

AT27C256

T-46-13-29

Features

- Low Power CMOS Operation
100 μ A max. Standby
30 mA max. Active at 5 MHz
- Fast Read Access Time - 120ns
- Wide Selection of JEDEC Standard Packages Including OTP
28-Lead 600 mil Cerdip and OTP Plastic DIP or SOIC
32-Pad LCC and OTP PLCC
- 5V \pm 10% Supply
- High Reliability Latch-Up Resistant CMOS Technology
2000V ESD Protection
- Fast Programming - 4ms/byte (typical)
- Two-line Control
- CMOS and TTL Compatible Inputs and Outputs
- Integrated Product Identification Code
- Full Military, Commercial and Industrial Temperature Ranges

Description

The AT27C256 is a low-power, high performance 262,144 bit Ultraviolet Erasable and Electrically Programmable Read Only Memory (EPROM) organized 32K x 8. It requires only one 5V power supply in normal read mode operation. Any byte can be accessed in less than 120ns, making this part compatible with high performance microprocessor systems by eliminating the need for speed-reducing WAIT states.

Atmel's 1.5-micron CMOS technology provides optimum speed, low-power and high noise immunity. Power consumption is typically only 10mA in Active Mode and less than 1 μ A in Standby. Atmel's CMOS EPROM process uses industry-proven floating poly EPROM technology to provide high quality and manufacturability.

The AT27C256 comes in a choice of industry standard JEDEC-approved packages including; 28-pin DIP in ceramic or one time programmable (OTP) plastic, 28-pin OTP plastic small outline (SOIC), and 32-pad ceramic leadless chip carrier (LCC) or OTP plastic J-leaded chip carrier (PLCC). The device features two-line control (\overline{CE} , \overline{OE}) to give designers the flexibility to prevent bus contention.

Description (Continued)

With a high density 32K byte storage capability, Atmel's 27C256 allows firmware to be stored reliably and to be quickly accessed by the system without the delays of mass storage media.

The AT27C256 has additional features to ensure high quality and efficient production use. The fast programming algorithm reduces the time required to program the chip and guarantees reliable programming. The Integrated Product Identification Code electronically identifies the device and manufacturing origin. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages.

Erasure Characteristics

The entire memory array of the AT27C256 is erased (all outputs read as V_{OH}) after exposure to ultraviolet light at a wavelength of 2537Å. Complete erasure is assured after a minimum of 20 minutes exposure using $12,000 \mu W/cm^2$ intensity lamps spaced one inch away from the chip. Minimum erase time for lamps at other intensity ratings can be calculated from the minimum integrated erasure dose of $15W \cdot sec/cm^2$. To prevent unintentional erasure, an opaque label is recommended to cover the clear window on any UV erasable EPROM which will be subjected to continuous fluorescent indoor lighting or sunlight.

Absolute Maximum Ratings*

| | |
|---|--------------------------------|
| Temperature Under Bias | -55°C to +125°C |
| Storage Temperature | -65°C to +150°C |
| Voltage on Any Pin with Respect to Ground | -2.0V to +7.0V ⁽¹⁾ |
| Voltage on A9 with Respect to Ground | -2.0V to +14.0V ⁽¹⁾ |
| V _{PP} Supply Voltage with Respect to Ground | -2.0V to +14.0V ⁽¹⁾ |
| Integrated UV Erase Dose..... | 7258 w. sec/cm ² |

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Notes:

1. Minimum voltage is -0.6V dc which may undershoot to -2.0V for pulses of less than 20ns. Maximum output pin voltage is $V_{CC}+0.75V$ dc which may overshoot to +7.0V for pulses of less than 20ns.

- Notes: 1. X can be V_{IL} or V_{IH}.
 2. Refer to Programming characteristics.
 3. V_{IH} = $12.0 \pm 0.5V$.

4. Two identifier bytes may be selected. All Ai inputs are held low (V_{IL}), except A9 which is set to V_{IH} and A0 which is toggled low (V_{IL}) to select the Manufacturer's Identification byte and high (V_{IH}) to select the Device Code byte.

A.C. Waveforms for Read Operation ⁽¹⁾

Notes:

1. Timing measurement references are 0.8V and 2.0V. Input AC driving levels are 0.45V and 2.4V, unless otherwise specified.
2. t_{DF} is specified from \overline{OE} or \overline{CE} , whichever occurs first. Output float is defined as the point when data is no longer driven.
3. \overline{OE} may be delayed up to t_{CE-OE} after the falling edge of \overline{CE} without impact on t_{CE}.
4. \overline{OE} may be delayed up to t_{ACC-OE} after the address is valid without impact on t_{ACC}.
5. This parameter is only sampled and is not 100% tested.

Notes:

1. The Input Timing Reference is 0.8V for V_{IL} and 2.0V for V_{IH}.
2. t_{OE} and t_{DFP} are characteristics of the device but must be accommodated by the programmer.
3. When programming the AT27C256 a 0.1μF capacitor is required across V_{PP} and ground to suppress spurious voltage transients.

Fast Programming Algorithm

Two $\overline{\text{CE}}$ pulse widths are used to program; initial and over-program. A_i are set to address the desired byte. V_{CC} is raised to 6.0V. The first $\overline{\text{CE}}$ pulse is 1ms. The programmed byte is then verified. If the byte programmed successfully, then an overprogram $\overline{\text{CE}}$ pulse is applied for 3ms. If the byte fails to program after the first 1ms pulse, then up to 25 successive 1ms pulses are applied with a verification after each pulse. When the byte passes verification, the overprogram pulse width is 3X (times) the number of 1ms pulses required earlier (75ms max).

4

If the part fails to verify after 25 1ms pulses have been applied, it is considered as failed. After the first byte is programmed, the A_i are set to the next address repeating the algorithm until all required addresses are programmed. Then V_{CC} is lowered to 5.0V. All bytes subsequently are read to compare with the original data to determine if the device passes or fails.

***A.C. Conditions of Test:**

- Input Rise and Fall Times (10% to 90%) 20ns
- Input Pulse Levels 0.45V to 2.4V
- Input Timing Reference Level 0.8V to 2.0V
- Output Timing Reference Level 0.8V to 2.0V

Notes:

- V_{CC} must be applied simultaneously or before V_{PP} and removed simultaneously or after V_{PP}.
- This parameter is only sampled and is not 100% tested. Output Float is defined as the point where data is no longer driven — see timing diagram.
- Initial Program Pulse width tolerance is 1msec±5%.
- The length of the overprogram pulse may vary from 2.85 msec to 78.75 msec as a function of the iteration counter value X.
