

BYTE SAVER

ASSEMBLY MANUAL

Cromemco

Specialists in computer peripherals

2432 Charleston Rd., Mountain View, CA 94043 • (415) 964-7400

BYTESAVER ASSEMBLY INSTRUCTIONS

The Cromemco BytesaverTM kit can be assembled in about one evening. All components are mounted on the component side of the pc board (the side with the printed legend) and soldered on the opposite side. Be sure to use high-quality rosin core solder for the assembly and a fine-tipped low wattage soldering iron.

() Solder in position the 10 14-pin IC sockets, the 6 16-pin IC sockets, and 8 24-pin IC sockets.

() Solder in position the $\frac{1}{4}$ watt resistors:

| | | |
|---------|------|----------------------|
| R1 | 47K | yellow-violet-orange |
| R2 | 10K | brown-black-orange |
| R3 | 180 | brown-gray-brown |
| R4 | 1K | brown-black-red |
| R5 | 9.1K | white-brown-red |
| R6 | 1.5K | brown-green-red |
| R7 | 1K | brown-black-red |
| R8 | 47 | yellow-violet-black |
| R9 | 1K | brown-black-red |
| R10 | 10 | brown-black-black |
| R11 | 5.6K | green-blue-red |
| R12 | 5.6K | green-blue-red |
| R13 | 10K | brown-black-orange |
| R14 | 5.6K | green-blue-red |
| R15 | 180 | brown-gray-brown |
| R16-R39 | 18K | brown-gray-orange |

() Next install the 1N914 diodes. NOTE we recommend that no diode be installed in the diode position just below transistor Q0. When using the Bytesaver we recommend that the PROM containing the Bytemover software be inserted in PROM position zero. By not installing this diode there will be no chance of accidentally programming this PROM.

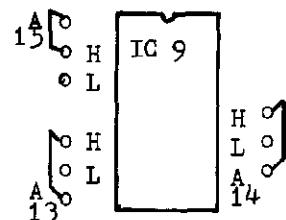

When installing the diodes be careful to orient them properly, noting the position of the cathode (banded) end. Due to the close spacing of the holes in the pc board, the diodes should be mounted on end.

() Now install the 23 capacitors as shown on the pc board. Be careful that the electrolytic capacitors are oriented with the positive (+) end as shown.

() Now solder the transistors in place taking care to orient them properly. Note that Q8 and Q9 are 2N3906 transistors, and Q10 is a type MPS6560. All other transistors are type 2N3904.

() Install the pc board switch, SW1, in the upper left corner of the board.

- () Install the Cromemco high-speed pulse transformer, model XT8K, in position T1. Note that the leads are asymmetrically positioned so that there is only one correct orientation of the transformer.
- () Now install IC14, the positive twelve volt regulator IC, using a 6-32 X $\frac{1}{4}$ screw and nut.
- () Next install the heatsink in the upper right corner of the board just starting the nuts on the 6-32 x 3/8 screws. Install IC12 and IC 13 being sure to place the insulating washer between IC13 and the heat sink. The nylon screw must be used to hold IC13 in place. (The insulating washer supplied may have to be trimmed with a pair of scissors to clear the protrusions of the heatsink.) Tighten the nuts on the screws in the heatsink assembly only after all screws have been inserted. Take care that the leads on the voltage regulators do not come in contact with sides of the openings in the heatsink.
- () Next install three jumper wires to select where the Bytesaver is to reside in memory space. Each of the three high order address lines (A15, A14, and A13) may be tied either to the corresponding "H" or "L" terminal. For the Bytesaver to reside in the top 8K of memory space, for example, the three jumper wires would be installed as shown:

- () Now install the ICs in their sockets being careful to orient pin one of each IC as shown by the small white dot on the pc board at each IC position. Install a PROM containing Bytemover software in PROM position 0.

The assembly of your Bytesaver is now complete. Detailed operating instructions are given in the Bytemover software manual.

PROM AVAILABILITY: Additional 2704 and 2708 PROMs are available from Cromemco. The 2704 is \$50 each, and the 2708 is \$75. Our PROMs are factory fresh, full speed devices that we purchase directly form the manufacturer.

WAIT STATE: Should you wish to use low speed 2704 or 2708 PROMs in your Bytesaver (with access times greater than 450 ns) there is a provision for a wait state. Simply insert a jumper wire, as shown, between IC10 and IC11. No jumper wire need be inserted here when using full-speed PROMs.

