational Diskette for LCF

A Distribution Tape Reel (DTR) is required for controllers that are used with a S/370, 43XX, or 30XX host system. The user will receive a DTR tape delivered to the address provided with the subscription form.

An installation diskette is required at a controller location where an operational diskette will be created by an image transmission from a host S/370.

A Local Configuration Facility (LCF) diskette is required where the customer requires the capability to create operational diskettes at the controller using the Local Configuration Facility (LCF).

A Pre-operational Diskette for LCF is required where the output of an LCF CPGEN is written upon a diskette for subsequent use as an operational diskette. LCF output will only write upon a diskette formatted as a pre-operational diskette.

Normally, a S/370 customer will enter a subscription for a Distribution Tape Reel (DTR) and an Installation Diskette. A non-S/370 customer who would generate operational systems without the use of a S/370 would typically order the Local Configuration Facility (LCF) diskette and a Pre-operational Diskette.

Normally, only one subscription form need be entered for each host location. Periodically, an availability notice will be sent to the address provided by the subscription. Upon receipt of this notice the customer will acknowledge to IBM by return mail their requirement for that enhancement update.

User of the Local Configuration Facility (LCF), who may have no host or a non-S/370 host, similarly will require only one subscription.

Form GX31-4501 replaces:

- The use of the 9xxx specify codes.
-

- **Cables:** See "Accessories" for additional information. See also *4700 Finance Communication System, Installation Planning Manual*, GC31-2018.

SPECIAL FEATURES

Note: Unless otherwise stated, all features available for field installation require service personnel.

NON-COMMUNICATIONS FEATURES

For specify codes **#9618** and **#9622** the last 8,192 bytes of machine storage are not addressable by the user.

Add'l Storage (#1007): Provides an additional 64K (65,536) bytes of machine storage to increase a 192K mdl 1 to 256K bytes. **Limitations:** Can only be ordered as the first increment on already installed 192K byte mdl 1 via MES, or as the first increment of an order for a mdl 1 greater than 192K bytes. **Maximum:** One, see "Limitations". **Field Installation:** Yes. **Specify:** See table below and "Controller Storage Size" in Specify section.

4701 Finance Communication Controller (cont'd)

Add'l Storage (#1008): Provides an additional 64K (65,536) bytes of machine storage. **Limitations:** Can only be ordered as an additional increment on already installed mdl 1 320K, or 448K byte machines via MES. **Maximum:** One, see "Limitations". **Field Installation:** Yes, field only. **Specify:** See table below.

Add'l Storage (#1009): Provides an additional 128K (131,072) bytes of machine storage. **Limitations:** Mdl 1 is restricted to specify codes **#9617** and **#9618**. **Maximum:** The maximum number of #1009 for mdl 1 is two. The maximum number of #1009 for the mdl 2 is five. **Field Installation:** Yes. For specify codes **#9619, #9620, #9621** and **#9622** parts removed becomes the property of IBM. **Prerequisites:** For mdl 1, one #1007. **Specify:** See table below and controller storage size in the specify section.

Feature and specify codes required for storage upgrades.

To Storage Size (K Bytes)

Storage Size		256	384	512	640	768	768	896
Specify Code		#9616	#9617	#9618	#9619	#9620	#9621	#9622
From Storage Size (K Bytes)	192	#1007	#1007 and #1009	#1007 and 2 #1009	X	X	X	X
	256	X	#1009	2 #1009	3 #1009	4 #1009	4 #1009	5 #1009
	320	X	#1008	#1008 and #1009	X	X	X	X
	384	X	X	#1009	2 #1009	3 #1009	3 #1009	4 #1009
	448	X	X	#1008	X	X	X	X
	512	X	X	X	#1009	2 #1009	2 #1009	3 #1009
	640	X	X	X	X	#1009	#1009	2 #1009
	768	X	X	X	X	X	X	#1009

Feature codes #1007 and #1008 are for mdl 1 only. For 192K, 320K, and 448K byte mdl 2 see mdl Conversion section. See Specify section for instructions on changing specify codes for storage upgrades.

Note:
Specify **#9619** = 384K user storage and 256K microcode storage
Specify **#9620** = 384K user storage and 384K microcode storage
Specify **#9621** = 512K user storage and 256K microcode storage
The minimum microcode storage is 256K bytes.
Specify **#9619** to **#9622** are for mdl 2 only.

Customer Order Acknowledgement Letters for purchase MESs for specify codes **#9619, #9620, #9621,** and **#9622** will involve the removal of parts which become the property of IBM.

Auxiliary Diskette Storage .5 Megabyte (#1035): [Mdl 1] Provides approximately 560,000 bytes of additional diskette storage via a second diskette drive for 1- or 2-sided diskettes. No storage area offered by the auxiliary (or secondary) diskette will be reserved for the control program. **Limitations:** May not be installed with #1045. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #3651.

Auxiliary Diskette Storage 1.0 Megabyte (#1045): Provides approximately 985,088 bytes of additional diskette storage via a second diskette drive for 1- or 2-sided diskettes (type 1, 2 or 2D). No storage area offered by the auxiliary (or second) diskette will be reserved for the control program. **Limitations:** May not be installed with #1035. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #3651, or #3652 and #1065 , or #3652 and #1055.

Disk Storage 15.4 Megabyte (#1055): Provides 15,423,488 bytes of disk storage when ordered with Expansion Frame (#3652). **Limitations:** Can only be installed with #3652, or #3652 and #1045. Cannot be installed with #1065 or #1075. **Maximum:** One. **Field Installation:** Only when ordered for delivery with expansion frame #3652. **Prerequisites:** #3652.

Disk Storage 30.8 Megabyte (#1065): Provides 30,846,976 bytes of disk storage when ordered with Expansion Frame (#3652). **Limitations:** Can only be installed with #3652, or #3652 and #1045, or #3652 and #1075. Cannot be installed with #1055. **Maximum:** One. **Field Installation:** Only when ordered for delivery with expansion frame #3652. **Prerequisites:** #3652.

Second Disk Storage 30.8 Megabyte (#1075): Provides an additional increment of 30,846,976 bytes of Disk Storage. **Limitations:** Can only be installed with #3652 and #1065. Cannot be installed with #1045 or #1055. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #3652 and #1065.

Device Cluster Adapter (#3101): Provides for the local attachment of up to a maximum of eight devices with a mix of 3262 mdl 3, 13 Line Printers, 3178 mdls C1, C2 3278 mdl 2 Display Stations, 3279 mdl 2A, S2A, 2B, S2B, 02X, 4704 mdl 2 Display Stations, 4704 mdl 3 Display Stations, 5210 mdls G01, G02 Printwheel Printers and 3287 mdl 1, 2 Printers, 6580 Displaywriter System and 5150 or 5160 XT Personal Computer. When attaching the 3278 mdl 2 Display Station to the device cluster adapter, no-charge 3278 RPQ 8K0880 is required. When attaching Displaywriter or Personal Computer via their 3278 emulation adapter, file transfer is not supported on the 4701. See M6580, 5150 or 5160 pages for additional prerequisites and/or limitations. **Limitations:** Maximum distance from controller to terminal is 1.5Km (4,920 feet). The 5210 printer is supported in SCS mode only. **Maximum:** One. **Field Installation:** Yes.

Diskette Expansion Unit (#3651): Provides a matching unit for housing an auxiliary diskette drive. The unit is cable attached to the main unit. **Limitations:** Cannot be installed with #3652. If #1035 is installed, conversion to #1045 is via RPQ 8V0099. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1035 or #1045.

Disk Expansion Unit (#3652): Provides a matching unit for housing up to 60MB of disk storage capacity. No storage area offered by the Disk Storage features will be reserved for the control program. **Limitations:** Cannot be configured with #3651. Can only attach to 4701 mdl 2. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #1055, or #1045 and #1055, or #1065, or #1065 and #1075 or #1045 and #1065.

Add'l Loops (#4745): Provides two additional loops for attachment of additional 4700 Finance Communications System or 3600 Finance Communications System terminals. **Maximum:** One feature providing two loops. **Field Installation:** Yes.

COMMUNICATIONS FEATURES

BSC Communications Without Business Machine Clocking (#1422): Required for attachment to communications lines through an external modem which does have internal clocking at speeds up to 4800 bps when operating with Binary Synchronous Communications BSC-3. **Limitations:** Cannot be installed with #1424. **Maximum:** One. **Field Installation:** Not recommended.

Note: SNA and BSC communications are mutually exclusive. Conversion in the field from one to the other requires an RPQ.

X.21 Adapter for Nonswitched or Switched Networks (#1424): This feature provides an interface and 6 meter cable for attachment to an X.21 native nonswitched network with no changes to existing SNA/SDLC procedures for controlling nonswitched lines. This feature will operate only with SNA/SDLC procedures. It enables the user to connect DCEs whose electrical characteristics match those described in CCITT Recommendation X.21 for nonswitched point-to-point and multipoint communication. The network establishes the data rate and supplies the clock. Speeds supported include 2400, 4800 and 9600 bps. Also provides an interface adapter and 6 meter cable for attachment to the X.21 Switched Network. SDLC Communications at speeds of 2400, 4800 and 9600 bps are supported. **Limitations:** Cannot be installed with #1422. **Maximum:** One. **Field Installation:** Not recommended. **Specify: #9750** for switched network or **#9751** for nonswitched network.

Fan Out Communications Adapter (#1551): Permits local attachment of up to four 4730 Personal Banking Machines communicating via SDLC. **Limitations:** Cannot be installed with #3701. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #4502. **Specify:** One of the following line speeds:

Specify	Speed	Maximum Cable Length
#9181	9600 bps	30.48m (100 ft.)
#9182	4800 bps	60.96m (200 ft.)
#9183	2400 bps	121.92m (400 ft.)

Note: All attached 4730s will run at the selected speed.

EIA/CCITT Interface (#3701): Provides the appropriate cables and interface logic necessary to attach an external modem for communications attachment to remote 4730 Personal Banking Machines via SDLC at speed up to 9600 bps. Non-IBM modems may be attached subject to the Multiple Supplier Systems Policy. **Limitations:** Cannot be installed with #1551. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** #4502.

SDLC Communications Adapter Without Business Machine Clocking (#4502): Required to communicate with local or remote 4730 Personal Banking Machines using SDLC at speeds from 1200 bps to 9600 bps. **Limitations:** Can only be used to attach the 4730 Personal Banking Machine. **Maximum:** One. **Field Installation:** Yes.

MODEL CONVERSIONS

Model 1 may be converted to a model 2 having 256K, 384K or 512K bytes of machine storage. Model 1s with 192K, 320K or 448K bytes of machine storage will be converted to model 2s with 256K, 384K, or 512K bytes respectively. The price of this model conversion includes the price of an additional 64K bytes of machine storage.

4701 Finance Communication Controller (cont'd)

Model 1s with 256K, 384K, or 512K bytes of storage will be converted to model 2s of the same machine storage size. To upgrade to larger machine storage sizes see the table for the features that must be added to the model 2 to reach the desired storage size. Parts removed become the property of IBM.

If #1007 is currently installed then #1007 must be changed from chargeable to standard. If #1008 is installed add #1009, and #1008 must be changed from chargeable to standard. Model 2s installed with 192K , 320K, or 448K bytes of machine storage have been designated as model A2 for administrative purposes only. Adding storage increments to model A2 requires conversion from a model A2 to a model 2. This conversion includes 64K bytes of machine storage. Parts removed become the property of IBM.

If #1008 is currently installed add #1009, and #1008 must be changed from chargeable to standard. If Expansion Frame (#3651) is installed, it must have a Auxiliary Diskette Storage 1.0 Megabytes (#1045) installed. See "Limitations" under Expansion Frame (#3651).

ACCESSORIES

Keylock Cable Assembly: Replacement keylock cable assembly (used to load Master key) may be purchased from IBM. Order **P/N 6018769.**

Cables: Cables to attach 4700 units may be purchased from IBM or a customer-selected source. See *Physical Planning Manual,* GC31-2018 for cable and connector specifications. The customer is responsible for installation and maintenance of these cables. Assembled cables may be purchased from IBM.

Cable Assem No	Use	Length
8249921	Cable Assy, (Inch) - EIA/CCITT	6m (20 ft.)

The following are "X" length cables with maximum length shown.

1563155	Loop Cable Assembly	610m (200 ft.)

For attachment of 3262, 3287, 3278 to a 4701:

2577672	Cable Assembly - indoor	1,500m (4920 ft.)
or		
323921	Coax Wire	1,500m (4920 ft.)
and		
1836418	Connector Kit	

Loop Repeater (P/N 4400002): Plugs into the Loop cable and redrives all signals being transmitted in a 3600 or 4700 Finance Communication System. Each Loop Repeater contains Loop redriving capabilities which allow for the extension of the Loop cable length by 2,000 feet. Loop Repeaters may be employed on a Loop to extend its overall length to a maximum of 20,000 cable-feet. The unit can be physically mounted on a wall in an out-of-the-way location. **Prerequisite:** An operating 3600 System Local Loop or Remote Subloop.

Bibliography: GC22-0005

Customer Responsibilities: The customer must be advised that: [1] The customer is responsible for making certain that the use of the equipment compiles with all Federal, State, and Local Laws, Regulations and Ordinances. [2] The customer is responsible for price quotations, installation and cost (initial and recurring) of common carrier equipment and service. [3] The customer is responsible for the set-up of the unit. [4] The customer will determine the failing unit (see Maintenance below). [5] The customer is responsible for determining the required number of spares.

Physical Planning and Set-up: Physical planning and set-up is the responsibility of the customer. Attachment to the Loop cable is provided by ordering External Signal Cable Assembly **(P/N 1745372),** or equivalent. See *IBM 3600 Finance Communication System Installation Manual - Physical Planning,* GA27-2766, or *IBM 4700 Finance Communication System, Installation Planning Manual,* GC31-2018.

Spares: The customer may wish to replace a failing unit with a spare and must be advised to purchase sufficient spare units for such use. The number of spare units recommended is dependent upon the number of units the customer has installed, application requirements, physical locations and layouts. However, the minimum number of spare units recommended is shown in the following table:

Number of Loop Repeaters Installed	Minimum Number Spares Recommended
100	2
200	2
300	3
500	4
1000	6
1500	9
2000	10
2500	12
3000	14
3500	16
4000	18
4500	19
5000	21

Warranty: Service is available at the designated IBM Repair Center during the 90 day warranty period, which commences 30 days following date of shipment from the plant of manufacture (Raleigh). It shall be the customer's responsibility to set up the equipment. It shall be the customer's responsibility to determine the failing unit and remove it from the Loop, and if the unit is still under warranty, to pack it in the designated shipping container and ship it prepaid to the designated IBM Repair Center. IBM will return the serviced unit, shipping charges prepaid. There is no regularly scheduled preventative maintenance recommended by IBM on these units.

Maintenance agreements are not available. FE on-site service will not be provided.

Ordering: See IBM.

	Machine	P/N
Loop Repeater	3601	**4400002**
Loop Repeater	3602	**4400002**
Loop Repeater	4701	**4400002**

GENERAL ACCESSORIES

For delivery with the machine (if offered), specify the appropriate Feature Number on 4700 machine order. For delivery at any other time, specify the appropriate Part Number on MSORDER (Category = Accessories/ Supplies) on AAS.

Filters: Anti-glare filters protect against light reflection and provide either a yellow character display on a brown background (amber) or bright green characters on a dark green background (green). One filter is provided with each 4700 display terminal.

Cradle: The display monitor may be mounted in a cradle to provide a vertical tilt capability which allows the display operator to adjust for the best viewing angle within plus or minus 30 degrees. The cradle may be set on a counter top or be mounted to the under side of a horizontal surface. A bracket supplied for hanging the cradle provides a swivel capability.

