PolyMorphic Systems Announces Inventory Control System

Inventory Control gives you those periodic stock status reports that are too expensive to compile manually, yet so necessary to manage your growing business. With PolyMorphic Systems inventory control, you can start with minimum equipment for 600 inventory records, knowing that add-on storage is available should you later need up to 2400 records.

Each record provides the following:

- part number
- description
- supplier number
- data for up to three outstanding purchase orders
- date
- quantity
- P.O. number
- weighted average cost
- re-order point
- date of last issue
- date of last receipt
- issues to date
- balance on hand

The user can easily create new inventory items and post inventory transactions. At any time you may print out a stock status report which includes total inventory value as well as value by category. For further information, contact any PolyMorphic Systems dealer, or phone us directly.