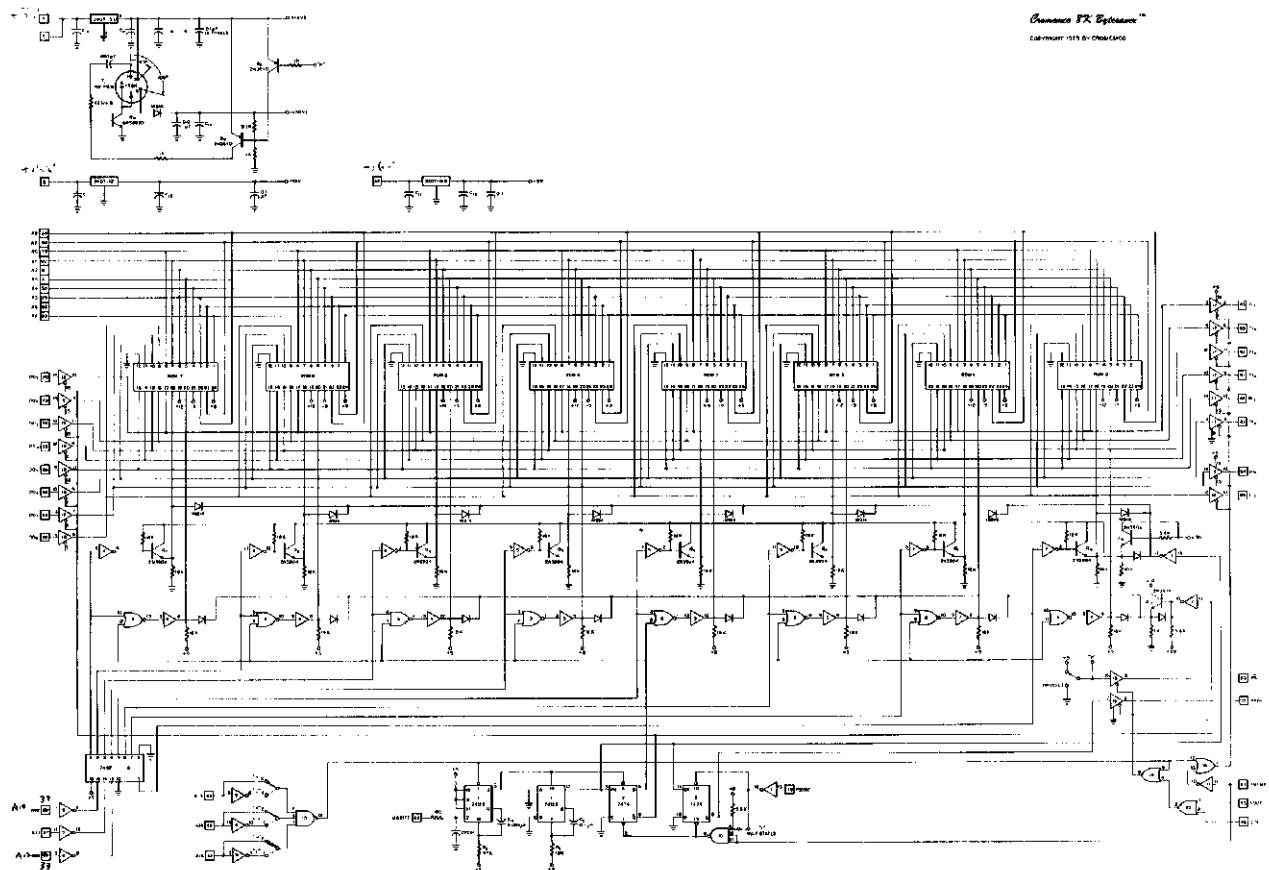

REPAIR: If for any reason you need service on your Bytesaver, you may return it to Cromemco along with a check for \$35. The \$35 covers the cost of repair and return postage. We reserve the right to not repair any Bytesaver that we judge to be unserviceable.

BYTESAVER PARTS LIST

| | | | |
|----------------|---|---|----------------------|
| C1 - C8 | 0.1 uF | IC1 | 74123 |

| R16-R39 | 18K | Schematic diagram | |
| SW1 | pc board switch | <u>Other</u> | |
| T1 | Cromemco XT8K high-speed pulse transformer. | Insulating washer to be used under IC13 | |
| <u>Sockets</u> | | Bytesaver pc board | |
| 10 | 14 pin | | |
| 6 | 16 pin | | |
| 8 | 24 pin | | |

* NOTE: The three voltage regulator ICs (IC 12, 13 and 14) may look physically similar, but they are not interchangeable. Each must be mounted in the proper IC location.

** NOTE: The nylon screw is used to secure IC13. It is important that the screw be inserted from the pc board side of the assembly so that the head of the screw is against the foil side of the pc board.