Magnetic Stripe Reader: Has read capability only. The MSR is capable of reading the contents of ANSI Track 2 (75 bpi) on a credit or other plastic card.

Magnetic Stripe Reader/Encoder: Has read and encode capability. The device is capable of reading the contents of Track 2 on a credit card (encoded at 75 bpi according to the ANSI Standard X4.16) or an ID card or passbook encoded at 210 bpi on a 4704 or 3604, or equivalent. The device encodes at a density of 210 bpi in the IBM Passbook Format. The slot in the unit is designed to accept documents ranging in thickness from 0.25mm (0.010") (excluding magnetic stripe), to 0.84mm (0.033") (including magnetic stripe). It will accept plastic credit cards and ID cards or one cover of a magnetically encoded passbook.

Cleaning Card: A card which is used for cleaning the magnetic head on a Magnetic Stripe Reader.

Encrypting PIN Keypad: A twelve key numeric keypad that has the data encryption algorithm (DEA) implemented in hardware for personal identification number (PIN) encryption within the keypad prior to transmission to a 4704 display terminal.

Includes ten data keys in the basic touch-pad telephone format with the Q and Z over the numeric "0" , or an alphameric arrangement in the American Banking Association Standard format with the Q and Z over the numeric "1". Two function keys are provided: "End" which signifies completion of correct entry and "Erase" which signifies incorrect entry requiring the entry to be repeated. An indicator light notifies the user when the encrypting PIN keypad is ready to accept entry. Data entered from the encrypting PIN keypad is not displayed on the 4704 to which it is attached. **Prerequisites:** A 4704.

Note: When ordering, select only one of the two possible Q and Z formats to avoid mixed format input data.

Non-Encrypting PIN Keypad: A twelve key numeric keypad for entry of a Personal Identification Number (PIN) to a 4704. Includes ten data keys in the basic touch-pad telephone format with the Q and Z over the

4701 Finance Communication Controller (cont'd)

numeric "0" , or an alphameric arrangement in the American Banking Association Standard format with the Q and Z over the numeric "1". Two function keys are provided: "End" which signifies completion of correct entry and "Erase" which signifies incorrect entry requiring the entry to be repeated. An indicator light notifies the user when the PIN keypad is ready to accept entry. Data entered from the PIN keypad is not displayed on the 4704 to which it is attached. **Prerequisites:** A 4704. **Note:** 4700 non-encrypting PIN keypad and 3600 PIN keypad not interchangeable.

Note: When ordering, select only one of the two possible Q and Z formats to avoid mixed format input data.

Encrypting PIN Keypad Privacy Shield: Attaches to the encrypting PIN keypad accessory. Provides a degree of visual shielding while allowing easy manipulation of the encrypting PIN keypad keys. Shielding is optimum where an observer is located directly behind the encrypting PIN keypad shield such as in the customary teller/customer relationship in a banking transaction.

Non-Encrypting PIN Keypad Privacy Shield: Attaches to the non-encrypting PIN keypad accessory. Provides a degree of visual shielding while allowing easy manipulation of the non-encrypting PIN keypad keys. Shielding is optimum where an observer is located directly behind the non-encrypting PIN keypad shield such as in the customary teller/customer relationship in a banking transaction.

Keytop Protective Caps: Clear plastic caps which cover each non-engraved keytop to protect the label from normal wear and tear. These may be ordered to replace, if required, the ones shipped with the 4704 keyboards.

Keytop Label Sheets: Sheets of 30 labels each for use on the 4704 keytops. The blank sheet contains 30 blank labels. The preprinted sheet contains sixteen blank labels and the following preprinted labels: digits 0 through 9, 00, 000, (.) period, and (,) comma).

ACCESSORY SUMMARY

	Feature No.	P/N	Description
Filters	**#9181**	**6019525**	Green (5.5")
	#9182	**6019527**	Green (9.0")
	#9191	**6019526**	Green (5.5")
	#9192	**6019528**	Amber (9.0")
Cradles		**6019529**	For (5.5") Monitor
		6019530	For (9.0") Monitor
MSR	**#4904**	**6019474**	Magnetic Stripe Reader
MSR/E	**#4905**	**6019470**	Magnetic Stripe Reader/Encoder
Cleaning Card		**6019483**	MSR Cleaning Card
Encrypting PIN Keypad			
		5667650	English "QZ" over zero
		5680917	English "QZ" over one

Note: When ordering, select only one of the two possible "QZ" formats to avoid mixed format input data.

Non-Encrypting PIN keypad	**5680905**	English QZ over zero
	5680908	English QZ over one

Note: When ordering, select only one of the two possible "QZ" formats to avoid mixed format input data.

Encrypting PIN Privacy Shield	**4707195**	Shield
Non-Encrypting Privacy Shield	**4402169**	PIN keypad Privacy Shield
Keytop Caps	**4585103**	Keytop Protective Cap (one)
Keytop Labels	**6019424**	Keytop Label Sheet (blank)
	6019425	Keytop Label Sheet (preprinted)
Fuses	**512137**	(5A Slow Blow) -(100-120V, 50/60Hz)
	5718367	(3A Slow Blow) -(200-240V, 50Hz)

SUPPLIES

The 4701 uses a standard IBM Diskette type 1, 2 or 2D or equivalent.

4704 FINANCE COMMUNICATION DISPLAY STATION

PURPOSE

A modular user-configurable 480 or 1,920 character CRT display and keyboard station for input and output in interactive banking applications.

Three display models with a variety of keyboards provide flexibility to offer a wide range of display functions and keyboard configurations.

MODELS

Model 1	001	A loop-attached keyboard display for use in interactive banking applications.
Model 2	002	A DCA attached keyboard display with 9" CRT for use in interactive banking or administrative applications.
Model 3	003	A DCA attached keyboard display with 12" CRT for use in interactive banking or administrative applications.

Prerequisites:

Model 1: An available position on a loop of a 4700 Finance Communication System or 3600 Finance Communication System. One Display Monitor and filter, and one keyboard type must be selected to complete the order (see Special Features), unless the unit is being ordered for use as a spare and then the specify for the Display Control Module only, must be indicated (See Specify).

Model 2 or 3: An available position on the 4700 DCA feature. One filter and one keyboard type must be selected to complete the order (see Special Features), unless the unit is being ordered as a spare and then the specify for the Display Module must be indicated (See Specify).

Customer Setup (CSU): Machine and selected features.

HIGHLIGHTS

Model 1: A basic display station consists of a Display Control Module, a Display Monitor (5.5" or 9") with filter and a Keyboard. The Display Control Module provides capability to attach to the 4700 or 3600 System Controller via a loop connection.

Model 2 or 3: A basic display station consists of a Display Module with filter and a keyboard. The Display Module provides capability to attach to the 4700 System Controller via a DCA connection and offers improved performance for administrative applications. (Additional information under Special Features).

Model 1, 2 and 3: A magnetics device and a PIN keypad (see Accessories) may be optionally attached to the Display Control Module (mdl 1) or the Display Module (mdl 2 and 3).

The characters are well defined. Brightness and contrast are adjustable.

Automatic initiation of diagnostics begins when station is powered on.

Four different keyboards are available to meet various user and application requirements (see Special Features).

Additional standard display station functions include:

- Upper and lower case characters
- Normal and high intensity
- MSR, MSR/E and PIN Keypad attachment capability
- Audible alarm
- 3604 Compatibility
- Banking Loop communication (mdl 1)
- Address sharing with printers (mdl 1)
- 3278-2 Compatibility (except magnetics) (mdl 2 and 3 only)
- DCA Communication (mdl 2 and 3 only)

Risers on the mdl 1 and 2 displays, and a pedestal on the mdl 3 that attach to the bottom of the Displays and keyboard, tilt the front of the display, or the rear of the keyboard, upward approximately 15 degrees. An optional cradle (mdl 1 and 2 only) enables the operator to adjust the viewing angle of the display from (-5 degrees to +20 degrees). A choice of anti-glare filters protect against light reflection. The anti-glare filters provide either yellow characters displayed on a brown background or bright green characters on a dark green background (see Accessories). One filter is provided with (and must be specified) for each display station.

Customer Setup (CSU): The 4704 is designated customer setup, thereby offering the customer early availability and station relocation flexibility. One copy of the CSU Instructions is shipped with each 4704.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all Federal, State and local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Receipt at the customer's receiving dock, unpacking and placement of the 4704.
- Performing 4704 checkout in accordance with IBM supplied procedures for initial installation or relocation.
- Physical setup, connection of cables in protected customer access areas including loop cables (mdl 1), DCA cables (mdl 2 and 3), cables that attach the Display Control Module to the Display Monitor (mdl 1), and cables that attach keyboards, magnetics and PIN keypads to the Display Control Module (mdl 1) or Display Module (mdl 2 and 3).
- Using problem determination procedures provided with the 4704 to determine the failing unit and filling out the appropriate 4700 Problem Report prior to forwarding the failing unit to an IBM designated location (see Maintenance below).
- Determining any required spares.

Maintenance: The 4704 utilize IBM Service/Exchange Centers under either Maintenance or Replacement options. Replacement option is not available for rental machines. It is the customer's responsibility to setup the equipment and to determine when maintenance is required. The customer may wish to replace a failing unit with a spare and should be advised to purchase sufficient spare units if such use is planned. Under Service Center Maintenance it is the customer's responsibility to disconnect the unit(s), transport them to the designated IBM location, pick them up when repair is completed and reinstall them.

Maintenance is provided during the warranty period as described in the Maintenance option of the IBM Service Center Maintenance plan.

Customers with 4704s not covered by IBM Maintenance Agreements may have the unit(s) repaired (if the unit is repairable) at a designated IBM location for a time and material charge.

If maintenance coverage is not contracted for immediately following expiration of any service and parts warranty and the customer subsequently wants IBM Maintenance Agreement Coverage, he may have the machine(s) inspected. This inspection will be done at the designated IBM location for a fixed charge.

If the unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs are billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage.

Bibliography: For information on 4704 publications, refer to the *IBM 4700 Finance Communication System: Introduction to the IBM 4704 Model 2 and 3 Display Station,* (GC31-2049).

SPECIFY

Unless indicated otherwise, these specify features are not recommended for field installation.

- Voltage (120V AC, 1-phase, 60 Hz): **#9890** for locking plug, **#9891** for non-lock plug. A line cord of 1.8 meters (6 feet) is provided at time of shipment.
- Cables: For DCA attachment, refer to Accessories for ordering information. The following cables are provided:

  Model 1 - Attached to the Display Control Module are the cables for the Display Monitor attachment and the loop attachment.

  Model 1 and 2 - The keyboards, magnetics, and PIN keypads provide a cable for attachment to the Display Control Module or Display Module. All cables are 2.0m (6.5 feet) long. For more information, see *IBM 4700 Finance Communication System: Installation Planning Manual,* GC31-2018.
- Display Control Module or Display Module: Specify **#9480** when ordering mdl 1 without Display Monitor or Keyboard, or mdl 2 or 3 without Keyboard.

SPECIAL FEATURES

Display Monitors (mdl 1 only)

The Display Monitors are free-standing units which are cable attached to the Display Control Module. One Display Monitor must be selected for each Display Control Module. Only one Display Monitor may be attached to a 4704 Display Control Module. For spares, any number of Display Monitors may be ordered depending on user requirements.

Display Monitor (5.5 in.) (#3255)Mdl 1 only: Displays up to 480 characters in 12 lines of 40 characters each on a 5.5-inch (diagonal) CRT. **Limitations:** Cannot be installed with #3290. **Field Installation:** Yes (CSU). **Specify:** One of the following must be selected for each #3255 Display Monitor, **#9181** Antiglare filter (green), or **#9191** Antiglare filter (amber).

4704 Finance Communication Display Station (cont'd)

Display Monitor (9 in.) (#3290)Mdl 1 only: Displays, under program control, either 1,920 characters (24 lines of 80 each) or 480 characters (12 lines of 40 each) on a 9-inch (diagonal) CRT. In the 480-character mode (default mode), the characters are larger than in the 1920-character mode. **Limitations:** Cannot be installed with #3255. **Field Installation:** Yes (CSU). **Specify:** One of the following must be selected for each #3290 Display Monitor: **#9182** Antiglare (green), or **#9192** Antiglare filter (amber).

Display Modules (Mdl 2 and 3 only)

The Display Module is an integrated unit which contains a CRT plus the logic and power necessary to drive the CRT, keyboard and the optional magnetics and/or PIN keypad devices. One keyboard or keyboard combination must be selected for each Display Module.

The Display Module will display, under program control, either 1,920 characters (24 lines of 80 characters each) or 480 characters (12 lines of 40 each). In the 480-character mode, the characters are larger than in the 1920-character mode. **Limitations:** Not attachable to a 3600 System Controller. **Field Installation:** Yes (CSU). **Specify:** One of the following must be selected for each Display Module: **#9183** Antiglare Filter (Green) or **#9193** Antiglare Filter (Amber).

Keyboards

The keyboards are packaged separately from the display, with a cable for attachment to the Display Control Module or Display Module. The Function, Expanded Alphameric and Administrative keyboards have a combination of pre-engraved and non-engraved keytops. These keyboards are provided with a set of keytop labels, some of which contain pre-printed numbers and the remainder blank. The clear plastic cap which covers each non-engraved keytop protects the label from wear. One keyboard must be selected for each Display. Only one keyboard or keyboard combination may be attached to a 4704 Display Station. For spares, any number of keyboards may be ordered depending on user requirements.

Function Keyboard (#4650): A 50-key keyboard containing two clusters of 15 keys (a matrix of five rows, with three keys in each row) plus one cluster of 20 keys (a matrix of five rows, with four keys in each row) to the right side of the keyboard. Forty-five of these keys are non-engraved and may be personalized by the user according to requirements. The remaining 5 keys are pre-engraved. This keyboard may be combined with Alphameric Keyboard (#4662) for additional function. **Limitations:** May not be combined with an Expanded Alphameric Keyboard (#4677) or Administrative Keyboard (#4607). **Field Installation:** CSU.

Alphameric Keyboard (#4662): A 62-key alphameric keyboard. It provides a typewriter layout with permanently labeled keys. This keyboard may be combined with Function Keyboard (#4650) for additional function. **Limitations:** May not be combined with an Expanded Alphameric Keyboard (#4677) or Administrative Keyboard (#4607). **Field Installation:** CSU.

Expanded Alphameric Keyboard (#4677): A 77-key Keyboard with a permanently labeled typewriter layout of 62 keys plus a cluster of 15 non-engraved function keys to the right of the alphameric block. The 15 function keys are programmable and can be labeled according to the application requirements. **Limitations:** May not be combined with a Function Keyboard (#4650), Alphameric Keyboard (#4662) or Administrative Keyboard (#4607). **Field Installation:** CSU.

Administrative Keyboard (#4607): A 107-Key keyboard with a permanently labeled typewriter layout of 62 keys plus a cluster of 10 control keys to the left of the alphanumeric block, a cluster of fifteen keys to the right of the alphanumeric block and a cluster of twenty keys to the right of the fifteen-key cluster. Two of the keys in the ten-key cluster are permanently labeled; the remaining 8keys plus the entire fifteen and twenty-key clusters are programmable and may be labeled according to the application requirements. **Limitations:** (1) May not be combined with a Function Keyboard (#4650), an Alphameric Keyboard (#4662) or an Expanded Alphameric Keyboard (#4677) (2) Attaches to 4704 mdls 2 and 3 only (3) This keyboard is not supported on 3600 System Controllers. **Field Installation:** CSU.

