Abstract

This file contains the latest version of CLIB for NetWare 3.12 and 3.2. The only changes in since LIB312C.EXE are the inclusion of updated AFTER311.NLM and A3112.NLM.

Installation Instructions

Before installing the new modules included in this update kit, it is recommended that you make a backup of all files that will be overwritten.

1- Copy files to appropriate subdirectory (ea. CLIB.NLM to SYS:\SYSTEM\, and NWSNUT.MSG to SYS:\SYSTEM\NLS\4\).

2- Re-load the updated modules or just restart the server using the console command "RESTART SERVER".

Issue

The only changes in since LIB312C.EXE are the inclusion of updated AFTER311.NLM and A3112.NLM that address a possible memory corruption issue.

Fixes previously included in LIB312C.EXE:

Follow Novell   Request a Call   44-1344-724000   Print   Feedback

ary 29, 2000. For example, March 1, 2000 is a Wednesday, but some backup software products using this API displayed March 1, 2000 as a Tuesday. If backups were set for every Tuesday, two backups would occur the week of February 29, 2000. Backups made after Tuesday, February 29, 2000 would be off by one day. This problem does not affect any application that uses dates in numeric format, only those applications using the CTIME API that rely on the day of the week.

Applications using the API STRFTIME with the %D parameter return
the wrong date. If the date is February 01, 2000, it return 02/01/100 instead of 02/01/00.

Developers:
  These problems are seen with NLMs developed using ANCII C source code, with the Novell APIs STRFTIME and CTIME. These problems are seen only with NetWare versions 3.12 and 3.2, and have not been observed in NetWare versions 4.x or 5.x.

CLIBAUX.NLM Issue:

1. Fixed a 4 byte overwrite of the stat structure in the routines stat() and fstat(). This can only be seen on a NetWare 3.12 or 3.2 server.