BYTE MOVER

SOFTWARE FOR THE CROMEMCO BYTESAVER

Cromemco

Specialists in computer peripherals

2432 Charleston Rd., Mountain View, CA 94043 • (415) 964-7400

CROMEMCO BYTEMOVER 3.1 OPERATING INSTRUCTIONS

Cromemco BYTEMOVER software is designed to be used with the Cromemco 8K BYTESAVER. When you purchase a Bytesaver with one 2704 PROM, the Bytemover software comes preprogrammed in the 2704 PROM.

The 2704 PROM containing the Bytemover software is normally inserted into PROM location 0 on the Bytesaver board. The Bytemover software can be used to program a PROM in any of the PROM locations on the Bytesaver board. The Bytemover software can also be used to transfer programs from PROM to RAM. The operation of the Bytemover software is controlled by the setting of the front panel sense switches on the Altair computer. To use the Bytemover software there must be a RAM board in the Altair beginning at location zero in memory; further, this RAM board must be unprotected for proper execution of the Bytemover software.

STEP-BY-STEP INSTRUCTIONS

- 1) Before using the Bytesaver you must install three jumper wires to set the location of the Bytesaver in memory space. This is shown in Figure 1. The assembled Bytesaver comes with A13, A14, and A15 each tied to the corresponding "Hi" pad to position the board at the very top of memory. In the following instructions it is assumed that this is the jumper connection used.
- 2) With the Altair 8800 power turned off, plug the Bytesaver board into the computer.
- 3) Be sure that the program power on the Bytesaver is turned OFF (program power switch in the down position.)
- 4) Turn on the Altair. Raise the reset switch, then raise the stop switch, and then raise the reset switch once again to initialize the Altair.
- 5) Raise address switches A15, A14, and A13. All other address switches should be down.
- 6) Raise the examine switch. You are now examining the contents of the first byte of PROM in PROM location zero of the Bytesaver memory board (memory location 340 000). If the PROM supplied with your Bytesaver is in this PROM location the data lights will read "061", the first byte of the Bytemover program.

EXAMPLE: Transfer the Bytemover program from PROM to RAM beginning at location zero in RAM.

- 1) Raise the reset switch.
- 2) Depress the unprotect switch (on the Altair front panel).
- 3) Raise A15, A14, and A13. Raise the examine switch. The data lights should read "061" octal.

4) Now set the sense switches for the task to be done, referring to Fig. 2.

A15 - Down to transfer from PROM to RAM
A14 - Down for the transfer of 1K bytes.
A13 - Down
A12 - Down All down since we are transferring from the same PROM that contains BYTEMOVER (PROM 0)
A11 - Down
A10 - Down All down for storage to begin at location zero in RAM.
A9 - Down
A8 - Down

5) Push the run switch. In less than one second the contents of PROM will be transferred to RAM. (Of course the contents of the PROM are unaffected by this operation.)

6) Raise the STOP switch.

7) Raise the reset switch. Note that the data lights read "061".

EXAMPLE: Program a 2708 PROM inserted in PROM location 1. This PROM is to be programmed with the contents of the first 1K bytes of RAM beginning at location zero in memory. The Bytemover software is still in the PROM in PROM location zero on the Bytesaver board.

1) Raise the reset switch.

2) Depress the unprotect switch (on the Altair front panel)

3) Raise A15, A14, and A13. Raise the examine switch. The data lights should read "061" octal.

4) Raise the protect switch on the Bytesaver board (i.e., program power switch to the ON position). The protect light on the Altair front panel should go off when this switch is raised.

5) Now set the sense switches for the task to be done:

A15 - Up to program a PROM
A14 - Down (always down for PROM programming)
A13 - Down
A12 - Down To select the PROM 1K higher in memory than the PROM that contains BYTEMOVER
A11 - Up
A10 - Down All down for transfer to begin at location zero in RAM.
A9 - Down
A8 - Down

6) Push the RUN switch. Note that panel light A9 is blinking at a rate of about twice per second. When this light stops blinking the PROM programming is complete.

7) Raise the STOP switch.

8) Now note the INTE light on the Altair front panel. If this light is on, the BYTEMOVER VERIFIER has verified that the contents of the programmed PROM are indeed identical to the contents of the selected 1K bytes of RAM. If this light is off, the PROM has not programmed correctly; this could be due, for example, to a defective PROM.