MODEL CONVERSIONS

Available at time of manufacture only.

ACCESSORIES

The following items are available on a purchase-only basis. Order by feature number with original machine order for delivery of the item with the 4704. Order the item by part number for delivery at any other time.

Filters: Anti-glare filters will protect against light reflection and provide either a yellow character display on a brown background (amber) or bright green characters on a dark green background (green). (One filter is provided with each display station.) One filter must be selected for each display monitor feature (see Special Features).

Feature No	Part Number	Description
#9181	6019525	Filter, Green (5.5 in.) Mdl 1
#9182	6019527	Filter, Green (9.0 in.) Mdl 1
#9191	6019526	Filter, Amber (5.5 in.) Mdl 1
#9192	6019528	Filter, Amber (9.0 in.) Mdl 1
#9183	8583464	Filter, Green (9.0 in.) Mdl 2
#9193	8583465	Filter, Amber (9.0 in.) Mdl 2
#9184	8583443	Filter, Green (12.0 in.) Mdl 3
#9194	8583443	Filter, Amber (12.0 in.) Mdl 3

Cradle: A vertical tilt capability allows the display operator to adjust the display monitor from -5 to plus 20 degrees, (mdls 1 and 2 only). The cradle may be set on a counter top or for mdl 1 only may be mounted to the underside of a horizontal surface. A bracket supplied for hanging the cradle provides a swivel capability.

Part Number	Description
6019529	Cradle (5.5 in.)
6019530	Cradle (9.0 in.)

Magnetic Stripe Reader: Specify **#4904** for delivery of the unit with the 4704. Order P/N 6019474 for delivery of the unit any other time. Has read capability only. The MSR is capable of reading the contents of ANSI Track 2 (75 bpi) on a credit or other plastic card. **Limitations:** Cannot be installed with Magnetic Stripe Reader/Encoder. **Maximum:** One.

Magnetic Stripe Reader: Specify **#4901** for delivery of the unit with the 4704. Order P/N 6019489 for delivery of the unit at any other time. The MSR is capable of reading both the contents of ANSI or ISO Track 2 (75 bpi) on a credit or other plastic card and the contents of a track encoded on a magnetic striped savings book by a 4704 or 3604 magnetic stripe encoder (210 bpi). The slot in the device is designed to accept documents ranging in thickness from 0.10" (0.25mm) to 0.096" (2.44mm). **Limitations:** Can not be installed with Magnetic Stripe/Reader/Encoder. **Maximum:** One.

Magnetic Stripe Reader/Encoder: Specify **#4905** for delivery of the unit with the 4704 ... P/N 6019470 for delivery of the unit any other time. Has read and encode capability. The device is capable of reading the contents of Track 2 on a credit card (encoded at 75 bpi according to the ANSI Standard X4.16) or an ID card or passbook encoded at 210 bpi on another magnetic stripe encoder attached to a 4704 or 3604, or equivalent. The device encodes at 210 bpi in the IBM 3604 Passbook Format. The slot in the device is designed to accept documents ranging in thickness from .010" (0,25mm) (excluding magnetic stripe), to .038" (0,96mm) (including magnetic stripe). It will accept plastic credit cards and ID cards or one cover of a magnetically encoded passbook. **Limitations:** Cannot be installed with Magnetic Stripe Reader. **Maximum:** One.

Cleaning Card: A card which is used for cleaning the magnetic head on a Magnetic Stripe Reader.

Part Number	Description
6019483	Cleaning Card

Encrypting PIN Keypad: A cable attached encrypting PIN keypad device enabling the customer to enter a personal identification number that becomes encrypted during a transaction. **Limitation:** Cannot be installed with a Non-Encrypting PIN Keypad. **Maximum:** One.

Part Number	Description
5667650	English "QZ" over zero
5680917	English "QZ" over one

Note: When ordering, select only one of the two possible Q and Z formats to avoid mixed format input data.

Non-Encrypting PIN Keypad: A cable attached non-encrypting PIN keypad device enabling the customer to enter a personal identification number during a transaction.

Part Number	Description
5680905	English QZ over "0"
5680908	English QZ over "1"

Note: When ordering, select only one of the two possible Q and Z formats to avoid mixed format input data.

Encrypting PIN Keypad Privacy Shield: Provides a degree of visual shielding while allowing easy manipulation of the encrypting PIN keypad keys.

Part Number	Description
4707195	Shield

Non-Encrypting PIN Keypad Privacy Shield: Provides a degree of visual shielding while allowing easy manipulation of the PIN keypad keys.

Part Number	Description
4402169	Shield

Keytop Protective Caps: Clear plastic caps which cover non-engraved keytops to protect the label from wear.

4704 Finance Communication Display Station (cont'd)

Part Number	Description
4585103	Keytop Cap

Keytop Label Sheets: Labels which provide the user with some pre-printed numbers and/or blanks for users requirements.

Part Number	Description
6019424	Blank Labels
6019425	Labels Blank, Pre-printed

Fuses	512137	(5ASlow Blow) -(100-120V, 50/60Hz)
	5718367	(3ASlow Blow) -(200-240V, 50Hz)

SUPPLIES

See IBM.

4710 FINANCE COMMUNICATION SYSTEM RECEIPT/VALIDATION PRINTER

PURPOSE

The 4710 receipt/validation printer is a table top printer designed to fit into a teller workstation along with other teller operated keyboards and displays. The 4710 attaches to both the 4700 and 3600 controllers via a loop.

MODELS

Model 1 001 — Provides for banking receipt, validation and journal functions. Has a 96-character set, and prints at 10 or 12 characters per inch.

Prerequisites: An available position on a loop of a 4700 or 3600 Finance Communication System.

Customer Setup (CSU): Machine only.

HIGHLIGHTS

The 4710 printer prints on a variety of forms and paper stock to provide for banking receipt, validation and journal functions. It prints on single, double or triple part forms such as checks, receipts and validation documents. Documents are inserted vertically and do not require edge justification. Forms can easily be inserted/positioned with one hand to a fixed bottom registration point.

Printing operations are initiated manually via either of two separate keys if shared, or automatically upon sensing an inserted document. Either option can be selected under application program control.

Ribbon replacement is a "clean hands" operation.

Printing is bidirectional with a maximum of 120 characters per second at 12 cpi, and a maximum of 100 characters per second at 10 cpi, selectable by Application program. The 4710 printer can print from one to four lines per document. **BOLD** printing (2 x normal character width) is standard, selectable by application program.

Sixteen customer-designable characters can be added to the character set.

Shared Workstations is included. (Station A/B Start Keys.)

Address sharing is supported. Like and Unlike devices. (Printer with Printer and Printer with Display.)

A Locked Journal Roll function is standard. One- or two-part paper rolls may be used.

Single part rolls may be 25.4m (100 feet) in length.
Two part rolls may be 12.7m (50 feet) in length.
A tear bar is provided for the exiting paper.
A slot is provided to permit manually writing on the journal.

The Journal Print Station is located directly behind the Document Print Station, thus allowing the same lines which print on the cut form document to print on the journal roll.

The 4710 is attached to controllers by loops, which operate at speeds of 1200, 2400 or 4800 bps.

Indicator Lights: Six indicator lights are provided.
- **Ready:** Indicates status of loop communications.
- **Check:** Indicates a machine check.
- **Insert Form:** Signals operator to insert form; when extinguished, verifies form accepted. Controlled by application program.
- **Programmable Indicators 1 and 2:** Controlled by application program.
- **Journal Paper Out:** Paper nearing end.

Operator Control Keys: Four control keys are provided.
- **Start Keys (2)**
- **Stop Key**
- **Journal Advance Key**

Forms Specifications: Refer to *Forms Design Reference Guide for Printers,* GA24-3488.

Customer Setup (CSU): The 4710 is designated customer setup, thereby offering the customer early availability and terminal relocation flexibility. For additional information on CSU, refer to the GI section. One copy of the CSU Instructions is shipped with each 4710. The CSU allowance is four days.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all Federal, State, and local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Receipt at the customer's receiving dock, unpacking and placement of the 4710.
- Replacement of ribbon and paper. (See "Supplies" below.)
- Performing 4710 checkout in accordance with supplied procedures for initial installation or relocation.
- Physical setup, connection of cables in protected customer access areas including loop cables.
- Using the problem determination procedures provided with the 4710 to determine the failing unit and filling out the appropriate Report prior to forwarding the failing unit to an IBM designated location. (See "Maintenance" below.)
- Determining any required spares.
- Notifying IBM of intent to relocate and following IBM instructions for relocation.

Maintenance: The 4710s utilize IBM Service/Exchange Centers under either Maintenance or Replacement options. Replacement option is not available for rental machines. See GI, FE Services sub-section 71) for description and procedures associated with Service/Exchange Centers. It is the customer's responsibility to install the equipment and to determine when maintenance is required. The customer may wish to replace a failing unit with a spare and should be advised to purchase sufficient spare units if such use is planned. Under Service/Exchange Center Maintenance it is the customer's responsibility to disconnect the unit(s), transport them to the designated IBM location, pick them up when repair is completed and reinstall them.

Maintenance is provided during the warranty period as described in the Maintenance option of the IBM Service Center Maintenance plan. (See GI pages).

Customers with 4710s not covered by IBM Maintenance Agreements may have the unit(s) repaired (if the unit is repairable) at a designated IBM location for a time and material charge. (See GI pages).

If maintenance coverage is not contracted for immediately following expiration of any service and parts warranty and the customer subsequently wants IBM Maintenance Agreement Coverage, he may have the machine(s) inspected. This inspection will be done at the service center for a fixed charge.

If the unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs are billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage.

Bibliography: For information on Publications about the 4710, refer to the *IBM 4700 Finance Communication System: Summary,* GC31-2016.

SPECIFY

Unless indicated otherwise, specify features are not recommended for field installation.

- Voltage (120V AC, 1-phase, 60 Hz): **9890** for locking plug, **#9891** for non-locking plug. A line cord of 1.8 meters (6 feet) is provided at time of shipment.

SPECIAL FEATURES (None)

Volume Purchase: Volume purchase quantity 100 or more, price reduction percentage, 15%.

MODEL CONVERSIONS (None)

ACCESSORIES

Locks and Keys: The 4710 is shipped with two identical keys for the cover lock. Additional keys may be purchased from IBM. Order via MSORDER (Category = Supplies/Accessories; Group Code = Supply Order, on AAS. Indicate serial number of lock.

SUPPLIES

The following items, available from the System Supplies Division (SSD), or their equivalents, are required.

Paper: 100-foot single journal roll paper:

Carton of 48 rolls 4.5 inches wide	P/N 7032894
One roll 4.5 inches wide	P/N 7032895
50-foot two-part journal roll paper:	
Carton of 48 rolls 4.5 inches wide	P/N 7032919
One roll 4.5 inches wide	P/N 7032920

Ribbon:

Black Ribbon, one box	P/N 7037985
Purple Ribbon, one box	P/N 7033537

4710 Fin. Comm. System Receipt/Validation Printer (cont'd)

Starter Kits: Two starter kits are available, one containing two-ply roll paper and the other containing single-ply paper. Each contains black ribbons and provides approximately a six month supply of ribbons and paper for every four 4710s being installed. Both kits are available as purchase-only items.

#6320	1 carton two-ply roll paper 10 black printer ribbons
#6321	1 carton single-ply roll paper 10 black printer ribbons

4720 FINANCE COMMUNICATION SYSTEM FORMS/PASSBOOK PRINTER

PURPOSE

The IBM 4720 forms/passbook printer is a family of table top printers designed to fit into a teller or administrative workstation along with other 4700 devices. The 4720 printer is available in a series of Models intended to provide appropriate printing capabilities for a variety of financial applications. The 4720 printers attach to 4701 controllers via a loop. Attachment to 3600 controllers is supported by PRPQ 5799-BJE.

MODELS

Model 1	001	Provides cutform printing capability.
Model 2	002	Provides cutform and journal printing capability.
Model 3	003	Provides cutform and passbook printing capability.
Model 4	004	Provides cutform, passbook, and journal printing capability.

Prerequisites: An available position on a loop of a 4701 Finance Communication System Controller.

HIGHLIGHTS

The 4720 printer provides the capability to print on a range of sizes of cutforms or passbooks. Journal printing function is also available, depending on model.

Printing is bi-directional at a maximum of 120 characters per second. Printing takes place at 10 or 12 cpi, selectable by Application program.

Forms advance can be specified at 5 or 6 lines per inch, or in 1/90 inch steps, selectable by Application program.

Shared Workstations is included, implemented by two Start Keys. In a non-shared environment, printing operations can be initiated manually via either of the two separate start keys, or automatically upon sensing an inserted document. Either option can be selected under application program control.

Ribbon replacement is a "clean hands" operation.

The basic machine provides a set of 212 characters. From this set, character sets of up to 192 characters may be selected. In addition to standard alphabetics and numerics, this set includes diacritic characters used in most countries, and special characters used in both data processing and word processing applications. Non-Latin Languages (Arabic, Hebrew, and Greek), and Katakana are supported via Specify Features. Sixteen customer-designable characters can be added to the character set. The above set is available in both standard and quality print. BOLD printing (2 x normal character width) is standard.

A Quality Print function is provided. When performing quality print, the 4720 makes two printing passes over each line. Both printing passes begin at the same margin, and each pass is made at one half of the normal print head speed. The quality print characters have a more formal, typewriter-like appearance suitable for applications requiring a higher print quality than the standard matrix character.

Address sharing is supported. Like and Unlike devices. (Printer with Printer and Printer with Display.)

A Locked Journal Roll function is standard on the Models 2 and 4. One or two partrolls of 8.5" width can be used. Single part rolls may be 90 feet (27.4 m) in length. Two part rolls may be 45 feet (13.7 m) in length. A tear bar is provided for the exiting paper.

The Journal Print Station is located directly behind the Document Print Station, thus allowing the same lines which print on a cut form document to print on the journal roll.

The 4720 attaches to a 4701 controller via a loop, which operates at speeds of 1200, 2400, or 4800 BPS.

Customer Setup (CSU): The 4720 is designated customer setup, thereby offering the customer early availability and terminal relocation flexibility. One copy of the CSU Instructions is shipped with each 4720. The CSU allowance is four days.

Customer Responsibilities: The customer must be advised that these responsibilities include:

- Assuring that the use of the equipment complies with all Federal, State and local laws, regulations and ordinances.
- Adequate site, system and other vendor preparation.
- Receipt at the customer's receiving dock, unpacking and placement of the 4720.
- Replacement of ribbon and paper. (See Supplies below).
- Performing 4720 checkout in accordance with supplied procedures for initial installation or relocation.
- Physical set-up, connection of cables in protected customer access areas including loop cables.
- Using the problem determination procedures provided with the 4720 to determine the failing unit and filling out the appropriate 4700 Problem Report prior to forwarding the failing unit to an IBM Service/Exchange Center. See "Maintenance" below.
- Determining any required spares.
- Replacing worn or defective print heads and maintaining a supply of spare printheads.

Maintenance: The 4720's utilize IBM Service/Exchange Centers under either Maintenance or Replacement options. Replacement option is not available for rental machines. It is the customer's responsibility to install the equipment and to determine when maintenance is required. The customer may wish to replace a failing unit with a spare and should be advised to purchase sufficient spare units if such use is planned. Under Service/Exchange Center Maintenance it is the Customer's responsibility to disconnect the units, remove his ribbon and journal roll (if applicable), and transport the unit (s) to the Service/Exchange Center, pick them up when repair is completed, and reinstall them. If the Replacement option is used, the customer should also remove his printhead prior to transporting the unit (s) to the Service/Exchange Center.

Maintenance is provided during the warranty period as described in the Maintenance option of the IBM Service/Exchange Center Maintenance plan.

Customers with 4720's not covered by IBM Maintenance Agreements may have the unit(s) repaired (if the unit is repairable) at a Service/Exchange Center for a time and material charge.

If maintenance coverage is not contracted for immediately following expiration of any service and parts warranty and the customer subsequently wants IBM Maintenance Agreement Coverage, he may have the machine(s) inspected. This inspection will be done at the designated IBM location for a fixed charge.

If the unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs are billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage.

Forms Specifications: Refer to *Forms Design Reference Guide For Printers,* GA24-3488.

Publications: *IBM 4700 Forms/Passbook Printer Introduction and Installation Planning,* GC31-2050.

The Introduction includes a product description, configuration data, forms specifications, and physical planning information for the 4720 printer.

SPECIFY

Unless indicated otherwise, the following specify and order codes are only available at time of manufacture.

- Voltage (120V AC, 1-phase, 60Hz): **#9890** for locking plug, or **#9891** for non-lock plug. A line cord of 1.8 meters (6 ft.) is provided at time of shipment.

SPECIAL FEATURES (None)

MODEL CONVERSIONS

Available at time of manufacture only.

ACCESSORIES (None)

SUPPLIES

Paper: 90 feet single part journal roll action paper. Carton of 24 rolls 8.5 inches wide P/N 457363.

45 feet two part journal roll action paper. Carton of 24 rolls 8.5 inches wide P/N 457365.

Ribbon: Black Ribbon, one box P/N 7032757.

The above Supplies may be ordered through your IBM SSD Sales Representative .

Print Head, Customer Replaceable P/N 7034533: One print head is supplied with the printer. The print head is a consumable item, and to assure maximum availability, it is recommended that the customer have one spare print head per location on hand.

All the above supplies may be ordered via IBM Direct Sales.

4730 PERSONAL BANKING MACHINE

PURPOSE

A self-service financial terminal for use in bank lobbies, supermarkets, and other shopping and work locations.

MODELS

Model F01 A self-service financial terminal with a basic configuration containing a 480-character 9-inch diagonal display with selection keys, a keyboard consisting of a numeric keypad and function keys with optional overlays and masks, an identification card reader with Track 2, and a statement printer all located in a single console unit which may be positioned to the left or the right of a currency unit. Five currency cartridges plus one for CE service are provided with each machine. (Additional cartridges are available.) In addition, the model F01 is supplied with SNA/SDLC LU0 communications support and security keylocks. Servicing doors are on the front. Customizable panels for the upper rear and upper side of the currency unit are shipped with the machine. They can be removed and repainted. They are also available as accessories from National Distribution Division (NDD) for replacement or for early customization before the machine is installed. Special features which may be ordered for the Model F01 include a check depository, an envelope depository, and a coin dispenser. Two keylock access to the check and envelope depositories is provided with the basic machine.

Model F02 A self-service financial terminal with a basic configuration containing two displays with selection keys, two keyboards with optional overlays and masks, two identification card readers with Track 2, and two statement printers located in two console units, one on either side of a single currency unit. Five currency cartridges plus one for CE service are provided with each machine. (Additional cartridges are available.) In addition, the model F02 is supplied with SNA/SDLC LU0 communications support, and security keylocks. Servicing doors are on the front. A customizable panel for the upper rear of the currency unit is shipped with the machine. It can be removed and repainted. It is also available as an accessory from NDD for replacement or for early customization before the machine is installed. Special features which may be ordered for the Model F02 include two check depositories, two envelope depositories, and two coin dispensers. Two keylock access to the check and envelope depositories is provided with the basic machine.

Model R01 Same as the model F01 except that the servicing doors are on the rear and the currency unit customizable panels for the upper front and upper side are shipped with the machine.

Model R02 Same as the model F02 except that the servicing doors are on the rear and the currency unit customizable panel for the upper front is shipped with the machine.

Prerequisites: Attaches to an available position on the Fan-out Communications Adapter of the 4701 Finance Communication Controller or communicates with the IBM 4701 controller via the EIA/CCITT Interface. If Host Connected -- a communications controller with appropriate features ... see M3704, 3705, 3725, 3727 or 4321/4331/4361 (for Communications Adapter, #1601, on the 4321, 4331 and 4361) pages.

Customer Setup (CSU): Yes.

HIGHLIGHTS

The 4730's modular design and configuring flexibility allow it to be ordered as a low-cost cash issuer, with selected features, or fully featured with its unique new functions. All mdls of the 4730 can be configured to issue currency in up to five denominations plus four denominations of coin; cash checks in the exact amount; validate checks for acceptance by a cashier; stack checks individually for deposit; sequentially stack enveloped deposits in the order they were deposited; and perform other financial transactions including transfers and bill payment ...other documents, such as Traveler's checks, may be dispensed if (via RPQ) they complete a document issue qualification test successfully.

- New 4730 capabilities:
  - Check deposits without envelope.
  - Envelope deposits sequentially stacked in a spill-proof sealable container.
  - Cashing of non-maker checks in the exact amount.
  - Uneven amount cash back or cash withdrawal transactions.
  - Check authorization (cashier function).
  - Check verification through MICR reader.
  - Audit trail through check printer.
  - Multiple transactions on transaction statement.
  - Dynamic currency/coin cartridge reconfiguration when a cartridge is out of currency/coin.
  - Customer pre-determined automatic reconfiguration if a component fails.
  - Consumer display and statement printer used for settlement and operator tasks.
  - Locally stored image and microcode eliminate need to download after power loss or machine reset.
- New features:
  - 480-character 9-inch diagonal CRT display.
  - Selection keys ... can be used in conjunction with or in place of function keys.
  - 4-denomination coin dispenser.
  - Check depository - check MICR reader, check printer, and stacker.
  - Sequential stacking envelope and check depositories.
  - Continuous form statement printer ... multiple transactions per statement ... automatically cut to proper length when statement is issued.
  - 5-denomination currency unit.
  - Modular packaging, horizontal configuration, customizable appearance.
  - Installation flexibility ... free standing or in-counter installation.
  - Single or dual consoles ... dual consoles share common logic and currency unit providing cost savings.
  - Front or rear service ... front service for a free-standing installation near a wall, rear service for other free-standing installations or for in-counter installations.
  - Menu-driven service interface.
  - Customer servicing activities such as replacing ribbons, replacing paper rolls, emptying depository containers, etc., can be performed on one console of a dual console 4730 while the other console remains operational.
  - Customizable panels ... lower panels for all sides but service doors are provided as accessories by NDD. . The customer can leave the accessory lower panels pearl white, repaint them, or install his own lower panels (wood, veneers, etc.) in place of the accessory panels. Lower panels may not be required for in-counter installation. Upper panels are always shipped with the machine. Certain upper panels can be removed and repainted (mdl F01 -- upper rear and upper side; mdl F02 -- upper rear; mdl R01 -- upper front and upper side; mdl R02 -- upper front). If the customer wishes to have custom-finished upper panels available at the time of installation, accessory upper panels can be ordered from NDD in advance of machine shipment.
  - Dynamic reconfiguration without machine closing ... at customer option. **Documents:** Automatic recovery with documents of same or lower denomination (including substitution of coins for dollars to complete a transaction). **Coin:** Automatic recovery with coin of lower denomination. **Check Depository:** Automatic recovery using envelope depository. **Envelope Depository:** Automatically configured out when out of service. **Statement Printer:** Automatically configured out when out of service. (Consumer option to complete transaction without receipt.)
- Other characteristics:
  - Full function keyboard with optional overlays and masks.
  - Identification card reader with Track 2.
  - Optional dual-custody keylocks for currency unit.
  - Customer setup.
  - UL291 certification for "business hour" service.
  - Multiple language display capability ... based on identifier code recorded on magnetic stripe card.
  - Multiple installation usage capability ... can accept magnetic stripe cards of many different card issuers.

Capacities:

Document cartridge: 2,000 new documents, approximately 1,500 used documents.

Coin cartridges (average per console): 1 - 410; 5 - 325; 10 - 480; 25 - 350.

Check depository: Approximately 300.

4730 Personal Banking Machine (cont'd)

Envelope depository: 325 sealed envelopes each containing an average of three documents.

Statement printer: 1,000 3-inch statements using a 3.75 inch o.d. roll of 16-pound paper.

Currencies and coins tested and supported for the U.S. include:

Bills	Coins
$ 1	1
5	5
10	10
20	25
50	

An RPQ should be submitted for a document issue qualification test for note denominations not specified above, for traveler's checks, or for other documents. Specify currency denomination or note and issue to be tested.

System attachment: The 4730 was designed to communicate with any host CPU or subhost capable of communications via an SDLC line discipline using an SNA LU TYPE 0 protocol. The electrical interface presented by the 4730 complies with EIA Standard RS-232-C.

Local Attachment: For local attachment to a 4701 Finance Communication Controller via SNA/SDLC LU0, the customer must order cable assembly P/N 6125820 from Poughkeepsie, specifying the length required (connectors provided). The customer must also specify for the 4701 the SDLC Communications Adapter Without Business Machine Clocking, feature #4502, the Fan-out Communication Adapter, feature #1551, and one of the following line speeds (Refer to *IBM 4700 Finance Communication System Installation Planning,* GC31-2018):

Specify	Speed	Maximum Cable Length Supported
#9181	9600 bps	30.48m (100 ft.)
#9182	4800 bps	60.96m (200 ft.)
#9183	2400 bps	121.92m (400 ft.)

Remote Attachment: A 20-foot cable assembly will be provided for attachment of a 4730 to an external modem with clocking for remote attachment to a 4701 Finance Communication Controller, or to a 4321/4331/4361 Communications Adapter, or through a 3704, 3705, 3725 or 3726 Communication Controller to a S/370, 303X, 308X, 4341 or 4381 ... specified length cable assembly P/N 6093901 up to 40 feet may be ordered from Poughkeepsie for attachment to an external modem with clocking. **Prerequisites:** (1) External modems (such as 3863 or equivalent) capable of supplying data clocking are required. Supported transmission rates are 1200 through 9600 bps. (2) For remote attachment to a 4701 Finance Communication Controller, the EIA/CCITT Interface (#3701) and the SDLC Communications Adapter Without Business Machine Clocking (#4502) are required on the 4701.

Cabling: Refer to *IBM 4730 Personal Banking Machine Planning and Site Preparation Guide,* GC31-2075, for information regarding the specified length (up to 40 feet) cable assembly and bulk cable. See "Accessories" for ordering instructions.

Customer Responsibilities: The customer is responsible for:

- Assuring that use of the equipment complies with all Federal, State and local laws, regulations and ordinances.
- Adequate site, system, and other vendor preparation.
- Price quotations, installation, and cost (initial and recurring) of common carrier equipment and service.
- Receipt at the customer's receiving dock, unpacking, and placing of the 4730.
- Physical setup, connection of cables in protected customer-access areas.
- Performing 4730 checkout in accordance with supplied procedures for initial installation or relocation.
- Creating the customization image and loading it onto the operational diskette.
- Checking communications with the 4701 controller or with the host processor.
- Developing and/or obtaining and installing application programs to communicate with the 4730.
- Using the problem determination procedures provided with the IBM 4730 to determine the failing component and filling out the appropriate 4730 Trouble Report prior to requesting on-site maintenance service (see "Maintenance" below).
- Notifying IBM of machine relocation for CE coverage.
- Procuring and replacing replacement ink ribbons for the statement printer and the check printer, and replacement paper rolls for the statement printer. Ink ribbons and paper rolls are available from NDD.
- Procuring any spare or replacement accessories.

Maintenance: Maintenance of the 4730 is available under the IBM Maintenance Agreement.

IBM will not provide warranty or maintenance service on a 4730 containing money. The customer will be responsible for removing, controlling, and reloading all money in the 4730 so that IBM can fulfill its warranty and maintenance obligations. A service document cartridge is supplied with the basic machine, and a service coin cartridge is supplied with the coin feature. These cartridges are intended for use in customer problem determination and by the CE for servicing the 4730.

Customers with 4730s not covered by IBM Maintenance Agreements may have the unit(s) repaired, if repairable, on-site for a time-and-material charge.

If maintenance coverage is not contracted for immediately following expiration of any warranty and the customer subsequently wants IBM Maintenance Agreement coverage, the customer must first have the machine(s) inspected so that eligibility for maintenance coverage may be determined. This qualification will be done at the customer's site. If the unit requires repair and the repair is requested, all parts needed are billed at IBM's prevailing parts prices and the additional time required for repairs is billed at IBM's applicable service rates. The machine then becomes eligible for IBM Maintenance Agreement coverage.

Accessories are not maintained by IBM.

CUSTOMIZATION

The 4730 is supplied by IBM in pearl white only.

Customizable Panels: All 4730 panels and service doors shipped by IBM are finished in pearl white. Lower panels for all sides but service doors are not shipped with the 4730 but must be ordered and are billed separately by NDD. The customer can leave the accessory lower panels pearl white, repaint them, or install his own lower panels (wood, veneers, etc.) in place of the accessory panels. Lower panels may not be required for in-counter installation. Upper panels are always shipped with the machine. Certain upper panels can be removed and repainted (mdl F01 -- upper rear and upper side; mdl F02 -- upper rear; mdl R01 -- upper front and upper side; mdl R02 -- upper front). If the customer wishes to have custom-finished upper panels available at the time of installation, accessory upper panels can be ordered from NDD in advance of machine shipment.

Mounting hardware to be used to mount panels the customer provides is also available from and will be billed separately by NDD.

Orders for customizable panels and mounting hardware should be submitted to NDD sufficiently early to allow the customer to obtain customized panels before installation of the 4730.

When a standard panel is ordered early (as an accessory), the customer will have to replace the standard panel that is always shipped on the 4730 with the one he has customized.

Customizable Bezels: The 4730 is shipped with bezels and graphics for the identification card reader, envelope depository, and check depository slots. These bezels are also available from NDD without graphics as accessories. This allows the customer to customize his graphics on the bezels through silk screening or decals.

Kick Strips: Kick strips around the base of the 4730 may not be required for in-counter installations. Kick strips are recommended for free-standing installations and are available as an accessory.

Currency Unit Security Bracket: A currency unit security bracket is available as an accessory. It allows the currency unit to be bolted to the floor. The currency unit security bracket and 4730 replacement accessories and supplies may be ordered from NDD.

CURRENCY UNIT OPERATION

Document Cartridges: Five document cartridges are provided with the basic 4730 for customer use. An additional service document cartridge is provided for use by CE personnel. Additional cartridges for use as spares or replacements may be ordered from NDD. Spare cartridges permit the customer to fill some with currency while other cartridges are in use. The customer is responsible for determining if the cartridge is the failing unit within a 4730. The customer is responsible for determining if the cartridge is the failing unit within a 4730. Failing document cartridges should be replaced; the document cartridge was not designed to be repaired. Service for the document cartridge under the IBM Maintenance Agreement is not offered. The service document cartridge must be made available by the customer to the CE for normal 4730 maintenance.

Use new or used currency in good condition: The general condition of used currency may vary. Used currency must be inspected to remove excessively worn, damaged, or torn bills. The *4730 Personal Banking Machine Operator's Guide for Front-Serviced 4730s,*

4730 Personal Banking Machine (cont'd)

GC31-2518, and the *4730 Personal Banking Machine Operator's Guide for Rear-Serviced 4730s*, GC31-2520, contain procedures for preparation of new currency and inspection of used currency for operation in the 4730.