EXAMPLE: Altair 8K BASIC can be stored in seven 2708 PROMs. Given that these seven PROMs are in PROM locations 1 through 7 on the BYTESAVER board, 8K BASIC can easily be transferred into RAM using the following procedure:

- 1) Raise the RESET switch.
- 2) Depress the unprotect switch (on the Altair front panel).
- 3) Raise A15, A14, and A13. Raise the examine switch. The data lights should read "061" octal.
- 4) Now set the sense switches for the task to be done:

A15 - Down to transfer from PROM to RAM.
A14 - Up for a 7K transfer
A13 - Down
A12 - Down To begin transfer from the PROM 1K higher
A11 - Up in memory than the BYTEMOVER program.
A10 - Down
A9 - Down All down for storage to begin at location
A8 - Down zero in RAM.

- 5) Push the RUN switch. In less than one second BASIC will be loaded into RAM (it sure beats paper tape!). Raise the STOP switch.

EXAMPLE: If you do not have BYTEMOVER in PROM, you can program a PROM with BYTEMOVER that is stored in RAM. The BYTEMOVER software (a listing of which is attached) must first be loaded into RAM beginning at location zero in memory. The BYTEMOVER software can then be burned into a PROM using the following procedure:

- 1) Raise the reset switch.
- 2) Depress the unprotect switch (on the Altair front panel).
- 3) Insert an erased PROM into PROM location 0 on the BYTESAVER board.
- 4) Examine location 000 240 in memory.
- 5) Raise the program power switch on the BYTESAVER board.
- 6) Set the sense switches with A15 and A14 and A13 up.
- 7) Push the RUN switch. When light A9 stops blinking the programming is complete. The INTE light will be on to verify correct programming.
- 8) Turn off PROM program power by depressing the switch on the BYTESAVER.

ERASING PROMs: The 2704 and 2708 PROMs are erased by shining intense UV light through their quartz window. One such UV source, the UV-85 PROM ERASER, is available for \$37.50 from the BYTE SHOP, 1063 El Camino Real, Mountain View, CA 94040.

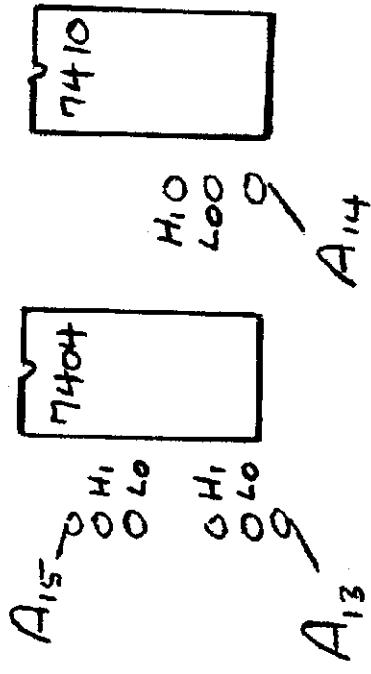

Fig. 1. How to set the Bytesaver address in memory. The built Bytesaver comes with A15, A14, and A13 connected to the corresponding "Hi" terminals so that memory address occurs when these three bits are high. Any or all of these address lines may be connected to the corresponding "Lo" terminal to move the memory board lower in memory. There are thus eight positions in memory that this board can be used.