Coin Cartridges: Each 4730 coin cartridge is used to hold one denomination of coins. Four coin cartridges are provided with the feature for customer use. An additional service coin cartridge capable of holding multiple denominations is provided for use by CE personnel. Additional cartridges for use as spares or replacements may be ordered from NDD. Spare cartridges permit the customer to fill some with coins while others are in use. The customer is responsible for determining if the cartridge is the failing unit within a 4730. Failing coin cartridges should be replaced; the coin cartridge was not designed to be repaired. Service under the IBM Maintenance Agreement is not offered. The service coin cartridge must be made available by the customer to the CE for normal 4730 maintenance.

Use new or used coins in good condition: The general condition of used coins may vary. Used coins must be inspected to remove excessively worn or damaged coins. The *4730 Personal Banking Machine Operator's Guide for Front-Serviced 4730s*, GC31-2518, and the *4730 Personal Banking Machine Operator's Guide for Rear-Serviced 4730s*, GC31-2520, contain procedures for inspection of used coins for operation in the 4730.

SPECIFY

- Voltage (AC, 1-phase, 60 Hz): **#9911** for 120V (usable on 115V). Specify **#9891** for line cord with non-locking plug.
- Console unit position (Consumer facing front of machine): [mdls F01, R01] Specify **#9120** for console unit to the left of the currency unit. Specify **#9121** for console unit to the right of the currency unit.
- Dual-Custody Keylock: Specify **#9550** for a second keylock provided for the currency unit. **Maximum:** One. **Field Installation:** Not recommended.
- Keyboard Overlays (Numeric or Alphameric Key Arrangement): Specify **#9301** for numeric-only keypad. Specify **#9302** for alphameric keypad ... alphameric arrangement is the basic touch-pad telephone format with the Q and Z added over the numeric "0" and no alpha over the numeric "1" or specify **#9303** for alphameric keypad ... alphameric arrangement is the American Banking Association Standard format with the Q and Z over the numeric "1" and no alpha over the numeric "0".
- Function Key Arrangement: Specify one of the following function key arrangements. All keyboards can be customer installed.

	1	2	3	4	5	6	7	8
1	Withdraw Cash	Deposit	From Checking	To Checking	1	2	3	Cancel
2	Fixed Amount	Cash Check	From Savings	To Savings	4	5	6	(Reserved)
3	Account Balance	Payment	From Credit Card	To Credit Card	7	8	9	Change
4	Transfer	Other Service	From Other Account	To Other Account	Correc-tion	0	Decimal Point	OK

As shown (numeric only): Specify **#9301**
Alphameric with QZ/0: Specify **#9302**
Alphameric with QZ/1: Specify **#9303**

	1	2	3	4	5	6	7	8
1	Withdraw Cash	Deposit	From Checking	To Checking	1	2	3	Cancel
2	Special	Payment Enclosed	From Savings	To Savings	4	5	6	(Reserved)
3	Account Balance	Payment From Account	From Credit Card	To Credit Card	7	8	9	Change
4	Transfer	Other Service	From Other Account	To Other Account	Correc-tion	0	Decimal Point	OK

As shown (numeric only): Specify **#9305** and **#9301**
Alphameric with QZ/0: Specify **#9305** and **#9302**
Alphameric with QZ/1: Specify **#9305** and **#9303**

	1	2	3	4	5	6	7	8
1	Withdraw Cash	Deposit	From Checking	To Checking	1	2	3	Cancel
2	Check Approval	Cash Check	From Savings	To Savings	4	5	6	(Reserved)
3	Account Balance	Payment	From Credit Card	To Credit Card	7	8	9	Change
4	Transfer	Other Service	From Other Account	To Other Account	Correc-tion	0	Decimal Point	OK

As shown (numeric only): Specify **#9306** and **#9301**
Alphameric with QZ/0: Specify **#9306** and **#9302**
Alphameric with QZ/1: Specify **#9306** and **#9303**

- Keyboard Masks: Specify one of the following keyboard masks: All keyboard masks can be customer installed.

SPECIAL FEATURES

Note: All field installable special features require service personnel for field installation.

Check Depository (#1550): Provides a check transport mechanism leading from a check slot to a MICR check reader, a check printer, and a container with a capacity of approximately 300 checks. One container per Check Depository is supplied with the feature. Additional containers are available through NDD as an accessory. Handles checks between 66.7mm (2.63 in.) and 108.0mm (4.25 in.) wide and between 146.1mm 5.75 in.) and 225.4mm (8.9 in.) long and between 0.09mm (0.0035 in.) and 0.18mm (0.007 in.) thick with a base weight of between 20 and 32 pounds (75 and 120 grams per square meter). The check printer will print up to 55 characters (45 characters when check authorization is implemented) of customer selected information on the check to aid reconciliation and return item processing, or to provide

4730 Personal Banking Machine (cont'd)

data for check authorization. This information will be printed in a multiple field single line across the face of the check. The check will be printed after the check has been accepted for stacking or authorization and returned to the customer. The checks will be stacked in sequence in a container which is transportable and spill-proof. **Limitations:** One per mdl F01 or R01; two per mdl F02 or R02. **Field Installation:** Yes.

Coin Dispenser (#1650): Transports coins from four denomination-specific coin cartridges to a coin cup located in the currency unit ... four coin cartridges per Coin Dispenser are provided with the feature for customer use. An additional service coin cartridge capable of being installed in any position in the coin dispenser is provided for use by CE personnel. Additional coin cartridges are available through NDD as an accessory. The approximate coin capacities for the 4730 Mdls F01 and R01 and each station of a Mdl F02 and R02 are: 1 - 410; 5 - 325; 10 - 480; 25 - 350. **Limitations:** One per mdl F01 or R01; two per mdl F02 or R02. **Field Installation:** Yes.

Envelope Depository (#3650): Provides an envelope transport leading from a controlled access slot to a deposit receptacle inside the 4730. The depository transport is designed to discourage tampering with previously inserted deposits. The deposited envelopes are stacked in a portable container in sequence. The depository will accept sealed envelopes up to 12.7mm (0.5 in.) thick. It will accept the normal (maximum) size envelope for the U.S. and Canada which is 107mm (4.2 in.) by 241mm (9.5 in.). The envelope depository will accept 325 sealed envelopes each containing an average of three documents. One container per Envelope Depository is supplied with the feature. Additional containers are available through NDD as an accessory. **Limitations:** One per mdl F01 or R01; two per mdl F02 or R02. **Field Installation:** Yes.

MODEL CONVERSIONS

Model F01 can be field upgraded to model F02. Model R01 can be field upgraded to model R02. Model changes between F01 and R01 or between F02 and R02 are available at time of manufacture only. Field changes between left and right console unit attachment to the currency unit for a model F01 or R01 are not recommended.

ACCESSORIES

The 4730 is shipped without lower panels (since these panels may not be required for in-counter installation). Panels may be ordered as an accessory from NDD. Other accessories, such as the privacy filter, kick strips, the currency unit security brackets, and customizable bezels, also can be ordered. Cartridges and containers for documents, coins, check and envelope depositories and all items required to make the 4730 operative and for Customer Setup (CSU) and customer maintenance will be provided with each machine in accordance with its configuration. Contact IBM for replacement accessories and supplies, such as document separators, ink ribbons, and statement printer paper.

All 4730 Accessories and Supplies are available from NDD.

Cables to attach 4730 units may be purchased from IBM ... The customer is responsible for installation and maintenance of these cables. Assembled cables may be purchased from IBM. Specify bulk cable number, cable assembly number or P/N as appropriate. Allow lead time of 90 days.

The following are "X" length cables with maximum length shown.

Cable Assy No.	Use	Length
6093901	Cable Assy, EIA/CCITT (to ext modem)	12m (40 ft)
5680977	Cable Assy, EIA/CCITT (to 4701)	122m (400 ft)

SUPPLIES

The following 4730 accessories and supplies are available from NDD. Customers planning to order large volumes of additional or replacement cartridges/containers should contact their NDD Marketing Representative at least one month prior to installation.

Document Cartridge	Service Document Cartridge
Envelope Container	Check Container
Coin Cartridges	Coin Cartridge Stand
Service Coin Cartridge	Customizable Bezels
Customizable Panels	Mounting Hardware
Privacy Display Filter	Currency Unit Security Brackets
Kick Strips	Check Printer Ribbon
Statement Printer Ribbon	Statement Printer Paper
Document Separators	Magnetic Head Cleaning Card

4860 PCjr

PURPOSE

The 4860 PCjr is a small, low-cost system which is compatible with other members of the IBM Personal Computer family. PCjr is designed for use in home and educational environments and for personal productivity applications.

MODELS

Model 004 System Unit/Keyboard, 64KB Memory, two cartridge slots, transformer.

Model 067 System Unit/Keyboard, 128KB Memory (including 64KB memory and display expansion), two cartridge slots, transformer, one 360KB Diskette Drive.

Prerequisites: One of the following display options is required: A) an Adapter Cable for IBM Color Display (#0021) and a 5153 mdl 001 Color Display or equivalent, or B) a Connector for TV (#0020) and a user-supplied color television set, or C) a user-supplied color video monitor and cable. Four user-supplied AA-size batteries are required to operate the cordless keyboard. The optional Keyboard Cord (#0012) is required to operate the keyboard without batteries. The use of the 360KB Diskette Drive requires IBM Personal Computer Disk Operating System (DOS) 2.1 (6024120).

Customer Setup (CSU): All mdls and special features of the 4860 PCjr are customer setup.

HIGHLIGHTS

- The 4860 PCjr base system consists of three separate units: The system unit, a cordless keyboard, and a small power transformer. The optional keyboard cord and the transformer plug into rear-mounted jacks on the system unit. The system unit includes 64KB of Read-Only Memory (ROM), which contains the power-on self-test, Cassette BASIC interpreter, and cassette operating system.
- The Cassette BASIC interpreter provides the necessary cassette input/output instructions and a high level of support for display, keyboard, printer, light-pen, and joy sticks, as well as a full complement of editing, logic, math, and string functions. It is operational as soon as the system is turned on.
- The cordless keyboard, with a technology that is unique to the PCjr, is a low-profile, 62-key, detached keyboard that allows low cost and high quality. The keys are arranged in standard typewriter layout with the addition of a function key and cursor control keys. The keytops themselves are not labeled. The standard keyboard layout is permanently affixed above each key. This allows customization of the entire keyboard. There are two tilt positions for operator comfort: The normal position has 5-degree slope; with legs extended it has a 12-degree slope.
- The cordless keyboard is battery-powered and interfaces with the system unit by an infrared (IR) optical link. Mounted in the keyboard are two infrared emitting diodes that transmit coded information to the system unit. The receiver card, located in the system unit, has an infrared sensing device that receives the signal transmitted from the keyboard. The keyboard is powered by four customer-supplied AA-size batteries during cordless operation. It will function in cordless mode when located within 20 feet of, and in front of, the PCjr.
- An optional keyboard cord connection to the system unit is available power the keyboard and to send data to the system unit. The cord option must be used when multiple systems are being operated in the same immediate area to eliminate cross communication.
- The following items are supplied as standard with the 4860 PCjr system unit:
  - 62-key cordless keyboard
    battery-powered infrared optical link
    operation within 20 feet of and in front of system unit
  - 64KB of read-only memory (ROM)
    250ns access time; 375ns cycle time
    Cassette BASIC interpreter
    Power-on self-test
    Cassette operating system
  - 64KB (mdl 004) random access memory
    28KB (mdl 067) random access memory (16KB reserved for video buffer)
  - 360KB Diskette Drive (mdl 067 only)
  - Intel 8088 microprocessor
    4.77 MHz clock (210ns clock-cycle time)
  - Two cartridge slots
  - 60-volt-ampere step-down power transformer
    Separately housed
    Weight: 2 lb 13 oz.
    Power cord: 6 feet from power source to transformer; 4 feet from transformer to system unit
  - 33-watt, 3-voltage-level, 2-stage power supply
  - Audible alarm
  - Sound subsystem that uses the speaker(s) in TV or display
  - I/O connectors, keyed to prevent improper installation, for the following devices and options:
    - Serial Devices
    - Cassette recorder for loading or saving programs or data
    - Joy sticks
    - Modem
    - Diskette
    - Video/graphics subsystem
    - Direct-drive video, composite video, and television
    - Light-pen
    - I/O expansion bus
    - External audio

    Options for the 4860 PCjr that attach to the I/O connectors are:
  - 360KB diskette drive for mdl 004 (standard on mdl 067)
  - 64KB memory and display expansion for mdl 4 (standard on mdl 067)
  - Internal modem
  - Parallel printer attachment
  - Keyboard cord
  - Adapter cable for IBM Color Display
  - Adapter cable for cassette
  - Adapter cable for serial devices
  - Connector for TV (RF modulator)
  - Joy sticks

  In addition, a carrying case and cordless keyboard overlays are available.

Physical Specifications (system unit):
Width - 354mm (13.9 inches)
Depth - 290mm (11.4 inches)
Height - 97mm (3.8 inches)
Weight - less than 9 pounds with diskette drive;
less than 6 pounds without diskette drive

Physical Specifications (keyboard):
Width - 342mm (13.5 inches)
Depth - 168mm (6.6 inches)
Height - 26mm (1.02 inches)
Weight - 616 grams (22 oz.) without batteries;
700 grams (25 oz.) with batteries

Operating Environment:
Temperature (system on): 16 to 32 degrees C (60 to 90 deg. F)
Temperature (system off): 10 to 43 degrees C (50 to 110 deg. F)
Temperature (storage): 0.6 to 60 degrees C (33 to 140 deg. F)
Temperature (shipment): -40 to 60 degrees C (-40 to 140 deg. F)
Relative Humidity (system on): 8% to 80% RH
Relative Humidity (system off): - 8% to 80% RH
Transformer operating: Altitude to 7,000 feet.

Publications: *Logo: Programming with Turtle Graphics* (#2229): A spiral-bound manual that explains how to construct programs using Logo and includes a step-by-step introduction to Logo turtle graphics. The manual is intended for use with IBM Logo (6024076), and is identical to the manual that is shipped with the software.

Hands-on BASIC for the IBM PCjr (#2290): This manual is provided as standard with all mdls of the 4860 system unit. The manual is a primer for learning BASIC language programming. The manual may be purchased separately by ordering feature #2290.

IBM PCjr Guide to Operations (#2292): Provides information on operations for users of the 4860 PCjr. This manual is shipped as standard with all mdls of the 4860 system unit. The manual may be purchased separately by ordering feature #2292.

IBM PCjr Technical Reference Manual (#2293): This manual is designed to provide hardware design and interface information. The manual is intended for programmers, engineers involved in hardware and software design, designers, and interested persons who have a need-to-know how the 4860 PCjr is designed and works.

IBM PCjr Hardware, Maintenance, and Service Manual (#2294): Provides step-by-step instructions that aid the user in identifying the failure of a 4860 PCjr Field Replaceable Unit (FRU). When the FRU has been identified, the manual provides the necessary information to complete the repair activity (i.e., adjustments, replacements, etc.).

BASIC Made Easy for the IBM PCjr (#4116): An introduction to the BASIC programming language on the 4860 PCjr. It takes inexperienced users of the 4860 PCjr and the BASIC programming language through the more commonly used commands, statements, and functions of BASIC. The student learns by doing, and sets his or her own pace. The book is written in a friendly, conversational tone with heavy emphasis on the use of color, sound, and examples. Once the student has

4860 PCjr (cont'd)

completed *BASIC Made Easy*, it can be used as a reference book, since it contains a list of common BASIC error messages, as well as an index of BASIC programming terms. **Prerequisites:** Before beginning *BASIC Made Easy*, the user should read the *IBM PCjr Guide to Operations* to become familiar with the keyboard. To enter examples shown in the text requires a 4860 PCjr with the BASIC Interpreter cartridge (#4101), and one of the following: A) a color TV set with the connector for TV (#0020); or, B) a color video monitor with cable.

IBM Personal Computer Disk Operating System (DOS) 2.1 Technical Reference (#4125): Intended for the more experienced DOS users, system programmers, and those who will be developing their own applications. It contains detailed technical information not contained in the manuals available with DOS 2.1 (6024120).

IBM PCjr BASIC Reference Manual (#4702): This manual (which is provided as standard with the BASIC Interpreter cartridge #4101) describes the full capabilities of cassette and cartridge BASIC. The manual may be purchased separately without a cartridge by ordering feature #4072.

SPECIFY

- Voltage (110V AC, 60 Hz): No specify required.

MODEL CONVERSIONS (None)

SPECIAL FEATURES

Diskette Drive (#0005): The Diskette Drive is a standard feature on the 4860 mdl 067. It provides for the 4860 to read and write data on both sides of a double-sided, soft-sectored 5-1/4 inch diskette. Each side of a diskette can be formatted for 40 tracks with 9 sectors per track. Formatted storage capacity is approximately 360KB. Space and power have been provided for one drive in the system unit. Included with the Diskette Drive is the diskette drive adapter which connects to the diskette drive through an internal, flat cable attached to one end of the adapter. The diskette drive parameters are programmable. In addition, the attachment supports the diskette drive's write-protect feature. The adapter is buffered on the I/O bus and uses the system read-only memory BIOS (basic input/output system). Diskettes created on any member of the IBM Personal Computer family may be read on any other member of the family. Technical Information: 512 bytes/sector ... 9 sectors/track ... 48 tracks/in. track density ... 2 sides ... 40 tracks per side (80 total) ... 300 RPM ... 6ms track to track access time ... 250K bits/sec data transfer rate ... maximum operating altitude 7,000 feet above sea level ... dimensions -- height, 41.6mm (1.6 in.); width, 146mm (5.8 in.); depth, 208mm (8.3 in.); weight, 1.1kg (2.2 lbs). **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** 4860 mdl 004. IBM Personal Computer DOS 2.1 (6024120) is required. It is recommended that the 64KB Memory and Display Expansion (#0007) be installed on diskette-based systems. **Customer Setup:** Yes.

64KB Memory and Display Expansion (#0007): The 64KB Memory and Display Expansion is a standard feature on the 4860 mdl 067. This option permits the use of higher density video modes and 80-column text support while increasing the system memory size by 64KB for a total of 128KB (including 16KB video buffer). The option is a shielded adapter card containing eight 64K-by-1, 150ns, dynamic memory modules which plugs into a 44-pin connector on the system board. Parity checking is not supported. The memory and display expansion does not require the user to reconfigure the system to recognize the additional memory. **Maximum:** One. **Field Installation** : Yes. **Prerequisites:** 4860 mdl 004. **Customer Setup:** Yes.

Internal Modem (#0008): Provides for full-duplex asynchronous communication over 2-wire, switched network channels (normal household telephone installation). The Internal Modem plugs into the modem connector on the system board and does not require the use of the system unit serial port. Auto/manual answer ... auto/manual originate ... direct connection to telephone line uses modular phone jack (USOC RJ11) - modem cable is included ... auto dial Touch-tone* (* Touch-tone is a trademark of AT&T) or pulse by software command ... compatible with Bell 103 series modems ... call progress reporting ... dial tone, ring-back tone, and busy-tone detection ... fully programmable serial-interface characteristics: 7- or 8-bit characters; even-, odd-, or no-parity bit generation and detection; one stop-bit generation; baud rate generation (110 bps or 300 bps); false start-bit detection ... complete status reporting capabilities ... line-break detection ... internal diagnostic capabilities: loopback controls for communications link fault isolation; break, parity, overrun, framing error simulation ... fully-prioritized interrupt system controls. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Customer-provided modular telephone jack connected to the telephone system. **Customer Setup:** Yes.

Parallel Printer Attachment (#0009): Supports attachment of the 5152 mdl 002 Graphics Printer or equivalent. Attaches to the I/O bus on the right side of the system unit and presents the I/O bus at its right side for additional attachments. Dimensions: Height 76mm (3 in.); length 244mm (9.6 in.); weight 12 oz. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** Printer cable (#5612) is required for attachment of a printer. **Limitations:** When the Parallel Printer Attachment is present, the 4860 PCjr directs print output only to this attachment. **Customer Setup:** Yes.

Attachable Joy Stick (#0010): This option is an input device which provides the user with 2-dimensional positioning control. Two momentary contact pushbutton switches on the joy stick give the user additional input capability. Two modes of operation are available. In the "spring return" mode, the stick will return to the center position when released. The "free floating" mode allows smooth, force-free operation with the stick remaining in position when released. Selection of these modes can be made for each axis independently. Two controls are provided for individual adjustment to the electrical center of each axis. **Maximum:** Two. **Field Installation:** Yes. **Customer Setup:** Yes.

Keyboard Cord (#0012): Connects the cordless keyboard to the system unit, giving power to the keyboard and serially encoded data to the system unit. When connected, it disengages the battery power, disables the infrared circuit in the keyboard, and disables the infrared receiver in the system unit. System performance with or without the cord is the same. Length: 1.8m (6 ft.) straight cord. **Maximum:** One. **Field Installation:** Yes. **Customer Setup:** Yes.

Cordless Keyboard Overlays (#0013): Provided for those users who may want to customize their 4860 PCjr keyboard. This option includes five overlays in one package. An overlay fits between the keyboard keys and covers the preprinted symbols. Overlays may be customized by writing on them, by typing on them, or by having them printed commercially. The overlays are made of blank heavy stock paper and are scored so that they may be easily folded for storage and distribution.

Connector for TV (#0020): Allows the 4860 PCjr to use a standard home television set as an output device. This option connects to the VHF terminals of the television set and has a selection switch that allows the TV to be used in either a "computer" or "TV" mode. The Connector for TV plugs in to the system unit. Supports TV sets made for operation in U.S. or Canada. Includes sealed RF modulator certified within the limits for an FCC class-B computing device for operation on TV channel 3 or 4. Weight: 12.5 oz. **Prerequisites:** A user-supplied television set is required. For connection to cable TV and in "TV" mode, a user-supplied 75-ohm to 300-ohm converter may be required. **Maximum:** One. **Field Installation:** Yes. **Customer Setup:** Yes.

Adapter Cable for IBM Color Display (#0021): Allows for attachment of the 5153 mdl 001 Color Display. Provides one connector to match the 5153 mdl 001 Color Display cable connector, and another to match the 4860 PCjr system unit display attachment connector. **Maximum:** One. **Field Installation:** Yes. **Customer Setup:** Yes.

Adapter Cable for Cassette (#0022): Allows for attachment of a user-supplied cassette recorder/player to the cassette connector on the rear of the system unit for storage of programs and data. **Maximum:** One. **Field Installation:** Yes. **Prerequisites:** A user-supplied cassette recorder/player is required. Cassette recorder/player to be connected requires all of the following type connectors (or equivalent): Belden Style-51 miniature phone-plug (auxiliary); Belden Style-51 miniature phone-plug (earphone); Belden Style-56 subminiature phone-plug (remote). **Customer Setup:** Yes.

Carrying Case (#0023): The Carrying Case has been made especially for the owner who occasionally wishes to safely, securely, and conveniently move or store the PCjr. The case is black with a lightly textured surface. A 3-digit combination lock aids in protecting the system. The lock combination can easily be changed by the owner. The carrying case will fit under many airline seats. The case has the capacity for: PCjr system unit; parallel printer attachment; connector for TV; cordless keyboard; keyboard cord; transformer and power cord; up to five diskettes; up to four program cartridges. **Limitations:** The Carrying Case should not be used as a shipping container. It is intended only to provide hand transportation or storage of the 4860 PCjr. The original packing material should be retained for shipping the system.

Adapter Cable for Serial Devices (#0026): Allows connection of PCjr system unit to serial devices such as printers and modems. A male RS-232C connector on one end of this short cable matches standard D-type 25-pin serial device cable connectors, and a connector on the other end matches the PCjr system unit serial device attachment connector. Connection is provided for the following typical RS-232C signal pins: transmit data, receive data, request-to-send, clear-to-send, data set ready, signal ground, carrier detect, data terminal ready. The cable length is 72mm (3 in.). **Maximum:** One. **Field Installation:** Yes. **Customer Setup:** Yes.

Mouser Cartridge (#4087): A fast-paced, arcade-type cartridge game for the PCjr system in which the player is cast in the role of a farmer whose 9-room farmhouse has been overrun by mice. The object of the game is to trap, within the allotted time, all of the mice in the rooms by building traps with movable walls. To clear all of the rooms requires skill, strategy, and dexterity. Some of the rooms are not lit, and the player must locate a flashlight that can be used to illuminate a portion of the room. On the higher levels, the mice reproduce themselves as the player is attempting to trap them. The farmer loses by running out of time or by touching a mouse. Points are awarded for each mouse trapped. The total score depends on how fast the player traps the mice. 1- or 2-player mode ... player movement with either joy stick or

4860 PCjr (cont'd)

keyboard ... full 16-color graphics ... three-voice music and sound effects ... pause game feature ... displays high score ... nine screens ... multiple levels of difficulty. **Prerequisites:** Minimum configuration required is 4860 mdl 004 with attachment of a supported display type.

Scubaventure Cartridge (#4088): An action-packed, arcade-type game cartridge designed to run on the PCjr system. Here, each player is in control of a 3-diver expedition team that is searching the dangerous recesses of an undersea cavern for sunken treasure. Each expedition sends one diver at a time to brave the treacherous waters to collect rare fish, to avoid poisonous fish and electric eels, and to find keys to open the treasure chests. Unlike many other arcade games, two players may play simultaneously, competing for the same rare fish and for survival. Played in 1-player mode, a ghostly white diver with a strange knack for being in the wrong place at the right time accompanies you. Points are awarded for each chest opened and for each rare fish collected. 1- or 2-player mode ... simultaneous play in two-player mode ... player movement with either joy sticks or keyboard ... pause game feature ... full 16-color graphics ... 3-voice sound. **Prerequisites:** Minimum configuration required is 4860 mdl 004 with attachment of a supported display type.

Crossfire Cartridge (#4091): An exciting, arcade-type game cartridge in which the player must defend the grid-like streets of a city from the onslaught of a swarm of insects. Fortunately, the player has a fleet of three ships containing insecticide missiles to clear the streets. A bonus ship is awarded every 5,000 points. The object is to clear the town of these enemies, but, with a limited supply of ammunition and invaders coming from all directions, this is not an easy task. Points are awarded for each invader hit and for bonus targets that occasionally appear in the streets. Player movement with either keyboard or joy stick ... pause game feature ... sound on/off feature ... game restart control... full 3-voice sound ... current high score maintained ... three difficulty settings ... full-color graphics. **Prerequisites:** Minimum configuration required is 4860 mdl 004 with attachment of a supported display type.

Mine Shaft Cartridge (#4092): A fast-paced, action-packed game cartridge in which the player maneuvers a mining car around dangerous mine shafts looking for a fortune in diamonds. In addition to the twisty, treacherous shafts, there are a number of runaway robot miners that seem bent on destruction of the mining car. Disabling the robots and collecting diamonds earn the player points. Clearing either all of the diamonds or all of the robots out of one mine shaft will allow the player to explore the next level. Player movement with either keyboard or joy stick ... pause game feature ... sound on/off feature ... game restart control ... full three-voice sound ... current high score maintained ... full-color graphics. **Prerequisites:** Minimum configuration required is 4860 mdl 004 with attachment of a supported display type.

BASIC Interpreter Cartridge (#4101): Provides extensions to the PCjr built-in Cassette BASIC interpreter. Extensions to the language provide a full set of instructions, commands, and functions. Most of these can be used with or without DOS present. The *IBM PCjr BASIC Reference Manual* is provided with cartridge BASIC and describes the full capabilities of cassette and cartridge BASIC. Superset of advanced BASIC on the 5150 Personal Computer and the 5160 Personal Computer XT ... improves programmer productivity by reducing the need for special machine-language subroutines ... compatible with IBM Personal Computer DOS 2.1 ... current date and time of day (DOS must be present for these functions) ... path name support for tree-structured directories (DOS must be present for these functions) ... event trapping of communications, function key, joy stick, light-pen, music, and timer activity ... stores and plays musical notes ... advanced graphics: Paint, circle, get/put display contents, store and draw line segments, line styling, tiling, viewports, windows, and palette control ... supports one parallel printer ... provides a terminal emulator for asynchronous communications ... ability to load and run a BASIC program in a second cartridge slot. **Prerequisites:** Minimum configuration required is 4860 mdl 004 with attachment of a supported display type. IBM Personal Computer DOS 2.1 (6024120) is required for diskette input/output operations.

Printer Cable (#5612): Provides for the attachment of a 5152 mdl 002 Graphic Printer or equivalent to the Parallel Printer Attachment (#0009). **Maximum:** One. **Field Installation:** Yes. **Customer Setup:** Yes.

ACCESSORIES (None)

SUPPLIES (None)

4952 PROCESSOR

PURPOSE

Provides arithmetic, logic, and control functions for Series/1.

MODELS

Model A	A00	128KB maximum, five I/O feature locations, half-width unit. 32KB basic storage provided.
Model B	B00	128KB maximum, 14 I/O feature locations, full-width unit. 32KB basic storage provided.
Model C	C00	128KB maximum, four I/O feature locations, full-width unit. 32KB basic storage and one built-in diskette drive provided. Second diskette drive optional.
Model 30D	30D	128KB maximum, seven I/O feature locations, full-width unit. 32KB basic storage, with a 30MB disk, optional cache and optional 1.2MB diskette.

All models are designed for mounting on support rails in a 4997 Rack Enclosure (see M4997 pages) or in an EIA standard 19-inch enclosure. Models C and 30D can also be mounted in the Stand-Alone Enclosure (#4520).

Limitations: 4999 Battery Backup Unit may not be used with mdl A prior to mdl A serial number 50,000 (EC 375810). Mdl B is not supported by 4999 when primary power consumption exceeds 800VA (corrected for power factor). Contact IBM for further information. 4999 may not be used with mdl C or 30D.

Prerequisites: For mdl A, a space in Rack Mounting Fixture (**#4540**). See "Accessories" in the M4959 pages.

HIGHLIGHTS

The 4952 is a processor unit in the Series/1 family. It provides CPU, 32,768 bytes of main storage, enclosure, and power. It includes storage address translation function (two 64KB address spaces), clock/comparator, and communications power. Three additional storage increments of 32KB each are pluggable on the processor card. The number of feature locations is model-dependent. See "Specification Table". Standard features include rich instruction set, four interrupt levels, and power failure detect/auto-restart. There are eight general purpose registers per level and byte-addressable storage. The 4952 includes a clock/comparator with a single 32-bit register, which is incremented at one millisecond intervals and runs continuously when power is on. A 32-bit comparator generates a class interrupt if the clock is greater than or equal to the comparator. One clock/comparator is provided on the processor card. Timers (#7840) are also available.

Mdl C provides one or two diskette drives and four I/O feature positions. The diskettes, one standard and the second an optional feature, provide the multiple functions of diskette writing and reading including input of data and programs generated offline, output of programs and data for personal or offline storage, journaling, recording of an audit trail, checkpoints, system errors, etc. Data exchange media is compatible with other systems.

Diskette Types: Either the 1-sided Diskette 1 or the 2-sided Diskette 2 or Diskette 2D may be used.