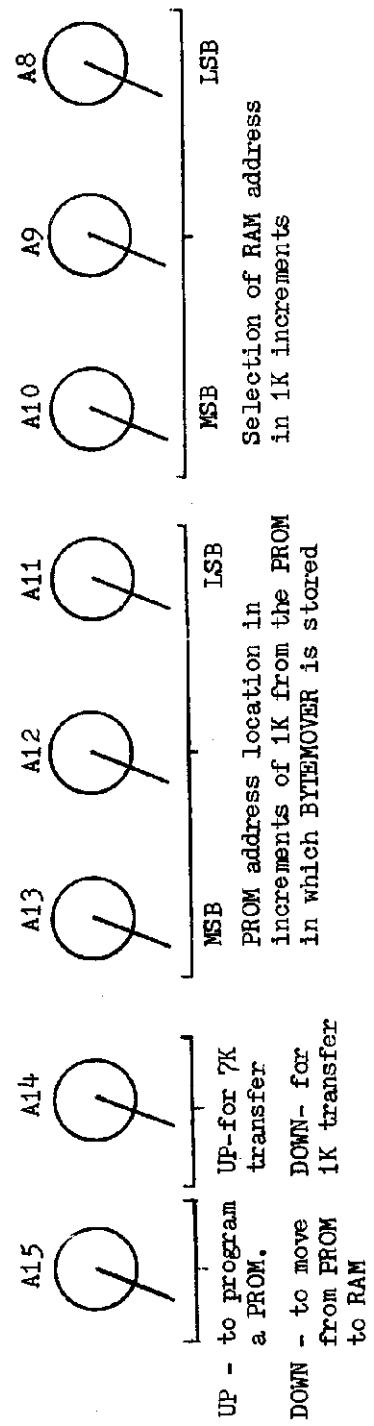

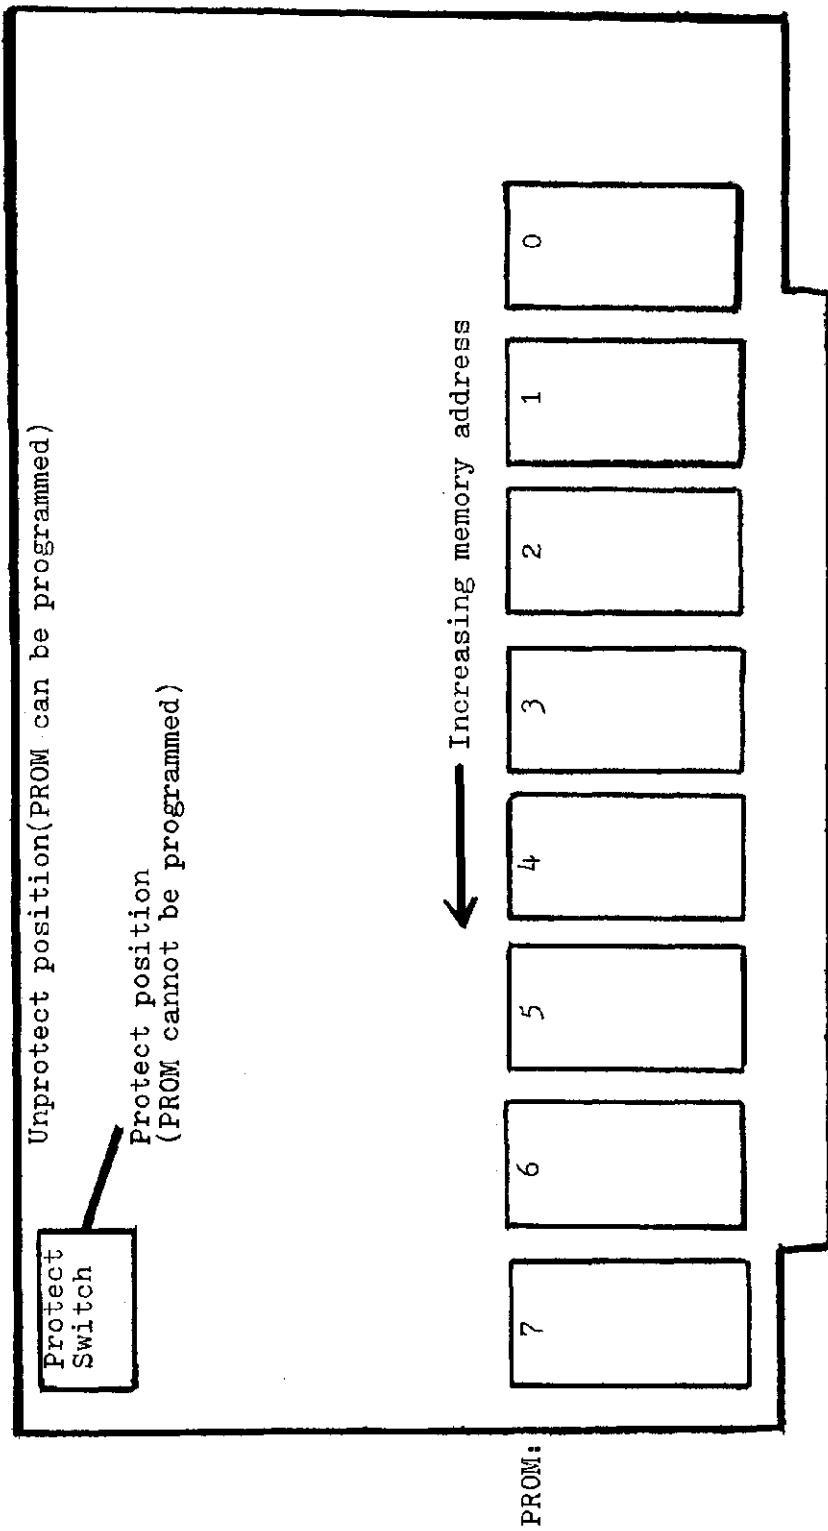

FIGURE 2. FUNCTION OF THE SENSE SWITCHES IN THE BYTEMOVER PROGRAM.

Fig. 3. Bytesaver physical layout.