Diskette Formats: Diskettes 1 or 2 may be initialized for 128-, 256-, or 512-byte sectors. Diskette 2D may be initialized for 256-, 512-, or 1,024-byte sectors.

Diskette Capacity: Capacity of diskette is dependent upon type and format. **Note:** Actual useful capacity depends on the system software used and may be less than capacities shown here.

Bytes/ Sector	Sectors/ Track *	Diskette Type	Capacity (bytes)
128	26	1	246,272
256	15	1	284,160
512	8	1	303,104
128	26	2	492,544
256	15	2	568,320
512	8	2	606,208
256	26	2D	985,088
512	15	2D	1,136,640
1,024	8	2D	1,212,416

* 74 data tracks per surface; Diskettes 2 and 2D have two surfaces.

Diskette Drive: Access time includes 5 milliseconds per track crossed plus 35 milliseconds for head settling. Diskette rotates at 360 rpm, yielding a data rate of 62,500 bytes per second and average latency of 83.8 milliseconds.

The use of flexible diskette storage provides significant advantages such as low cost, compact size, multiple system functions, ease of media handling and storage, etc. It should be recognized, however, that during recording and reading, the read/write head is in contact with the diskette, causing wear over time. Variations in the rate of wear will depend upon the particular operating environment and application characteristics. Care in the storage, use, and handling can also affect diskette life. See guidelines in the *IBM Diskette General Information Manual* (GA21-9182). Excessive wear, handling, or contamination can cause possible failures in recording and/or reading.

Ultimate wear is to some extent dependent upon total usage of individual tracks. Care taken to distribute data, so that accessing occurs over the entire recording surface with about the same frequency, can extend the useful life of the diskette. Actual experience with individual applications and environments will allow development of guidelines as to when the diskette should be replaced. Unpredictable circumstances, such as contamination or severe handling, can shorten useful life. For all the above reasons, consideration should be given to providing an adequate recovery plan.

Disk Drive Mdl 30D: Provides a capacity of 30 megabytes per disk drive. This mdl has an average access time of 40 milliseconds. Average rotational latency is 9.5 milliseconds. The disk rotates at 3151 rpm yielding an instantaneous data rate of 1,250,000 bytes per second. A high level of data integrity is maintained by Error Checking and Correcting (ECC) which corrects any error of nine bits or less and any error of 16 bits or less within a 2-byte boundary. Also, ECC will detect up to two 2-byte errors within any 256-byte block.

Cache Mdl 30D: The 64 kilobyte cache is microprocessor controlled and has the potential to significantly improve system performance. Selected data sectors, determined by the cache control algorithm to be probable candidates for system read request, are pre-fetched and stored in cache. The microprocessor monitors its own "hit-ratio" and adjusts to optimize performance. Least-recently-used algorithm eliminates inactive data from cache, as space for new data is required. This allows the disk to dynamically adapt to changes in the jobstream. Performance improvements are application dependent -- test cases from a variety of applications thought to be typical have shown improvements in disk throughput ranging from 50% to above 200%. No guarantee of result can be made. Applications which are truly random (test cases found none) or which are heavily write-oriented may experience little or no improvement from a cache function.

Environmental Restrictions: Certain atmospheric contaminants can destroy miniaturized electronic circuitry. These may be found in certain industrial and general urban environments. This machine and its features should be protected from hostile, ambient conditions. See *Customer Site Preparation Manual* (GA34-0050) for details.

Publications: *IBM Series/1 4952 Processor and Processor Features Description* (GA34-0084), *IBM Series/1 4952 Model C Processor and Processor Features Description* (GA34-0159), and *IBM Series/1 4952 Model 30D Processor and Processor Feature Description* (GA34-0251).

SPECIFY

Unless otherwise indicated these specify features are only available at time of manufacture. Specify codes **#2XXX**, **#8XXX**, and **#9XXX** apply to plant orders only ... do not use on MES orders.

- Voltage (AC, 60 Hz, 1-phase,): Specify **#9901** for 115V, **#9902** for 208V, or **#9904** for 230V.
- Power Cord: 1.8 meter (6 foot) cord, no specify required.
- Type of Distribution Channel (specify one):

  #9001 Sales to Third Party Participants (TPPs): Sales to Value Added Remarketer, systems integrators, programming houses, and other equipment manufacturers (OEMs) who, in turn, resell to end-users. Includes sales to business concerns who resell to their independent franchises or distributors.

  #9002 End-User Sales: Sales directly to the business concern which will use the system for the intended application.

- Primary Application (specify one):

  Industry Terminal Systems:

  #9010 Plant Floor System: Collection or dissemination of data using plant floor terminals requiring human intervention. Time and attendance, job reporting.

  #9011 Banking: System with banking terminal(s) attached.

  #9012 Point of Sale: System with point of sale terminal(s) attached.

  #9019 Other Industry Terminal System: Hospital systems or any other industry terminal systems.

  Industrial Automation:

  #9020 Electrical Test and Inspection: Monitoring or control of equipment that measures material or products to ensure conformance with specifications.

  #9021 Process Control: Monitoring and control of production operations, primarily in the fluid and non-fluid process industries.

4952 Processor (cont'd)

#9022 Laboratory Automation Systems: Includes instrument automation, experiment monitoring, and general laboratory automation.

#9023 Power Management - FC/PM: Power Management Systems which will use the Facilities Control/Power Management (FC/PM) licensed program.

#9024 Power Management - Non-FC/PM: Power management systems which will not use the FC/PM licensed program.

#9025 Facilities Management and Security: All other facilities management and security systems except Controlled Access System (CAS).

#9029 Other Industrial Automation: Controlled Access System (CAS), production monitoring, testing, and inspection (other than electronic test), discrete piece manufacturing, numerical tape control, materials handling, environmental monitoring, maritime, railroad, auto traffic control, air traffic control, simulators, other industrial automation.

Communications:

#9030 Concentrators/Multiplexers: Consolidation of input from terminals for transmission over high-speed lines to a remote computer.

#9031 Front End Processors - Large Systems.

#9032 Front End Processors - Small and Medium-Sized Systems.

#9033 Message Switching: Message routing and dispatching in a data communications network.

#9034 Telephone Switching: Switching (PABX Control), call routing, and central offices switching.

#9035 Audio Store and Forward.

#9039 Other Communications Applications: All other communications applications.

Scientific Computation:

#9050 Problem Solving: Engineering/Scientific Calculations. May be timesharing.

#9051 Instructional: Stand-alone or timeshared systems for computer-assisted instruction and related functions.

Business Data Processing:

#9070 Remote Job Entry: RJE or remote batch terminal.

#9071 Distributed Host Support - Data Entry: Single or clustered workstation terminal controller with limited peripherals and batch communication to a host. Primarily for dedicated intelligent data entry, but may be combined with remote job entry/batch functions.

#9072 Distributed Processing - Host Dependent: Combinations of terminal control, file management, communications, peripheral control, data entry, and local processing with heavy dependency on a host processor for continuous operation.

#9073 Distributed Business Processing: Stand-alone batch or interactive system for business applications in an enterprise with large systems. Offline communications to a host system is optional.

#9074 Business System: Same as **#9073** but in new accounts or in enterprises with small or medium-sized systems only.

#9075 Business Problem Solving: Series/1 installed for the primary purpose of providing non-DP professional business problem solving support.

#9076 Office Automation: Series/1 installed primarily for text processing, electronic mail, audio distribution, etc., with or without some commercial applications.

#9079 Other Business Applications: All other business data processing applications.

Other Applications:

#9090 Applications not classified in any category above: For example, graphic arts (e.g., typesetting), design and drafting, undefined government, and any other.

Application Unknown:

#9095 Applications temporarily unknown: Specify within 15 days of order entry.

- Multiple Processors:

  #92AA Number of processors
  #93BB Sequence number

  For multiple processor configurations, specify **#92AA** where AA is the number of processors in the configuration, and **#93BB** where BB is the sequence number of this processor.

  Note: Use the multiple processor specify codes given above to define the number of processors and the sequence numbers for each processor in a multiprocessor system. Processors in a multiprocessor system need not be of the same type or mdl. For more than 16 processors in system, contact IBM.

- Diskette IPL:

  Mdl C:

  #9138 1st diskette primary IPL, 2nd diskette not used
  #9139 1st diskette alternate IPL, 2nd diskette not used
  #9140 2nd diskette primary IPL, 1st diskette not used
  #9141 2nd diskette alternate IPL, 1st diskette not used
  #9142 1st diskette primary IPL, 2nd diskette alternate IPL
  #9143 2nd diskette primary IPL, 1st diskette alternate IPL
  #9144 No IPL

  Mdl 30D:

  #9148 Disk primary IPL, Optional diskette not IPL device
  #9149 Disk alternate IPL, Optional diskette not IPL device
  #9150 Diskette primary IPL, Disk not IPL device
  #9151 Diskette alternate IPL, Disk not IPL device
  #9152 Disk primary IPL, Diskette alternate
  #9153 Diskette primary IPL, Disk alternate
  #9144 No IPL

- Diskette Functions: When diskette function is included in a Series/1 configuration, IPL from such a device is required for loading diagnostics.

SPECIAL FEATURES

All channel features which may use a feature position in this unit are presented in the "Specification Table" below. To simplify, shorten, and improve the usability of these pages, descriptions of all those features which are available on all processors, the 4959, and the 4965 are presented in the M4959 pages. Storage addition and features unique to this unit or for which there are model-dependent considerations are presented below.

Channel Repower (#1565): Provides channel repower for the 4959 Input/Output Expansion Unit, and 4965 Storage and I/O Expansion Unit required in the processor for a 4959 or 4965 connected to 4952 mdls A, B, C, and 30D. **Field Installation:** Yes.

Communications Indicator Panel (#2000): Provides visual display of various states and conditions of a single selectable communication line as well as providing a means of manually controlling certain modem functions. The panel attaches to any single or multiline control by a connector on the feature. Line selection and information to be displayed is selected by eight switches on the panel. Eight lights are used for the display. Coded information is displayed to show status information and modem control line settings such as Data Set Ready, Clear-to-Send, Transmit and Receive Data Lines. Mounts under front cover of a mdl B or 30D Processor only. Does not require a feature position. **Limitations:** Cannot be installed on a mdl A or C Processor. **Field Installation:** Yes.

Diskette Drive (#4100): Provides for a second diskette on mdl C and a single diskette drive on the mdl 30D. Does not require a feature position. **Field Installation:** Yes.

Stand-Alone Enclosure (#4520): For the 4952 mdls C and 30D. Consists of a 3-sided wraparound cover with decorative, removable, front and rear covers. When connecting a mdl C or 30D to a 4965 both in the Stand-Alone Enclosure, specify Stand-Alone Enclosure Cable (#4525). **Limitations:** Features and devices that interconnect using flat or internal cabling are not supported in the Stand-Alone Enclosure. See Note 1 at the end of the "Specification Table". **Field Installation:** Yes.

Stand-Alone Enclosure Cable (#4525): Provides a 3.1 meter (10 foot) external shielded cable between a 4965 in a Stand-Alone Enclosure (#4520) and a 4952 also in a #4520. **Field Installation:** Yes. **Prerequisites:** #1565.

Programmer Console (#5650): Provides data entry/data display console. Includes hexadecimal key pad, display lights, and ability to stop on error or on address. In addition to basic console provided with base processor. #5650 does not require a feature position. **Field Installation:** Yes.

Storage Addition Module - 32,768 Bytes (#6306): Provides additional processor main storage in 32,768-byte increments. Mounts on processor card. **Maximum:** Three. **Field Installation:** Yes.

Cache (#6400): Provides a means of reducing the effective access time of the disk, which can result in a substantial system level performance

4952 Processor (cont'd)

improvement (mdl 30D). The cache option does not require a feature position. **Field Installation:** No.

Specification Table: The table below is provided to determine if 4959s or 4965s are required to mount the desired features. Available feature positions within the processor unit are model-dependent and are expressed as a negative number for availability. A positive number is used for feature requirement. The test of a viable configuration is that the sum of the availability and requirements numbers cannot exceed zero. **Note:** Storage Addition Modules mount on processor card and do not occupy any feature positions.

Machine/ Feature Number		Feature Positions	Notes

RPQ	D02118 GPIB Adapter	+1	

Notes:

(1) Not supported on the Stand-Alone Enclosure due to flat or internal cabling.

(2) Must be contiguous I/O feature positions.

(3) Contact IBM when considering the use of this feature.

(4) This feature may be placed in mdl B feature position A (leftmost). Other features may not be located in this position. Does not apply to mdls A, C, and 30D.

(5) Must be contiguous I/O feature position with its associated controller.

(6) This feature may be placed in mdl B feature position A (leftmost) if no system + and - 12 V DC power is required.

(7) Supported in Stand-Alone Enclosure only with Stand-Alone Enclosure Cable (#4525).

(8) Requires #2010 if the CCITT V.35 interface is used.

MODEL CONVERSIONS (None)

ACCESSORIES

Customer Access Panel (#1590): Assembly and cables to provide interface at surface of rack with quick disconnect type connection for Integrated Digital Input/Output (#1560) or Customer Direct Program Control Adapter (#5430) features (up to four in any mix), plus one Timer (#7840) with external sources and one Teletypewriter Adapter (#7850). Connecting cables from panel for Timer and Teletypewriter Adapter are included. Cables for connected Integrated Digital Input/Output and Customer Direct Program Control Adapter are obtained separately. See **#1593** and **#1594** below. **Field Installation:** Yes. **Restrictions:** May not be mounted behind the following units: 4952A without EC375810, any mdl 30D or any unit in a Stand-Alone Enclosure (#4520).

Customer Access Panel - Integrated DI/DO Cable (#1593): Internal cable which connects Integrated Digital Input/Output (#1560) with Customer Access Panel (**#1590**). Provides both plug and receptacle at Customer Access Panel and connectors at Integrated Digital Input/Output feature. Up to a total of six **#1593**s and **#1594**s may be accommodated in each full-width machine. (Half-width machines are limited by available feature positions.)

Customer Access Panel - Customer DPC Adapter Cable (#1594): Internal cable which connects Customer Direct Program Control Adapter (#5430) with Customer Access Panel (**#1590**). Provides both plug and receptacle at Customer Access Panel and connectors at Customer Direct Program Control Adapter. Up to a total of six **#1593**s and **#1594**s may be accommodated in each full-width machine. (Half-width machines are limited by available feature positions.) **Field Installation:** Yes.

Frame Stand (P/N 6841365): Provides a steel stand capable of supporting a 4952 mdl C or 30D and a 4975 Printer. The stand rests on glides, and comes in a pebble gray color only.

Auxiliary Features/Cables/Connector Kits: Certain devices, cables, etc., involved in system installation are available and may be ordered with this unit. For details, see section following "Specification Table" in M4959 pages.

SUPPLIES

Diskettes: The 4952 mdls C and 30D use the 1-sided Diskette 1 or the 2-sided Diskette 2 or Diskette 2D. The 4952 mdl C or 30D may be used to reformat the diskettes. Single diskettes are packaged 10 per box. Minimum order is one box.

4953 PROCESSOR

[The 4953 is no longer available ... certain features, RPQs, and Accessories still available.]

PURPOSE

Provides arithmetic, logic, and control functions for Series/1.

MODELS

Mdl A	A00	64KB maximum, 4 I/O feature or storage locations, half-width unit. 16KB basic storage provided.
Mdl B	B00	64KB maximum, 13 I/O feature or storage locations, full-width unit. 16KB basic storage provided.
Mdl C	C00	64KB maximum, 4 I/O feature or storage locations, half-width unit. 32KB basic storage provided.
Mdl D	D00	64KB maximum, 13 I/O feature or storage locations, full-width unit. 32KB basic storage provided.

All models are designed for mounting in a 4997 or an EIA standard 19-inch rack enclosure.

Prerequisites: For mdl A or C space in Rack Mounting Fixture (#4540). See "Auxiliary Features" in M4959 pages.

HIGHLIGHTS

Processor Unit in Series/1 family. Internal performance approximately 1.25 times that of 4952. Provides CPU, 16,384 bytes or 32,768 bytes of main storage, enclosure, and power. Includes storage address translation function (eight 64KB address spaces), and communications power. Three additional storage increments of 64KB each are pluggable on the storage card. Number of I/O feature locations is mdl-dependent. See "Specifications Table" at end of section. Standard features include rich instruction set, four interrupt levels, power failure detect/auto restart. Eight general purpose registers per level. Byte-addressable storage.

Environmental Restriction: Certain atmospheric contaminants can destroy miniaturized electronic circuitry. These may be found in certain industrial and general urban environments. This machine and its features should be protected from hostile, ambient conditions. See *Customer Site Preparation Manual* (GA34-0050) for details.

Publications: *IBM Series/1 4953 Processor and Processor Features Description* (GA34-0022).

SPECIFY

- Voltage (AC, 1-phase 60 Hz): With a 1.8 meter (6 foot) cord.

  115V **#9901** 230V **#9904**
  208V **#9902**

- Type of Distribution Channel: Specify only one.

  #9001 Sales to Third Party Participants (TPPs): Sales to Value Added Remarketer, systems integrators, programming houses, other equipment manufacturers (OEMs), who, in turn, resell to end-users. Includes sales to business concerns who resell to their independent franchises or distributors.

  #9002 End-User Sales: Sales directly to the business concern which will use the system for the intended application.

- Primary Application: Specify only one.

  – *Industry Terminal Systems*

  #9010 Plant Floor System: Collection or dissemination of data using plant floor terminals requiring human intervention. Time and attendance, job reporting, etc.

  #9011 Banking: System with banking terminal(s) attached.

  #9012 Point of Sale: System with point of sale terminal(s) attached.

  #9019 Other Industry Terminal System: Hospital systems or any other industry terminal systems.

  – *Industrial Automation*

  #9020 Electrical Test and Inspection: Monitoring or control of equipment that measures material or products to ensure conformance with specifications.

  #9021 Process Control: Monitoring and control of production operations, primarily in the fluid and non-fluid process industries.

  #9022 Laboratory Automation Systems: Includes instrument automation, experiment monitoring, and general laboratory automation.

  #9023 Power Management - FC/PM: Power Management Systems which will use the Facilities Control/Power Management Program Product (FC/PM).

  #9024 Power Management - Non-FC/PM: Power Management Systems which will not use the FC/PM Program Product.

  #9025 Facilities Management and Security: All other facilities management and security systems [except Controlled Access System (CAS)].

  #9029 Other Industrial Automation: Controlled Access System (CAS), production monitoring, testing, and inspection (other than electronic test), discrete piece manufacturing, numerical control tape control, materials handling, environmental monitoring, maritime, railroad, auto traffic control, air traffic control, simulators, other industrial automation.

  – *Communications*

  #9030 Concentrators/Multiplexers: Consolidation of input from terminals for transmission over high speed lines to a remote computer.

  #9031 Front-End Processors - Large Systems: Front end processors for large systems.

  #9032 Front-End Processors - Small Systems: Front end processors for small systems.

  #9033 Message Switching: Message routing and dispatching in a data communications network.

  #9034 Telephone Switching: Switching (PABX control), call routing, and central office switching.

  #9035 Audio Store and Forward.

  #9039 Other Communications Applications: All other communications applications.

  – *Scientific Computation*

  #9050 Problem Solving: Engineering/Scientific Calculations. May be timesharing.

  #9051 Instructional: Stand-alone or time-shared systems for computer-assisted instruction and related functions.

  – *Business Data Processing*

  #9070 Remote Job Entry: RJE or Remote Batch Terminal.

  #9071 Distributed Host Support - Data Entry: Single or clustered workstation terminal controller with limited peripherals and batch communication to a host. Primarily for dedicated intelligent data entry, but may be combined with remote Job Entry/Batch functions.

  #9072 Distributed Processing - Host Dependent: Combinations of terminal control, file management, communications, peripheral control, data entry, and local processing with heavy dependency on a host processor for continuous operation.

  #9073 Distributed Business Processing - Stand-alone, Large Account: Stand-alone batch or interactive system for business applications in an enterprise with large systems. Offline communications to a host system is optional.

  #9074 Business System - Small account: Same as **#9073** but in enterprises with small systems as the largest system or in new accounts.

  #9079 Other Business Applications: All other business data processing applications.

  – *Other Applications*

  #9090 Applications not classified in any category above: For example, graphic arts (typesetting, etc.), design and drafting, undefined government, and any other.

  – *Application Unknown*

  #9095 Applications temporarily unknown: Specify within 15 days of order entry.

- Multiple Processors:

  #92AA Number of Processors
  #93BB Sequence Number

  For multiple processor configurations, specify **#92AA** where AA is the number of processors in the configuration, and **#93BB** where BB is the sequence number of this processor.

Note: In ordering, for processors which are part of a multiprocessor system, use a suffix X as the low-order digit in the three-digit AAS mdl code. For example, in a 2-processor system using mdl B processors, the first will be B00 and the second will be B0X. Use the multiple processor specify codes given above to define the number of processors and the sequence number for each proc-

4953 Processor (cont'd)

essor in a multiprocessor system. Processors in a multiprocessor system need not be of the same type or mdl. For more than 16 processor systems, contact IBM.

- Attachment of 3101:

  #2787 Designates that a 3101 Display Terminal is on order for this system and that its delivery is to be synchronized with that of the system.

SPECIAL FEATURES

All channel features which may use a feature position in this unit are presented in the Specification Table below. To simplify, shorten and improve the usability of these pages, the description of all those features which are available in all processors, the 4965 Diskette Drive and I/O Expansion Unit and the 4959 Input/Output Expansion Unit are presented in the M4959 pages. Storage addition and features unique to this unit or for which there are model-dependent considerations are presented below.

Channel Repower (#1565): Provides channel repower for 4959 Input/Output Expansion Unit. Required for 4959 or 4965 connected to 4953. **Field Installation:** Yes.

Communications Indicator Panel (#2000): Provides visual display of various states and conditions of a single selectable communication line as well as providing a means of manually controlling certain modem functions. The panel attaches to any single or multiline control by a connector on the feature. Line selection and information to be displayed is selected by eight switches on the panel. Eight lights are used for the display. Coded information is displayed showing status information and modem control line settings such as Data Set Ready, Clear-to-Send, Transmit and Receive Data Lines. Mounts under front cover of a mdl B or D Processor only. Does not require a feature position. **Limitations:** Cannot be installed on a mdl A or C processor. **Field Installation:** Yes.

Communications Power(#2010): Provides + and - 12 volts regulated power. Required for mdl B or D containing one or more intergrated communications features #1310, #1610, #2074, #2075, #2090, #2091, #2092, #2093, #2094, #2095, #2096 and #7881. Also required for Teletypewriter Adapter (#7850) configured for EIA voltage interface or for current loop where Series/1 supplies the powerand for #2080 when V.35 interface is used. Not required for a 4953 Processor mdl A or C. This feature is installed in the power supply section and does not occupy a feature position. **Field Installation:** Yes.

Programmer Console (#5650): Provides data entry/data display console. Includes hexadecimal key pad and display lights, ability to stop on error or on address. In addition to Basic Console provided with base processor. Does not require a feature position.

Field Installation: Yes.

Storage Addition - 16,384 Bytes (#6315): Provides additional processor main storage in 16,384 byte increments. Requires one feature position. **Maximum:** Three in mdls A and B, two in mdls C and D. **Field Installation:** Yes.

Specification Table: The table below is provided to determine if 4965 Diskette drive and I/O Expansion Units or 4959 Input/Output Expansion Units are required to mount the desired features. Available feature positions within the processor unit are mdl dependent and are expressed as a negative number for availability. A positive number is used for feature requirement. The test of a viable configuration is that the sum of the availability and requirements numbers cannot exceed zero.

Notes:

(1) This feature may be placed in 4953-B or 4953-D feature position A (leftmost). Other features may not be located in this position. Does not apply to 4953-A or 4953-C.

(2) Requires #2010 to provide + and - 12 volts used in mdls B or D.

(3) Requires #2010 (except in mdls A and C) to provide + and - 12 volts if the system is to provide power for the current loop or if the EIA voltage level compatibility option is selected.

(4) This feature may be placed in 4953-B or 4953-D feature position A (leftmost) when the feature does not require + and - 12V DC.

(5) Mdls C and D only.

(6) Must be contiguous I/O feature positions.

(7) Must be in contiguous I/O feature position with its associated controller.

(8) Branch level systems assurance is required before ordering this feature.

(9) Requires feature #2010 if the CCITT V.35 interface is used.

MODEL CONVERSIONS (None)

ACCESSORIES

Frame Stand (P/N 6841365): Provides an attractive, steel stand capable of supporting a 4954 C and a 4975 Printer. The stand rests on glides and comes in a pebble gray color only.

Auxiliary Features/Cables/Connector Kits: Certain devices, cables, etc., involved in system installations are available and may be ordered with this unit. For details, see section following "Specification Table" in M4959 pages.

SUPPLIES

Diskette: The 4954 mdl C uses the 2-sided Diskette 2 or Diskette 2D or the 1-sided Diskette 1. Diskette 1 is prepared in 128, 256, or 512 bytes per sector. The Diskette 2 is prepared in 128, or 256 bytes per sector and must be re-initialized for other formats. The Diskette 2D is prepared in 256, 512, or 1,024 bytes per sector. The 4954 mdl C may be used to reformat the diskette. Single diskettes are packaged ten in a box. Minimum order is one box.

4954 PROCESSOR

PURPOSE

Provides arithmetic, logic, and control functions for Series/1.

MODELS

Model A	A00	256KB maximum, 4 I/O feature locations, half-width unit. 64KB basic storage provided.
Model B	B00	256KB maximum, 13 I/O feature locations, full-width unit. 64KB basic storage provided.
Model C	C00	256KB maximum, 3 I/O feature locations, full-width unit. 64KB basic storage and one built-in diskette drive provided. Second diskette drive optional.
Model 30D	30D	256KB maximum, six I/O feature locations, full-width unit. 32KB basic storage, with a 30MB disk, optional cache and optional 1.2MB diskette.

All models are designed for mounting on support rails in a 4997 Rack Enclosure (see M4997 pages) or in an EIA standard 19-inch enclosure. Models C and 30D can also be mounted in the Stand-Alone Enclosure (#4520).

Prerequisites: For mdl A, a space in Rack Mounting Fixture (#4540). See "Auxiliary Features" in M4959 pages.

Limitations: 4999 Battery Backup Unit may not be used with mdl C or 30D. Mdl B is not supported by 4999 when primary power consumption exceeds 800 VA (corrected for power factor).

HIGHLIGHTS

Processor Unit in Series/1 family. Internal performance approximately twice that of 4952. Provides CPU, 65,536 bytes of main storage, enclosure, and power. Includes storage address translation function (eight 64KB address spaces), and communications power. Three additional storage increments of 64KB each are pluggable on the storage card. Number of I/O feature locations is model-dependent. See "Specifications Table" at end of section. Standard features include rich instruction set, four interrupt levels, power failure detect/auto restart. Eight general purpose registers per level. Byte-addressable storage. Includes clock/comparator which has a single 32-bit register which is incremented on 1 millisecond intervals and runs continuously when power is on. A 32-bit comparator generates a class interrupt if the clock is greater than or equal to the comparator. One clock/comparator is provided on the processor card. Timers (#7840) are also available.

Mdl C provides one or two diskette drives and three I/O feature positions. The diskettes, one standard and the second an optional feature, provide the multiple functions of diskette media including input of data and programs generated offline, as well as output of programs and data for personal or offline storage, journaling, recording of audit trail, checkpoints, system errors, etc. Data exchange media is compatible with other systems using the diskette types and formats shown below.

Diskette Types: Either the 2-sided IBM Diskette 2, IBM Diskette 2D, or the 1-sided IBM Diskette 1 may be used.

Diskette Formats: Diskette Type 1 or 2 may be initialized for 128, 256, or 512 byte sectors. Diskette Type 2D may be initialized for 256, 512, or 1024 byte sectors.

Diskette Capacity: Capacity of diskette is dependent upon type and format.

Note: Actual useful capacity depends on the system software used and may be less than capacities shown here.

Bytes/ Sector	Sectors/ Track*	Diskette Type	Capacity (bytes)
128	26	1	246,272
256	15	1	284,160
512	8	1	303,104
128	26	2	492,544
256	15	2	568,320
512	8	2	606,208
256	26	2D	985,088
512	15	2D	1,136,640
1024	8	2D	1,212,416

* 74 Data tracks per surface, Diskette-2 and 2D have two surfaces.

Diskette Drive: Access time includes 5 milliseconds per track crossed plus 35 milliseconds for head settling. Diskette rotates at 360 rpm, yielding a data rate of 62,500 bytes per second and average latency of 83.8 milliseconds. The use of Flexible Diskette Storage provides significant advantages such as low cost, compact size, multiple system functions, ease of media handling and storage, etc. It should be recognized, however, that during recording and reading, the read/write head is in contact with the media causing diskette wear over time. Variations in the rate of wear will depend upon the particular operating environment and application characteristics. Care in the storage, use, and handling can also affect diskette life (see guidelines in the *IBM Diskette General Information Manual,* GA21-9182). Excessive wear, handling, or contamination can cause possible failures in recording and/or reading. Ultimate wear is to some extent dependent upon total usage of individual tracks. Care taken to distribute data, so that accessing occurs over the entire recording surface with about the same frequency, can extend the useful life of the diskette. Actual experience with individual applications and environments will allow development of guidelines as to when the media should be replaced. Unpredictable circumstances, such as contamination or severe handling, can shorten useful life. For all the above reasons, consideration should be given to providing an adequate recovery plan.

Disk Drive Mdl 30D: Provides a capacity of 30 megabytes per disk drive. This mdl has an average access time of 40 milliseconds. Average rotational latency is 9.5 milliseconds. The disk rotates at 3151 rpm yielding an instantaneous data rate of 1,250,000 bytes per second. A high level of data integrity is maintained by Error Checking and Correcting (ECC) which corrects any error of nine bits or less and any error of 16 bits or less within a 2-byte boundary. Also, ECC will detect up to two 2-byte errors within any 256-byte block.

Cache Mdl 30D: The 64 kilobyte cache is microprocessor controlled and has the potential to significantly improve system performance. Selected data sectors, determined by the cache control algorithm to be probable candidates for system read request, are pre-fetched and stored in cache. The microprocessor monitors its own "hit-ratio" and adjusts to optimize performance. Least-recently-used algorithm eliminates inactive data from cache, as space for new data is required. This allows the disk to dynamically adapt to changes in the jobstream. Performance improvements are application dependent -- test cases from a variety of applications thought to be typical have shown improvements in disk throughput ranging from 50% to above 200%. No guarantee of result can be made. Applications which are truly random (test cases found none) or which are heavily write-oriented may experience little or no improvement from a cache function.

Environmental Restriction: Certain atmospheric contaminants can destroy miniaturized electronic circuitry. These may be found in certain industrial and general urban environments. This machine and its features should be protected from hostile, ambient conditions. (See *Customer Site Preparation Manual,* GA34-0050, for details.)
